**The occurrence of sucrase in must and wine.** C. VON DER HEIDE AND H. MANDLEN. *Z. Untersuch. Lebensm.* 57, 13-36 (1929).—A gradual decrease in sp. rotation of sucrose is an indication of the presence of sucrase in wine. Sucrase was detected in grapes, musts and wines. The action of sucrase is particularly marked in new wines and those containing yeast deposits. Probably because of the combined action of acid and EtOH, the action of sucrase in matured wines is only slight and gradually becomes inactive. The life of sucrase depends upon the acid, EtOH and sugar concns. as well as the temp. of storage. After 5 yrs. sucrase is usually inactive. Sucrase is derived from grapes and yeast. It is partly or completely destroyed by heat. C. R. FELLERS

**Identification of volatile acids in wines by fractional distillation.** VIRGILE MIROIR. *Chimie & Industrie* Special No., 614-8 (Feb., 1929).—In wine analysis, detn. of the total volatile acidity in terms of  $H_2SO_4$  is not sufficient, and it is important to have some idea of the nature and relative proportions of the volatile acids. This may be obtained by Duclaux' fractional distn. method. In order to obtain reliable and concordant results, the technic adopted must be followed very closely, and the following is recommended:

After elimination of  $\text{CO}_2$  and  $\text{SO}_2$  place 110 cc. of wine in a small distg. flask provided with a thermometer divided in  $0.1^\circ$  from  $89^\circ$  to  $105^\circ$ , distil 100 cc. in 30 min., collecting the distillate in 10 10-cc. volumetric flasks and observing the time and temp. at the beginning and end of each fraction; titrate each fraction with 0.01 *N* NaOH, and compare the curve with those of formic, acetic, propionic, butyric and valeric acids. Results of a few analyses carried out by this method on wines of known origin are given and discussed. The curves obtained with normally fermented wines are practically identical, irrespective of the compn. and origin of the wines, and lie between the curves of formic acid and AcOH; the curve for soured wines is practically identical with that of AcOH as detd. by Duclaux; the curve for wines attacked by "tourne" is intermediate between those of AcOH and propionic acid.

**Identification of urotropine in wines.** MIRCEA V. IONESCU AND CORNELIU BODEA. *Bull. soc. chim.* 45, 466-8 (1929).—Portions of clear wine, 2-5 cc., and 1-2 vol. of an aq. soln. of dimethyldihydroresorcinol (7%) in presence of urotropine or HCHO show a white, cryst. ppt. of methylenebisdimethylidihydroresorcinol, m.  $184-7^\circ$ . MeCHO reacts similarly. A. PAPINEAU-COUTURE

**Detection of fruit wine in grape wine by use of dibenzalsorbitol.** C. VON DER HEIDE AND K. HENNIG. *Z. Untersuch. Lebensm.* 57, 240-1 (1929).—Werder's method (*C. A.* 23, 4296) using 100 cc. of wine was used. Also in *Z. anal. Chem.* 77, 441-50 (1929). K. H. ENGEL

**Diastatic "casse" of red wines.** VIRGILE MIROIR. *Chimie & industrie Special No.*, 619-23 (Feb., 1929).—Diastatic "casse" is an alteration of wine due to the action of O in presence of enoxidase, the degree to which it proceeds depending on the amt. of enoxidase present. As regards the presence of the latter in wines, it comes practically solely from *Botrytis cinerea*. The disease is proportional to the amt. of enoxidase present and is not contagious. The lack of success of attempts to age wines artificially by treatment with O is attributed to the low oxidizability of wines; as wines contg. enoxidase have a considerable affinity for O, it might be expected that by mixing a certain amt. of it with normal wine, the affinity of the mixt. for O would be such as to permit of artificial aging with O. Preliminary expts. along these lines have given promising results as regards the general appearance (particularly color) and taste of the treated wine, though it did not give the delicate bouquet of naturally aged wines. When the desired degree of oxidation has been obtained, further change may be prevented by pasteurizing at  $80^\circ$  (preferably  $85^\circ$ ). A. PAPINEAU-COUTURE

**Determination of volatile acids in beer.** W. WINDISCH, P. KOLBACH AND E. SCHILD. *Wochschr. Brau.* 46, 245-8, 255-9 (1929).—Vacuum distn. of beer at  $p_H$  3 will liberate all the AcOH and  $\text{HCO}_2\text{H}$  and only a negligible amount of lactic acid. Bottom-fermentation beers made from 12 to 14% worts have a volatile-acid content ranging from 1.71 to 4.17 cc. 0.1 *N* per 100 cc. beer. A. SCHULTZ

**Investigations on the sarcinas of beer, particularly from the standpoint of their viscous properties.** JEAN SATAVA. *Chimie & industrie Special No.*, 633-6 (Feb., 1929). A. PAPINEAU-COUTURE

**Abnormal ester content of kirsch.** G. BONIFAZI AND L. BENVEGNIN. *Mitt. Lebensm. Hyg.* 20, 88-91 (1929).—Although the ester content of alc. beverages is the official analytical test of their quality, it is not always dependable. Kirsch made in 1919, 1921 and 1923, favorable years for the ripening of cherries, showed a very low ester content, but had an excellent flavor. Kirsch made in 1922 and 1924, when the weather was not favorable, had an odor of EtOAc and a higher ester content. A complete analysis, therefore, should include both chem. and organoleptic tests. AMY LEVESCONTE

**Influence of temperature and duration of storage on the fermentative power, cell increase and acid production of top fermentation yeasts.** F. WINDISCH. *Wochschr. Brau.* 46, 31-2 (1929).—Storage of yeast at low temp. was most favorable for subsequent fermentation, increase and acid production. A. SCHULTZ

**Biological quality of the yeast in vat sediments. Practical effect of separating the fermenting wort from these sediments.** F. WINDISCH. *Wochschr. Brau.* 46, 183-7, 197-200 (1929).—The yeast usually removed in the vat sediment shows a greater fermentative power than the yeast in suspension. A. SCHULTZ

**Frozen yeast.** STAIGER AND GLAUBITZ. *Z. Spiritusind.* 52, 116 (1929).—Yeast which was frozen at  $-10^\circ$  to  $-25^\circ$  for 1 to 4 days and subsequently thawed for 24 hrs. at room temperature and  $5^\circ$  showed little change in properties. Its baking and keeping qualities, N content and biol. appearance were almost normal. A. SCHULTZ

**Solid molasses (STAIGER, GLAUBITZ) 28. Determination of the starch value of frozen potatoes (LAMPE) 28.**

SEGHERS, JOZ.: *De fruitwijnen. Bereiding. Ziekten en Behandeling van zieke Wijnen. Champagniseeren. Welten. Tweede uitgave.* Brussels: De Nationale Drukkerij. 114 pp. F. 50.

**Fermentation.** PHILIPPE MALVEZIN. *Fr.* 34,104, June 30, 1927. Addn. to 631,782. Worts, wine, beers, etc., are sterilized by making a culture of the enzyme against which it is desired to protect the liquid, destroying the enzyme and extg. with ether, removing the ether and grinding up with salted water, and adding the vaccine obtained to the wort, etc. The step of destroying the enzyme may be omitted.

**Lactic and acetic acids.** WM. H. PETERSON and EDWIN B. FRED (to Wisconsin Alumni Research Foundation). U. S. 1,723,298, Aug. 6. A special newly discovered microorganism (which is described and which may be obtained from fermenting-plant materials such as silage or sauerkraut) is used for producing lactic and acetic acids by the fermentation of molasses solns. or products derived by the hydrolysis of wood, straw, sawdust, corncobs, corn stover, cottonseed hulls or like materials. Lactic acid is the main product.

**Apparatus for vinegar making.** ELMER W. LOSSING. U. S. 1,722,382, July 30. Various structural details are described, of an app. for carrying out the Schützenbach process.

**Beer and by-products.** E. JALOWETZ and M. HAMBURG. *Brit.* 303,110, Dec. 28, 1927. Malt enzymes, diastases, etc., are obtained as by-products in beer brewing, and the quality of the beer is improved by mashing the malt with water at such temps., below 35°, that the peptonization of the insol. albuminous substances cannot take place and the enzymes are not injured. A soln. contg. enzymes is sepd. and concd.

**Yeast production.** FRED RANSOHOFF (to The Fleischmann Co.). U. S. 1,722,858, July 30. During propagation of yeast in a nutrient soln., with aeration, EtOH is added to the propagating liquid (suitably in a quantity of about 10% by vol. of 25 proof alc.), and a substantial increase in the yield of yeast may thus be obtained, without increasing the time of propagation or adversely affecting the quality of the yeast for baking purposes.

**Yeast manufacture.** JOHN HASLING, JR. (to The Fleischmann Co.). U. S. 1,722,746, July 30. Yeast propagation may be initiated in a dil. yeast-nutrient soln. which is aerated until the seed yeast is increased approx. 50%, whereafter approx. one-third of the propagating liquid may be withdrawn and the yeast sepd. from it; an approx. equal quantity of fresh nutrient soln. is added and the propagation is continued.

**Bakers' yeast.** ERWIN KLEIN (to The Fleischmann Co.). U. S. 1,722,803, July 30. Yeast is propagated in a nutrient medium with aeration until a high yield of "forced" yeast is obtained, the yeast produced is removed, subjected to a purifying treatment and the "forced" yeast is strengthened by propagating it in a second nutrient until it has good baking and keeping qualities; the second nutrient medium is composed principally of ingredients of a relatively easily assimilable character.

## 17—PHARMACEUTICAL CHEMISTRY

W. O. EMERY

**Tobacco smoking. II.** A. WINTERSTEIN and E. ARONSON. *Z. Hyg. Infektionskrankh.* 108, 530-53 (1928).—The main current from a cigaret carries about 25% of the nicotine into the mouth, at least 50% passing into the air; from a cigar 60% reaches the mouth. The main current from cigarets of light tobaccos contains markedly less nicotine than that from dark tobaccos. B. C. A.

**Detection of parsley preparations.** L. VAN ITALLIE and A. HARMSMA. *Pharm. Weekblad* 66, 645-7 (1929).—Preps. of parsley fruit are being sold as alleged abortifacients, usually flavored with peppermint or anise and sometimes colored with a green dye. The content of apiol is too small for isolation and identification of this characteristic constituent. Aside from taste and odor a useful test for the recognition of parsley is the prepn. of dibromomyristicin dibromide, m. 130°, by treating an Et<sub>2</sub>O ext. of the steam distillate with Br in AcOH. Myristicin occurs in several other plants; hence its presence is a fair indication rather than conclusive evidence of parsley. A test for parsley oil is the sepn. of the solid glyceride of petroselinic acid, sapon. and identification of the unsatd. acid. In the proprietary preps., however, this glyceride was not present in sufficient amt. to sep. A. W. DOX

**Vinca rosea.** R. C. COWLEY and F. C. BENNETT. *Australasian J. Pharm.* 9, 61

(1928); *Quart. J. Pharm.* 1, 253.—*Vinca rosea*, Linn, N.O. Apocynaceae, is used as a household remedy for diabetes. Various specimens of dried leaves yielded from 0.53 to 0.85% of alkaloidal residue. This gave ppts. with the ordinary alkaloidal reagents and a red coloration with concd.  $\text{HNO}_3$ , and with dil.  $\text{HCl}$  and a crystal of  $\text{KClO}_3$ . By fractional crystn. of the tartrates C. and B. obtained 3 sep. compds. from this residue.

H. L. D.

**Iron and ammonium citrate.** R. C. COWLEY AND F. C. BENNETT. *Australasian J. Pharm.* 9, 170(1928); *Quart. J. Pharm.* 1, 248.—Fe and  $\text{NH}_4$  citrate is not a double citrate of Fe and  $\text{NH}_3$  but a ferricitrate of  $\text{NH}_3$  of indefinite compn. If progressive quantities of  $\text{Fe}_2\text{O}_3$  are dissolved in a definite amt. of citric acid, it is found that the first addns. reduce the amt. of  $\text{NaOH}$  or other alkali required to produce neutrality, but after an amt. of  $\text{Fe}_2\text{O}_3$  equiv. to 1.85 g. to 6.348 g. of citric acid has been dissolved, although further amts. of  $\text{Fe}_2\text{O}_3$  up to a total of 5.58 g. will dissolve, no further reduction in the amt. of  $\text{NaOH}$  required to neutralize the soln. is observed. It is deduced that the further amt. of  $\text{Fe}_2\text{O}_3$  beyond 1.85 g. is in the colloidal condition and that this gives the ppt. caused by the addn. of saline substances to solns. of Fe and  $\text{NH}_4$  citrate. The scales produced by evapg. the neutralized soln. contg. 1.85 g. of  $\text{Fe}_2\text{O}_3$  are green; those contg. larger porportions of Fe are reddish black.

H. L. D.

**Studies on insulin. II and III.** J. BEČKA. *Biol. sp. zvěrolék.* 6, 1–10, 255–60 (1927) Czech, with English summary; *Physiol. Abstracts* 13, 653.—A new method for the prepn. of insulin is described. The glands are ground up with 10%  $\text{FeCl}_3$ , which preserves the insulin content for at least 14 days. The insulin is extd. by 70% methylated spirit at a reaction of  $\text{pH}$  2.0. The final product is a white powder of a value of 10 clinical units in 1 mg. Some expts. for the prepn. of insulin from *Lactuca sativa* had neg. results. An active substance was prepd. from the offal of a sugar factory.

H. L. D.

**Oxidation of adrenaline. I.** The rates of oxidation of commercial solutions. T. VACEK. *Biol. sp. zvěrolék.* 6, 283–90(1927) Czech, with German summary; *Physiol. Abstracts* 13, 662–3; cf. *C. A.* 21, 3065; 22, 1652; 23, 3541.—The rates of oxidation (with  $\text{H}_2\text{O}_2$ ) of different com. adrenaline solns. differ. These rates do not depend upon the  $c_{\text{H}}$  of the solns. Some solns. with a high  $c_{\text{H}}$  oxidize more readily than others with a lower  $c_{\text{H}}$ . **II. The importance of preservatives.** *Ibid* 319–23; *Physiol. Abstracts* 13, 662–3.—The oxidation (with  $\text{H}_2\text{O}_2$ ) of different com. adrenaline solns. depends upon the quality of the solvent and of the different preservative substances. A soln. of pure adrenaline dissolved in  $\text{HCl}$  was oxidized more slowly than a com. soln. of adrenaline at the same  $c_{\text{H}}$ . **III. The importance of some acids of different dissociabilities as solvents of adrenaline.** *Ibid* 347–57; *Physiol. Abstracts* 13, 662–3.—Various “pure” adrenaline substances were dissolved in  $\text{HCl}$ , lactic, acetic and boric acids at a normality of 1, 0.1 and 0.015. The rates of oxidation (with  $\text{H}_2\text{O}_2$ ) of these different solns. have been detd. Different adrenalinols dissolved in the same acid of the same normality were oxidized at various rates. The same adrenaline dissolved in different acids of the same normality also oxidized at different rates. The rate of oxidation does not depend upon the degree of dissociation of the acids. **IV. The photooxidation of commercial solutions and the role of preservatives.** *Ibid* 359–64; *Physiol. Abstracts* 13, 663.—The photooxidation of different com. adrenaline solns. was detd. Oxidation with ultra-violet and visible rays is much more intense than that with visible rays only. Oxidation by visible rays only is, however, nearly as intense as by ultra-violet radiation only.

H. L. D.

**Fixed oil of Caloncoba glauca seeds.** E. PERROT. *Bull. sci. pharmacol.* 35, 260 (1928); *Quart. J. Pharm.* 1, 233.—Since *Oncoba echinata* is not found commonly in the French Cameroons, where leprosy is very prevalent, a common indigenous species, *Oncoba klainii*, or *Caloncoba glauca* A. Chevalier, has been examd. with a view to ascertaining if it can afford a fixed oil suitable to replace chaulmoogra oil in the treatment of that disease. The crushed kernels of the seeds of *Caloncoba glauca* yield to extn. with petr. ether, 30% of pale yellow, semi-solid fat with I value, 86.3,  $a_D^{25} + 60.8^\circ$ . Tested on a lizard weighing 6 g. it developed a stupefying effect in 4 min. From the very high dextrorotation, it is evident that the oil contains a large proportion of acids of the chaulmoogric or hydnocarpic group. The I value is also very near that of *Hydnocarpus anthelmintica* oil. The rapid stupefying action of the fat upon the lizard points to the probable presence of a cyanogenetic glucoside in the kernels. H. L. D.

**On the bottom of the citrate bottle.** WM. J. LOWRY. *Glass Container* 8, No. 9, 16–34(1929); cf. Barnby and Voight, *C. A.* 23, 2783.—Suggested changes in the U.S. P.X formula for citrate of magnesia are: (1) natural oil of lemon should be replaced by the equiv. of terpeneless oil; (2) the  $\text{K}_2\text{CO}_3$  should be reduced to 2 g.; (3) distd.  $\text{H}_2\text{O}$

of room temp. should be specified and (4) the purified talc should be deleted and the formula made for multiples of 1 bottle. To prep. Mg citrate add the citric acid at room temp. to the distd.  $H_2O$ , then gradually the  $MgCO_3$  followed by the terpeneless oil of lemon. Let stand several hrs., filter through thick filter paper and make to vol. minus the allowance for sirup. Sirup should be added just before bottling to decrease danger from mold spoilage. The  $K_2CO_3$  is added without agitation. The bottled citrate is heated at  $74^\circ$  in a water bath for 30-90 min. By following this procedure, sediment formation is entirely prevented.

C. R. FELLERS

Simple tests for stock solutions of quinine and potassium iodide. J. W. D. MEGAW AND HERBERT HAWLEY. *Indian Med. Gaz.* 64, 378-80 (1929).—The concn. of quinine solns. is detd. by phosphotungstic acid as reagent, and that of KI by  $Pb(NO_3)_2$ . The vol. of the ppt. in each instance is compared with that obtained by the employment of standard solns.

FREDERICK G. GERMUTH

Germicides and antiseptics. JAMES F. MALCOLM. *Scottish J. Agr.* 12, 174-85 (1929).—A no. of the more common germicides and antiseptics are discussed with particular reference to the factors affecting their effectiveness.

K. D. JACOB

The determination of ammonia and amide nitrogen in tobacco by the use of permutite. HUBERT B. VICKERY AND GEORGE W. PUCHER. *J. Biol. Chem.* 83, 1-10 (1929); cf. *C. A.* 23, 4019.—The presence of nicotine makes difficult the accurate detn. of  $NH_3$  and amide N in tobacco but it has been found that only a very small amt. of nicotine is taken up by permutite and that it gives no color with Nessler's reagent. In the method described the  $NH_3$  is distd. into acid, the distillate is treated with permutite, the  $NH_3$  liberated by alkali and detd. colorimetrically by Nessler's reagent. The amide N is detd. in a similar manner in the hydrolyzed ext. The method is simple and rapid and can be readily employed in the investigation of other tissues.

A. P. LOTHROP

Comparison of the disinfectants most used by the medical profession. ANDREA BARONE. *Semana méd.* (Buenos Aires) 35, 995-7 (1928).—I in  $H_2O$  soln.,  $C_6H_5OH$ ,  $HgCl_2$ ,  $KMnO_4$ , boric acid, lysol and quinosol are compared. Judged by the germicidal and irritating effect, quinosol is preferable.

A. E. MEYER

Java oil of citronella: necessity of a practical method of analysis. E. TAKENS. *Riechstoffind.* 3, 124-5 (1929); *Chimie et industrie* 21, 1243.—Shake 50 g. of oil for 2 hrs. with 3 vols. of concd.  $NaHSO_4$  soln., contg. a little  $NaOH$ , let stand several hrs., dissolve in 1 l.  $H_2O$ , after sepn. of the oil decant the aq. layer, treat the oil again with 50 cc.  $NaHSO_4$  soln. for 30 min., take up in 400 cc.  $H_2O$ , ext. the combined aq. solns. 3 times with  $Et_2O$ , add the ext. to the residual oil, dehydrate over anhyd.  $Na_2SO_4$ , filter, wash the  $Na_2SO_4$ , evap. the ext. *in vacuo* at about  $40^\circ$  and weigh. If  $a$  = wt. of residue,  $100 - 2a$  = % citronellal. The results obtained in this way on 2 samples were similar to those obtained via Kleber, and were about 3% lower than those via Dupont and Labaune.

A. PAPINEAU-COUTURE

A new method of estimating the potency of digitalis: Pigeon emesis. P. J. HANZLIK. *J. Pharmacol.* 35, 363-91 (1929).—It is proposed to assay digitalis prepn. by detg. the minimum emetic dose (m. em. d.) in pigeons. The method is economical, easy and convenient to use, and the results compare favorably with those obtained by frog and cat methods of assay. M. em. d. causes changes in pulse rate characteristic of digitalis action. The margin of safety in use of the drug can be obtained by detg. the ratio of m. em. d. to m. l. d. It is suggested that from the m. em. d. (pigeon units) there be calcd. the number of pigeon units per g. of prepn. and the strength of the prepn. so expressed

C. RIEGEL

Results with the pigeon-emesis method of estimating the probable therapeutic dose of digitalis. P. J. HANZLIK AND A. B. STOCKTON. *J. Pharmacol.* 35, 393-407 (1929).—Tincture of digitalis, assayed by the pigeon-emesis method, was given to human subjects by mouth, the dose being calcd. from the m. em. d. for pigeons. Slowing of the pulse and reduction in systolic and diastolic blood pressure were observed. The clinical doses agreed well with the m. em. d. detd. in pigeons. It is concluded that the pigeon-emesis method of estimating the potency of digitalis appears to predict the probable therapeutic dose for man.

C. RIEGEL

Elemi oil. SCHIMMEL & Co. *Ber. Schimmel* 1928, 24; *Chem. Zentr.* 1928, II, 1827.—A carana resin from Columbia, which is probably identical with the caranaelemi resin obtained from *Protium Carana* (humb.) L. March, yielded on distn. with steam 15.9% of a light brown oil of turpentine-like odor;  $d_{15}^{20}$  0.9683,  $[\alpha]_D^{20} + 18^\circ 34'$ ,  $n_D^{20}$  1.50448, acid no. 5.0, ester no. 22.4, ester no. after acetylation 42.9, sol. in 8 vols. of 90% alc. The first runnings of the oil (7%, b. p. up to  $175^\circ$ ) contained phellandrene.

G. SCHWOCH

**A rational method for preparing solutions of strychnine salts with the salts of arsenic, phosphoric, glycerophosphoric and methyl- and dimethylarsonic acids.** R. BRAGILOVSKA. *Farm. Zhur.* 1928, 25-30; *Chem. Zentr.* 1928, II, 2381.—In agreement with investigations of Eysseria (*Jahrb. Pharm.* 40, 382(1905)), Demo (*Jahrb. Pharm.* 56, 189(1921)) and others, B. believes that the ppts. occurring in solns. of strychnine salts with the Na salts of arsenic, phosphoric, glycerophosphoric and methyl- and dimethylarsonic acids are due to the alk. reaction of these solns. caused by the hydrolysis of the Na salts. The formation of the ppts., which in all cases could be identified as pure strychnine, is best prevented by addn. of HCl, whose concn. has to be calcd. from the amts. of strychnine and HCl salts present in the solns. Thus the originally alk. reaction becomes almost neutral. The solns. were prepd. by dissolving the strychnine salts in H<sub>2</sub>O contg. HCl and then adding the Na salts dissolved in HCl of the same concn. Thus the following combination, after sterilization at 100°, did not give a ppt.: Strychn. nitr. 0.005; natr. arsenici 0.1; na glycerinophosph. 1.0; Sol. acid. muriat. 0.02 N 10.0.

G. SCHWOCH

**The production of menthol from Ukrainian peppermint oil.** M. EIDERMAN. *Farm. Zhur.* 1928, 35-7; *Chem. Zentr.* 1929, II, 2355.—Several fractions were obtained in the vacuum distn. of peppermint oil at 8-10 mm. Hg and 45-111°. The fraction b. 88-90° contained most of the menthol (80%). The menthol was obtained in a pure state by cooling, sepg. it from the oily mother liquor and recrystallizing it.

G. SCHWOCH

**Australian sandalwood oil.** F. L. GRINBERG. *Farm. Zhur.* 1928, 247-8; *Chem. Zentr.* 1928, II, 821.—G. cites the data given in the literature concerning the chem. and phys. consts. of Australian sandalwood oil (from *Santalum spicatum* and *lanceolatum*) and reports the results of his own investigations for 1 Australian product imported to the Ucraina. Comparison with Indian oil shows that there are no objections to its employment in therapy.

G. SCHWOCH

**The extraction of strychnine in the forensic chemical examination.** N. VALYASHKO AND V. ROSVADOVSKII. *Farm. Zhur.* 1928, 532-4; *Chem. Zentr.* 1929, I, 117.—Strychnine is extd. with CHCl<sub>3</sub> from the soln. made distinctly acid with tartaric acid. The test for strychnine must be carried out directly in the residue on evapn. of the acid CHCl<sub>3</sub> ext. or after purification by dissolving in acidified H<sub>2</sub>O, rendering alk. and extg. with Et<sub>2</sub>O or CHCl<sub>3</sub>. With the extn. according to Gadamer by means of Et<sub>2</sub>O and CHCl<sub>3</sub> from the acid and, later on, alk. soln. and examn. of the ethereal-alk. ext. it is possible that no strychnine is found in material contg. this drug.

G. SCHWOCH

**Absolute flower oils.** W. A. POUCHER. *Chemist and Druggist* 108, 308-9(1928).—A comparison of the enfleurage and volatile solvent products. The latter process of manuf. is now the most frequently used. Regarding the odor evaluation and yield of the abs. oils from jasmine (cf. Cerighelli, *C. A.* 19, 843) and tuberosc, the relative value of the 2 processes is still in doubt. For jasmine flowers, the difference in yield is believed to be nil (cf. v. Soden, *C. A.* 19, 3147; the ratio 5:2 is claimed). P. shows that from the point of view of prices for given strength of odor, there is very little choice between the abs. jasmine oils from both mfg. sources, since about 3 times the cheaper (enfleurage) at approx. 1/3 the price was required to equal the odor strength of the volatile solvent abs. oil.

S. WALDBOTT

**Moscow Endocrinology Institute.** ANON. *Chemist and Druggist* 109, 345(1928).—This Soviet State institution supplies its country with exts. of *orchicrin* (Kravkov) and other preps., e. g., adrenaline, *mascrin*, *antiasthmocrin*, *masmocrin*, *pilucrin*, insulin, thyroxine, ovary hormones and pituitrin. It maintains its own breeding farms, and at Sukhum (Caucasus) is located "the only sub-tropical monkey-breeding farm in the world."

S. WALDBOTT

**Slovakian mud bath.** J. G. F. DRUCE. *Chemist and Druggist* 108, 467(1928).—At Trencsen-Teplicz, a radioactive, inorg. mud, free from bacterial life, accompanies some of the H<sub>2</sub>S-bearing hot springs, and is used with success in cases of rheumatism, gout, etc. Dried at 100-105°, its compn. is: SiO<sub>2</sub> 60.14, Al<sub>2</sub>O<sub>3</sub> 13.96, CaO 9.61, Fe<sub>2</sub>O<sub>3</sub> 6.10, SO<sub>3</sub> 3.12, CO<sub>2</sub> 0.91, MgO 0.80, K<sub>2</sub>O 3.46, Na<sub>2</sub>O 1.85, P<sub>2</sub>O<sub>5</sub> 0.001%. The hot springs (36-42°C.) yielding 9,000,000 l. daily are used medicinally for the same purposes; the water of 1 spring is used for a drinking cure. Its compn. per 10,000 parts is: Na<sub>2</sub>SO<sub>4</sub> 0.779, K<sub>2</sub>SO<sub>4</sub> 0.605, CaSO<sub>4</sub> 12.104, MgSO<sub>4</sub> 5.880, NaCl 1.806, CaCO<sub>3</sub> 3.007, Fe<sub>2</sub>O<sub>3</sub> and Al<sub>2</sub>O<sub>3</sub> 0.012, SiO<sub>2</sub> 0.354, CO<sub>2</sub> (as bicarbonate) 1.323, free CO<sub>2</sub> 2.423, H<sub>2</sub>S 0.022 parts.

S. WALDBOTT

**The chemistry of hair dyes.** H. STANLEY REDGROVE. *Chemist and Druggist* 109, 760-2(1928).—The chem. nature of the substances used as hair dyes, and the mode of formation of the color in the hair are presented. The question of toxicity and effect on the hair is discussed.

S. WALDBOTT

**Modern face powders.** W. A. POUCHER. *Chemist and Druggist* 108, 810-2 (1928).—A discussion of quality requirements of the powder, substances used (e. g., osmo-kaolin, C. A. 18, 1549), effect on the skin and the choice of color and of perfume.

S. WALDBOTT

**Sketches in the history of English medicine. I. Dawn: Celtic and Anglo-Saxon medical and pharmaceutical practice from the 9th to the 13th centuries.** CHARLES SINGER. *Chemist and Druggist* 108, 823-32 (1928). **II. Twilight: The Anglo-Norman period and the advent of the learning of Salerno and the Arabs (13th and 14th centuries).** *Ibid* 110, 795-807 (1929).

S. WALDBOTT

**Emulsio petrolei, Brit. Pharm. Codex.** W. A. KNIGHT. *Pharm. J.* 121, 297 (1928).—Since the use of gum acacia (A) alone produces much smaller oil globules with liquid paraffin (B) than gum tragacanth (C) as used in the Codex, K. recommends first making an emulsion with A, then incorporating B. Half the quantity of A prescribed would be sufficient. The use of 0.15% BzOH is better than that of gum benzoïn as a preservative. In the place of the expensive C, an *emulsio petrolei cum agar agar* is recommended.

S. WALDBOTT

**Antimony in pharmacy and chemistry. I. History and occurrence of the element.** G. MALCOLM DYSON. *Pharm. J.* 121, 397-8 (1928).—The manuf. of Sb from stibnite and the method of freeing it from As are included. **II. The metal and its inorganic compounds.** *Ibid* 520-1.—The compn. of Sb alloys (bearing metals and type metals) is given. The alloy Sn 3, Pb 2, Sb 1 is used in mfg. ship's nails resisting corrosion by sea water. The history and prepn. of inorg. pharmaceutical Sb compds., e. g., Alga-roth and Carthusian powders, and of tartar emetic are reviewed. **III. The organic antimony compounds in therapy.** *Ibid* 596 (1928).—The Sb analogs of arspenamine and arsacetin are useless in the therapy of syphilis. Org. Sb compds., aliphatic and aromatic, are employed in trypanosomiasis, leishmania and schistosomiasis, e. g., tartar emetic (cf. C. A. 17, 3371), "Bayer 205" (cf. C. A. 20, 450, 2702, 2866, 3742; 22, 817, 959), *sulfoform* (Ph<sub>3</sub>Sb:S), stibhenyl (C. A. 14, 2953; 17, 420), *stibosan* (3,4-Cl(AcNH)-C<sub>6</sub>H<sub>3</sub>SbO<sub>2</sub>Na<sub>2</sub>) and luargol (C. A. 12, 830); also cf. C. A. 22, 4648. Sb compds. in conjunction with chaulmoogra oil have been used in leprosy (cf. C. A. 21, 2935). S. W.

**The apothecary and some curious materia medica of the 17th century.** C. T. S. THOMPSON. *Pharm. J.* 121, 474-5, 480; *Chemist and Druggist*, 109, 607-9 (1928).—A lecture on the use of the human skull, blood, brain, fat, urine, gall, etc., and of insects, reptiles, earth (terra sigillata), etc., in the materia medica of that period. However, recent materia medica which uses bone marrow, brain ext., corpus luteum, cobra venom, etc., furnishes many counterparts.

S. WALDBOTT

**Manufacture of lead-selenium preparations.** A. L. TAYLOR AND E. LLOYD. *Pharm. J.* 121, 542-3 (1928); cf. C. A. 20, 2700.—Details are given of the manuf. of a colloidal Pb-Se compd. for intravenous injection in the treatment of cancer. The compd "D<sub>1</sub>" contained 0.4% Pb and 0.04% Se in filtered and sterilized soln. of gum acacia as vehicle. About 0.1% Pb was present as PbSe, 0.3% as Pb(AcO)<sub>2</sub>. An improved new prepn. "D<sub>2</sub>S" (all Pb being present as selenide) is on the market.

S. WALDBOTT

**Everyday problems in pharmacy.** J. H. FRANKLIN. *Pharm. J.* 121, 597-8; *Chemist and Druggist* 109, 673-4 (1928).—In a certain dispensing problem, pptn of salicylic acid from a mixt. of Na salicylate (A), KBr, dil. HBr and H<sub>2</sub>O was avoided by dissolving KBr (11.64 g.), dil. HBr (10.65 cc.) and K citrate (3.88 g.) in H<sub>2</sub>O (150 cc.); then an aq. soln. of A (19.4 g.) was added and the vol. made up with H<sub>2</sub>O to the required 240 cc. No ppt. was formed within a week. The characteristics of *oxymel scillae*, Brit. Pharm., are defined; prolonged heating alters the constituent purified honey, producing a very dark color. *Aromatic spirit of ammonia*, Brit. Pharm., developed a pale straw color in 18 months; if distn. is omitted in its prepn., darkening (mainly caused by the action of the alkali on the essential oil) will probably take place rapidly. The formula for *sirup of citric acid*, Brit. Pharm. Codex, requires revision, on account of the abundant pptn. of inverted sugar soon forming. The difference between the physiol. actions of *red squill*, a rat poison (cf. C. A. 21, 2937) and white squill (contg. glucosides acting on the heart) is pointed out.

S. WALDBOTT

**Nitrogen as a preservative for certain emulsions and sirups.** WILLIAM JOHNSTON. *Pharm. J.* 121, 619 (1928).—The N obtained as a by-product in the manuf. of O from air may be utilized to provide a non-oxidizing atm. in emulsion making, e. g., of cod-liver oil, or for ferrous sirups, ferrum reductum, etc.

S. WALDBOTT

**Homonarceine.** D. B. DORR. *Pharm. J.* 121, 620; *Chemist and Druggist* 109, 802 (1928); cf. C. A. 1, 1083, 2442; 2, 494.—By using EtI in place of MeI in the prepn. of narceine (A) from narcotine, homonarceine (B) may be obtained. B closely resembles A in its general properties. Heated to 98° in the oven, it loses 3 mols. of H<sub>2</sub>O.

Soly. in  $H_2O$  at ordinary temp. is 1:140. The dried *B m.* 169.5° (temp. raised gradually). With  $H_2SO_4$ , *B* dissolves with yellow color which tends to darken; it turns red on warming, deepening to brown. The fully hydrated  $HCl$  salt of *B* probably contains 3 mols. of  $H_2O$ ; soly. in  $H_2O$  is about 1:25. S. WALDBOTT

**Morphine sulfates.** D. B. DORR. *Pharm. J.* 121, 620, 627; *Chemist and Druggist* 109, 802 (1928).—The acid salt  $M.H_2SO_4$  ( $M = C_{17}H_{19}NO_3$ ) is easily sol. in  $H_2O$  (cf. *C. A.* 12, 1235); by repeated crystns. the normal salt  $M_2.H_2SO_4.5H_2O$  (*A*) is formed. When  $M.H_2SO_4$  is recrystd. from  $EtOH$ , titration of the product with 0.1 *N*  $NaOH$  indicates a sesquisulfate of *M*,  $M_{1.5}.H_2SO_4$  (*B*). When *M* is dissolved in a small quantity of  $H_2O$  and the soln. mixed with 0.75 mol.  $H_2SO_4$ , a mass of well-defined crystals, probably *B*, is also formed. Treatment with  $H_2O$  will convert *B* into *A*. The U. S. P. statement that *A* "dried to const. wt. at 130° loses not more than 12% ( $H_2O$ )" needs revision. After *A* contg. 5 mols. of  $H_2O$  was heated on the water bath, 3 mols. of  $H_2O$  was lost, nothing more, however, at 130°. At 150–160° more  $H_2O$  was lost slowly, with decompn. of the salt. S. W.

**Strychnine phosphate.** D. B. DORR. *Pharm. J.* 121, 620, 627; *Chemist and Druggist* 109, 802 (1928).—The salt,  $C_{21}H_{22}N_2O_2.H_3PO_4.2H_2O$ , loses its  $H_2O$  slowly at 100°, more readily at 130°. Soly. in  $H_2O$  is 1:30 at ordinary temp.; (not 1:15). When the salt is prepd. with the aid of  $EtOH$ , the unstable compd.  $(C_{21}H_{22}N_2O_2)_2.H_3PO_4$  is formed;  $H_2O$  decomposes it, pptg. part of the alkaloid. S. WALDBOTT

**Some notes on chamomile.** H. STANLEY REDGROVE. *Pharm. J.* 122, 50–1 (1929).—The botanical differences between the English *Anthemis nobilis* and the German *Matricaria chamomilla* are sketched and explained. The chemistry of the essential oils and of the flower-heads (Power and Browning, *C. A.* 8, 3485; 9, 64) is reviewed. In addn. to the old medicinal uses as a tonic, etc., the dried flower-heads are now much employed in shampoo powders and hair washes, and sometimes in powder form as a hair dye, dependent on its apigenin content, a flavone deriv. S. WALDBOTT

**Arsenic in pharmacy and chemistry.** I. The element, its history and compounds. G. MALCOLM DYSON. *Pharm. J.* 122, 72–3 (1929).—The uses of the metal and its inorg. compds. in pharmacy and industry are pointed out, e. g., of a basic *Ca* arsenate in combating the boll-weevil pest (cf. *C. A.* 14, 3495; 16, 3162; 22, 2024). II. Some forensic aspects of arsenic. *Ibid* 146–8.—Detailed reference is made to famous cases of poisoning by  $As_2O_3$  in the Middle Ages, to the toxic properties of  $AsH_3$ , the detection of arsenic and arsenic eating. III. The organic arsenicals. *Ibid* 199–200, 225–6.—"From a small and apparently unimportant academic observation —(the discovery in 1760 of Cadet's fuming arsenical liquor or acétite oléo-arsénicale)—has sprung an important branch of modern chemotherapy." S. WALDBOTT

**Pharmacies in Czech Silesia.** J. G. F. DRUCE. *Pharm. J.* 122, 92 (1929).—A brief account of old pharmacies, and of medicinal springs in Czech Silesia. S. W.

**The keeping properties of dispensed medicine.** HARRY BODSWORTH. *Pharm. J.* 122, 94–5 (1929).—*B.* refers to periodic, e. g., monthly hospital supplies of medicine to convalescent patients for home use. Deterioration upon careless handling was established in 5 sets of expts., with preps. tending to lose strength (e. g., those contg.  $HCN$ ), to gain strength (e. g.,  $H_2O_2$  caused by evapn. of  $H_2O$ ), preps. liable to develop fungus growths, preps., the ingredients of which interact, and preps. which act on the cork, e. g., tinctures contg.  $NH_3$ . The latter action is avoided by coating the cork with paraffin. When bottles contg. medicine are well corked and kept in a cool dark place, little or no deterioration is noted. S. WALDBOTT

**The copper sulfate-sodium hydroxide test for ephedrine isomers and related compounds.** K. K. CHEN. *J. Am. Pharm. Assoc.* 18, 110–3 (1929).—To 1 cc. of a 1% soln. of the alkaloid add 0.1 cc. of 10%  $CuSO_4$  and 1 cc. of 20%  $NaOH$ . A purplish or deep blue color is produced. If the test reacts positively add 2 cc. of  $Et_2O$  and shake. The color dissolves in  $Et_2O$ . The test applied to 27 aromatic amines, of which 6 were optical isomers of ephedrine, was positive in 22. All that reacted contain an  $OH$  attached to the  $\beta$ -C atom from the amine *N*. The  $Cu$  complexes formed by 16 of the amines are insol. in  $NaOH$ . The  $Cu$  complexes from 13 were sol. in  $Et_2O$ . The test may be used to distinguish the 3 ephedrines from the corresponding pseudo compds. L. E. W.

**The colloidal nature of iron scale salts.** D. LOESER. *J. Am. Pharm. Assoc.* 18, 124–8 (1929).—Several iron salts were prepared in scale form and their solns. dialyzed. It was concluded that the  $Fe K$  tartrate,  $Fe, NH_4$  tartrate and  $Fe$  glycerophosphate are true colloids. Several of the others exist partly in the colloidal state. This accounts for the lessened astringency of such salts. L. E. WARREN

**The ash content of resin of podophyllum.** L. D. HAVENHILL. *J. Am. Pharm. Assoc.* 18, 129–30 (1929).—Fifteen commercial samples of resin of podophyllum were

examd. for ash. Eight gave 0.18–0.45% of ash and five 0.65–0.89%; two were not claimed to be U. S. P. The color varied considerably. The resin can easily be made to contain less than 0.25% ash.  $\text{NaAl}(\text{SO}_4)_2$  used as a precipitant gives yellow resin and is no better than dil.  $\text{HCl}$ . The present U. S. P. limit of 1.5% ash is too high; an upper limit of 0.5% is recommended.

L. E. WARREN

A preliminary report on the composition of sirup of calcium iodide. CATY J. BRADFORD AND H. A. LANGENHAN. *J. Am. Pharm. Assoc.* 18, 135–42 (1929).—Sirup of  $\text{CaI}_2$  was prepd. by 3 formulas and the finished product stored under a variety of conditions. The specimens were assayed from time to time and the keeping qualities noted. The total iodide ranged from 2.80 to 5.89%. Some of the specimens contained free I. The contents of  $\text{FeI}_2$  and  $\text{CaI}_2$  varied greatly.

THOMS, H.: *Handbuch der praktischen und wissenschaftlichen Pharmazie*. Band V. pp. 753 to 980. Lieferung 27. Berlin: Urban und Schwarzenberg. M 10. Reviewed in *Pharm. J.* 123, 66 (1929).

Synthetic drugs. I. G. FARBERIND. A.-G. Brit. 303,097, June 23, 1927. Alkoxy aminophenols are converted into more basic polyamino derivs. by the introduction of alkylaminoalkyl groups into the OH and  $\text{NH}_2$  groups. An example is given.

Alkylaminoalkylamino compounds (synthetic drugs). I. G. FARBERIND. A.-G. Brit. 302,984, June 23, 1927. The process described in Brit. 274,058 (C. A. 22, 2033) is modified to yield compds. in which the aliphatic side chain is interrupted by O or S atoms or by secondary or tertiary amino groups. Examples are given. Brit. 302,985 specifies the conversion of aminophenols or diamines of the benzene series or their derivs. or substitution products into more strongly basic polyamino derivs. by introducing more than one alkylaminoalkyl group into the same or different amino groups of the benzene nucleus. Examples are given. These products may be used as therapeutic agents in combating blood parasites.

Medicine for bronchial affections. ANATOLE PANALLE (one-third to Sam L. Needle). U. S. 1,723,459, Aug. 6. South Carolina yellow pine tar 4 drams is used with beechwood creosote 1 oz. and  $\text{CS}_2$  8 oz., to form a mixt. which is used by inhalation.

Bismuth camphocarboxylate. MARIUS L. PICON. Fr. 657,694, Jan. 4, 1928. Neutral Bi camphocarboxylate is prepd. by the action of camphocarboxylic acid on anhydrous  $\text{Bi}_2\text{O}_3$  in the presence of a little water, drying the product under vacuum at a temp. below  $100^\circ$ , and afterward treating with an org. solvent such as benzene and removing the benzene with traces of water by distn.

Diethylaminoethyl thiourea and similar compounds (substitutes for ergot). HANS HAHN AND LUDWIG SCHÜTZ (to Winthrop Chemical Co.). U. S. 1,723,696, Aug. 6. Na (6 parts) is dissolved in 60 parts of alc. and 20 parts of thiourea is added. Subsequently 36 parts of diethylaminoethyl chloride is added. The reaction begins at ordinary temp. and is accelerated by warming. The mixt. is poured into water, the oil which seps. is dried and distd. It is a thick oil having most probably the formula:  $\text{NH}:\text{C}(\text{NH}_2)\text{SCH}_2\text{CH}_2\text{N}(\text{Et})_2$ . It  $b_{10}$   $140\text{--}143^\circ$ . With  $\text{HCl}$  it forms a salt which crystallizes from alc. in the shape of white needles sol. in water. The aq. soln. can be used for subcutaneous injections. Other alkylhalogenides can be used, e. g., ethylenebromide as starting materials for producing similar compds.

Hemoxyptic compounds. HANS HAHN AND LUDWIG SCHÜTZ (to Winthrop Chemical Co.). U. S. 1,723,695, Aug. 6. Na (6 parts) is dissolved in 60 parts of alc. and 60

parts of phenylthiodiazolone hydrosulfide is added. Subsequently 40 parts of  $\text{ClCH}_2\text{CH}_2\text{NEt}_3$  is added. The reaction begins at the ordinary temp. and is accelerated by warming. The mixt. is poured into water, the oil which ppts. is sepd., dried and distd. It is probably 5-[ $\beta$ -(diethylamino)ethylmercapto]-3-phenyl-1,3,4-thiodiazol-2(3)-one. With  $\text{HCl}$  it forms a salt which crystallizes from alc. in the shape of white needles sol. in water and m. 207–208°. The aq. soln. can be used for subcutaneous injections. Instead of phenylthiodiazolone hydrosulfide other S-contg. compds. possessing the chem. character of mercaptans and other alkylaminoalkyl halides can be used for producing similar products, which may be used as substitutes for ergot.

**Alkylamino compounds (therapeutics against blood parasites).** I. G. FARBENIND. A.-G. Brit. 303,093, June 23, 1927. The process described in Brit. 274,058 (C. A. 22, 2033) is extended to amines of the benzene series contg. more than 2 amino groups, or is modified to yield products in which a newly introduced alkylamino group is connected to the amino group of an amino hydroxy compd. or polyamine of the benzene series through the medium of a hydroaromatic residue. Examples are given of the prepn. of some of these products and of the production of intermediates for these reactions.

**Hormones.** O. KAMM, T. B. ALDRICH and I. W. GROTE (to Parke, Davis & Co.). Brit. 303,362, Dec. 31, 1927. In purifying and isolating the active principles of various glandular products such as those of exts. of the posterior lobe of the pituitary gland, the material is treated with an org. carboxylic acid such as  $\text{HOAc}$  or propionic or butyric acid, to dissolve the active principles but leave behind most of the contaminating substances, and the soln. formed is then subjected to fractional pptn. as by the addn. of acetone, ether and petr. ether. It is stated that a pressor and an oxytocic hormone may be separately obtained from pituitary ext. Various details are given.

## 18—ACIDS, ALKALIES, SALTS AND SUNDRIES

E. M. SYMMES

**Safety in the manufacture of sulfuric acid by the contact process.** STANLEY H. KERSHAW. *Ind. Eng. Chem.* 21, 762–3(1929).—Recommended practices. T. H. C.

**Chamber process and its regulation.** Y. N. SLAVYANOV. *Zhur. Prikladnoi Khim.* 1, 319–22(1928).—The old method of regulating the  $\text{H}_2\text{SO}_4$  chamber process by temp. differences and by color of the gases is not satisfactory and should be abandoned in favor of control of acidity of escaping gases. V. KALICHEVSKY

**Basic processes of manufacturing alumina.** G. G. URAZOV and Y. E. VILNYANSKII. *Zhur. Prikladnoi Khim.* 1, 271–83(1928).— $\text{Na}_2\text{O} \cdot \text{Al}_2\text{O}_3$  is formed by fusing  $\text{Al}_2\text{O}_3$  and  $\text{Na}_2\text{CO}_3$  at 500–1050°. The presence of  $\text{NaCl}$  has no appreciable effect on the reaction. The reaction rate increases with the increase in the amt. of  $\text{Na}_2\text{CO}_3$  present, but is also dependent on the nature of the raw material. For bauxites fusion with  $\text{Na}_2\text{CO}_3$  for 2 hrs. at 980° is recommended. Quick leaching with water leaves  $\frac{1}{4}$  of the  $\text{Al}_2\text{O}_3$  in an insol. form. Addn. of  $\text{Na}_2\text{CO}_3$  to this water is of no benefit, but addn. of  $\text{NaOH}$  ( $\frac{1}{3}$  of the amt. present in the melt) increases the yield of  $\text{Al}_2\text{O}_3$  by almost 100%. Mol. ratio of  $\text{Na}_2\text{O}$  to  $\text{Al}_2\text{O}_3$  in the soln. is about 1.09–1.48 which is not in accordance with the Goudrian diagram (C. A. 15, 478). V. KALICHEVSKY

**Barium process of manufacturing alumina from bauxites and aluminum silicates rich in silica.** G. G. URAZOV and A. V. CHITAEV. *Zhur. Prikladnoi Khim.* 1, 96–109 (1928); cf. C. A. 14, 1006.—Ba aluminates are formed at higher temps. than those of Na. Fusion at 1220° with  $\text{BaCO}_3$  converts 88–98% of  $\text{Al}_2\text{O}_3$  into water-sol. form, while at 1000° not over 55%  $\text{Al}_2\text{O}_3$  can be extd. In the presence of fluxes such as  $\text{NaCl}$  about 93%  $\text{Al}_2\text{O}_3$  is converted into the water-sol. form at 1000°. Soly. isotherms of the system  $\text{BaO}-\text{Al}_2\text{O}_3-\text{H}_2\text{O}$  were investigated at 60°. Max. soly. corresponds to 348%  $\text{BaO}$  and 1.129%  $\text{Al}_2\text{O}_3$  by wt. ( $\text{Al}_2\text{O}_3:2\text{BaCO}_3$ ). No compds. are formed. Soly. isotherms of the system  $\text{Ba}(\text{OH})_2-\text{NaCl}-\text{H}_2\text{O}$  at 60° show that no compds. are formed and that the highest soly. corresponds to a mixt. of 1.17 mols. of  $\text{BaO}$  and 1 mol. of  $\text{NaCl}$  (the ratio may be even closer to one).  $\text{NaCl}$  increases soly. of  $\text{Ba}(\text{OH})_2$  by 1.52% only. Investigation of the system  $\text{BaO}-\text{Al}_2\text{O}_3-\text{NaCl}-\text{H}_2\text{O}$  at 60° showed that presence of  $\text{NaCl}$  has no effect on soly. By fusing bauxites with  $\text{Na}_2\text{CO}_3$ , more  $\text{Al}_2\text{O}_3$  is converted into a sol. form than by fusing with  $\text{BaCO}_3$ , but the Ba process yields a product with a low  $\text{SiO}_2$  content as compared with the  $\text{Na}_2\text{CO}_3$  process. V. KALICHEVSKY

**Soda-lime process of manufacturing alumina from bauxites and aluminum silicates rich in silica.** G. G. URAZOV, YA. E. VILNYANSKII and YA. V. MORACHEVSKII. *Zhur. Prikladnoi Khim.* 1, 77–96(1928).—In fusing Al silicates with  $\text{Na}_2\text{CO}_3$  the principal

comps. formed are  $\text{Na}_2\text{O} \cdot \text{Al}_2\text{O}_3$  and  $1-1.5\text{Na}_2\text{O} \cdot \text{Al}_2\text{O}_3 \cdot 2-2.5\text{SiO}_2$ . Not more than 1 mol. of  $\text{Na}_2\text{CO}_3$  should be present per mol. of  $\text{Al}_2\text{O}_3$  and per 2 mols. of  $\text{SiO}_2$ ; otherwise considerable  $\text{SiO}_2$  is obtained in water-sol. form. The residue insol. in water has an approx. compn.  $\text{Na}_2\text{O} \cdot \text{Al}_2\text{O}_3 \cdot 2\text{SiO}_2$ . Best fusing temp. is  $850-950^\circ$ . When nepheline ( $\text{Na}_2\text{O} \cdot \text{Al}_2\text{O}_3 \cdot 2\text{SiO}_2$ ) was fused with  $\text{CaO}$  and the melt leached with water the insol. residue contained all four oxides. The  $\text{Al}_2\text{O}_3$  and  $\text{Na}_2\text{O}$  content of this residue decreases with the increase in the amts. of  $\text{CaO}$  and  $\text{SiO}_2$  present. When clay ( $\text{SiO}_2$  44.25,  $\text{Al}_2\text{O}_3$  38.73,  $\text{Fe}_2\text{O}_3$  0.85,  $\text{TiO}_2$  1.62,  $\text{H}_2\text{O}$  14.44%) was fused with  $\text{Na}_2\text{CO}_3$  and  $\text{CaCO}_3$  more water-sol.  $\text{Na}_2\text{O}$  and  $\text{Al}_2\text{O}_3$  were formed than with nepheline. The insol. residue probably contains  $3\text{CaO} \cdot \text{SiO}_2$ . By leaching the melt with hot  $\text{NaOH}$  soln. more  $\text{Al}_2\text{O}_3$  is extd. but  $\text{SiO}_2$  is also partly dissolved. The soln. of the problem consists in finding conditions under which all of  $\text{Al}_2\text{O}_3$  and no  $\text{SiO}_2$  are extd., but this could not be accomplished.

V. KALICHEVSKY

The estimation and control of acidity in the crystallization of ammonium sulfate. J. A. CRANSTON AND J. STOCKDALE. *J. Roy. Tech. Coll.* (Glasgow) 2, No. 1, 36-9 (1929).— $(\text{NH}_4)_2\text{SO}_4$  crystallizes best from a soln. contg. 2%  $\text{H}_2\text{SO}_4$ . To control automatically the amt. of acid added, an app. is described in which  $\text{SO}_2$  is liberated in the mixing vessel and then passes to an external cond. cell. The resulting increase in cond. is sufficient to operate a relay which regulates the admission of acid into the mixing vessel. Me orange was found to be a satisfactory indicator of acidity of  $(\text{NH}_4)_2\text{SO}_4$  solns. by titration with  $\text{NaOH}$ .

R. H. FERGUSON

Iron carbonyl. HEINRICH PINCESS. *Chem.-Ztg.* 53, 525-6 (1929).—The original Mond and Langer process of making  $\text{Fe}(\text{CO})_5$  was very tedious and gave a yield of about 1%, calcd. upon the  $\text{Fe}$  used. A recent I. G. Farbenindustrie A.-G. process uses  $\text{Fe}$  ore and  $\text{CO}$  from producer gas or water gas, with at least 5%  $\text{H}$  present, with temps. near  $500^\circ$  and pressure near 200 atm. It has not been possible to make the process continuous, but the gas is circulated until its  $\text{CO}$  content is less than 10%. The  $\text{Fe}(\text{CO})_5$  formed may be converted into metallic  $\text{Fe}$  or oxide of great purity, suitable for use as catalyst.

W. C. EBAUGH

Chemical treatment of potassium deposits at Solikamsk. F. F. WOLF AND V. S. YATLOV. *Zhur. Prikladnoi Khim.* 2, 85-90 (1928); cf. *C. A.* 23, 1220.—Deposits contain high-grade sylvanite and can be handled as an ideal  $\text{KCl}-\text{NaCl}-\text{H}_2\text{O}$  system.  $\text{CaSO}_4$  does not give trouble, and the quantity of  $\text{MgCl}_2$  is also small. The flow sheet of the process is given.

V. KALICHEVSKY

Bromine: importance and economic perspectives. PAUL MAQUENNE. *Chimie & industrie* 21, 1305-11 (1929).

A. PAPINEAU-COUTURE

Contribution to the preparation of pure chlorine gas. H. ECKSTEIN. *Chem. Fabrik* 1929, 335. R. WASMUHT. *Ibid* 335-6; cf. *C. A.* 23, 2769.

J. H. MOORE

Mining and treatment of gypsum in South Australia. L. J. WINTON. *Chem. Eng. Mining Rev.* 21, 337-40 (1929).

E. H.

Fermentation of brine water. SHINKICHI AKIMOTO. *Science* (Japan) 3, 148-52 (1928).—Owing to the fact that  $\text{H}_2\text{S}$  is formed in the tank contg. brine, removal of the sulfate ion by means of a culture of sulfate-reducing bacteria in the  $\text{NaCl}$  mfg. industry of Japan was attempted. For this purpose sulfate-reducing bacteria from natural brine water which can live in salty  $\text{H}_2\text{O}$  were inoculated in a brine of  $17^\circ \text{Bé}$ . at  $30^\circ$ . In 2 weeks 30% of the total sulfate could be decompd. by the bacteria.

K. SOMEYA

A study on agar-agar. I. TETSUNOSUKE YANAGAWA. *Repts. Imp. Ind. Research Inst. Osaka, Japan* 10, No. 6 (1929).—A preliminary rept. The historical development of the agar-agar industry in Japan together with the present status, and the effect of 16 inorg. and 11 org. compds. on the viscosity, degree of hydrolysis and degree of gelatinization of agar-agar soln. are discussed.

F. I. NAKAMURA

Preparation of plastics from unsaturated hydrocarbons. L. AUER. *Rev. gén. mat. plastiques* 5, 315, 317 (1929).—See *Fr. pat.* 652,795 (*C. A.* 23, 3804).

A. P.-C.

Notes on *p*-dichlorobenzene and naphthalene as repellents against clothes moth larvae. L. J. BOTTIMER. *J. Econ. Entomol.* 22, 570-3 (1929).—Small amts of  $p\text{-C}_6\text{H}_4\text{Cl}_2$  and  $\text{C}_{10}\text{H}_8$  exposed in a room did not repel larvae of the webbing clothes moth, *Tineola biselliella*.

C. H. RICHARDSON

The control of the tobacco beetle in upholstered furniture. S. MARCOVITCH. *J. Econ. Entomol.* 22, 602 (1929).—The stuffing inside the furniture infested with *Lasioderma serricorne* is treated with a satd. aq. soln. of  $\text{N}_2\text{SiF}_6$ .

C. H. R.

Sodium fluosilicate as a house fly poison. S. MARCOVITCH. *J. Econ. Entomol.* 22, 602 (1929).—A satd. aq. soln. was readily imbibed by *Musca domestica* and it readily killed them.

C. H. R.

**Soap production** [NaOH production from  $\text{Na}_2\text{CO}_3$  and milk of lime] (U. S. pat. 1,722,687) 27.

**DERSEN, HANS AND TIEDT, ERICH:** *Verhalten von Chemikalien bei Bränden*. 2nd ed., revised and enlarged. Munich: Feuerschutzverlag Ph. L. Jung. 43 pp.

**Sulfuric acid.** FRIEDERICK J. CORBETT. Australia 11,475, Jan. 31, 1928. A mixt. of  $\text{SO}_2$ , O and water is heated under pressure in a chamber,  $\text{HNO}_3$  is added and the mixt. agitated. The residual gases are withdrawn and recovered.

**Sulfuric acid.** MARIO C. MANNI. Fr. 34,290, Sept. 13, 1927. Addn. to 623,860. Cooling chambers are put in communication with the Pb chambers of Fr. 623,860 to create a circulation for the hot gases.

**Sulfuric acid.** S. ROBSON, B. LAMBERT and NATIONAL PROCESSES, LTD. Brit. 303,459, Oct. 3, 1927. In prepg.  $\text{H}_2\text{SO}_4$  by use of the contact material described in Brit. 301,853 (C. A. 23, 4306) sulfurous gases obtained by roasting ores, etc., are subjected only to such purification as is necessary to remove dust or suspended matter, as by electrostatic sepn. or filtration.

**Nitric acid.** I. G. FARBERIND. A.-G. Brit. 303,351, Dec. 31, 1927.  $\text{HNO}_3$  is sepd. from solns. contg. other volatile acids such as halogen acids or their salts by reducing the  $\text{HNO}_3$  to N oxides by gaseous reducing agents such as  $\text{SO}_2$ , washing the evolved N oxides with water or alk. solns. and oxidizing them with air or O to form  $\text{HNO}_3$  or nitrates.

**Potassium nitrate and nitric acid.** I. G. FARBERIND A.-G. Brit. 303,355, Dec. 31, 1927. In prepg.  $\text{KNO}_3$  by treating KCl or  $\text{K}_2\text{SO}_4$  (or a mixt. of both) with  $\text{HNO}_3$ , most of the  $\text{KNO}_3$  is sepd., as by cooling to  $-5^\circ$ , and filtering or centrifuging, and the mother liquor is treated to sep. the remaining  $\text{HNO}_3$  as described in Brit. 303,351 (preceding abstract). The mother liquor freed from  $\text{HNO}_3$  is distd. to sep. HCl, leaving a soln. of a K salt formed during the treatment.

**Titanic acid.** I. G. FARBERIND. A.-G. Brit. 303,468, Oct. 4, 1927. White titanic acid which is not discolored by heating to incandescence is pptd. by hydrolysis of Ti solns. in the presence of a sufficient quantity of a weak reducing agent such as  $\text{SO}_2$  or  $\text{Na}_2\text{SO}_3$  (which will not reduce quadrivalent Ti to trivalent Ti) to reduce not only all ferric Fe to the ferrous state but also all other oxidizing agents, other than quadrivalent Ti, present in the soln. Various details of procedure are given. Cf. C. A. 23, 3779.

**Carbon monoxide.** I. G. FARBERIND. A.-G. Fr. 658,108, July 26, 1928. CO is produced by treating coal in a shaft furnace with O, the O being passed in at a speed of at least 35–40 m./sec., and with the addn. of CO or  $\text{CO}_2$  as a cooling gas.

**Apparatus for making solid carbon dioxide.** WALDEMAR HESSLING. Fr. 657,969. July 23, 1928.

**Gases for ammonia synthesis.** EMIL EDWIN. U. S. 1,723,772, Aug. 6. Carbonaceous combustible material such as coal or coke and water vapor are subjected to the action of an elec. high-tension arc to produce a gas consisting essentially of CO and H, and this gas is introduced into a hot gas producer which is supplied with air and water vapor, moisture is added to the gas directly leaving the producer, and a portion of this moist gas is returned to the high-tension arc; the rest of the moist gas is subjected to catalytic action to convert CO and  $\text{H}_2\text{O}$  vapor into H and  $\text{CO}_2$ , the  $\text{CO}_2$  is removed, and the gas is purified.

**High-pressure joint suitable for ammonia-synthesis apparatus, etc.** FRANCIS H. BRAMWELL (to Atmospheric Nitrogen Corp.). U. S. 1,722,623, July 30. Structural features.

**Apparatus adapted for catalytic combustion of ammonia.** HARRY PAULING. U. S. 1,722,339, July 30. Various structural details are described, of an app. adapted for forming nitrous gases.

**Use of ammonia to precipitate metal compounds from solution.** I. G. FARBERIND. A.-G. Brit. 303,366, Dec. 31, 1927. Gaseous or liquid  $\text{NH}_3$  is used (suitably under pressure) for pptn. of NaOH from soln. and its sepn. from a mixed soln. including also  $\text{NaNO}_3$ , for producing and pptg. NaOH from solns. of NaCl, for producing an  $\text{NH}_4$  compd. of  $\text{CaCl}_2$  from  $\text{CaCl}_2$  soln., for pptg.  $\text{CaCl}_2$  from a mixed aq. soln. contg.  $\text{Ca}(\text{NO}_3)_2$  and  $\text{NH}_4\text{Cl}$ , and for various similar reactions.

**Alkali bicarbonates.** A. E. GIBBS (to Pennsylvania Salt Mfg. Co.). Brit. 303,857, Jan. 11, 1928. Cathode liquors of an electrolytic alkali chloride cell are treated with  $\text{CO}_2$  or with flue gases or other suitable gases contg.  $\text{CO}_2$ .

**Alkali metal hydrides.** DEUTSCHE GOLD- & SILBER-SCHNEIDANSTALT VORM. ROESSLER. Fr. 34,192, Sept. 29, 1927. Addn. to 637,794 (C. A. 23, 487). Alkali metal hydrides are prep'd. by submitting the finely divided metal at a high temp. to the action of H under pressure.

**Alkaline earth cyanides.** I. G. FARBENIND. A.-G. Brit. 303,115, Dec. 28, 1927. NaCN and  $\text{Ca}(\text{NO}_3)_2$  are treated with liquid  $\text{NH}_3$ , yielding a soln. of  $\text{NaNO}_3$  and a residue of an  $\text{NH}_3$  compd. of  $\text{Ca}(\text{CN})_2$  from which  $\text{NH}_3$  is driven off by heating to obtain  $\text{Ca}(\text{CN})_2$ . Other alk. earth metal cyanides may be similarly prep'd.

**Fluorides.** A. F. MEYERHOFER. Brit. 303,760, July 28, 1927. Complex fluorides such as Na, K or Ba fluosilicates are decomposed to form a metal fluoride and a volatile fluoride such as that of Si by rapid heating (to avoid sintering) in thin layers in a partial vacuum. Residual fluoride, fluorspar or substances which react with the metal fluoride may be added to the fluosilicate, a rotating or oscillating furnace may be used, and neutral gases or vapor such as air, steam, O, flue gas or producer gas may be used to accelerate the removal of the gaseous fluoride, etc. An app. is described. Cf. C. A. 23, 1478.

**Chromium compounds.** PAUL WEISE (to I. G. Farbenind. A.-G.). U. S. 1,723,536, Aug. 6. An excess of chrome ore is heated with an alk. reagent such as  $\text{Na}_2\text{CO}_3$  and the Cr compds. are leached out of the mass; the residue is then prep'd. for reuse in the process by treatment with an excess of acid such as hot 15° B $\acute{e}$ .  $\text{H}_2\text{SO}_4$ . Cf. C. A. 23, 1381.

**Ammonium and magnesium salts.** REX D. CURLEWIS. Australia 12,403, Mar. 20, 1928. Magnesia with  $\text{MgSO}_4$  and  $(\text{NH}_4)_2\text{CO}_3$  as by-products is manuf'd. by the reaction of magnesite and  $(\text{NH}_4)_2\text{SO}_4$ , sepg. the  $(\text{NH}_4)_2\text{CO}_3$  as a sublimate, leaching out the  $\text{MgSO}_4$ , and drying and calcining the magnesia residue.

**Ammonium nitrate.** CARLO TONIOLO. U. S. 1,721,798, July 23. In prep'g. dry  $\text{NH}_4\text{NO}_3$ , solid  $\text{NH}_4\text{NO}_3$  is dissolved in a concd.  $\text{NH}_4\text{NO}_3$  soln. (by heating at a temp. not exceeding 125°) in sufficient quantity that the latent heat of solidification liberated on solidification will evaporate substantially all the water present. Cf. C. A. 23, 1480.

**Ammonium phosphate.** I. G. FARBENIND. A.-G. Brit. 303,455. Ca phosphates such as raw phosphate or ppt'd. tri-Ca phosphate are decomposed by treatment with acids such as HCl,  $\text{H}_2\text{SO}_4$  or  $\text{HNO}_3$  which form sol. Ca compds. The soln. is neutralized by adding tri-Ca phosphate,  $\text{CaCO}_3$ , milk of lime or the like to obtain a ppt. of mono- and di-Ca phosphate which is sepd. and treated with  $\text{NH}_3$  with or without  $\text{CO}_2$  or with an  $\text{NH}_4$  salt such as the fluoride which yields a sparingly sol. Ca compd. The  $\text{NH}_4$  phosphate soln. thus obtained may be evap'd. to obtain mono- or di- $\text{NH}_4$  phosphate, or, by addn. of  $\text{NH}_3$  in excess, tri- $\text{NH}_4$  phosphate. Cf. C. A. 23, 3546.

**Alumina.** JEAN C. SEAILLES. Fr. 34,239, Aug. 29, 1927. Addn. to 634,430. In the wet treatment of Al ores by alk. earth bases, a mixt. of CaO and BaO is used, the BaO acting as a sort of catalyst, the amt. of CaO being sufficient to ppt. all the  $\text{Al}_2\text{O}_3$  as  $\text{Ca}(\text{AlO}_2)_2$ . Fr. 34,249, Sept. 6, 1927, describes a process in which a mixt. of BaO and CaO or NaOH, or CaO and KOH is used.

**Alumina.** JEAN C. SEAILLES. Fr. 34,231, Aug. 20, 1927. Addn. to 634,430. Al ore and an alk. earth base in the proportion of 3 mols. of base to 1 of  $\text{Al}_2\text{O}_3$  and 1.3 mols. of base to 1 mol. of  $\text{SiO}_2$  are calcined, and the mass obtained is treated with  $\text{Na}_2\text{CO}_3$  soln. to form  $\text{NaAlO}_2$ .

**Alumina.** JEAN C. SEAILLES. Fr. 34,230, Aug. 20, 1927. Addn. to 649,027 (C. A. 23, 2791). The  $\text{NaAlO}_2$  lye of the prior patent is purified by treatment with  $\text{Na}_2\text{S}$  which acts as a reducing agent on any chromates, ferrates, silicates, vanadates, etc., present. An alkali zincate may be added before treatment with  $\text{Na}_2\text{S}$  whereby Ga is carried down and may be recovered.

**Green hydrated chromium oxide.** KURT H. MEYER and HANS KRZIKALIA (to Grasselli Dyestuff Corp.). U. S. 1,723,556. See Can. 283,413 (C. A. 22, 4212).

**Copper sulfate.** HUNGARIA MÚTRAGYA, KÉNSÁV ÉS VÉGYI IPAR RESZVEVÉNYTÁRSASÁG and L. DEUTSCH. Brit. 304,052, Feb. 10, 1928.  $\text{CuSO}_4$  crystals of a size of  $1/8$ -5 mm., with or without addn. of a binding agent such as  $\text{Na}_2\text{SO}_4$ , are molded into briquets under low pressure to facilitate their transport.

**Cyanogen chloride.** I. G. FARBENIND. A.-G. Brit. 303,469, Oct. 4, 1927. See Fr. 642,548 (C. A. 23, 1223).

**Iron carbonyl composition.** MARTIN MÜLLER-CUNRADI and ANNELIESE KOSSUTH (to I. G. Farbenind. A.-G.). U. S. 1,722,076, July 23. A compn. which comprises iron carbonyl together with hydrocarbons such as gasoline is colored with a sol. org. coloring substance such as  $\alpha$ -naphthalene-azo- $\alpha$ -naphthol which serves to stabilize the carbonyl against decompn. by light.

**Iron and nickel carbonyls.** SOC. NATIONALE DE RECHERCHES SUR LE TRAITEMENT DES COMBUSTIBLES. Fr. 34,348, Sept. 21, 1927. Addn. to 607,296. Carbonyls of Fe and Ni are recovered from industrial gases, particularly mixts. of CO and H used for the synthesis of MeOH, by washing with an alc. NaOH soln.

**Ferric oxide and sulfur trioxide from sulfates.** I. G. FARBERIND. A.-G. Brit. 303,808, Jan. 9, 1928. Dehydration and decompn. of Fe sulfates are effected in the presence of a decompn. product of an Fe salt, preferably  $\text{Fe}_2\text{O}_3$ , and a small quantity of an alkali or alk. earth oxide, hydroxide or carbonate also may be present. Drying may be effected in a revolving furnace at 300–400° and decompn. in a calcining furnace at 750–850°, and  $\text{SO}_3$  formed may be completely recovered.

**Potassium manganate.** SOC. CHIM. DES USINES DU RHÔNE. Fr. 34,235, Aug. 26, 1927. See Brit. 296,074 (C. A. 23, 2255).

**Sodium fluoride.** VEREINIGTE ALUMINIUM-WERKE A.-G. Fr. 658,155, July 27, 1928. NaF is made from fluosilicates with temporary formation of  $\text{K}_2\text{SiF}_6$  which is decomposed by alk. K compds. and the KF soln. thus obtained is reacted upon with alk. Na compds. The  $\text{CaF}_2$  resulting from the purification with Ca compds. of the solns. of alk. K compds. contg. KF is treated with  $\text{H}_2\text{SiF}_6$  in the presence of  $\text{SiO}_2$  and KCl, whereby more  $\text{K}_2\text{SiF}_6$  is obtained.

**Sodium hydrogen sulfide.** HARRY P. BASSETT. U. S. 1,722,170, July 23. A mixt. of  $\text{CaSO}_4$ , coal and coke is heated to a reducing temp. to produce coke and a mixt. of Ca compds. including the sulfide, sulfite and oxide; these products are heated under superatm. pressure with a soln. of  $\text{Na}_2\text{SO}_4$  (in less than mol. proportion with respect to the Ca sulfide present) to produce Na sulfide and  $\text{CaSO}_4$ ; the product is then leached and the soln. thus formed is sepd. into 2 parts.  $\text{H}_2\text{SO}_4$  is added to one of the parts to produce  $\text{H}_2\text{S}$  and  $\text{Na}_2\text{SO}_4$  and the  $\text{H}_2\text{S}$  is conducted into the other part to produce NaHS. The intermediate products are reused for continuation of the main process.

**Gels of silica, alumina, etc.** G. C. CONNOLLY and E. B. MILLER (to Silica Gel Corp.). Brit. 303,138, Dec. 30, 1927. Hydrogels of silica, or of oxides of Al, Ti, W, etc., are washed with water heated to 20–80° so that after drying a gel is obtained, the apparent d. of which is less affected than usual by high-temp. reactivation.

**Chlorine.** DAVID A. PRITCHARD and JESSE H. HUBEL (to Canadian Industries, Ltd.). U. S. 1,723,300, Aug. 6. Cl-contg. gas mixts. such as residual gas of liquid Cl plants are brought into contact with liquid aq. refrigerated material such as brine in excess, at a temp. sufficiently low to convert substantially all the Cl directly into Cl hydrate, and the latter is then warmed to vaporize and gasify the Cl. An app. is described.

**Hydrogen from gaseous mixtures.** GEORGE F. JAUBERT (to Soc. Ammonia). U. S. 1,723,425, Aug. 6. Coal gas contg. H is passed in heat exchange relation with cold liquefied constituents of the gas other than H, and the thus-cooled gas is passed in confined streams in heat exchange relation with cold liquefied N, the further-cooled gas is allowed to expand and the expansion is utilized for producing work, and the expanded gas is passed into contact with liquid N under pressure. An app. is described.

**Phosphorus.** ÉDOUARD URBAIN. Fr. 658,184, Dec. 7, 1927. Natural Al phosphates are treated at a high temp. with the addn. of CaO,  $\text{SiO}_2$  and charcoal to form  $\text{Ca}(\text{AlO}_2)_2$  or cement with recovery of P as  $\text{H}_3\text{PO}_4$ .

**Phosphorus from vapors.** MAX MAYER. U. S. 1,721,868, July 23. P-contg. vapors are passed through a tower through which liquid passes countercurrentwise and then passed through an electrostatic separator.

**Phosphorus and fusion cement from natural phosphates.** WLADIMIR KYBER. U. S. 1,723,791, Aug. 6. Natural Ca phosphate, Al phosphate and C are smelted together in such proportions that the dross contains at least 27%  $\text{Al}_2\text{O}_3$ .

**Treating abnormally colored sulfur.** JAMES W. SCHWAB (to Texas Gulf Sulphur Co.). U. S. 1,723,815, Aug. 6. The molten S is treated with finely divided zeolites and then sepd., to remove abnormal coloration.

**Activated carbon.** R. DEFRIS and R. WÄLDER. Brit. 303,669, Feb. 7, 1928. Briquets, carbonized and activated, are made so that there is formed in them a system of macro-capillaries which traverse the material like a system of veins and afford ready admission of gases to the interior of the material. For this purpose, fibrous filaments such as hair, silk or cotton may be incorporated with the materials used and on carbonizing these are burned out and leave suitable channels. Various other details of procedure are also described.

**Active charcoal.** MARCEL CAMBIER and ROBERT CAMBIER. Fr. 657,848, July 20, 1928. Products absorbed by active charcoal are recovered by a circulating fluid in

tubes in contact with the mass or by elec. heating elements buried in the mass, or by passing an elec. current through the mass, the vapors liberated being carried away by a circulating inert gas at atm. or lower pressure.

**Granular carbon.** HOMER H. LOWRY (to Western Electric Co.). U. S. 1,722,055, July 23. Commiunited raw carbonaceous material such as anthracite coal is heated to gradually increasing temps. at such a rate that a homogeneous product of low porosity is produced, and the product is subsequently heated to a higher temp. An app. is described. The product obtained is suitable for use in telephone transmitters.

**Granular desiccant comprising magnesium perchlorate with a carrier such as barium perchlorate.** E. THOMAS. Brit. 303,263, Dec. 9, 1927.

**Catalysts.** I. G. FARBENIND. A.-G. Fr. 34,299, Sept. 21, 1927. Addn. to 631,474. Catalysts composed of metals such as Ni, Co, Cu or their mixts. and suitable particularly for the reduction or hydrogenation of org. compds. are sepd. from aq. or ammoniacal solns. of their salts in the presence of org. bases or acid amides, by treatment with H under pressure, with or without a carrier.

**Catalysts.** SOC. L'AIR LIQUIDE (SOC. ANON. POUR L'ÉTUDE ET L'EXPLOITATION DES PROCÉDÉS GEORGES CLAUDE). Fr. 657,911, Dec. 3, 1927. Catalysts which have been used to free gases from oxides of N are regenerated by washing with an alk. soln., particularly an ammoniacal soln. which may contain alkali or  $\text{NH}_3$  free or as carbonate or hydrosulfide.

**Dehydrogenating catalysts.** SOC. ALSACIENNE DE PRODUITS CHIMIQUES (to J. P. P. Mayor). Brit. 303,347, Dec. 31, 1927. Stabilized hydrated Cu oxides having the compn.  $n\text{CuO} \cdot \text{H}_2\text{O}$  (in which  $n$  is greater than 1) are used as dehydrogenating catalysts. Details of their prepn. are given.

**Urea-formaldehyde products.** EDWARD G. BUDD MANUFACTURING CO. Fr. 657,813, July 19, 1928. Urea is condensed with slightly acid  $\text{CH}_2\text{O}$  at low temps., *e. g.*, 25–50°, the mixt. is distd. under vacuum at a higher temp. but preferably below 100° and thiourea is added either before or after the distn. The mixt. is distd. again at 100–200° and the viscous product may be poured into a mold to cool, and heated again to 70–95° when it becomes tough and insol., or the product from the mold may be ground, mixed with fillers and molded under heat and pressure. Fr. 657,844 describes a process of treating  $\text{CH}_2\text{O}$  with urea and completing the condensation with thiourea and a trace of acid, *e. g.*,  $\text{HCOOH}$ , the final product being distd. under vacuum, with the addn. of more acid just before or after the distn., and molded as desired. Cf. C. A. 23, 2000.

**Solutions or plastic masses from cellulose derivatives, rubber, resins, etc.** W. E. CROOKS and C. D. WALTON (to British Celanese, Ltd.). Brit. 303,152, Dec. 29, 1927. The solids used are pretreated preferably with the vapor of the solvent or liquid subsequently incorporated to make the soln. or plastic mass (which may be dild. with another inert liquid). Various examples and details are given.

**Adhesive containing rubber latex.** ARTHUR BIDDLE (to United Products Corp of America). U. S. 1,722,553, July 30. An adhesive which is suitable for various uses comprises rubber latex, tapioca meal and lime.

**Binder or adhesive containing cellulose esters.** W. PLINATUS (to Compagnie française d'exploitation des procédés Plinatus). Brit. 303,855, Jan. 11, 1928. Dry binding agents such as are described in Brit. 302,324 (C. A. 23, 4308) contg. cellulose esters with high b. p. solvents distributed in them are modified by the addn. of substances resembling the materials to be joined together, *e. g.*, wood meal or sawdust is added for joining wood or leather meal is added for joining leather. Natural or synthetic resins, coloring substances, etc., also may be added.

**Protecting ebonite from the action of light.** BRITISH HARD RUBBER CO., LTD., and P. E. WELLS. Brit. 303,814, Sept. 6, 1927. Ebonite, for "wireless panels" or for other purposes where it is exposed to the light, is coated with a layer of synthetic resin (suitably a phenol-aldehyde or urea resin) to protect it from discoloration due to the light. Coloring substances, etc., may be mixed with the resin.

**Black ash from barytes.** ZOLTAN DE HORVATH (to Eagle Picher Lead Co.). U. S. 1,723,138, Aug. 6. A mixt. of barytes and carbonaceous material is passed through and heated in a rotary kiln and sufficient  $\text{CaCO}_3$  is added to the mixt. to combine with a substantial quantity of the silica present in the barytes.

**Sheeted cork composition.** ENRIQUE VINCKE (to Manufacturas de Corcho S. A.). U. S. 1,722,611, July 30. Cork bark is shaved in planes substantially parallel to the layers of yearly growth to form paper-thin shavings; these are broken up into flakes and the latter are assembled into layers of substantial thickness and subjected to heat

and pressure to cause the flakes to adhere. U. S. 1,722,648 specifies generally similar products reinforced with fine-mesh wire cloth.

**Alkaline cleansing composition with a fluorescent concentration indicator.** LEONARD H. ENGLUND (to Economics Laboratory, Inc.). U. S. reissue 17,383, July 30. See original pat. 1,584,022 (C. A. 20, 2053).

**Detergent composition containing isopropyl alcohol.** EDWARD F. HEYDT (to Petroleum Derivatives Co.). U. S. 1,723,169, Aug. 6. A compn. suitable for use on fabrics, etc., comprises iso-Pr alc., a smaller proportion of tertiary Bu alc. and sufficient water to give the compn. a relatively slow rate of evapn.

**Detergent suitable for removing grease and oil from garage floors.** ALBERT E. PLANK. U. S. 1,723,521, Aug. 6. Wood flour 10 lbs., kerosene 4 qts., crude carbolic acid 4 oz. and oxalic acid 0.5 oz.

**Brake-lining material.** FREDERICK C. STANLEY (to Raybestos Co.). U. S. 1,721,675, July 23. Glycerol and PbO are used for treating material such as brake linings to prevent freezing to brake drums when wet.

**Brake-lining material.** SAMUEL HUGHES (to Raybestos Co.). U. S. 1,721,696, July 23. A wet yarn is passed through powdered C to coat it with the latter and is then woven, satd. with a suitable binder and cured.

**"Friction material."** ALEXANDRE BLUHM (to Soc. anon. française du "Ferodo"). U. S. 1,722,890, July 30. Pure finely divided metallic Pb is incorporated in friction material such as brake linings.

**Stiffening material for boots and shoes.** HORACE M. EATON (to Norman Edmunds). U. S. 1,721,549, July 23. A layer of fibrous material such as felted burlap is impregnated with and united to a sheet of paper by a mixt. which may be formed of celluloid soln., powdered asbestos, plaster of Paris, dextrin and alc. or similar substances.

**Plastic filler for boots and shoes.** I. G. FARBERNIND, A.-G. Brit. 303,451, Jan. 3, 1928. A mixt. of S, zinc white and a vulcanizing accelerator is added to a filling material comprising cork chips, sawdust, leather meal or other solid material and crude rubber soln., shortly before use, so that vulcanization is produced even at room temp. and the filler resists the action of damp and heat. Factis, resins, asphalts, oils, etc., also may be added.

**Resilient flexible sheets suitable for box toes of shoes.** WILLIS A. BOUGHTON (to Bennett Box Co.). U. S. 1,722,968, July 30. A sheet of cloth is impregnated with rosin or similar brittle stiffening material, throughout the sheet, in a continuous body of the material, and the surface portions of the impregnating material are cracked into minute sections on both sides of the cloth. The material may be further superficially coated with rubber.

**Felted water-resistant sheet material.** LESTER KIRSCHBRAUN. U. S. 1,722,431, July 30. A binder such as clay paste, asphalt or tar is added in its adhesive state to an aq. fibrous pulp including cellulosic colloid material such as corn-stalk pulp and dispersion is effected to produce a substantially non-sticky stock which is felted and evapn. of water present then ensues to cause the binder to hold the fibers together by its adhesive action. Cf. C. A. 22, 2650.

**Waterproofed felted sheet material.** LESTER KIRSCHBRAUN. U. S. 1,722,434, July 30. An aq. fibrous stock is mixed with a dispersion contg. asphalt or a similar heat-liquefiable waterproofing material in an aq. medium and the proportions of the materials are so regulated as to produce a sheet incompletely satd. with the waterproofing material but with the latter substantially uniformly distributed in the form of coalesced films about the fibers. The stock is sheeted and dried. An app. is described.

**Composition for treating machine belts, etc.** ROBERT N. BURNETT (one-fourth to A. M. Bowman). U. S. 1,723,328, Aug. 6. Gum arabic 18, castor oil 68 and fish oil 14%.

**Luminous signs.** JOSEPH O. SULLIVAN. U. S. 1,721,534, July 23. A base such as metal, wood, fiber or plaster has a section coated with a mixt. of mica, powdered glass and an "adulterant" such as marble dust or sand and a non-luminous section forming a design, and a section coated with a mixt. of mica and forming a contrasting background for the other sections. The brilliance of the mica is modified by a powder such as blue schmelze.

**Transferring designs to wood.** J. WERNER and F. SCHLOBACH GES. Brit. 303,836, Jan. 10, 1928. In printing wood (as for imitating other woods or tarsia work) by means of transfers, the surface of the wood is smoothed by pressure and heat, provided

with a layer such as zinc white mixed with a siccative and dild. with turpentine and the transfer is applied under great pressure but without heat.

**Bottle-closure pads of fibrous material coated with nitrocellulose.** EWALD GOLTSTEIN and EBERHARD MEYER. U. S. 1,722,909, July 30.

**Pictures in colors on metal surfaces.** G. MANETTI, P. BENAGLIA and M. LUCHSINGER. Brit. 303,419, Jan. 2, 1928. A metal or metallized surface is covered with a thin layer of material such as a lacquer or varnish having a base of nitrocellulose, cellulose, resin or drying oils, and a method of printing with designs in transparent colors is described.

**Radiator sealing composition.** ROSCOE C. MENERAY. U. S. 1,722,437, July 30. A sealing compn. is formed from finely pulverized  $\text{Al } 6\frac{2}{3}\%$ , granulated  $\text{Al } 1\frac{1}{3}\%$ ,  $\text{Na}_2\text{CO}_3$  4,  $\text{NaHCO}_3$   $21\frac{1}{2}\%$  and "rectified flaxseed flour" (contg. oil)  $66\frac{2}{3}\%$  parts.

**Lightning arrester.** NORMAN A. LOUGHEE (to General Elec. Co.). U. S. 1,723,872, Aug. 6. A resistance element is used comprising pellets of  $\text{PbO}_2$  coated with a lower oxide of Pb such as  $\text{PbO}$ . Structural details are described.

**Fire extinguishing solutions.** LOUIS É. NOTTELLE. Fr. 657,938, July 21, 1928.  $\text{NH}_4\text{NO}_2$  is used in fire extinguishing solns. to produce N under the action of the heat, the  $\text{NH}_4\text{NO}_2$  being added to one of the solns. or being obtained by double decomposition between solns. of  $\text{NaNO}_2$  and  $\text{NH}_4$  salts. A foam is produced as the foam from the  $\text{CO}_2$  begins to cease.

## 19—GLASS, CLAY PRODUCTS, REFRACTORIES AND ENAMELED METALS

G. E. BARTON, C. H. KERR

**Glauber's salt as a refining medium for glass melts.** ERICH FELSNER. *Keram Rundschau* 35, 239-40(1927).—Its advantages are stated. H. IMSLEY

**Taylor studies of the technic of analysis of raw materials for glass. III.** DOROTHEA JAPHE. *Sprechsaal* 62, 8-10, 22-5(1929).—Known methods for the detn. of the constituents of  $\text{Na}_2\text{SO}_4$  are considered for the purpose of comparing the accuracy and time required for analysis. The constituents detd. are  $\text{Na}_2\text{SO}_4$ , free acid,  $\text{NaCl}$ ,  $\text{Al}_2\text{O}_3$ ,  $\text{Fe}_2\text{O}_3$ ,  $\text{CaSO}_4$ ,  $\text{MgSO}_4$ ,  $\text{H}_2\text{O}$  and the acid-insol. portion. For an accuracy of  $\pm 0.15$  0.2% (% variation from 100% in summation of all constituents) the shortest time for the analytical procedure was 3 hrs. and 7 min. For an accuracy of  $\pm 0.5$  0.7% the time required was 2 hrs. and 28 min. Cf. C. A. 20, 3217. C. H. LORIG

**Contribution to testing glasses for chemical resistance.** LUDWIG SPRINGER. *Sprechsaal* 62, 187-90, 206-9(1929).—Tests were made on various bottle and plate glasses to det. their resistance to weather,  $\text{H}_2\text{O}$  at  $80^\circ$ , 10% soda soln. at  $80^\circ$  and 5.6% KOH soln. Sulfate glasses in general show the greatest resistability. C. H. LORIG

**The manufacture of glass for electrical incandescent lamps. II.** JOSEF TISCHER. *Sprechsaal* 62, 413-6(1929); cf. C. A. 23, 3551.—Through vaporization and reduction during the melting process, corrections in compn. are necessary either by a second melting or by applying a correction for the loss in the original melt. Chem. analysis is therefore essential. The quant. analysis procedure for a Ba-Pb glass is completely described. The detn. of the oxides  $\text{SiO}_2$ ,  $\text{PbO}$ ,  $\text{BaO}$ ,  $\text{Al}_2\text{O}_3$ ,  $\text{Fe}_2\text{O}_3$  and  $\text{Na}_2\text{O}$  is considered. C. H. LORIG

**Making the glass disk for a 70-inch telescope reflector.** A. N. FINN. *Ind Eng Chem.* 21, 744-50(1929).—Details are given of the procedure followed in making a glass disk 70 in. in diam. and 11 in. thick for use as a reflector in an astronomical telescope. K. D. JACOB

**The permeability of glass to ultra-violet light.** GOTTFRIED ROSE. *Sprechsaal* 62, 314-5, 333-5, 352-5, 375-7(1929).—Permeability is measured with a spectrograph. By comparing the light transmitted through a known medium and through the glass in question, the % absorption of the ultra-violet light of various wave lengths can be detd. In the region of  $300\mu$  to  $280\mu$  the absorption of ultra-violet light in com. glass increases very rapidly. Small addns. of  $\text{Fe}_2\text{O}_3$  in glass increases its absorption. Tervalent Fe is 100 times more effective in absorbing ultra-violet light than is bivalent Fe. On exposure to light for a long time glasses lose a considerable amt. of their ability to pass light of short wave lengths owing to the slow oxidation of the  $\text{FeO}$  to  $\text{Fe}_2\text{O}_3$ . C. H. LORIG

**The trend of the average linear coefficient of expansions between  $25^\circ$  and  $150^\circ$  in the technically useful field of the  $\text{SiO}_2$ - $\text{B}_2\text{O}_3$ - $\text{Na}_2\text{O}$  system.** R. WEINIG and E. ZSCHIM-

**MER.** *Sprechsaal* 62, 93(1929).—A surface which shows the change in the linear coeff. of expansion between 25° and 150° and the compn. is developed by plotting the value of the coeffs. against the Na<sub>2</sub>O and B<sub>2</sub>O<sub>3</sub> content of glasses. C. H. LORIG

**The variation of refractive index of glass at high temperatures.** A. I. STOZAROV. *Trans. Opt. Inst. Leningrad* 4, Part 39(1928); *J. Soc. Glass Tech.* 12A, 381-4(1928).—If a piece of glass is held at any temp. in the critical range, its  $n_D$  approaches a value which corresponds to the equil. state of the glass. The  $n_D$  of glass in a state of equil. was investigated for 6 types of optical glass. In all cases the relationship between the  $n_D$  of glass in a state of equil. and its temp. was a straight line. The rate of variation of  $\Delta$ , the difference between the equil. value and the actual value of the  $n_D$ , are expressed by: (1)  $d\Delta/dt = -\alpha\Delta$ ; (2)  $d\Delta/dt = A\Delta^2$ . The coeffs.  $\alpha$  and  $A$  depend on the temp. according to the equations:  $\log \alpha = -l + k\theta$ ; and  $\log A = -L + K\theta$ , in which  $k$ ,  $K$ ,  $l$  and  $L$  depend only on the type of glass. Expt. shows that equations (1) and (2) give almost equally accurate results; it was possible to obtain trustworthy data for  $\Delta$  only in the range  $10^{-4}$  to  $10^{-3}$ . Adams and Williamson recommended that pieces of glass of different sizes be annealed at different temps. so that the larger the size the lower must be the temp. to which it should be heated and the longer the time at which it must be maintained. This, however, would produce a difference in  $n_D$  between sep. pieces, which can attain in some cases three units in the third decimal place. This difference is too great to be permitted in optical glass; therefore, for this glass, all pieces must be annealed at the same temp. D. E. SHARP

**Stability of glass-furnace parts with special consideration to the refractory materials.** W. GROOTHOFF. *Sprechsaal* 62, 311-3, 331-3(1929). C. H. LORIG

**Innovation and advances in the ceramic industry.** G. HELM. *Z. Ver. deut. Ing.* 73, 985-91(1929). E. H.

**Boiler-furnace refractories.** C. F. HIRSFIELD AND W. A. CARTER. *Fuels and Steam Power (A. S. M. E. Trans.)* 50, No. 23, 115-25(1928).—Brick, tile, wall mortars, plastic compds. and so-called high-temp. cements were studied. A field survey of conditions to which refractories were subjected in different kinds of service was made along with the lab. investigation to det. the chem. and phys. phenomena occurring in boiler-furnace refractories. E. I. S.

**Proprietary air-cooled refractory [furnace] walls.** C. S. GLADDEN. *Trans. Am. Soc. Mech. Eng.*, Advance paper, May 13-6, 1929, 11 pp. E. I. S.

**Refractories service conditions in furnaces burning fuel oil.** R. A. SHERMAN, F. TAYLOR AND H. S. KARCH. *Fuels and Steam Power (A. S. M. E. Trans.)* 50, No. 23, 313-22(1928).—A progress report of committee on boiler-furnace refractories. Slag formed in furnaces was the result of fusion of oil ash. Slag action was probably related to spalling. E. I. S.

**Cupola linings.** L. SCHMID. *Z. ges. Giessereipraxis* 50, 161-4, 197-9(1929).—Properties of refractory materials suitable for cupola linings (fireclay brick, quartz brick, magnesite or dolomite brick) are discussed. E. I. S.

**Enamel sanitary-ware manufacture.** ALICE HAMILTON. *J. Ind. Hyg.* 11, 139-53(1929).—Health hazards are discussed. G. SCHWOCH

**Determination of the coefficient of heat conductivity [of refractory materials, etc.] (VLASOV) 2.** Sealed joints between metal and glass (Brit. pat. 303,348) 1. Electric furnace for producing glass and water glass (Brit. pat. 303,798) 4. Furnace linings (Brit. pat. 303,574) 1.

PINKL, V.: **Manufacture of Hollow Brick and Tile.** Halle (Salle): Wilhelm Knapp. M. 4. Reviewed in *Brick Clay Record* 74, 812; *Clay-Worker* 91, 585; *Ceramic Abstracts* 8, 581(1929).

**Glass making.** SOC. ANON. DES MANUF. DES GLACES ET PRODUITS CHIM. DE SAINT-GOBAIN, CHAUNY ET CREY. Fr. 658,192, Dec. 8, 1927. Method of arresting the flow of glass from the furnace.

**Glass making.** N. V. MIJ. TOT BEHEER EN EXPLOIT VAN OCTROOIEN. Fr. 657,627, July 18, 1928. Method of transporting sheets to the cooling furnace. Cf. C. A. 23, 2262.

**Crucible for drawing plate glass.** GEORGE G. ROBERTS (to Virginia Plate Glass Corp.). U. S. 1,722,445, July 30. Structural features.

**Apparatus for drawing sheet glass.** ARTHUR E. SPINASSE. U. S. 1,722,483, July 30. Structural features.

**Apparatus for effecting circulation of molten glass of a pool.** ERNEST G. NELSON, JR. (to Hartford-Empire Co.). U. S. 1,721,968, July 23. Structural features.

**Apparatus for accumulating and distributing intermittently molten glass.** ADOLF SCHILD. Fr. 658,078, July 25, 1928.

**Apparatus for shaping the edges of glass beakers.** JAMES BAILEY (to Corning Glass Works). U. S. 1,721,983, July 23. Structural features.

**Opal glass.** W. C. TAYLOR (to Corning Glass Works). U. S. 1,721,979, July 23. An acidic batch is used for melting under oxidizing conditions, contg. a metallic element of the even series of the 6th periodic group with an atomic wt. between 95 and 185 (suitably  $\text{MoO}_3$  or  $\text{WO}_3$ ) which serves to produce a dense opal glass of good permanent opacity not burnt out by overheating.

**"Non-splintering" composite glass sheets.** J. H. ROBERTSON. Brit. 303,332, June 25, 1928. Sheets of glass are united to an intervening celluloid sheet or the like after one face of the glass has been treated with a thin coating of casein and then when dry with a soln. of celluloid in  $\text{AmOAc}$  or the like to which pure  $\text{PhOH}$  is added.  $\text{EtOH}$  or  $\text{PrOH}$  may also be used to facilitate union of the sheets under pressure.

**Composite sheets of glass and celluloid.** J. A. WATT. Brit. 303,700, March 30, 1928. Glass sheets of somewhat uneven surfaces are preliminarily ground in contact with each other by use of an abrasive, polished, cleaned and then united in the same relative positions as when the grinding began. Various details are described.

**Kiln of the car-tunnel type for brick, tile, etc.** GEORGE W. DENISON. U. S. 1,721,774, July 23.

**Ceramic material.** I. G. FARBERNIND. A.-G. Fr. 657,651, July 18, 1928. A ceramic material of high thermal cond. has Si as an essential constituent. Thus, mixts. contg. (1) pure finely ground Si 95, and milk of lime 5 parts, (2) ferrosilicon (90%) 50, clay matter 40, feldspar 5, cryolite 5 parts are baked in known manner.

**Ceramic and roofing tiles.** ERNEST A. ETHERIDGE. Australia 12,342, Mar 19, 1928. Tiles having a low wt. and a glazed surface are made by mixing white cement with an aggregate of siliceous clay, aluminous clay, Cornish stone and (or) feldspar, and with or without pulverized slate or pumice; and a glaze is applied consisting of a slip prepd. from the same ingredients together with a frit in very finely powd. condition with  $\text{ZnO}$ , barytes,  $\text{SnO}$  or  $\text{Al}(\text{OH})_3$ . For burnt goods, fusible clay, pulverized pumice and siliceous sharp sand, and (or) magnesite are mixed with any fusible frit and glaze is applied thereto.

**Pottery decoration.** LOVATT & LOVATT, LTD., and A. E. LOVATT. Brit. 303,679, Feb. 20, 1928. Coloring matter crushed to particles of desired size is subjected to an initial firing, mixed with raw or fritted glaze, and the mixt. is applied to ware to be decorated and fired. The preliminary firing of the coloring particles prevents them from dissolving in the glaze.

**Use of dumortierite in batches for making white ware or other ceramic products.** JOSEPH A. JEFFREY and FRANK H. RIDDLE (to Champion Porcelain Co.). U. S. 1,723,174, Aug. 6. Dumortierite is used with feldspar, ball clay and china clay.

**Spark plugs.** HENRY FORD. U. S. 1,723,026, Aug. 6. A formed porcelain is coated with material such as flake graphite adapted initially to form a heat insulator and cushion to protect the porcelain from molten iron and subsequently to form a gas seal between the iron and porcelain, and an iron shell is then cast on to the porcelain.

**Opacifying enamels.** DEUTSCHE GOLD- UND SILBER-SCHNEIDANSTALT VORM. ROESSLER. Brit. 303,061, Dec. 27, 1927.  $\text{ZrO}_2$  which has been heated to above  $1000^\circ$  is used for opacifying. Other compds. of Zr or compds. of Ti or Sb are also stated to be improved by a similar preheating.

## 20—CEMENT AND OTHER BUILDING MATERIALS

J. C. WITT

**The hydraulic index of hydraulic cements.** HENRI LAFUMA. *Rev. matériaux construction trav. publics* 1929, 241-6.—The ratio  $(\text{SiO}_2 + 0.2\text{Al}_2\text{O}_3)/\text{CaO}$  gives the best expression of the hardening tendency of a cement; while the ratio  $(\text{SiO}_2 + \text{Al}_2\text{O}_3)/\text{CaO}$  gives the best index of its chemical resistance. F. O. ANDEREGG

**The determination of the finest portion of cement.** H. W. GONELL. *Tonind.-Ztg.* 53, 1105-7(1929).—Air elutriation will separate to 10 and perhaps to 5 microns. F. O. ANDEREGG

**Composition and properties of the so-called natural cements.** HÄGERMANN.

*Tonind.-Ztg.* 53, 981-5(1929).—Natural cements obtained on the German market and tested according to German specifications are lower in strength than standard cements and are apt to be much less uniform in quality. F. O. ANDEREGG

The storage of portland cement. ANON. *Tonind.-Ztg.* 53, 946-7(1929).—A general review of recent literature. F. O. ANDEREGG

Physico-chemical principles underlying the methods of testing the constancy of volume of portland cement. I. A. ALEKSANDROV. *Zhur. Prikladnoi Khim.* (Leningrad) 2, 303-16(1929).—Changes in the compn. of portland cement on aging are discussed. Exptl. work showed that Faija's method of testing soundness of cement is not sufficiently severe. Heinzl's method and drying at 120° bear no definite relationship to the properties of cement and should be discarded as misleading. Boiling in water results in hydration of the cement and though the process is not exactly the same as encountered in aging under normal conditions, its use can be recommended. Of these methods that of Le Chatelier is the most exact. Drying at 120° followed by steam treatment is very promising, but considerably more work must be done before this method becomes practical. Storage for 28 days under water gives valuable results and cannot be discarded. V. KALICHEVSKY

Fuel control in the cement industry. GEOFFREY MARTIN. *J. Inst. Fuel* 2, 80-6 (1928).—A discussion. LESLIE B. BRAGG

The stereoscopic microscope as an aid in studying concrete deterioration. RICHARD GRÜN. *Tonind.-Ztg.* 53, 1039-41, 1058-60(1929). F. O. ANDEREGG

Water-tight concrete. A. A. BRYUSHKOV AND P. N. SHABLUKIN. *Nefyanoye Khozyaistvo* 16, 561(1929).—Water-tight concrete is prepd. from mortar by the addn. of up to 10-12% by vol. of a mixt. of mineral and fatty oil; and up to 30% of asphalt tar, fuel oil, etc. An excess of this mixt. increases the impermeability of concrete and decreases its strength. This process is covered by the Russian (Soviet) patent No. 4939, Aug. 13, 1929. A. A. BOEHLINGK

Termite control in the Gulf States. THOS. E. SNYDER. *Quart. Bull. State Plant Bd. of Miss.* 9, No. 1, 1-19(1929); cf. *C. A.* 22, 1664.—Non-subterranean species are killed by fumigating framework of buildings with HCN and furniture with CS<sub>2</sub>, by treating infested wood with com. *o*-C<sub>6</sub>H<sub>4</sub>Cl<sub>2</sub> or kerosene emulsion contg. Na arsenate or by forcing dry Paris green with a blower into the nest galleries. All woodwork used in buildings should be impregnated with a standard chem. wood preservative and cut surfaces should be covered with the preservative applied hot. Interior woodwork and furniture should be treated with 0.75-1.5 lb. ZnCl<sub>2</sub> per cu. ft. NaF and chlorinated naphthalene also may be used for this purpose. Wood pulp or fiber products, compn. boards, etc., are protected by the following compds. added in the course of manuf.: crude C<sub>6</sub>H<sub>5</sub>OH, 1 gal. per 1000 sq. ft.; HgCl<sub>2</sub>, 49 oz. per 1000 sq. ft.; CuSO<sub>4</sub>, 113 oz. per 1000 sq. ft.; NaF, Na<sub>2</sub>SiF<sub>6</sub>; Na dinitrophenolate and chlorinated naphthalene. For subterranean or ground-nesting termites the soil should be broken up and treated with NaCN, Ca(CN)<sub>2</sub>, Na arsenite (10% soln.), coal-tar creosote-kerosene mixt., CS<sub>2</sub> emulsion, or *o*-C<sub>6</sub>H<sub>4</sub>Cl<sub>2</sub>. C. H. RICHARDSON

Electric impregnation of copper sulfate solution through Japanese cedar wood. H. MURAOKA. *Researches Electrotechn. Lab., Japan* No. 253, 23 pp.(1929).—The elec. impregnation proceeds best when the liquid moves only electroendosmotically but electrolysis cannot be entirely avoided. By immersing the wood in the electrolyte and insulating one electrode-chamber from the outside liquid except through the wood, electrolysis was avoided to some degree. High temp. of the impregnating liquid gave the best results. The concn. of the soln. must not be too high; M. used a soln. of d. 1.02. The highest quantity of Cu impregnated was 0.0220 g. per cc. of dry wood, and that of SO<sub>4</sub> was 0.034 g. W. OGAWA

**Wood Construction.** Principles, Practice, Details; a project of the National Committee on Wood Utilization. Edited by DUDLEY F. HOLTMAN. New York: McGraw-Hill Book Co. 711 pp. \$6. Reviewed in *Mining and Met.* 10, No. 272, p. 22 of advertising section (1929).

**Cement.** N. V. S. KNIBBS. Brit. 303,639, Dec. 16, 1927. A cement of the high alumina type is produced by subjecting a mixt. of lime and bauxite or other highly aluminous material to the action of steam, and then heating to a higher temp. but usually somewhat below the m. p. Proportions and details of procedure are given.

**Cement.** OTTO LELLEP. Fr. 657,785, Mar. 26, 1928. See Brit. 288,192 (C. 1 23, 686).

**Hydraulic cement.** CARL PONTOPPIDAN (to F. L. Smidth & Co.). U. S. 1,722,480, July 30. In producing a rapid-hardening cement, raw materials are mixed in such proportions as to secure in the finished cement an hydraulic modulus of not less than 2.20 and a silica modulus of less than 3.00; the mixt. is ground to such fineness that 95% passes a 200-mesh screen, sintered, and the resulting clinker also is ground so that 95% passes a 200-mesh screen. Cf. C. A. 23, 1489.

**Concrete blocks.** ROBERT R. KENWORTHY. U. S. 1,723,043, Aug. 6. In forming a dense, coherent, non-absorbent concrete, cement is mixed with mineral aggregate of at least 2 sizes and including a fine powder; all the water that is ever used is added initially and the materials are mixed. An outer skin of cement and finer aggregate is formed upon the mass by molding and tamping which confines water to the interior, the interior is permitted to set, and the mass is split to provide a surface resembling stone.

**Casting concrete walls and tubes in situ.** A. T. KNUDSEN and S. D. TÖNNESSEN. Brit. 303,882, Jan. 12, 1928. Glass shutters and cores are used which are left in position until the concrete contracts away from their surfaces. A smooth waterproof surface is thus formed on the concrete.

**Concrete reinforced with metal strips or shreds such as those of old tin cans.** G. WATSON. Brit. 303,406, Oct. 1, 1927.

**Waterproofing concrete surfaces.** EUGENE R. ODEN. U. S. 1,721,861, July 23. The surface of concrete is coated with successive layers of materials such as asphaltic compns. and mixts. and with overlying strips of paper and the materials are subjected to heavy pressure together.

**Pavement comprising inlaid rubber strips, etc.** UNIVERSAL RUBBER PAVIORS, LTD., and L. GAISMAN. Brit. 302,959, Sept. 22, 1927. Structural features.

**Molding sheets of "artificial marble."** C. ZWART and P. ZWART (to J. A. Trouwborst). Brit. 303,831, Jan. 10, 1928. A prepd. viscous mass is molded in a tray of celluloid or formed of Zn with a loose bottom of celluloid or like rustless smooth resilient material. Various details of construction and operation are described.

**Surfacing material for interior walls.** CARLISLE K. ROOS (to U. S. Gypsum Co.) U. S. reissue 17,394, Aug. 6. See original pat. No. 1,606,722 (C. A. 21, 161).

**Plasters and cements.** L. C. SCHILLING. Brit. 303,889, Jan. 13, 1928. In prepg. compns. contg. colloidal solns., emulsions or suspensions of bituminous, resinous, oily or fatty substances with Sorel cement, calcined gypsum or like products which harden by absorbing water, such a proportion of water is used in the mixt. as approx. corresponds to that which will be fixed as water of crystn. in the hardened product.

**Fiber-board manufacture.** OTTO MANTIUS. U. S. 1,723,051, Aug. 6. An app. and details of its operation are described.

**Waterproofing and hardening gypsum building blocks, plaster boards or other porous and fibrous materials.** H. A. AARONSON and CHEMICAL WATERPROOFING CORP. Brit. 303,935, Oct. 20, 1927. The materials are impregnated with a soln. comprising pitch dissolved without heating in a noninflammable solvent such as  $C_2H_5Cl$  or  $C_2H_5Cl_4$ . Turpentine may be used as a diluent, and the treatment is suitable for textile fabrics.

**Dust-preventive composition for use on roads.** R. KARLBERG. Brit. 303,433, Oct. 3, 1927. A 70%  $CaCl_2$  30-70 is used with dried sulfite-cellulose lye 70-30 parts.

**Preserving wood.** WALTER O. SNELLING. U. S. 1,723,384, Aug. 6. Wood or similar porous material is impregnated with "thermolyzed" petroleum material such as heavy Mexican crude oil heated above 400° and under pressures up to 800 lb. per sq. in.

**Preserving wood.** I. G. FARBERNIND. A.-G. Brit. 303,168, Dec. 29, 1927. Wood is preserved against attacks by fungi by treatment with an aq. soln. of a diazo compd. (of which several examples are given) either freshly prepd. or used in the form of  $ZnCl_2$

double salts, naphthalenesulfonates or the like, with or without other preservatives such as NaF or  $\text{HgCl}_2$ . Cf. *C. A.* 23, 4322.

**Wood preservative composition.** LEO P. CURTIN (to Western Union Telegraph Co.). U. S. 1,722,323, July 30. Wood is treated with Cl derivs. of coal-tar acids of higher mol. wt. than the cresols, which are characterized by high toxicity and permanence relative to creosote oil. These Cl derivs. may be used with a diluent such as a heavy petroleum oil.

## 21—FUELS, GAS, TAR AND COKE

A. C. FIELDNER

**The control of fuel in the chemical industry.** ERNEST S. GRUMELL. *J. Inst. Fuel* 2, 73-9(1928).—A discussion of methods

**Characteristics and classification of fuels in U. S. S. R.** L. K. RAMZIN. *Trans. Fuel Conference, World Power Conference, London, 1928* 1, 177-91(1929); cf. *C. A.* 23, 950.—A discussion of the properties of Russian fuels based on a table of analyses of 3 firewoods, 1 peat, 10 brown coals, 18 coals, 9 anthracites, 3 oil shales, 2 cokes, 2 charcoals and 1 mazout showing moisture, volatile matter, C, H, N, O, S, ash, heating value, softening temp. of ash, characteristics of coke, weathering properties and tendencies to spontaneous combustion.

ALDEN H. EMERY

**Automatic combustion control.** T. A. PEEBLES. *J. Inst. Fuel* 2, 131-40(1929).—The use of automatic regulating devices, such as Hagan regulators, for the automatic balancing of the loads on a number of boilers and the proper proportioning of air and fuel is carefully discussed.

LESLIE B. BRAGG

**[Mechanism of] combustion processes.** P. SCHLÄFFER AND M. BRUNNER. *Schweiz. Ver. Gas u. Wasserfach. Monats.-Bull.* 9, 161-9(1929).—The slow combustion of hexane was studied at 210° and const. vol. both with and without catalysts. Products of the combustion were identified and detd. from time to time. A proposed mechanism for the reaction assumes first the formation of mol. oxides of hexane, then the decompn. of these mol. oxides both to form unsatd. compds. and  $\text{H}_2\text{O}$ , and also to form normal peroxides. Pyrex glass powder hindered the oxidation; this is explained as due to the decompn. of the mol. oxides into hexane and  $\text{O}_2$ . A trace of  $\text{PhNH}_2$  retarded the combustion to about one-tenth its former rate.

W. A. GALLUP

**Progress in the development of combustion of Victorian brown coal.** STATE ELECTRICITY COMMISSION OF VICTORIA. *Trans. Fuel Conference, World Power Conference 1928* 1, 1-32(1929).—Daily analyses for 1927 showed the following averages for Morwell and Yallourn coal, resp.:  $\text{H}_2\text{O}$  48.5, 63.4; volatile matter 27.3, 19.0; fixed C 22.0, 16.8; ash 2.17, 0.76; C 33.79, 23.74; H 2.38, 1.62; O 12.71, 10.19; N 0.31, 0.2, S 0.14, 0.09; B. t. u. 5736, 3979. Individual samples departed but little from the averages. Designs of boilers to utilize coal of such low heating value and high moisture (large stack losses) are discussed and results of boiler tests showing about 75% net efficiency are given. Tests are discussed on pre-drying (1) in hot flue gases, (2) on an inclined grate in the combustion chamber (feeding the chain grate), (3) externally with steam and (4) by feeding through a drying shaft in the combustion chamber. The latter used with mech. step grates proved most satisfactory.

A. H. E.

**Low-temperature carbonization.** DAVID BROWNLIE. *Gas Age-Record* 63, 753-4, 757-8(1929); cf. *C. A.* 23, 3790, 4322.—A brief general discussion.

LESLIE B. BRAGG

**Low-temperature carbonization and the gas industry.** DAVID BROWNLIE. *Gas Age-Record* 63, 243-4, 250(1929).—A short discussion of low-temp. carbonization plants now in operation or in process of construction.

LESLIE B. BRAGG

**The Honigmann-Bartling carbonization process.** DAVID BROWNLIE. *Gas Age-Record* 63, 69-70(1929).—The Honigmann-Bartling process for the carbonization of lignite consists chiefly of a revolving horizontal disk of cast iron, placed convex upwards, on which a thin layer of lignite is carbonized. The disk is heated from below by a shallow chamber filled with small pieces of fire brick which are raised almost to incandescence by being fired underneath by a series of gas burners operated with an air blast. The

lignite is fed on to the disk from a hopper and scraped off after one revolution, which takes about one minute. The gas collects beneath a casing and is drawn off at the top. The process is claimed to have a large throughput and may be suitably operated in conjunction with a furnace plant using the carbonized lignite in the pulverized condition.

LESLIE B. BRAGG

**The Sauerbrey process of low-temperature carbonization.** DAVID BROWNLEE *Gas Age-Record* 62, 857-8(1928).—A new mechanically continuous cylindrical rotary retort for use in the low-temp. carbonization of lignite is described in detail. The standard installation consists of 4 retorts carrying sets of thin longitudinal fins slightly bent at the top. The lignite is fed in between these fins at one side and is discharged at the bottom after being carried up and around by the retort. The lignite travels by gravity from one retort to another while the retorts are heated internally and counter-current to the flow of the lignite, the hot gases passing through all four retorts in series.

LESLIE B. BRAGG

**A municipal low-temperature carbonization plant.** JOHN B. C. KERSHAW. *Combustion* 19, 308-10(1928).—The MacLaurin process plant at Glasgow is discussed and some of the financial results obtained by the operation of the plant during the two years ending May 31, 1928, are given.

**Coal carbonization.** J. HERON. *Iron Coal Trades Rev.* 118, 832-4(1929) — An historical review.

LESLIE B. BRAGG

**Methods of burning Dutch East Indian coals.** D. J. L. CONINCK. *Trans. Fuel Conference, World Power Conference, London, 1928* 1, 102-18(1929).—The coal is a noncoking, long-flame, highly gaseous, very friable and moist Eocene coal. Its compn. varies as follows: fixed C 48-56, volatile matter 34-39, moisture 5.5-8, ash 0.5-7.5, S 0.4-1, C 74.7-79.6, H 5.6-7.3, O 12.6-17.5, N 1.7-15% and heating value 6800-7500 cal. Various methods of firing are discussed. Summary data are given on boiler tests using hand firing, traveling grate and underfeed stokers. Detailed figures on three tests of pulverized fuel firing are given.

ALDEN H. EMERY

**A practical comparative basis for the calorific value of coal.** STANISLAW FELSZ. *Trans. Fuel Conference, World Power Conference, London, 1928* 1, 271-2(1929).—F. defines a hypothetical standard coal as contg. 6320 cal. per kg. This simplifies calcs. if the total heat of steam be assumed to be 632 cal. and the equiv. factor per h. p. hr. be also taken as 632 cal. Examples are given.

ALDEN H. EMERY

**Waste-heat recovery.** FRANK H. PREECE. *Fuel Econ. Rev.* 8, 69-71(1929)

H. C. PARISH

**New method for utilizing soft coal as generator fuel.** JAMES N. PAFF. *Gas Age-Record* 63, 605-6(1929).—Soft coal when used as a water-gas-generator fuel causes a dense smoke during blasting and builds up a central core of dense, partially coked coal, which causes considerable trouble and loss. At the plant of the Peoples Gas Company of Glasboro, N. J., this trouble has been largely overcome by the use of a centrally located, water-cooled steam and air nozzle, which increased the make from 60,000 to 67,000 cu. ft. per hr. and reduced the fuel requirement from 31.0 to 27.0 lb. per 1000 cu. ft. in operating with 100% coal.

LESLIE B. BRAGG

**A study of Post-Carboniferous coals.** EDGAR STANSFIELD. *Trans. Fuel Conference, World Power Conference, London, 1928* 1, 54-61(1929).—Approx. 68% of all estd. U. S. coal reserves and 98% of Canadian are Post-Carboniferous. Post-Carboniferous coals account for over 50% of the world coal reserves. However, North American Post-Carboniferous deposits account for but 3% of world production at the present time. Moisture and fuel ratio increase and fixed C and B. t. u. decrease as one goes further from regions of geologic disturbance. High-moisture coals must be analyzed as soon as possible after sampling as they are unstable and oxidize readily, even in stoppered bottles. Moisture detns. should be made in neutral gas to prevent oxidation. Volatile matter should be detd. by slow coking to avoid sparking. S. recommends exposure of coal for 48 hrs. to rapid current of air of 60% humidity (regulated by exposure to CaCl<sub>2</sub> soln. of 1.3 sp. gr.).

ALDEN H. EMERY

**Korean coals and their utilization.** M. KAMO. *Trans. Fuel Conference, World Power Conference, London, 1928* 1, 119-36(1929).—Analyses of the various grades of Korean coals are given and the results of tests which show that pulverized firing of anthracite and low-temp. distn. of brown coal combined with pulverized firing of the coke are efficient ways for utilizing Korean coals. Yields and analyses of products from the low-temp. carbonization (500°) of 4 brown coals are given.

A. H. F.

**Progress in coal preparation, during 1928.** R. V. WHEELER. *Iron Coal Trades Rev.* 118, 120(1929).

LESLIE B. BRAGG

**Proposals for technical designations of coal characteristics.** GESELLSCHAFT FÜR

**WARMEWIRTSCHAFT, WIEN.** *Trans. Fuel Conference, World Power Conference, London, 1928 1, 46-53(1929).*—In order to make reliable and representative information on the compn. of coals used in Austria available to the consumer, reference tables are being prepd. giving an av. of all data available for the various coals on the market.

**ALDEN H. EMERY**  
**The constitution of coal.** R. V. WHEELER. *Trans. Fuel Conference, World Power Conference, London, 1928 1, 199-213(1929).*—W. reviews the theories of the origin of coal, discusses the coal-forming materials and briefly reviews coal chemistry. To express the compn. and quality of coal it is necessary to know the amounts of hydrocarbons, resins, resistant plant entities and ulmin compds. that it contains and the degree of coalification of the ulmin. Rational analyses on these lines should lead to an ideal scientific classification of coals.

**ALDEN H. EMERY**  
**Sampling and testing of coal.** GESELLSCHAFT FÜR WARMEWIRTSCHAFT, WIEN. *Trans. Fuel Conference, World Power Conference, London, 1928 1, 261-70(1929).*—Sampling methods are similar to those in use in the U. S. Moisture is detd. by the xylene method; heating at 106-110 for 1 hr. was unsatisfactory for oxidizable coals. A coking test is made by heating 1 g. coal in a Pt crucible for 7 min. at 900°. Brown coals are carbonized in Rose crucibles with a gas flame. Loss of wt. = volatile matter. Coke porosity is detd. with special pycnometer-like app. (cf. Lant, C. A. 16, 2400). M. p. of ash in oxidizing atm. is detd. by micropyrometer method; for reducing atm., 15 mm. ash cone is heated in elec. tube furnace filled with any reducing gas. Calorific value is detd. by Berthelot-Mahler process in stainless-steel bomb. For gasification test, 0.2 g. sample is placed in a special tube or 20-50 g. is tested in a Fisher retort (cf. C. A. 14, 3149). Calorific value of gas is detd. in Strache-Löffler caloriscopes (cf. C. A. 22, 1460; 23, 3329). C and H are detd. by combustion; S and N compds. are retained by PbO at 180°. N is detd. by Dumas and Lambris method (cf. C. A. 21, 3115). Combustible S is detd. by absorption in NaBr or ammoniated H<sub>2</sub>O<sub>2</sub> soln. S in ash is extd. by boiling with soda soln. + a little Br for 10 min., acidified with HCl, filtered and S in filtrate detd. with BaCl<sub>2</sub>.

**ALDEN H. EMERY**  
**Determination of volatile matter in coal by low-temperature methods.** R. VON-DRÄCKE. *Trans. Fuel Conference, World Power Conference, London, 1928 1, 273-80(1929).*—The use of a boiling S bath (444°) is suggested for carbonization tests at low temp. The gases are collected and analyzed. V. gives results of studies of the relationship between compn. of fuels and vols. of gas and CO<sub>2</sub> evolved in this test. The approx. compn. and calorific value of the coal can be detd. from this simple assay.

**ALDEN H. EMERY**  
**Sulfur determination in coal.** N. A. NIKOLAI AND H. VOROBYEV. *Izvestiya Teplotekh. Inst. (Trans. Thermo-Tech. Inst. (Russia)) 1929, No. 3, 91-2.*—Coal samples with varying contents of S were analyzed by the Eschka method and then burned in a calorimetric bomb which was filled with O<sub>2</sub> at 20-25 atm. after admitting a few cc. of a 10 caustic soln. to absorb the oxides obtained and to ppt. the Fe. The contents of the bomb were placed in a beaker and the bomb was rinsed 3 times with hot water after the combustion. After the filtration the S was detd. in the same way as by the Eschka method. Pptn. of the BaSO<sub>4</sub> in the filtrate without a preliminary treatment with bromine water produced identical results. This method compared with that of Eschka or the Na<sub>2</sub>O<sub>2</sub> method showed that the material left after the calorimetric detn. can be used for the S detn.

**A. A. BOEHLINGK**  
**A new practical receiver for low-temperature distillation analyses of coal according to Fischer.** OTTO KELLER. *Chem.-Ztg. 53, 517(1929).*—Schaefer's app (C. A. 22, 3110) is applied to coal analysis.

**J. H. MOORE**  
**The distillation of coals from the Moscow basin at low temperatures and in vacuum.** W. WILLIAMS AND P. CHERNOSEMOV. *Izvestiya Teplotekh. Inst. (Trans. Thermo-Tech. Inst. (Russia)) 1927, No. 9, 12-4; Chem. Zentr. 1929, I, 329.*—Various coals were subjected to a 12-hr. distn. at various temps. (320°, 450° and 520°) and at various pressures (1, 0.75 and 0.5 atm.). The light and the heavy fraction increased with reduced pressure and also the paraffin yield from the heavy fraction increased. The oils from the tar had a lower solidification point, but a higher sp. gr.

**G. SCHWOCH**  
**The dry cleaning of coal.** K. C. APPLEYARD. *Trans. Fuel Conference, World Power Conference, London, 1928 1, 416-34(1929); cf. C. A. 22, 311.*—A. gives the general considerations in the dry cleaning of coal, describes the pneumatic cleaning plant at Thorne Colliery and discusses dust collection and its use for powdered fuel.

**ALDEN H. EMERY**  
**The cleaning of coal by froth flotation.** E. EDSER AND P. T. WILLIAMS. *Trans. Fuel Conference, World Power Conference, London, 1928 1, 374-84(1929).*—Since froth

flotation is applicable to coal sizes less than 3 mm. it is a natural complement of gravity methods. Coal particles are collected in the froth and the dirt sinks. To float bony coal, kerosene is added, the amount (about  $\frac{1}{2}$  lb. per ton of coal) depending on the ash required. If ash is to be rigorously excluded, Na silicate is added. Starch (a few oz. per ton of coal) will prevent flotation of fusain. Cresol (about  $\frac{3}{4}$  lb. per ton of coal) is used as a frothing agent. In practice, air bubbles are disseminated through the mass, which flows to a quiescent chamber where a froth contg. the coal forms. The residue goes to a second agitation chamber, then to a second froth-forming compartment, and so on.

ALDEN H. EMERY

**The cleaning of small coal.** W. R. CHAPMAN. *Trans. Fuel Conference, World Power Conference, London, 1928* 1, 359-73(1929); cf. *C. A.* 20, 2240, 2573, 3071, 3555, 21, 812, 1175, 3116, 3265, 4046; 22, 153, 493, 1839, 2254.—The following coal-cleaning processes are briefly described: the Baum jig, the Coppée jig, the Lührig jig, the Humboldt jig, the Rheolaveur washer, the Draper washer, the Chance washer, the Diester-Overstrom table, the H. H. table, froth flotation, pneumatic separators, spiral separators, the Ray process, the Berrisford process, the Dry Coal Cleaning Co.'s process, the Clean Coal Co.'s process ( $\text{CaCl}_2$  float-and-sink) and the Kirkup process. A. H. E.

**Cleaning bituminous coal.** J. R. CAMPBELL. *Trans. Fuel Conference, World Power Conference, London, 1928* 1, 307-27 (1929).—Sec. *C. A.* 22, 3510. A. H. E.

**The dewatering and drying of coal.** R. A. MORT. *Trans. Fuel Conference, World Power Conference, London, 1928*, 1, 341-58(1929).

ALDEN H. EMERY

**Glycerol process for dehydration.** C. H. S. TUPHOLME. *Gas Age-Record* 63, 311-3(1929).—The glycerol process of gas dehydration and the equipment used are described with figures on cost, glycerol requirements, etc. The cost of operation of the process is estd. to be about 0.3 cent per 1000 cu. ft. of gas handled. The first commercial-scale plant has been erected at the Colwyn Bay Gas Works and results of the first few weeks operation are given.

LESLIE B. BRAGG

**The hygroscopic qualities of coal.** R. VONDRÁČEK. *Trans. Fuel Conference, World Power Conference, London, 1928* 1, 281-4(1928).—The drying of coals is not strictly a reversible process, and the humidification of a dry fuel in an atm. of a gradually rising tension of aq. vapor is accompanied by a large time lag. There is no satisfactory method of detg. hygroscopicity. This property is important in the transportation and storage of coal, because of the slacking and oxidation which occur through this phenomenon.

ALDEN H. EMERY

**Methods of control, preparation, handling and storage of coals by the National Railways of Belgium.** H. CHENU. *Trans. Fuel Conference, World Power Conference, London, 1928* 1, 453-74(1929).—Since the Belgian railways purchase about 200 different varieties of coal they must maintain 4 central mixing plants from which, after blending to give the desired characteristics, the coal goes to about 100 points of consumption.

ALDEN H. EMERY

**Coal storage requires special attention to avoid fires.** A. T. WARD. *Iron Trade Rev.* 83, 1499-1500, 1506(1928).—Careful directions are given for the storing of coal so as to avoid spontaneous combustion and methods of inspection and care after storing.

LESLIE B. BRAGG

**The cellulose determination, a fundamental criterion in the differentiation of peat, brown coal and bituminous coal.** R. POTONIE AND W. BENADE. *Braunkohle* 28, 335-40(1929).—Practically no cellulose is found in bituminous coal, and only encrusted cellulose, principally lignocellulose, in brown coal, whereas peat contains also pure cellulose. The pure cellulose is extd. quantitatively by Schweizer's ammoniacal cupric soln., the encrusted cellulose only partially. There is thus a marked difference between peat and brown coal in the quantity extd. The extd. cellulose is pptd. by acids. By trial on a number of specimens, the 3 classes were readily distinguished by this means.

F. S. GRANGER

**Colloidal and chemical properties of peat.** I. I. ZHUKOV', E. A. KREMLEVA AND A. V. TIKHOMIROV. *Zhur. Prikladnoi Khim.* (Leningrad) 2, 257-66(1929).—Samples of peat were examd. by the methods of filtration analysis of Ostwald (*C. A.* 19, 1673) as follows: 30 g. of raw peat were mixed with 50 cc. of water or of a soln. contg. a coagulating agent. After 10 min. the mixt. was transferred to a filter. Readings were taken every min. for the first 3 min. and then every 5 min. Check detns. were in perfect agreement. Filtration proceeds more quickly with peats of higher degree of decompn. Filtration rate increases with the increase in valence of the coagulating agent.  $\text{CaCl}_2$  is a good coagulant, contrary to  $\text{MgCl}_2$ , but when added to peat both salts gave practically identical filtration rates.  $\text{Fe}^{+++}$  and especially  $\text{Fe}^{+++}$  and  $\text{Th}^{IV}$  are very efficient coagulants, colloidal  $\text{Fe}_2\text{O}_3$  being the most efficient. Filtration rate increases with the

increase in concn. of the coagulating agent, but when this concn. is above a certain max. further increase in concn. results in a decrease in the rate of filtration. Heat increases the coagulating rate but with very efficient coagulants this effect is masked.

V. KALICHEVSKY

**The drying of brown coal without breakage.** H. FLEISSNER. *Trans. Fuel Conference, World Power Conference, London, 1928 1, 328-40(1929).*—By heating in an autoclave with steam at 8-10 atm. pressure, the coal is brought to a uniform temp. throughout without evapn. With release of pressure drying proceeds from the center outward and slacking is avoided. During the steaming the lumps contract, preventing reabsorption of  $H_2O$  after drying, and reducing the danger of spontaneous combustion by reducing porosity. The temp. must be high enough to decompose the colloids. One kg. of dried coal gives 2.5 cu. m. of producer gas ( $CO_2$  3.5-4,  $CO$  30-31,  $H_2$  14-15, heavy hydrocarbons 0.2, methane 2% and heating value 1500 cal.) or 0.65-0.75 cu. m. of water gas (3000 cal.).

ALDEN H. EMERY

**Developments in the treatment of lignite.** ANON. *Iron Coal Trades Rev. 118, 821-2, 826(1929).*—The "Cohesite" process for the production of briquets from lignite carbonized in the Lurgi retort and the briquetting plant at Bienfait, Saskatchewan, Canada, are described in some detail.

LESLIE B. BRAGG

**Some considerations regarding the rational utilization of Roumanian lignites.** I. BUIOIU. *Trans. Fuel Conference, World Power Conference, London, 1928 1, 137-50(1929).*—Low-temp. distn. of Roumanian lignites is recommended. The method described recovers 65-80% of the original heating value in the coke. The yield of tar was 6.8-8% and of gas 50-130 cu. m. with a fuel value of 3335-9094 cal. per cu. m.

ALDEN H. EMERY

**Czechoslovakian lignite: its preparation and utilization.** J. FORMÁNEK. *Trans. Fuel Conference, World Power Conference, London, 1928 1, 62-79(1929).*—Statistics are given on world lignite reserves and production. In Bohemian lignite moisture varies from 16.6 to 35.9%, ash from 1.4 to 8.2% and heating value from 6370 to 10,410 B. t. u. Bohemian lignite briquets are not resistant; they slack in the fire or on weathering. Previous to the war, "kaumacite," a lignite char, was prepd. by high-temp. carbonization. The ovens are described. The product analyzed about 79% C, 0.8% H, 0.92% O + N, 1.25% S, 6.5%  $H_2O$ , 12.4% ash and 12,000 B. t. u. It was used in boiler furnaces and for briquets. Tar (3-3.5%) and  $NH_3$  (10% of N content) were recovered. Gas (390-440 B. t. u.) was used for kaumacite-retort heating, for zinc-retort heating and in gas engines. Expts. with low-temp. carbonization are described. Zinc works produce lignite char for use as a reducing agent. The gasification of lignite is important in glass works, metallurgical and chemical plants and towns in the lignite district. Elec. energy for Prague is generated by lignite-raised steam. Pulverized firing is coming into prominence.

ALDEN H. EMERY

**The Seaboard process with the utilization of actifier air.** D. L. JACOBSON. *Gas Age-Record 63, 895-900(1929).*—The actifier air from the Seaboard process which cannot be turned loose into the air on account of its  $H_2S$  content can be disposed of by use in boilers, as the primary air supply to gas producers and during the blow in water-gas machines by synchronizing several machines or by installing an air holder in the line. The  $H_2S$  is burned to  $SO_2$  but does not increase the amt. usually obtained from coal sufficiently to be objectionable, corresponding to an increase of S in the coal of from about 2.0 to 2.3%.

LESLIE B. BRAGG

**Possibilities in synthetic hydrocarbon processes.** W. W. ODELL. *Gas Age-Record 63, 37-41, 48-50(1928).*—The com. and economic possibilities of making hydrocarbons synthetically from water gas are discussed in some detail. Tables of yields and costs are given.

LESLIE B. BRAGG

**Industrial process for obtaining liquid hydrocarbons by simultaneous cracking and hydrogenation.** J. FOHLEN. *Chimie & industrie 21, 1141-8(1929).*—The process consists essentially in cracking the raw material (coal, lignite, shale, tar, etc.) in a suitable app., with addn. of suitable catalyst (chiefly metallic chlorides) if desired, immediately purifying and desulfurizing the hot gases by passing over reduced metals of the same nature as used for the hydrogenation, and finally mixing with  $H_2$  and passing over a catalyst. The purifiers and desulfurizers are practically identical with the catalyst and may be considered as catalysts which are purposely "poisoned" to protect the catalyst proper; they generally work at a somewhat higher temp. (300-250°) than the latter (250-170°). In order to have efficient purification, the nature of the reagents and temp. of reaction must be carefully regulated to avoid reversible reactions such as  $FeS + H_2O \rightleftharpoons FeO + H_2S$ ; 2 purifying chambers are provided, which work alternately and are frequently regenerated by roasting in a current of air or  $O_2$  (with

a final short period of reduction with  $H_2$  or water gas, if desired). Owing to the high yields of low-boiling products, the condensation and recovery of hydrocarbons should preferably be carried out by the methods used for recovering cracked and casinghead gasolines.

A. PAPINEAU-COUTURE

**The Thylox process of liquid purification.** D. L. JACOBSON. *Gas Age-Record* 63, 597-600(1929).—The Thylox liquid purification plant consists essentially of an absorber and a thionizer in which the S is oxidized with air and floated off as a froth to a S slurry tank. A filter is used to recover the S for sale as an agricultural fungicide or as brimstone after melting down. Soda ash soln. is added continuously to the system and Thylox compd. as needed. The process will remove about 98% of the  $H_2S$  and 100% of the HCN at a net cost of 0.91 cent per 1000 cu. ft. of gas.

LESLIE B. BRAGG

**The "Instill" benzene-refining process.** ANON. *Iron Coal Trades Rev.* 117, 719 (1929).—The "Instill" process as used at the Thornhill Collieries, Dewsbury, England, has been found to give an 8 to 10% increase in the benzene yield at about the same cost in a fraction of the time required by the acid process. The process is described in some detail and test results on low-temperature-carbonization spirit at the Mitchell Main Colliery plant are given which show an increase of about 26% in yield.

LESLIE B. BRAGG

**Manufacture of neutral sulfate of ammonia.** O. A. TERNES. *Gas Age-Record* 62, 890, 893(1928).—Methods of manuf. of neutral  $(NH_4)_2SO_4$  are discussed and a method using gaseous  $NH_3$  in air for neutralization and drying is described in detail.

L. B. B.

**The gas industry.** W. J. STONE. *Gas World* 90, 761-5(1929).—The various problems of the gas industry are discussed with suggestions for the operation of a water-gas plant and the production of a satisfactory tar.

J. B. CARPENTER, JR.

**A study of the gas industry.** JAMES JAMIESON. *Gas World* 91, 9-15(1929).—The proper blending of coals gives the product of high-temp. carbonization all the attributes claimed for low-temp. coke. Expts. with an 8-ton coking unit show that the proximate analysis is of little value in choosing a coal and that while throughput was a function of the coal size, moisture and volatile content, a high thermal output in the gas does not follow low quality. Tar yields are affected by the size and coking characteristics of the coal as well as the throughput. The technical possibility is discussed of enriching water gas by the synthesis of methane from CO and  $H_2$  in the presence of Ni catalysts at 265-75°.

J. B. CARPENTER, JR.

**Recent progress in gas engineering.** LESLIE B. BRAGG. *Gas Age-Record* 63, 741-5, 750(1929).

LESLIE B. BRAGG

**Gas dehydration in practical operation.** W. L. SHIVELY. *Gas Age-Record* 63, 445-7, 452(1929).—The gas dehydration plant in operation at the plant of the Grand Rapids Gas Light Co., Grand Rapids, Michigan, which is operating at a total cost of not over 0.75 cent per 1000 cu. ft., is described. The hygroscopic soln. used is a slightly alk. soln. of NaCNS, which is obtained as a by-product from the liquor from liquid purification plants.

LESLIE B. BRAGG

**Dehydration of gas with calcium chloride.** J. S. FERGUSON. *Gas Age-Record* 62, 677-80(1928).—A set of calcns. in connection with the use of  $CaCl_2$  solns. for the dehydration of gas.

LESLIE B. BRAGG

**Experience in gas dehydration at Grand Rapids.** J. E. SPINDLE. *Gas Age-Record* 64, 39-43(1929).—The effects of gas dehydration on drip, frost, water, rust and naphthalene complaints and on the distributing system are carefully considered and discussed. Oil has been used to prevent possible leakage as a result of the drying out of the distributing system; the methods of introduction of this oil are pointed out.

LESLIE B. BRAGG

**Treating waste water from Reading gas plant.** A. F. KUNBERGER. *Gas Age-Record* 63, 9-10(1929).—The app. and methods used by the Consumer's Gas Company of Reading, Pa., to treat waste water, in particular to remove suspended tarry matter, are described in detail. The process is essentially one of the formation of a flocculent ppt. by adding copperas and lime or soda ash, if necessary, followed by settling and filtering.

LESLIE B. BRAGG

**Apparatus for the complete gasification by the Humphrey and Glasgow process.** ANON. *J. usines gaz.* 53, 265-8(1929).—This system is a combination of coal distn. and water-gas manuf. The coal is charged into the top of the retort and distd., producing coal gas. The coke passes to the lower part of the retort, where steam is passed through it to produce water gas, which is drawn off in the center. The two gases are mixed. During blowing the air only passes through the lower part of the retort and out through a carburetor and superheater, as in an ordinary gas works. Tables show

the results obtained in the complete gasification of several different coals. This system gives good results with a wide variety of fuels ranging from gas coals to coke. W. J. M.

**Natural gas.** CLAUDE C. BROWN. *Gas Age-Record* 63, 4-6(1929).—A review of natural-gas production, utilization and methods of conservation, particularly with respect to the California field.

LESLIE B. BRAGG  
**Chemical composition of Polish natural gases and the determination of their calorific value.** I. Chemical composition of Polish natural gases. K. KLING AND L. SUCHOWIAK. *Trans. Fuel Conference, World Power Conference, London, 1928* 1, 821-3 (1929).—See C. A. 22, 4772; 23, 2273. II. Determination of the calorific value of natural gas from the relative density. W. DOMINIK. *Ibid* 823-6.—As natural gas consists almost entirely of paraffin hydrocarbons, the calorific value can be calcd. from the observed density. Heating value can be read directly from a chart which also corrects for contamination with air. III. Determination of the calorific value of natural gas by means of chemical analysis. W. LESNIAŃSKI AND K. KATZ. *Ibid* 826-9.—See C. A. 23, 2552. IV. A comparison of the methods for determining the calorific value of natural gas. J. WÓJCICKI. *Ibid* 829-33.—The calorific value of gas (10-17,000 cal. per l.) was detd. in (1) Junkers and (2) union calorimeters and calcd. by the (3) chem. compn. and (4) density methods. If the values of (1) after correction for unburned gas, etc., are correct, the errors are as follows: (1) without correction 7%, (2) 8%, without correction 29%, (3) 0.98%, (4) 6.9%. The relative time consumed is (1) 3.6, corrected 4.9, (2) 1, (3) 2.75 and (4) 1.5. It is concluded that the method employing chem. analysis is the most satisfactory.

ALDEN H. EMERY  
**Cracking natural gas.** J. A. YUNKER. *Gas Age-Record* 63, 674, 680(1929); cf. C. A. 23, 3793.—Natural gas can be cracked in a water-gas set by using it in place of steam after the blast. A gas contg. 90% H<sub>2</sub> and less than 10% hydrocarbon has been made and 7 lb. of carbon black, suitable for use in rubber tires, has been recovered per 1000 cu. ft. of natural gas processed. About 2.25 cu. ft. of cracked gas may be produced per cu. ft. of natural gas with a consumption of 0.015 lb. of coke. The gas may be used for mixing or for synthetic processes.

LESLIE B. BRAGG  
**Changing from manufactured to natural gas.** GEORGE WEHRLE. *Gas Age-Record* 63, 673, 676(1929).—The change increased the capacity of the distributing system for the delivery of heat units about 2.6 times. By satg. the natural gas with water and oil vapors trouble due to leakage, the drying out of diaphragms and dust in the mains is avoided.

LESLIE B. BRAGG  
**Some manufactured-gas technical developments.** C. J. RAMSBURG. *Gas Age-Record* 63, 205-6, 213-6(1929).—A review of recent developments in liquid purification, dehydration, naphthalene removal, back-run method, automatic operation of water-gas generators, Becker oven and the disposal of phenolic waste liquors. L. B. B.

**Heat loss due to combustibles in flue gas.** G. S. FRING. *Combustion* 19, 251-3 (1928).—An approx. method of detg. the heat loss due to combustibles in the flue gas without making a complete analysis of the gases.

LESLIE B. BRAGG  
**Interpretation of stack-gas analysis.** G. E. SALKVIST. *Blast Furnace & Steel Plant* 17, 1055-7(1929).—A graphic method is described of detg. CO in waste gas from the amt. of CO<sub>2</sub> and O<sub>2</sub> present in the gas and the analysis of the fuel. C. L. READ

**Naphthalene stoppages (in gas mains).** FRITZ SCHUSTER. *Gas Wasserfach* 72, 650-3(1929).—Naphthalene stoppages are avoided by spraying or vaporizing sufficient tetralin into the gas so that naphthalene sepg. out on cooling will be in soln. in the tetralin rather than deposited as a solid. The quantities of tetralin necessary are given and the vaporizing app. is discussed and illustrated.

R. W. RYAN  
**Experience with naphthalene removal.** R. C. DOWNING. *Gas Age-Record* 62, 861-6(1928).—A naphthalene history of the Lowell Gas Light Company, Lowell, Massachusetts from 1915 to date is given. A multiple oil washer, which is giving good results, is described with operating and cost data. The washer decreased the naphthalene content of the gas to an average of 1.3 grains per 100 cu. ft. of gas at an expense of 1/8 cent per 1000 cu. ft. of gas.

LESLIE B. BRAGG  
**Characteristics of low-temperature tar.** M. A. MATTHEWS. *Gas World* 90, 744 (1929).—The chief characteristics of low-temp. tar are discussed with emphasis on the prospects of increased motor-spirit production.

J. B. CARPENTER, JR.  
**Viscosity and adhesiveness of street-tar.** HEYDECKE. *Asphalt u. Teer* 29, 649-51 (1929).—The viscosity and adhesiveness of various tar samples were detd. at various temps. Tars having the same viscosity may have different degrees of adhesiveness.

W. A. GALLUP  
**The Reichmann continuous tar-distillation process.** ERNST WEISE. *Asphalt u. Teer* 29, 620-1(1929).—Four stills are operated in series and maintained at different

temps. The crude tar is introduced into the first still in very finely divided form, the vapors pass off into the condensing system and the residual tar flows to the second still, which is maintained at a higher temp., etc.

**Dehydrating water-gas-tar emulsions.** H. A. KLEINMAN. *Gas Age-Record* 63, 349-50, 353-4(1929).—An app. which has been successfully used at the gas plant of the Peoples Power Co., Moline, Ill., for the dehydration of 100% bituminous coal water gas tar at an expense of about 0.5 cent per gallon of dry tar, consists essentially of an exhaust steam emulsion heater and a separator. The emulsion is heated to about 220° F. in the heater while under a pressure so that no vaporization of the water takes place, and then passes through a set of sprays. After it leaves the sprays the pressure is atm and part of the water vaporizes and is condensed in a jet condenser and the emulsion is broken so that the tar and remaining water will sep. by gravity.

**Acids in peat tar.** G. STADNIKOV AND V. SABAVIN. *Brennstoff-Chem.* 10, 1 (1929).—Carboxylic acids together with phenols are extd. from a sphagnum peat tar with NaOH. The acids are next sepd. from the phenols by treatment with Na<sub>2</sub>CO<sub>3</sub>, esterified and fractionated. From analysis of the esters and of the acids set free therefrom by saponification, together with mol. wt. data, caproic, heptioic and caprylic acids are identified. The presence of unsatd. acids is also indicated. The authors believe that these acids exist as such in the peat and are not formed by destructive dist.

**Coke and by-products in 1927.** F. G. TRYON AND H. L. BENNETT. *Bur Mines, Mineral Resources of the U. S. 1927*, Pt. II, 595-687 (preprint No. 29 published July 3, 1929).

**Recent research on the production and utilization of coke.** W. T. K. BRAUNHOLTZ. *Gas World* 90, Coking Sect. 65-8(1929).—The work of the Northern Coke Research Committee, England, during the past year, is reviewed. The greater part of the paper deals with methods of testing the resistance of foundry coke to breakage in transit. In the detn. of volatile matter in coke, by the usual crucible method, loss of wt. continued to the limit of the test, 28 min., even in an atm. of N, amounting to about double the loss in 7 min. The loss in 7 min. was greater in a silica tube in N than in a crucible in a muffle furnace at the same temp., 950°, without N. Adding benzene in the crucible analysis, to produce an inert atm., gave a still lower value. Analyses of a number of coals showed a distinct tendency for the middle sieve fractions to contain the least ash.

**The part played by the bitumens of the coal in coke-formation.** G. AGDE AND L. VON LYNCKER. *Teer u. Bitumen* 27, 309-11(1929).—Analytical coking and absorption expts. indicate that the reactivity of a coke is decreased by the presence of solid decompn. products of the bitumens of the coal. These decompn. products are derived largely from the solid bitumens of the coal.

**The water content of semi-coke and its exact determination.** M. DOLCH, E. PÖCHMÜLLER AND M. DAVID. *Braunkohle* 28, 429-34(1929).—The usual methods, drying at 108° and distn. with xylene, are not applicable because they do not remove adsorbed moisture. The so-called cryohydric method gives exact results. The sample is boiled several minutes with a known quantity of abs. alc. which takes up all of the moisture. A measured vol. of the alc. is then mixed with an equal vol. of gasoline and the miscibility temp. is detd. exactly. The % H<sub>2</sub>O in the alc. is detd. from a table and from this the % in the coke is calcd.

**The coke-oven industry in 1928.** C. P. FINN. *Iron Coal Trades Rev.* 118, 121 (1929).

**By-product ovens are underfired with blast-furnace gas.** ANON. *Iron Trade Rev.* 84, 644-5(1929).—The results of the first three months of operation when firing Becker cross-regenerative type ovens at the S. Chicago plant of the By-Products Coke Corp. of Chicago with blast-furnace gas indicate the following advantages: more uniform distribution of heat to the walls of the oven; more uniform coke temperature and size as pushed; improvement in the smoothness and ease of operation of the furnaces and greater uniformity in the B. t. u. of the furnace gas.

**Blast-furnace gas on coke ovens.** F. B. THACHER. *Blast Furnace & Steel Plant* 17, 1048-52(1929).—A description of an installation to use blast-furnace gas exclusively to heat 2 batteries of Becker ovens, thus releasing the higher-grade coke-oven gas for other uses.

**Coking carbonaceous fuel.** EMIL RAFFLOER. U. S. 1,723,807, Aug. 6. An app. is described in which the material is constantly heated as it is progressively moved forward, to effect drying and desulfurization, then compressed in relatively long narrow masses while being constantly heated, and intermittently exposed for the free discharge of gases.

**Hydrogenation.** UNION FINANCIERE COMMERCIALE ET INDUSTRIELLE. Fr. 657,546, Nov. 24, 1927. Fuel such as lignite is reduced to a fine powder and heated under pressure of H or gas contg. H in the presence of a catalyst not capable of forming carbides such as Bi.

**Destructive hydrogenation of coal, etc.** MICHAEL MELAMID. U. S. 1,723,431, Aug. 6. The material is heated with Sn under pressure and at a temp. not substantially exceeding  $600^\circ$  and a current of H is forced into the material during the heating Cf. C. A. 23, 264.

**Hydrocarbon conversion.** I. G. FARBERIND. A-G Brit. 303,761, Sept. 3, 1927. Hydrocarbons of relatively low b. p. are produced from starting materials such as tars, tar oils, mineral and shale oils, products of destructive hydrogenation of carbonaceous materials and mineral oil fractions which are sol. in liquid  $\text{SO}_2$ , by treatment with a gaseous hydrogen halide such as HCl at above  $100^\circ$ , with or without pressure, in the presence of activated metals or alloys such as Al, Cu, Pb, Mg, Fe, Co, Cr, etc., and their alloys. Anhyd. chlorides such as  $\text{AlCl}_3$  also may be used. Several examples are given.

**Apparatus (with a screw retort) for carbonizing coal and similar materials.** FRANK C. GREENE and IRVING F. LAUCKS (to Old Ben Coal Corp.). U. S. 1,723,932, Aug. 6. Structural features.

**Testing coal to be gasified.** RUDOLF GEIPERT. U. S. 1,721,813, July 23. In order to test the gasification properties of coal, a test chamber is heated to a gasification temp. and a definite quantity of coal in brick form is placed in the chamber and gasified. An app. is described.

**Low-temperature distillation of brown coal, peat or similar materials.** KARL W. J. H. JACOBS. U. S. 1,721,997, July 23. Brown coal, peat or like material contg. appreciable quantities of O and capable of evolving tarry material of one character at  $250$ – $350^\circ$  and tarry material of a different character at temps. above  $350^\circ$  is dried by heating in a distg. retort and the temp. is progressively raised to about  $350^\circ$  and the residue is cooled while removing volatilized material from the retort and while the residue still contains most of the substances capable of releasing tar above  $350^\circ$ .

**Screening and washing system for separating lignite from sand and gravel.** JOSEPH W. REID. U. S. 1,723,372, Aug. 6. An app. is described.

**Montan wax.** I. G. FARBENIND. A.-G. Brit. 303,080, Sept. 22, 1927. Montan wax is bleached while warm by an aq. soln. of chromic acid or its salts in the presence of an aq. soln. of an org. acid such as HOAc or benzenesulfonic acid. Details and examples are given. Cf. C. A. 23, 4330.

**Montan wax.** A. RIEBECK'SCHE MONTANWERKE A.-G. and T. HELLTHALER. Brit. 303,036, Aug. 26, 1927. Montan wax, crude or deresinified, fractions extd. by solvents, or the wax alcs. and acids obtained by saponification and acidification, are refined with oxidizing agents such as  $H_2O_2$  or chromic acid or its derivs. in the presence of aq.  $H_2SO_4$ . Diluents or dispersing agents such as silicic acid, clay or  $CCl_4$  may be used to prevent thickening. Various examples and details are given. Cf. C. A. 23, 2558.

**Gas producer.** P. S. HULT (to Morgan Construction Co.). Brit. 303,784, Jan. 9, 1928.

**Gas producers.** POETTER G. M. B. H. Fr. 34,256, May 17, 1927. Addn. to 625,570. App for automatically stirring the fuel.

**Rotary gas producer.** P. B. MORGAN. Brit. 303,554, Oct. 5, 1927.

**Producer-gas boiler.** WM. B. CHAPMAN. U. S. 1,722,495, July 30. U. S. 1,722,496 also relates to a boiler construction.

**Plant for producing mixed coal gas and water gas.** HEINRICH KOPPERS (to Koppers Development Corp.). U. S. 1,723,279, Aug. 6. Various structural features are described. U. S. 1,723,280 relates to app. for producing coke and gas from coal.

**Oil gas.** JOHN E. HACKFORD (to Hakol, Ltd.). U. S. 1,723,418, Aug. 6. A spray stream of hydrocarbon material and air is partially burned (in an app. which is described) to form a combustible gas, and the heat of combustion is utilized for maintaining the combustion initiation region close to the place at which the hydrocarbon and air spray stream commences at a temp. exceeding about  $600^\circ$ .

**Gas holder.** R. WAGNER. Brit. 303,316, April 13, 1928. The joint between an axially movable closure disk and the holder wall is made by a seal of hard solid fat or grease which may consist of an emulsion of soap in mineral oil with or without graphite or kieselguhr. Various structural details are described.

**Waterless gas holder.** H. NIELSEN, B. LAING and J. McCLEARY. Brit. 303,045, Sept. 26, 1927. Structural features are described relating to a gas holder with movable pistons (dividing the holder into upper and lower compartments). The inflammable gas to be stored is held in the lower compartment and an inert gas deficient in O is placed in the upper compartment. Combustion gases from a chimney or stack may be used.

**Column still suitable for ammonia recovery from gas liquor.** WILLIAM H. PAVITT (to Wilputte Coke Oven Corp.). U. S. 1,723,657, Aug. 6. Structural features.

**Extraction of oils, etc.** I. G. FARBENIND. A.-G. Fr. 657,585, July 17, 1928. Oils or volatile substances are extd. from residues from the hydrogenation of certain coals under pressure or from other material by passing the material to be treated in the form of a mud or in a viscous state over surfaces cautiously heated. An app. is described.

**Distilling tars and oils.** GAS LIGHT & COKE CO., W. G. ADAM and F. M. POTTER. Brit. 303,038, Aug. 27, 1927. The material to be distd. is passed through heating coils under pressure, allowed to expand, liquids and vapors produced are sepd. and these passed separately in heat exchanging relation with the initial material. An arrangement of app. is described.

**Separating oil from coke-oven tar.** ANTON WEINDEL (to Zeche Mathias Stinnes) U. S. 1,722,872, July 30. In treating coke-oven tar to obtain lubricating oils without distn. of the main bulk of material, the tar is mixed with a "multiple quantity" of petroleum benzene at ordinary temp., the mixt. is allowed to stand for some time at a temp. below normal room temp., tar oils dissolved in the benzene are sepd. from the sepd. asphalt materials, the benzene is distd. off from the oils, and the oils are then distd. up to a temp. of  $245^\circ$  to remove light oils.

**Coke oven.** H. KOPPERS A.-G. (to F. Totzek). Brit. 303,107, Dec. 28, 1927.

**Coke-oven and gas-plant operation.** S. P. MILLER (to Barrett Co.). Brit. 303,163, Dec. 29, 1927. Valves and valve boxes are provided (in a plant construction which is described) whereby gases are directed into one or the other of different collector mains according to the stage of the distn. "Rich" and "lean" gases are thus collected separately in the mains and are cooled by  $NH_3$  liquor sprays. Tarry oil constituents are sepd. from the gases and the latter are then treated for extn. of  $NH_3$  and light oils. Various other details of operation are also described. Brit. 303,164 specifies a process (which may be carried out in the same plant construction) in which the "rich" gases evolved during an earlier period of the distn. are diverted into a collector main and a low free C tar is sepd. and distd. by the hot gases from a number of ovens. Pitch ob-

tained may be blended with tar or lower m. p. pitch to form low free C-pitch compns. and the distillates are condensed to obtain low-d. oils. Brit. 303,165-6-7 relate to app. for use in generally similar processes.

**Coke-oven battery.** JOSEPH BECKER (to Koppers Co.). U. S. 1,721,763, July 23.

**Progress in the petroleum industry.** WALTER SAMANS, P. L. GUARIN, T. H. KERR, H. R. PIERCE, C. F. BRAUN AND W. G. HELTZEL. *Petroleum* (A. S. M. E. Trans.) 51, No. 14, 1-8 (1929); cf. C. A. 23, 962. E. H.

**Progress of the liquefied petroleum gas industry.** G. G. OBERFELL. *Gas Age-Record* 63, 137-9, 145-6 (1929).—The properties of liquefied petroleum gas, propanes or butanes, and possible uses in connection with the gas industry are discussed.

LESLIE B. BRAGG

**Thermochemical investigations of petroleum.** Thermochemical transformation of squalene. RYONOSUKE ABE AND GORO SHIBAYASHI. *Bull. Inst. Phys. Chem. Research* (Japan) 8, 496-501 (1929); Abstract Sect. 2, 56-9.—At 185° squalene reacts exothermally, probably because it begins to polymerize. This exothermic reaction increases suddenly at 300°. During cracking, squalene undergoes first a polymerization and then breaks down into smaller volatile mols. The favorable action of  $AlCl_3$  on cracking is attributable to the fact that it helps the first step of the process. ALBERT L. HENNE

**Recent developments in the distillation of petroleum.** S. F. LIRCH AND A. E. DUNSTAN. *Trans. Fuel Conference, World Power Conference, London, 1928* 1, 614-40 (1929); cf. C. A. 22, 863.—A discussion of the modern pipe still and its accessories, fractionation in natural gas gasoline plants, and vacuum distn. of lubricating oils.

ALDEN H. EMERY

**Cracking petroleum oils by means of special metallic catalysts.** M. DARMOIS. *Chimie & Industrie Special No.*, 252-6 (Feb., 1929).—The catalyst used consisted of an inert base (pumice or charcoal) on which was deposited 2-3 g. of Ag per 200 g.; this material was used as cathode in electrolysis for depositing about 50 g. of catalyst per 200 g. of base. The petroleum was passed downward through a vertical glass tube heated by a nichrome coil; the bottom of the tube contained a layer of charcoal over which was placed the catalyst, which in turn was covered with a 2nd layer of charcoal, the upper portion of the tube being empty. The initial decompn. temp. depends on the nature of the catalyst: with Fe and Ni, decompn. is appreciable at 400°; the catalyzing properties of Cu are appreciably improved by using it for some time and then reducing it in a current of  $H_2$ ; this treatment renders it active below 450°. The activity of Ag begins only at about 500°. Decompn. of kerosene gives considerable gas and gasoline (products distg. up to 155°) and very little C (never more than 2% calcd. on the kerosene). As the temp. rises, the amt. of gasoline obtained increases to a max. and then decreases, while the amt. of gas increases continuously. In general the gasoline and gas obtained at low temps. contain  $C_2H_4$  and hydrocarbons contg. 3 or more double bonds, but no  $C_3H_2$ ; as the decompn. temp. increases, this class of hydrocarbons disappears in both the gasoline and the gas, and the proportion of  $C_2H_4$  in the ethylene hydrocarbons increases; at high temps. the gas contains almost pure  $C_2H_4$  in admixt. with  $H_2$  and satd. hydrocarbons, and the gasoline contains an increasingly large proportion of aromatic hydrocarbons, so that  $C_6H_6$  can be obtained from the lower-boiling fractions and naphthalene from the higher-boiling. The compn. of the residual kerosene (boiling above 155°) is changed, the proportion of cyclic hydrocarbons increasing steadily with the no. of times it is catalyzed. Tests on a gasoline of known compn. ( $C_8H_{18}$  +  $C_7H_{16}$  6.7%, dimethylcyclohexane 49.5%, paraffin hydrocarbons 43.8%),  $C_8H_{18}$ ,  $C_7H_{16}$ , cyclohexane, methylcyclohexane and *o*-dimethylcyclohexane showed that the aromatic hydrocarbons are very stable under the conditions of the expts., while the naphthene hydrocarbons gave chiefly  $C_2H_4$  under conditions which produced from the higher petroleum hydrocarbons a large proportion of higher olefins. The methods of analysis used in the investigation are discussed at length.

A. PAPINEAU-COUTURE

**Cracking.** A. N. SAKHANOV AND M. D. TILICH'EV. *Neftyanoe Khozyaistvo* 16,

62-6(1929); cf. C. A. 23, 3658.—An Emba gas oil from Konstantinovskii refinery, having a sp. gr. of 0.872,  $E_{20}$  viscosity 2.23, 109° flash, 0.149 acidity ( $\text{SO}_2$ ), 67% of which distd. over below 350°, was cracked at 450° and 40 atm. for 42-64 min. It produced 28.7-32% of gasoline and the cracked residues represented a high-quality fuel oil. After the gas-oil fractions were recycled 4 times the total yield of gasoline increased to 55% by wt., and gas and loss amounted to 15%. A 2nd Emba gas oil of 0.879 sp. gr., with 46% boiling below 350°, when cracked once at 450° at various pressures and for various periods of time, produced 26.2 to 39.0% gasoline. The total yield after four recycling operations was 58% by wt. with 15% of gas and loss. The C formation was insignificant. The cracked gasoline so obtained was practically free from S and required only very light treatment.

A. A. BOEHLINGK

Higher alcohols from petroleum hydrocarbons. I. STANISLAW PILAT and JOZEF WINKLER. *Przemysl Chem.* 13, 185-95(1929).—The optimum temp. for the formation of olefinic gases which can be converted into secondary alcs. on cracking gas oil in the vapor phase lies between 600° and 670°. In this temp. interval a max. yield of 5 1/2% is obtained, figuring on the basis of the gas oil as the starting material. It has been possible to isolate, though not in a quite pure state, isopropyl, secondary butyl and secondary amyl alcs. The temp. which is most favorable for high alc. yields is also the optimum temp. for the yield of gasoline, which is contrary to scientific and patent literature.

Oil-field emulsions. LESTER C. UREN. *Natl. Petroleum News* 21, No. 13, 51-7; No. 16, 59-65; No. 20, 61-8; No. 27, 59-66(1929); cf. C. A. 23, 3800. —The handling of oil-field emulsions is discussed from the standpoint of (1) gravity settling, (2) heat treatment, (3) elec. sepn., (4) chem. treatment, (5) centrifugal sepn. and (6) filtration. The phys. properties of crude-petroleum emulsions, theories advanced to explain them, economic aspects of the problem and practical applications of each method for breaking such emulsions are also discussed.

J. L. ESSEX

Kuban crude oils. M. A. BESTUZHEV. *Neftyanoe Khozyaistvo* 15, 339-42(1928). —Heavy Iiskii crude has a sp. gr. of 0.973, a viscosity  $E_{100}$  of 3.42, and low cold test. It contains 1.8% of asphaltenes and 17.2% of resins (adsorbed by silica gel). It has no gasoline fraction and only 3% of kerosene (up to 270°) of sp. gr. 0.876. The lubricating-oil fractions (distd. *in vacuo*) contained 55.7% of lubricating oils and 43.1% of residues. The residue is of high-quality asphaltic character with a sp. gr. of 1.01, softening point (Kraemer-Sarnow) 39°, elongation at 25° < 100° and a penetration of 50. The lubricating oils are aromatic in character. The fuel oil has about 10% each of spindle and solar oil and 35-40% of machine and cylinder oils. Light Iiskii crude oil has a sp. gr. of 0.890. The bore hole 9/9 produces an oil of sp. gr. 0.862 which contains up to 33 7/8% of gasoline (below 200°); the crude from 3/11 has a sp. gr. of 0.904. These crude oils are low in paraffin wax and their f. p. is below -20°. They are naphthene-base oils.

A. A. BOEHLINGK

Bituminous sands of Alberta. II. Separation. K. A. CLARK and S. M. BLAIR. *Alberta Sci. Ind. Research Council Rept.* No. 18, 36 pp.(1929).—A description of the development of the hot-water extn. methods for sepg. the bitumen from the sand. III. Utilization. K. A. CLARK. *Ibid* 33 pp.—The work was undertaken to find an outlet for the bituminous sands of Alberta. Two main uses were found: (a) direct application of the sands to road building to replace road oils and asphalts; and (b) raw material for gasoline manuf. The bitumen may be extd. from the sand and used for road oil, or it may be emulsified and then used for road building. The bitumen may be cracked by the Dubbs process to yield 45-50% of gasoline, which makes it a good source of motor fuel.

J. L. ESSEX

The availability of the Alberta bituminous sands for production of fuel oil. K. A. CLARK. *Trans. Fuel Conference, World Power Conference, London, 1928* 1, 581-4 (1929).—See C. A. 12, 1537; 17, 948; 18, 891, 1563, 1804, 1964, 2232, 3582; 19, 455, 1839; 21, 42, 2861, 3441.

Some facts about pumps and pumping. H. L. KAUFFMAN. *Refiner and Natural Gasoline Mfr.* 8, No. 7, 71-4(1929).—Types of pumps used in the petroleum industry and factors affecting pump capacity and pump efficiency are discussed.

J. L. ESSEX

**Hydrogenation process to be used first in conversion of heavy fuel oil.** PAUL TRUESDELL. *Natl. Petroleum News* 21, No. 28, 27-9(1929). J. L. ESSEX

**Distillation.** B. E. VLASENKO. *Neftyanoe Khozyaistvo* 16, 212-5(1929).—The efficiency of stills can be increased 25-30% by injecting into the vapor line a certain amt. of  $H_2O$  or of an oil fraction identical in b. p. with the vapors passing through the vapor line. A part of the vapors is condensed and a vacuum is thus created which increases the capacity of the still. The remaining vapors are condensed in the condensers. A. A. BOEHLINGK

**Data from air distillation explained.** G. G. BROWN. *Oil and Gas J.* 28, No. 5, 46, 107, 109, 110, 112(1929).—The continuous air distn. app. devised by Sligh for detg. partial volatility of motor fuels directly, and later used by Bridgeman, does not give results const. at varying rates of feed; that is, the results do not represent true equil. conditions. The vaporizing app. now used by Brown is pictured and its operation described. The attempt to extrapolate to zero rate of feed from the results obtained in the vaporization of some fuels with this app. again led to the absurdity that over a certain range the residue was made to appear to become more volatile as more of it was vaporized. Equil. continuous vaporization curves for pressures of 3-740 mm. were calcd. by the aid of Raoult's law from a careful analysis of the fuel. The calcd. curve for 740-mm. pressure was compared with the curve for values of percentage of fuel vaporized, detd. in a vaporizer known to give nearly equil. distn. within the feed range of 6-15 cc. for natural gasoline. At the 10% point the calcd. curve indicated 9% less vaporized than did the exptl. curve. At the 90% point the calcd. curve indicated about 12% more vaporized. From the known deviations of the percentage distd. from the amts. indicated by Raoult's law, the curves calcd. for all pressures were corrected. It was then possible by a method described to calc. corrected equil. vaporization curves, which were found to agree perfectly at the higher temps., where vaporization was nearly complete, with the air-distn. exptl. curves. The agreement, by all tests applied, between results computed and results by air distn. where conditions were those of equil. is evidence that the results computed closely represent equil. distn. A graphical method is described by which the results of equil. air distn. (a continuous distn.) are correlated, with approx. accuracy, with the curves of the A. S. T. M. distn. (a batch process) for natural-gasoline blends EMMA E. CRANDAL

**Rectification columns and fillers.** S. VISHETRAVSKII. *Azerbeidzyanskoe Neftyanoe Khozyaistvo* 1929, No. 3, 56-66.—A crit. review of various American and Russian rectification columns is given. Comparative runs are described and conclusions drawn. A. A. BOEHLINGK

**Improving the performance of rectifying columns and evaporators.** E. MISHKIN. *Azerbeidzyanskoe Neftyanoe Khozyaistvo* 1929, No. 3, 72-4.—The above equipment can be improved by installing a vertical cylinder in the lower part of the rectifying column, immersed in the condensate. Steam injected at the bottom of the cylinder, which is open at both ends, sets the condensate in circulation and carries off gasoline vapors held by the liquid. In another improvement the condensate discharge pipe is attached at the upper level of the condensate and is bent downwardly in U-shape, insuring const. level. The condensate collected in the bend prevents vapors and gases from escaping from the rectifying column with the condensate. A. A. BOEHLINGK

**Refinery research laboratory tied to practical plant operation.** PAUL TRUESDELL. *Natl. Petroleum News* 21, No. 27, 71-2; No. 28, 73-6(1929). J. L. ESSEX

**Oxidation mechanism of the paraffin hydrocarbons.** GUSTAV EGLOFF, R. E. SCHAAD AND C. D. LOWRY, JR. *Ind. Eng. Chem.* 21, 785-91(1929); cf. *C. A.* 23, 3337.—Neither the hydroxylation nor the peroxide theory is in accord with the facts known about the oxidation of paraffin hydrocarbons. The theory of chain reactions has been applied to hydrocarbon oxidation, and the action of suppressors of engine knock identified with that of antioxidants. There are facts which oppose this view. E., S. and I., develop the idea that antioxidants act as knock-suppressors by receiving and dissipating the energy passing along a reaction chain of hydrocarbon mols. only when temp. and pressure conditions in the engine cylinder raise the energy content of the mols. to a crit. point. It is possible that ozone and oxides of nitrogen are formed in the cylinder and from their unstable character act as knock-inducers by activating chains of hydrocarbon mols. EMMA E. CRANDAL

**Recovery of paraffin wax absorbed by fuller's earth.** L. SELSKIL. *Azerbeidzyanskoe Neftyanoe Khozyaistvo* 1929, No. 3, 84-5.—Fuller's earth contg. paraffin wax from treating was freed from paraffin by extg. 3 times with a naphtha b. 90-130° at a temp. of 70-75°. After heating to redness the earth recovered its original absorption power. The paraffin sepd. was of good com. quality and had a m. p. of 52.5-53°. A yield

of about 70%, calcd. on the waste product, was attained after evapg. the naphtha. A hot-H<sub>2</sub>O extn. of paraffin was a failure. Emulsions formed as the result of the emulsifying action of the fine suspended fuller's earth.

A. A. BOEHTLINGK

Properties required of liquid fuels for use in automobile and aircraft engines, and how the oil industry meets these requirements. WA. OSTWALD. *Trans. Fuel Conference, World Power Conference, London 1928* 1, 585-613(1929).

A. H. E.

Fuels—alternative or supplementary to gasoline—for use in internal-combustion engines for road vehicles. I. Liquid fuels. W. R. ORMANDY. *J. Inst. Fuel* 2, 199-204(1929).—A general discussion, covering cracking, high- and low-temp. carbonization, oil shales, alc., hydrogenation and catalytic processes. II. The future possibilities of gas producers and Diesel engines for transport purposes. A. METRAL. *Ibid* 204-220.—The subject is carefully discussed, with the possibilities of the production of sufficient quantities of fish or vegetable oils for use in Diesel engines.

LESLIE B. BRAGG

Comparison of various light motor fuels. D. N. VIRUBOV. *Izvestiya Teplotekhn. Inst. (Trans. Thermo-Tech. Inst. (Russia))* 1928, No. 6, 20-31.—Expts. with various Russian gasolines in a 4-cylinder gasoline-engine with a Zephyr carburetor led to the following conclusions: The volatility of a fuel is of primary importance. It can be detd. by using Gramenetzki's "carburetion number" (*Ibid* p. 12 ff.). "Dumb-bell" gasolines have the disadvantage of heavy ends which form a C deposit on the cylinder head and the valves; the light fraction constitutes a fire hazard. An analysis of Brown's work on "The relation of motor fuel characteristics to engine performance" (Univ. of Mich., 1927) (cf. C. A. 21, 2555) is found to confirm the results obtained by V.

A. A. BOEHTLINGK

Treatment of refinery absorption gasoline by the hypochlorite method. RALPH E. GOODE. *Refiner and Natural Gasoline Mfr.* 8, No. 7, 77-80(1929).—The hypochlorite process is applied for sweetening gasoline absorbed from refinery tail gases.

J. L. ESSEX

Determining gasoline content of (natural) gas. MARTIN SHEPHERD. *Oil and Gas J.* 28, No. 6, 48, 170, 172, 174, 176, 178(1929).—See following abstr.

E. E. C.

The accurate determination of the gasoline content of natural gas and the analytical separation of natural gases by isothermal fractional distillation. MARTIN SHEPHERD. *Bur. Standards J. Research* 2, 1145-99(1929).—S. describes a method for the accurate detn. of gasoline in natural gas. The detn. involves a special sepn. of the natural gas by fractional distn. at low temps. and pressures. A recombination of the resultant fractions is made in such a way that it is possible to det. the max. amt. of hydrocarbon condensate present in the original gas which possesses any given vapor pressure at any given temp. Special forms of app. are used for sepg. the higher-boiling constituents and detg. their liquid vol. to 0.001 ml. App. and procedures are described in detail, analytical results given, and a direct comparison is made with existing field and lab. methods. The analytical sepn. of natural gases and their com. condensates is also discussed.

A. WHITE

Gasoline-kerosene battery. K. KOSTRIN. *Azerbeidjanskoe Neftyanoe Khozjaistvo* 1929, No. 2, 55-71.—A description of the first pipe-still battery installed in Russia is given. A trial run to det. the upper limit of throughput of oil was made to bring out errors in construction, which are described in detail. A complete description of the unit is given, including operation.

A. A. BOEHTLINGK

Flushing. I. KLINGERMAN AND N. BOGOSLOVSKII. *Azerbeidjanskoe Neftyanoe Khozjaistvo* 1929, No. 2, 70-6.—In a gasoline stripping plant the preheated crude oil is sent through a pipe still into an evaporator placed in the flue and heated by flue gases. The hot oil is sprayed over two bell-shaped baffles in succession in this evaporator. The oil collected on the bottom is heated by a steam coil and the vapors thus produced carry the vapors produced on the baffles to the upper part of the evaporator, filled with Raschig rings. The vapors pass through a tower where they are sprayed with hot naphtha and through a second tower sprayed with cold H<sub>2</sub>O. The uncondensed vapors pass finally through two condensers of the usual type.

A. A. B.

Quality and standardization of motor naphtha. A. POPICH. *Vestnik Standartizatsii* 1928, No. 5, 9-13; *Chem. Zentr.* 1929, I, 333.—The properties of Diesel oils important for their valuation are discussed and the Russian plans for standardizing such oils are criticized.

G. SCHWOCH

Normal benzene. L. GUKHMAN AND N. TELESHEV. *Azerbeidjanskoe Neftyanoe Khozjaistvo* 1929, No. 3, 66-7.—A gasoline from Bibi-Eibat crude oil after being treated with H<sub>2</sub>SO<sub>4</sub> was fractionated through a Gadaskin column and the fraction boiling 65-70°, sp. gr. 0.7006, was used for asphaltene pptn. The amt. of asphaltene pptd. found to be very close to the amt. pptd. by Kahlbaum's normal benzene. This

Russian benzine contains more naphthenes than that of Kahlbaum, 30.5% as against 28.3%. A lower cut was therefore used to obtain the same pptn. of asphaltenes, with satisfactory results.

A. A. BOEHLINGK

**Flash-point determination.** ТУРКЕ. *Erdöl u. Teer* 5, 242-3, 258-60(1929).—The standard methods are critically reviewed, with a preference shown for the closed-cup methods.

F. S. GRANGER

**Mixture proportions and combustion processes in oil motors.** P. MEYER. *Z. Ver. deut. Ing.* 73, 824-6(1929).—Employing the analysis of exhaust gases from motors to det. the efficiency of the air-gas mixt. was satisfactory so long as too rich mixts. were not employed, but not otherwise. This stage comes in ordinary motors when the O<sub>2</sub> content of the exhaust gases falls below 3%, and in Diesel engines much earlier. In ordinary gasoline motors, the exhaust gases from rich mixts. contain CO, H<sub>2</sub>, CH<sub>4</sub>, and some C, increasing in amount with the richness of the mixture; with Diesel engines, in which atomized oil is injected into air, free C is found almost exclusively, and not CO, H<sub>2</sub> or CH<sub>4</sub>. In expts. made with a bomb contg. a hydrocarbon fuel evapg. completely at 70°, mixed with air in the proportion 1:15.23, at a pressure of 1.25 atm. abs., gases formed upon explosion under varying conditions did not check with those obtained when the same mixt. was used in a motor. In the latter case free O<sub>2</sub> and CO may even be present at the same time; this may be due to the nonhomogeneity of the exploding gas mixt. Illustrative curves are given.

W. C. EBAUGH

**Paraffin disease.** V. POPEL. *Azerbeidjanskoe Neftyanoe Khojaisitvo* 1929, No. 2, 86 7.—Symptoms of the paraffin disease are described. The disease is probably due to resins dissolved in the paraffin wax and absorbed by the skin. It can be avoided by cleanliness and by the use of a neutral fat, which must be rubbed in before coming in contact with the paraffin.

A. A. BOEHLINGK

**Occupational intoxication by lead tetraethyl.** F. HEIM DE BALSAC, E. AGASSE-LAFONT AND A. FEIL. *Chimie & industrie Special No.*, 740(Feb., 1929).—A brief discussion of the danger of acute or chronic saturnism attending the use of PbEt<sub>4</sub>.

A. PAPINEAU-COUTURE

**Tetraethyl lead, a new source of saturnism.** G. ICHOK. *Presse méd.* 36, 1127-8 (1928).—The physiol. and toxicological actions are described, and treatment with NaHCO<sub>3</sub> or MgO is recommended. The prophylaxis is discussed.

A. E. MEYER

**Iodine numbers of lubricating oils before and after use in automobile engines.** W. F. SEYER AND J. STANLEY ALLEN. *Ind. Eng. Chem.* 21, 793-4(1929).—The I nos. of 61 samples of oil were detd. before and after use in the crankcase of an engine, under carefully controlled conditions. In 54 of the oils, unsatn. was lower after use than before; whether because the unsatd. hydrocarbons were in part oxidized to gases or to sludge was not detd.

EMMA E. CRANDAL

**A new sulfuric-acid test for insulating and lubricating oils.** C. WALTHER. *Erdöl u. Teer* 5, 223-5(1929).—The Graefe NaOH method is unsatisfactory because emulsions form, and the Baum, Baader and other concd. H<sub>2</sub>SO<sub>4</sub> methods are unsatisfactory, because good as well as detrimental constituents are extd. without distinction. The following qual. method is found practicable: 5 cc. of oil, dild. with 5 cc. of normal benzene, is shaken with 5 cc. of 50% (by vol.) H<sub>2</sub>SO<sub>4</sub>. Injurious substances, due to insufficient re-  
mng, oxidation in use, etc., discolor the acid layer and deposit a middle asphaltic layer. the acid layer becomes nut-brown or turbid, or the middle layer exceeds 1 mm. in thickness, the oil is unfit for use in transformers.

F. S. GRANGER

**Oils for turbines.** MAURICE VAN RYSELBERGE. *Bull. fédération ind. chim.* 7, 44-70(1929).—The characteristics of lubricating oils for steam turbines, their firemen's, manuf., method of use and the value of lab. tests as a means of selecting the most suitable are reviewed. The routine tests do not help in the selection. Other tests have been investigated. A shaft is rotated by a motor until a speed of 1400 is reached; but neither the time required for the shaft to come to rest, nor the time reached by the bearing makes satisfactory discrimination. The steam-emulsifying method of the Inst. Petroleum Technologists is better. It has been modified as follows: 40 cc. of oil and 20 cc. of distd. H<sub>2</sub>O are agitated in a 100-cc. Pyrex cylinder by a motor. The vol. of H<sub>2</sub>O sepd. is recorded after each min. This is done at 20°, 40°, 60°, 80°, and the oil with the best demulsifying property at all temps. is selected as the best for steam-turbine lubrication. Sometimes the rate of sepn. is greater at the 80° than at the 20°. This is attributed to the method and degree of refining.

ALBERT L. HENNE

**K. WOLF.** *Petroleum Z.* 25, 95-8(1929).—Lubricating oils are produced by mixing mineral oils, tar, fatty oils or mixt. of mineral, and fatty oils to a glowing

elec. discharge, a. c. of 5000 v. being employed. The process is carried out at about 80° and in a vacuum of 60–70 mm., Al electrodes being used. B. C. A.

**Making "viscozins" from "lube-oil" bottoms.** P. MONTAG. *Azerbejdzhanskoe Neftyanoe Khozyaistvo* 1929, No. 3, 52–5—A mixt. of sp. gr. 0.9203, flash (Brenken) 152°,  $E_{100}$  viscosity 12.81 ( $E_{100}$  2.27), was obtained from 52% by wt. of Balakhany lubricating-oil bottoms, sp. gr. 0.9352, flash 302° and  $E_{100}$  viscosity 11.43, and 48% of a black gas oil, sp. gr. 0.8908, flash 132° and  $E_{100}$  viscosity 1.73. The mixt. was agitated by air for 1 hr. at 25° with 2.5% of 92.5%  $H_2SO_4$ . Part of the sludge was discharged after 4 hrs., and the remaining oil mixt. was agitated for 3 hrs. more with an additional 6% of  $H_2SO_4$ . The sludge was discharged completely after 14 hrs.' settling, without any difficulties. The oil was blown with air and steam at 302° to drive off the S-contg gases and the lower fractions, the final yield being 68% of the mixt. The remaining fraction, which amounts to 58.2% of the original bottoms, had a sp. gr. of 0.9264, flash 300°, viscosity  $E_{100}$  7.0, excise resins 0.0% and Conradson C 3.2%. Another mixt. of sp. gr. 0.9190, flash 152°,  $E_{100}$  viscosity 14.27 ( $E_{100}$  2.40) was prepd. from 62% by wt. of bottoms, sp. gr. 0.9431, flash 313° and  $E_{100}$  viscosity 8.79 and 38% of black gas oil, sp. gr. 0.8857, flash 128° and  $E_{100}$  viscosity 1.61. The same treatment was applied as above but with the temp. maintained at 38–40°; 63.4% of the mixt. was recovered. The final hot-air and steam treatment was applied for various periods of time, yielding viscozins of much higher quality than usual. Comparisons are given in the table

Viskozoin	Flash	Viscosity $E_{100}$	Conradson carbon	Color
No. 5 ordinary	263°	5.98	3.40%	black
No. 5 new method	263°	5.14	2.41%	greenish
No. 7 ordinary	305°	7.47	4.10%	black
No. 7 new method	305°	7.04	2.74%	greenish
No. 10 ordinary	331°	11.09	6.30%	black
No. 10 new method	326°	10.14	4.98%	olive-green

A. A. BOEHLTLING

**Results of tests of aluminum tanks.** L. G. E. BIGNELL. *Oil and Gas J.* 28, No 7, 38, 174–5(1929).—The ability of Al tanks to resist corrosion by the high-S West Texas crude oils, with their high brine content, is being tested by the Aluminum Co. of America in cooperation with the Parkersburg Rig and Reel Co. Two tanks, one constructed entirely of Al, the other of Al for the deck and upper ring but with steel for the bottom and lower ring, have been used for storing oil on the State-Lassiter lease, Crane Co., Tex., since Apr., 1928. Careful examn. after 1 yr. revealed no corrosion except that due to FeS falling to the bottom from steel bolts used to fasten a pressure gage in place, and from a steel gaging well, which was removed after a few months. The tanks are being continued in service, and will be inspected again in the fall of 1929.

EMMA E. CRANDAL

**Purification of ozocerite by means of various adsorbents.** V. SHACHOVZEV. *Neftyanoe Khozyaistvo* 13, 192–9(1927); *Chem. Zentr.* 1928, I, 1480–1.—A series of adsorbents were tested for their ability to decolorize a 2.5% soln. of ozocerite in  $C_6H_6$ . The powder obtained from  $K_4Fe(CN)_6$  and animal waste, when washed with  $H_2O$  and HCl, tested highest.

FRANCIS P. GRIFFITHS

**Varieties of Brazilian wood for the carbonization industry.** FRED. W. FREISE. *Arch. Wärmewirt.* 10, 233–5(1929).—The d., heating value, compressive strength, yield of charcoal, compn. and strength of charcoal, and rate of growth are given for 35 Brazilian woods, identified by their local names. In general, the yield is greater, and the porosity and combustibility are less, than for European charcoals. The exothermic reaction is stronger; hence small retorts have been found more suitable, to avoid overheating.

ERNEST W. THIBLE

**Composition of turpentine from *Pinus silvestris*.** V. KRESTINSKIĬ AND F. SOLODKIĬ. *Zhur. Prikladnoi Khim.* 2, 337–57(1929).—Russian turpentine can be divided into 3 groups: (1) steam-distd. from pitch of leaving trees and characterized by large amts. of pinene present, which makes them valuable raw products for chem. industry, (2) steam-distd. or extd. by solvents, such as  $C_6H_6$ , from wood chips and characterized by the presence of rather large amts. of carene and of alcs. of terpene series, but somewhat deficient in pinene, and (3) fire-distd. and then redistd. with steam. These turpentine are of variable compn. and of poor quality. They are the most common products and are known in Germany as *Kienöl*. Turpentine used in the exptl. work were obtained by distg. wood chips in presence and absence of alkalis. They were sepd. by fractional distn. into 20 fractions and their phys. consts. detd. Turpentine distd. in presence of alkalis contained 43%  $\alpha$ -pinene, 38.5%  $\Delta^3$ -carene, 6.5% ter-

pinolene, 7% alcs. ( $C_{10}H_{17}OH$ ) of unknown structure, 3.5% sesquiterpenes (probably cadinene) and 1.5% residue. Turpentine distd. in absence of alkalies contained 42.5%  $\alpha$ -pinene, 32.5%  $\Delta^2$ -carene, 4% terpinolene, 14% alcs., 3% sesquiterpenes and 4% residue.

V. KALICHEVSKY

**The composition of American spirit of turpentine.** G. DUPONT AND MISS M. BARBAUD. *Bull. inst. pin.* 1929, 155-6.—Analysis of a sample of commercial American spirit of turpentine gave: pinene 61.4, nopinene 33.5, tails 5.1%. Analysis of a sample of spirit of turpentine obtained from slash pine gave:  $\alpha$ -pinene 75.6, nopinene 21.2, tails 3.2%. Analysis of a sample of spirit of turpentine from longleaf pine gave:  $\alpha$ -pinene 64.3,  $\beta$ -pinene 31.8, tails 4.6%.

A. PAPINEAU-COUTURE

**Report on the operation of and work carried out at the Institut du Pin, Bordeaux.** G. DUPONT. *Bull. inst. pin.* 1929, 149-54.—An outline of the organization of the Institut du Pin, with a summary of the work carried out during 1928.

A. P.-C.

Transformations of fatty acids in the course of geologic periods (STADNIKOV, WEIZMANN) 8. Industrial process for obtaining liquid hydrocarbons by simultaneous cracking and hydrogenation (FOHLEN) 21. Plastometric studies of the formation of boundary layers (DE WAELE, LEWIS) 2. Soap production [Manufacture of lubricant and greases] (U. S. pat. 1,722,687) 27. Hydrocarbon conversion (Brit. pat. 303,761) 21. Apparatus for centrifugal purification of oils (U. S. pat. 1,723,329) 1. Apparatus for vacuum distillation of oils (Brit. pat. 303,078) 1. Carboxylic acids produced by oxidation of petroleum hydrocarbons (Brit. pat. 303,560) 29.

AMDURSKY, S. S.: **Handbook of the Petroleum Industry.** Rochester, N. Y.: Taylor Instrument Co. 192 pp. \$5 postpaid. Reviewed in *Instruments* 2, No. 7, p. 21 of advertising section (1929).

PENNIMAN, WILLIAM B. L.: **Lubrication.** New York: The Texas Co. 15 pp.

SKINNER, WALTER E.: **Oil and Petroleum Year Book, 1929.** London: Walter E. Skinner. 308 pp. 8s. 6d. Reviewed in *Mining and Met.* 10, No. 272, p. 18 of advertising section (1929).

**Apparatus for treating emulsified petroleum oils.** GUSTAV EGLOFF (to Universal Oil Products Co.). U. S. 1,722,041, July 23. A still with vertically spaced parallel sections is provided with independently controllable horizontal burners exterior to the still so that heat may be applied to the surface of the oil continuously as the body of the oil in the still decreases and the surface lowers.

**Cracking petroleum oils.** GUSTAV EGLOFF (to Universal Oil Products Co.). U. S. 1,722,042, July 23. Oil is heated to a cracking temp. under pressure as it flows through a pipe coil or the like and thence passes to an enlarged vaporizing chamber in which a somewhat lower super-atm. pressure is maintained. Vapors from the oil are caused to pass through a relatively thin layer of catalytic material such as  $ZnCl_2$  or other suitable metal oxide or chloride supported in the vapor space of the chamber and the pressure distillate is collected. Various details of the app. used are described. U. S. 1,722,043 specifies subjecting a bulk supply of oil to cracking conditions of temp. and pressure, continuously withdrawing portions of unvaporized oil from the bulk supply and dilg. with an oil of lighter gravity, passing the mixed oils through a bed of filtering material such as fuller's earth or bone black and injecting the cleansed oil into the lower portion of the bulk supply of oil being cracked. An app. is described. Cf. *C. A.* 23, 3804.

**Apparatus for distilling petroleum.** FOSTER WHEELER, LTD. Fr. 657,873-4-5, July 20, 1928.

**Heat-exchange apparatus suitable for use in petroleum refining, etc.** JOHN A. POTTER (to Foster Wheeler, Ltd.). U. S. 1,722,109, July 23. Structural features.

**Cracking hydrocarbons.** THOMAS MIDGLEY, JR. (to General Motors Corp.). U. S. 1,721,623, July 23. Cracking is effected by use of a catalyst of the Se type carried on a metal base such as Fe, Ni, Co or Pb. An app. is described. Te and pumice, etc., also may be used.

**Use of alkali metal cyanides and formates to promote cracking of hydrocarbons.** JOHN C. CLANCY. U. S. 1,721,728, July 23.

**Esterified products, etc., from cracked hydrocarbons.** AUGUST P. BJERREGAARD (to Doherty Research Co.). U. S. 1,723,008, Aug. 6. Hydrocarbon material is cracked in vapor phase at substantially atm. pressure, benzene is condensed from the vapors and olefins formed in the gases are esterified. An app. is described.

**Continuous rectification of hydrocarbons.** EMILÉ A. BARBET. U. S. 1,722,322,

July 30. The material to be rectified, that is, hydrocarbons and other liquids of high b. p., is subjected to the indirect action of satd. steam to vaporize a portion of its constituents, residual liquid is subjected to the indirect action of superheated steam to effect further vaporization and vapors from both treatments are brought into intimate contact in a single rectifying column with a reflux of condensates arising from the vapors, and the condensed material is withdrawn as a plurality of sharply defined fractions within different temp. ranges.

**Hydrocarbon oils from products of carbonaceous materials.** I. G. FARBENIND, A.-G. Brit. 302,941, June 20, 1927. Hydrocarbon oils are removed from mixts. of solids and liquids resulting from low-temp. carbonization, destructive hydrogenation, cracking, extn. and other industrial processes of heat treatment of carbonaceous materials, by intimate mixt. with an aq. liquid to which a wetting or emulsifying agent is preferably added. The material is then centrifuged, or treated with elec. or magnetic fields or with emulsion-resolving electrolytes to recover the oil from the aq. mixt. Numerous details and examples are given.

**Cracking hydrocarbon oils.** EUGENE C. HERTHEL (to Sinclair Refining Co.). U. S. 1,721,779, July 23. In a system in which oil is circulated through a heating zone where it is heated to a cracking temp. and thence to a vaporizing zone where vapors of the cracked oil are taken off under super-atm. pressure, vapors from an initial charge of oil are taken off from the vaporizing zone while a higher b. p. oil is circulated and recirculated through the heating zone from and to the vaporizing zone and a raw oil is supplied to the oil circulating through the heating zone until a substantial quantity of cracked oil has been taken off, and then, before the oil circulating through the heating zone becomes satd. with pitch, recirculation of unvaporized oil from the vaporizing zone to the heating zone is stopped while continuing to take off vapors and to circulate raw oil through the heating zone until a further substantial quantity of cracked oil has been taken off. U. S. 1,721,780 relates to app. suitable for use in processes of this character. Cf. C. A. 23, 3569.

**Cracking hydrocarbon oils.** E. C. HERTHEL (to Sinclair Refining Co.) Brit. 303,879, Jan. 12, 1928. Oil is circulated under pressure through a system of heating pipes or the like and a vaporizing drum from which the vapors pass to a dephlegmating tower and thence to a condenser and separator, and the circulation is continued until the concn. of pitch nearly reaches satn. The original circulation is then stopped and fresh oil is supplied while removing pitch-laden oil. An app. is described.

**Cracking hydrocarbon oils.** EDWARD W. ISOM (to Sinclair Refining Co.). U. S. 1,722,147, July 23. A stream of oil is passed once through a heating conduit such as a pipe coil where it is heated to cracking temp. and the hot products are thence discharged directly into a body of oil maintained in a reservoir at cracking temp.; vapors taken off from the reservoir are subjected to a first and second refluxing and fresh relatively refractory oil is passed in indirect heat-exchange relation with the vapors in the first refluxing operation and the oil thus preheated is fed to the reservoir; more refractory oil is similarly used in heat-exchange relation with the vapors in the second refluxing operation and this oil together with reflux condensate from both refluxing stages is forced through the heating conduit. Various details of the app. are described.

**Cracking hydrocarbon oils.** EDWARD W. ISOM (to Sinclair Refining Co.). U. S. 1,722,222, July 23. A stream of oil is passed once through a conduit in which it is heated to cracking temp. and discharged into oil in a reservoir also at cracking temp. An addnl. supply of fresh oil is passed through a reflux condenser in indirect heat exchange relation with vapors generated in the cracking operation to preheat the fresh oil and condense the heavy insufficiently cracked vapors and the fresh oil thus preheated is introduced directly into the body of oil in the reservoir. Uncondensed vapors from the first refluxing are subjected to a second refluxing in direct contact with fresh oil, and the condensate from both refluxing operations together with unvaporized fresh oil from the second refluxing is led to the heating conduit. Unvaporized residual oil is withdrawn from the reservoir. An app. is described. U. S. 1,722,223 specifies maintaining a body of oil at a cracking temp. by circulating oil from the body through heating tubes and back and heating the oil to a cracking temp. in the heating tubes, taking off and refluxing vapors from the oil body, forcing reflux condensate once through a sep. heating conduit in which it is heated to cracking temp., and discharging hot oil products from the heating conduit into the oil circulating from the specified body of oil to the heating tubes. An arrangement of app. is described.

**Refining hydrocarbon oils.** K. Cox and P. J. McDERMOTT. Brit. 303,991, Dec. 8, 1927. Benzene, "petrol," etc., purified by  $\text{Fe}_2(\text{SO}_4)_3$ , are treated with alkali prior to distn. (instead of after distn. as described in Brit. 269,242 (C. A. 22, 1470)).

**Distilling hydrocarbon oils.** WM. W. HOLLAND (to Standard Oil Co. of Ind.). U. S. 1,723,698, Aug. 6. Vapors rising from a distg. body of oil are subjected to partial fractionation and the partially fractionated vapors are passed in indirect heat conductive contact with a current of steam at a temp. of 105–115° further to heat the steam and partially condense the vapors; condensate thus formed is returned to the still in countercurrent to vapors from it, and the heated steam is passed into direct contact with a distg. body of oil. An app. is described.

**Increasing the viscosity of hydrocarbon oils for use in electrical insulation.** CABLON, LTD., and DUSSEK BROS. & Co., LTD. Brit. 303,852, Jan. 11, 1928. A synthetic resin such as coumarone resin is dissolved in the oils, for impregnating paper insulation of cables, etc.

**Cracking oils.** ROBERT T. POLLOCK (to Universal Oil Products Co.). U. S. 1,721,973, July 23. A stream of oil is passed through an enlarged chamber and discharged into a second chamber and the course of oil through the chambers is alternately reversed. Oil is heated when passing through the first chamber by consuming C formed in the chamber during conversion of the oil and is similarly heated in the second chamber. An app. is described.

**Cracking oils.** BLÜMNER CRACK-ANLAGEN A.-G. Fr. 657,949, July 21, 1928. In cracking oils they are given a whirling movement in the heating tubes. Constructional features of the app. are described.

**Drilling oil wells.** ANGLO-PERSIAN OIL Co., LTD. Brit. 303,937, Oct. 22, 1927. A viscous fluid which may comprise water 85 gal., clay 1000 lb. and yellow soap 224 lb. is used for preventing loss of oil or gas in withdrawal of tools from wells. Various details of app. are described.

**Apparatus for "tempering" oil-bearing materials preliminary to oil expression.** FRANK B. ANDERSON (to V. D. Anderson Co.). U. S. 1,723,118, Aug. 6. Structural features.

**Pressure method of working oil sands.** LEO RANNEY (to Standard Oil Development Co.). U. S. 1,722,679, July 30. An oil-expulsive agent such as natural gas is forced into the stratum near an outside surface only, and oil is withdrawn from points only opposite such surface, so that the expulsive agent travels transversely of the stratum. An installation of app. is described.

**Vertical retort for producing liquid hydrocarbons from oil shale.** AUGUST SCHILLING, RICHARD SACHSE, DIMITRI LIAMIN and THEOFIEL CALLAERT. U. S. 1,721,836, July 23. Structural features.

**Increasing the viscosity of mineral oils.** I. G. FARHENIND. A.-G. Brit. 303,776, Sept. 8, 1927. Viscosity is increased by subjecting the oil in liquid phase to high tension elec. treatment with a cs. of a frequency above 500 cycles per sec. but less than 10,000 cycles. Ionizable substances such as alcs., phenols, etc., are preferably excluded. An example is given of a treatment in high vacuum lasting 30 hrs. and applied to a middle fraction of a cracked brown coal-tar oil.

**Catalytic oxidation of mineral oils, etc.** I. G. FARHENIND. A.-G. Brit. 303,268, Dec. 21, 1927. Treatment of mineral oils, residual products sep'd. from oxidized aliphatic hydrocarbons or paraffin with a gaseous oxidizing agent such as air is effected in the presence of a catalyst comprising a comp'd. of a metal with an enolizable org. comp'd., with or without a metal oxide, such as basic Mn acetylacetonate or similar derivs. of Ce, Ni, Co or Zn.

**Dibasic acids and their salts from products of mineral oil oxidation.** JOSEPH H. JAMES. U. S. 1,721,958, July 23. Soaps substantially free from objectionable aldehydic odor are formed from oxygenated acids derived from mineral oil by further oxidation, to form dibasic acids which react with alkalies to form the soaps. Cl may be used as an oxidizing agent and various details and alternative procedures are described. U. S. 1,721,959 relates to the formation of dibasic acids by a further oxidation treatment applied to a mixt. contg. various alcs., aldehydes and oxygenated acids derived by the vapor-phase catalytic oxidation of petroleum oils or similar hydrocarbon materials. Numerous details and examples are given.

**Gasoline from mineral oil.** ARTHUR E. PEW, JR., and HENRY THOMAS (to Sun Oil Co.). U. S. 1,723,368, Aug. 6. A flowing stream of oil such as crude oil is heated to a temp. above the vaporizing temp. of relatively light constituents so that the oil is partly vaporized and the vapors are fractionated in a space heated by oil flowing into it; vapors are removed and residual oil from the fractionating space is passed into a second space or fractionating app. where it is heated by flowing over an extended surface in a thin layer and collected in a pool while the latter is simultaneously heated as is also the thin flowing layer of oil; hot vapors pass in contact with the flowing

thin layer of the oil, and thence pass to a third fractionating app. An arrangement of app. is described. Cf. C. A. 22, 162.

**"Motor spirit."** J. G. DAVIDSON (to Carbide and Carbon Chemicals Corp.) Brit. 303,505, Jan. 6, 1928. Gasoline, kerosene or like fuel is admixed with (suitably 30%) monoethyl benzene or other alkyl benzene in which the alkyl group or groups each have at least 2 C atoms, *e. g.*, propyl, iso-Pr, Bu or mixed derivs., and other "antidetontants" also may be added. The production of the alkylbenzenes may involve treating benzene or an alkylbenzene material with olefins in the presence of  $AlCl_3$ ,  $FeCl_3$  or a similar catalyst, preferably in countercurrent with vigorous agitation and near the b. p. and suitably under pressure.

**Recovering terpene products from gasoline-terpene mixtures.** EBENEZER E. REID (to Hercules Powder Co.). U. S. 1,722,765, July 30. A mixt. such as gasoline used for extg. rosin from chips is treated with liquid  $SO_2$  to dissolve out terpene products.

**Blended "antiknock" motor fuels produced by destructive hydrogenation.** I. G. FARBENIND. A.-G. Brit. 303,894, Jan. 13, 1928. A benzine such as one obtained from brown coal rich in bitumen, and which knocks at too low a compression ratio, is mixed with another benzine, such as one produced from pit coal, to produce an "antiknock" blend. Various details of destructive hydrogenations and blending are given, and it is stated that an antiknock fuel may be obtained directly from brown coal at 500° and 200 atm. in the presence of Al hydrosilicate.

**Automatic water-discharge device for oil tanks.** JOHN H. SMITH. U. S. 1,722,160, July 23. An elec. device serves to operate the discharge valve.

**Removing sediment from oil tanks of ships.** STEPHEN GUARDINO. U. S. 1,722,211, July 23. The deposits are treated *in situ* with a solvent such as kerosene and are heated, these materials are further heated and agitated with water and live steam and the resultant mixt. is removed. An app. is described.

**Dewaxing oils.** LESLIE W. NAYLOR (to Continental Oil Co.). U. S. 1,722,307, July 30. In treating a "long cut residuum" for the sepn. of wax and oil, it is treated with sufficient of a diluent such as naphtha capable of rendering the wax content completely sol. at a low temp., and the wax is pptd. from the sustaining solvent by the action of particles of  $PbO$ .

**Apparatus for sweating paraffin.** D. ARMSTRONG and G. C. G. DOBBIE (to Steel Bros. & Co., Ltd.). Brit. 303,812, July 8, 1927.

**Sweetening paraffin.** E. CANALS. Brit. 302,954, Sept. 21, 1927. Paraffin oil or partly solidified paraffin is sweetened by the addn. of a sweetening agent such as saccharin dissolved in olive oil.

**Effecting combustion of heavy oils in burners.** W. OSTHOFF. Brit. 303,300, March 10, 1928. The oil is first heated to a temp. (which may be 350–450°) not much above its b. p., to effect vaporization, and the vapor is then cooled (suitably to about 50°) by adding air so that an oil mist in air is formed and this is impinged on an incandescent material in the combustion chamber. An app. is described.

**Lampblack from liquid carbonaceous material.** J. L. MAJOR. Brit. 303,632, Dec. 6, 1927. The liquid material used is fed onto a series of trays (in an app. which is described) within a combustion chamber and cascades from tray to tray. Air is admitted through apertures having control plates. Various structural details are described.

**Lubricating oil from petroleum oils.** JOHN B. TERRY and RALPH A. HALLORAN (to Standard Oil Co. of Calif.). U. S. 1,721,719, July 23. Petroleum oil is distd. to asphalt under such reduced pressure as to avoid decompn., and approx. half the asphaltic residue is then destructively distd. to form a brittle residue of non-sticky pitchy character; lubricating oil constituents are then extd. from the pitch with petroleum naphtha.

**Use of magnets to remove magnetic particles from lubricating oils in engine crank cases, etc.** F. R. SIMMS and B. C. JOY. Brit. 303,076, Aug. 25, 1927. An app. is described.

**Insulating oils.** I. G. FARBENIND. A.-G. Fr. 657,804, July 13, 1928. Insulating oils are composed of polyalkyl naphthalenes or their derivs. having a sp. gr. below 1, preferably having a side chain contg. at least 2 C atoms.

**Oil filter.** KENNETH E. FIFE. U. S. 1,723,274, Aug. 6. Structural features.

**Filter for lubricating oil.** ALEXANDER H. ROEHR. U. S. 1,723,374, Aug. 6. Structural features.

**Magazine filter for lubricating oils or other liquids.** FRED W. MANNING and HORACE L. HIRSCHLER (to Stewart-Warner Corp.). U. S. 1,722,808, July 30. Structural features.

**Magazine filter and still suitable for lubricating oil of automobile engines.** FRED

W. MANNING (to Stewart-Warner Corp.). U. S. 1,722,809, July 30. Structural features.

Treated fabric magazine filter for engine lubricating oils. FRED W. MANNING (to Stewart-Warner Corp.). U. S. 1,723,741, Aug. 6. A filter fabric is used which may be treated with cotton fiber, paper pulp, asbestos, kieselguhr, C, fuller's earth or the like.

Oil filter suitable for use on automobile engines. JOHN T. McCUTCHEON. U. S. 1,723,945, Aug. 6. Structural features.

Oil filter suitable for use on automobiles. CHARLES W. MCKINLEY (to A C Spark Plug Co.). U. S. 1,723,054, Aug. 6. Structural features.

Apparatus for purifying the lubricating oil of an internal-combustion engine by heating and rectification. CHARLES E. FELCH-BLAKE. U. S. 1,723,023, Aug. 6. Structural features.

Bag filter suitable for filtering engine oil. CHARLES W. MCKINLEY (to A C Spark Plug Co.). U. S. 1,723,053, Aug. 6. Structural features.

Waterproof coatings. McRAE PAINT PRODUCTS, INC. Fr. 658,095, July 26, 1928. A waterproof coating is made by submitting a mineral asphalt, particularly of the type called "Trinité," to a high temp. (320°) until the light oils are vaporized, then adding a cold petroleum distillate to cool the residue quickly and dissolve it. The residue obtained by heating gilsonite is added and more petroleum distillate until the particles are dissolved. A pigment may be added.

Apparatus for making emulsions such as those of clay and bituminous materials. LESTER KIRSCHBRAUN. U. S. 1,722,433, July 30. Structural features.

Sulfonic acids serving as wetting and emulsifying agents. I. G. FARBERIND. A.-G. Brit. 303,281, Jan. 13, 1928. Various oxidation products of paraffin hydrocarbons are sulfonated.

Wood distillation. MAURICE VITRAC, PAUL MALSALLEZ, ANTOINE J. LABROUCHE and FRANÇOIS BAYLOCC. Fr. 657,685, Dec. 1, 1927. The vapors from wood distn. are condensed and absorbed by passing them through absorbent, spongy or finely divided material. The tars may be first removed by passing the vapors through the heavy products of the distn.

## 23—CELLULOSE AND PAPER

CARLETON E. CURRAN

The adsorptive power of cellulose. STEPHEN R. H. EDGE. *J. Soc. Chem. Ind.* **48**, 118 21T(1929).—The adsorption of acid, alkali and alum by different types of cellulose pulp was studied. Cellulose readily exchanges adsorbed metals or salts for one another when the soln. with which it is in contact changes. Ordinary pulps placed in an acid soln. cause a decrease in the acidity of the soln., and acid-boiled pulps placed in alk. soln. cause a decrease in the alky. The decrease in the acidity is in general nearly equal to the loss of alky. of the ash. In the disappearance of alky. from soln. there is no increase in alky. of the ash, and therefore the alkali is not adsorbed as such. E. postulates that some volatile org. acid in the cellulose is responsible for this effect. Rag pulp (I) contains no appreciable amount of this acid; sulfate pulp (II) contains a small amount thereof; and sulfite pulp (III) contains a considerable amount. Also, after acid treatment, I is readily washed neutral, while II and III remain persistently acid. This indicates that II and III contain org. acidic material normally masked by the alky. of the excess of ash-producing material present. Alum soln. will dissolve out about as much of the alk. ash-producing materials as does  $H_2SO_4$ , with a resulting increase in the ash due to alum adsorbed in exchange.

Properties, analyses and practical tests of cellulose acetates. MAURICE DESCHIEENS. *Chimie & industrie* **21**, 1131-40(1929).

A. PAPINEAU-COUTURE. K. WERNER and H. ENGELMAN. *Z. angew. Chem.* **42**, 438-44(1929).—The properties of cellulose acetate solns., films and threads depend greatly on the acetyl content of the material. Soly. relations with org. liquids are considered in the light of the Hildebrand polar-non-polar theory of the soln. and emphasis is placed on the distribution of acetyl and free hydroxyl groups on the surface of the micelle. The viscosity of cellulose acetate solns. is thought to be detd. by the degree of aggregation of primary particles, which are associated to different degrees in different solvents. To support this view, instances are cited where the viscosity of samples of acetates differed by 50% in  $Me_2CO$  while the viscosity in formic acid did not

change. The sorption of water by cellulose acetate films increases linearly as the acetyl content decreases. The sorption of EtOH reaches a max. at about 50% AcOH content. The film strength was found to be directly proportional to the formic acid viscosity of the dope; and the difference between the wet and dry strength of the film was found to decrease as the AcOH content of the film increased.

**Saponification of cellulose acetates.** D. KRÜGER. *Melliand's Textilber.* 10, 208-11 (1929).—Lab. preps. of cellulose triacetate made from purified Egyptian cotton and from wood pulp showed substantially the same rate of sapon. by *N* NaOH in MeOH as did some com. cellulose acetates contg. over 62% AcOH, manufd. from cotton and from pulp. Apparently chem. compn. is more important in this respect than fine structure. Values of *k* calcd. according to the monomol. reaction equation were not const. A previous swelling of cellulose acetate in 96% EtOH greatly accelerates the sapon. rate.

E. R. CLARK

**Nitrocellulose and its importance in the lacquer and cellulose acetate industry.** H. STADLINGER. *Chem.-Ztg.* 53, 377-8 (1929).—A brief account is given of the general methods of prep. cellulose nitrates of low viscosity.

J. G. McNALLY

**Viscosity of viscose.** I. Type of viscosity change during ripening. G. KITA, S. IWASAKI, S. MASUDA and K. MATSUYAMA. *Kolloid.-Z.* 48, 270-6 (1929).—The viscosity at 30° (a) by the falling-sphere method on 6% viscose soln. and (b) with the Ostwald viscometer on the dil. 2% soln. and the "thread forming" power at 45° of viscose were measured on 10 varieties of cellulose materials. The change of viscosity during ripening as detd. by method (a) agrees with results of Heuser (cf. *C. A.* 20, 2077), drops to min. during the first few days followed by gradual rise; the rate varies with the variety of cellulose and the temp. With method (b) those of high viscosity follow the type observed in (a); those of low viscosity follow the type previously reported by Ostwald, no min. The viscosity of the viscose and the properties of the threads formed from it are closely related to the  $\alpha$ -cellulose content, copper no. and viscosity in cuprammonium soln. The change in viscosity is probably due to 2 opposing effects, a dispersing action and a structure formation. The first is completed during the initial period. This action may explain the variance of the change in viscosity as detd. by the two methods.

E. R. S

**Technical improvements in the Italian rayon industry.** ALBERT SANDER. *Kunstseide* 11, 112-4 (1929).—In the viscose process the coagulating bath decreases and the fixing bath increases in vol., density and acid content. The regeneration of the coagulating bath is very important. The author discusses the foregoing changes and gives two methods of regeneration. In the first method the excess fixing bath (I) is concd., then, after sepn. of  $\text{Na}_2\text{SO}_4$ , added to the coagulating bath (II). In the second method, the Glauber salt is allowed to crystallize out from a portion of I, while another portion of I is mixed with some of the sepd. crystals and then concd., the concd. soln. being added to II. A plant using the latter method is described.

FREDERICK C. HAHN

**Water power in relation to the paper-making industry of Canada.** BRYSNOR CUNNINGHAM. *Water & Water Eng.* 31, 321-4 (1929).

E H

**Lignin.** I. Chemical and physical investigation of phenol-lignins (WEDEKIND, KATZ) 10. Chemistry of lignin. III. Destructive distillation of lignin from corn cobs (PHILLIPS) 10. Carboxylic acids suitable for use as softening agents in nitrocellulose coating compositions (Brit. pat. 303,560) 29. Coating compositions for making "artificial leather" (Brit. pat. 303,566) 29. Rotary permeable drum apparatus for drying, carbonizing or oxidizing paper (Brit. pat. 303,572) 25.

**The Story of Rayon.** New York: The Viscose Co. 63 pp. 2nd ed.

**Cellulose.** JOAQUIN DE LA ROZA (SENIOR). Fr. 657,770, July 18, 1928. Cellulose is obtained by treating vegetable substances with a dil. soln. of  $\text{H}_2\text{SO}_4$ , storing for some time, washing with water and treating with an alk. soln. under pressure above 100°.

**Cellulose esters.** HEINRICH HEIMANN and ALFONS BAYERL (to I. G. Farbenind. A.-G.). U. S. 1,722,914, July 30. Cellulose (which may be in the form of cotton) is treated with formic acid of about 85% strength, in order to obtain an intermediate product suitable for acetylation, etc.

**Cellulose esters.** I. G. FARBENIND. A.-G. Brit. 303,006, Dec. 24, 1927. Cellulose is first treated with the vapor of  $\text{HNO}_3$  under conditions which preserve the fibrous condition of the material and nitrates or nitroacetates are then produced by further nitration or acetylation of the pretreated material. Various details are given.

**Cellulose esters.** VEREIN FÜR CHEMISCHE INDUSTRIE A.-G. Brit. 303,485, Jan. 5, 1928. Cellulose acetates or other esters are formed in a revolving drum app. having acid-resisting walls and carrying, on its interior, bars or like devices which exert a cutting action on the central portion of the reaction mass.

**Cellulose ester filaments, etc.** HARRY P. BASSETT. U. S. 1,722,171, July 23. Filaments such as those formed of various artificial silk wastes are subjected to the action of a 1% aq. soln. of NaOAc, Na<sub>2</sub>SO<sub>4</sub>, Na sulfide or a similar compd., in order to render them more suitable for use. Soap and NaOH also may be used to produce a crinkled product.

**Molding compositions containing cellulose esters.** C. DREYFUS (to British Celanese, Ltd.). Brit. 303,516, Jan. 6, 1928. Thermoplastic powders consisting of an intimate mixt. of a finely divided cellulose ester or ether with plastifiers and with or without fillers, etc., as described in Brit. 282,723, (C. A. 22, 3988), are molded under heat and pressure (suitably at 50–80° and 300–500 lb. per sq. in.). The product may be variably colored, and may be rendered incombustible by incorporating in the powder org. or inorg. halogen compds. such as NH<sub>4</sub>Br or org. or inorg. phosphates such a triphenyl- or NH<sub>4</sub> phosphate.

**Cellulose derivatives formed with halohydrins of polyalcohols.** LEON LILIENFELD. U. S. 1,722,927, July 30. Products sol. in aq. caustic alkalies, but insol. in water and which are suitable for making films, artificial threads, etc., are prepd. by the action on cellulose (suitably in the form of sulfite cellulose or linters) of  $\alpha$ -monochlorohydrin or other suitable halohydrin of a polyalcohol in the presence of a caustic alkali soln. of less than 50% strength (suitably about 18% strength).

**Esterifying cellulose with formic and acetic acids.** MAURICE CUSIN and PIERRE A. CHEVALET (Cusin to Soc. lyonnaise de soie artificielle). U. S. 1,722,202, July 23. Cellulose such as cotton or wood pulp is treated with a mixt. of formic acid and H<sub>2</sub>SO<sub>4</sub>, and then with a mixt. of HOAc and H<sub>2</sub>SO<sub>4</sub>. The product is a mixed ester suitable for various uses.

**Rotating chambers for acetylation of cellulose.** H. L. BARTHELEMY (to Ruth-Aldo Co.). Brit. 303,099, Dec. 28, 1927. Structural features.

**Cellulose acetate.** WOLFGANG GRUBER (to Alexander Wacker Ges. für Electrochemische Industrie). U.S. 1,723,614, Aug. 6. Acetone-sol cellulose acetate of high viscosity is prepd. by treating acetone-insol. cellulose acetate in soln. with an acid chloride of Zn, Cu or Hg. Cf. C. A. 23, 1267.

**Cellulose acetates, etc.** H. L. BARTHELEMY (to Ruth-Aldo Co.). Brit. 303,098, Dec. 28, 1927. Saponification of primary cellulose acetates or other esters is effected with use of HCl and HF. Aq. HOAc or formic acid may be added to the primary acetylation soln. sufficient to decompose remaining Ac<sub>2</sub>O without producing flocculation, followed by adding to the cooled soln. a further quantity of aq. HOAc or formic acid contg. also such a quantity of HCl and HF that the no. of H ions thus introduced will be equal to or greater than the H ions of the H<sub>2</sub>SO<sub>4</sub> used as catalyst (the quantity of water added being proportioned to equal 5–15% of the org. acids present). Cf. C. A. 22, 3989.

**Cellulose acetates.** H. L. BARTHELEMY (to Ruth-Aldo Co.). Brit. 303,134, Dec. 29, 1927. Cellulose to be acetylated is preliminarily treated with HOAc vapors and a small quantity of a halogen or a halogen halogenide at a temp. not exceeding 65° (preferably 20–40°) and is given a supplementary bleaching. It is thus rendered more reactive to acetylating agents and the presence of residual halogen reduces the quantity of H<sub>2</sub>SO<sub>4</sub> required for the acetylating bath. Brit. 303,135 specifies esterification of cellulose in a succession of acetylating baths, those of the earlier stages of which contain a restricted quantity of anhydride under conditions such that only a small rise in temp. occurs; the reaction in each stage is allowed to proceed until equil. is reached. Various details are given. Brit. 303,136 specifies production of esters such as cellulose acetates or formates by esterifying cellulose in the presence of HF, in aq. or preferably glacial HOAc soln., as a catalyst. Brit. 303,137 relates to an app. for making filaments from solns. of cellulose derivs.

**Cellulose acetate and mixed esters.** C. RUZICKA. Brit. 303,432, Oct. 3, 1927. Cl is passed into a mixt. of glacial HOAc and trichloroacetic acid and the chlorinated acid is used to treat cotton or wood cellulose until it is partially chlorinated and hydrated; HOAc and ZnCl<sub>2</sub> are then added with a solvent such as a further addn. of glacial HOAc. Other acids or mixts. of acids such as HOAc, propionic, butyric or valeric anhydride, etc., may be chlorinated in the presence of trichloroacetic acid and the product used for reaction on cellulose.

**Cellulose acetates and other esters.** E. ORIOLI (to Ruth-Aldo Co.). Brit. 303,491, Jan. 6, 1928. See Can. 286,539 (C. A. 23, 1504). Brit. 303,493 specifies the prepn. of

cellulose sulfates by treating cellulose with  $H_2SO_4$  in the presence of an aliphatic anhydride such as  $Ac_2O$  under such conditions that no appreciable amt. of org. cellulose ester is formed, or at least such that the cellulose sulfate predominates in the product. Various details are given.

**Films, lacquers, plastic compositions, etc., containing nitrocellulose.** I. G. FARBENIND. A.-G. Brit. 302,961, Sept. 22, 1927. Plasticizing agents are used comprising phthalic acid esters in which one COOH group is esterized with the radical of an aromatic or hydroaromatic alc., while the other COOH group is esterized with the radical of an aliphatic or aromatic alc. Examples are given of substances which may be used. Various details are given.

**Treating used alkali solutions such as are obtained in the cellulose and viscose industries.** R. WINTERNITZ. Brit. 303,482, Jan. 4, 1928. Impurities are pptd by adding an alc. such as MeOH or EtOH, and a small quantity of Pb acetate or other suitable Pb salt may be added to remove the color. The filtered soln. is distd. to sep the alc. and treated with quick-lime to regenerate NaOH.

**Viscose "silk," films, etc.** I. G. FARBENIND. A.-G. Brit. 303,514, Jan. 5, 1928. In the manuf. of threads, films, etc., from viscose (which may be unmaturred), a coagulation bath is used contg. a high concn. of acid together with an org. substance of high mol. wt. (suitably one which coagulates albumin) such as Na carbazolesulfonate and the product of reaction of  $CH_2O$  on naphthalenesulfonic acid in quantity substantially to sat. the bath.

**Products such as films and artificial silk from cellulose derivatives.** LEON LILJENFELD. U.S. 1,722,928, July 30. A soln. in an alkali such as NaOH soln. of 1,2-dihydroxypropylcellulose or other suitable hydroxyalkyl deriv., of cellulose sol. in aq. alkalies but insol. in water is shaped into a sheet or film or other desired form and treated (suitably by a coagulating bath) in order to obtain a solid product.

**Artificial films, fibers, etc.** HENRY DREYFUS. Fr. 657,764, July 17, 1928. Films, artificial silk, etc., are made by extruding in air or a coagulating bath a soln. of cellulose acetate or other org. substitution product of cellulose in an aq. or org. soln. of urea, thiourea, guanidine or their alkyl or other simple derivs.

**Artificial silk.** ALLGEMEINE ELEKTRICITÄTS-GES. (to International General Electric Co.). Brit. 303,867, Jan. 11, 1928. Synthetic resins of the glycerol-phthalic anhydride type are used for making artificial silk. Various details are given.

**Artificial silk.** I. G. FARBENIND. A.-G. Brit. 302,956, Sept. 21, 1927. Ammoniacal Cu cellulose solns. for artificial silk production are made by dissolving raw cellulose material, which has been pressed into thin sheets.

**Artificial silk.** I. G. FARBENIND. A.-G. Fr. 34,184, Sept. 27, 1927. Addn to 621,154. Cuprammonium solns. from wood cellulose, straw, etc., and cotton fibers, are spun at a low temp. (20–30°) by increasing the time the thread remains in contact with the precipitant.

**Artificial silk.** J. HUEBNER and K. F. DIEHL. Brit. 303,421, June 28, 1927. To effect a drawing out of the filaments as they pass through the coagulation bath, a bath is used contg. such a high concn. of coagulating agent such as  $H_2SO_4$  as will produce a plasticizing effect on the coagulated filaments, and spinning is conducted at a speed over 60 m. per min. Various details are given.

**Artificial silk.** MELITTA KLEIN. Fr. 34,101, June 24, 1927. Addn to 648,397 (C. A. 23, 3099). The diaphragms extend only across part of the spinning chamber, whereby the movable portion is eliminated.

**Artificial silk.** OSCAR KOHORN & CIE and ALFRED PERL. Fr. 657,601, July 17, 1928. In the manuf. of artificial silk by stretch spinning, any pressure below atm is avoided in the spinning app., and the ptpg. liquid used is heated to a temp. a little higher than the spinning temp. before its introduction into the app.

**Multiple-orifice spinning nozzle for spinning artificial silk by wet or dry processes.** E. ORIOLI (to Ruth-Aldo Co.). Brit. 303,782, Jan. 9, 1928. Structural features

**Spinning nozzle and associated devices for producing artificial silk threads.** EMIL ELSAESSER and HUBERT KEMPF (to American Bemberg Corp.). U. S. 1,721,591, July 23. Structural features.

**Apparatus (with rotating spinning nozzles) for making artificial silk filaments.** U. MANCINI (to Ruth-Aldo Co.). Brit. 302,993, Dec. 26, 1927. Structural features.

**Apparatus for making artificial silk filaments by the dry-spinning method.** M. KLEIN (to Ruth-Aldo Co.). Brit. 303,056, Dec. 27, 1927. Structural features.

**Apparatus (with a special air-heating system) for manufacture of artificial silk by the dry-spinning method.** A. E. GULL. Brit. 303,821, Oct. 5, 1927. Structural features.

**Apparatus for making artificial silk filaments by extrusion into a current of heated air passing in the same direction as the filament.** A. E. GULL. Brit. 303,778, Oct. 5, 1927. Various structural details are described.

**Treating waste sulfite cellulose liquor for further use.** WILHELM MICHAEL and ALBERT PALM (to I. G. Farbenind. A.-G.). U. S. 1,723,800, Aug. 6. Free  $\text{SO}_2$  is expelled, the liquor is heated in a closed vessel to above  $150^\circ\text{C}$  is filtered off, and  $\text{NH}_3$  is expelled by use of a stronger base such as  $\text{Ca}(\text{OH})_2$ . Cf. C. A. 22, 4246.

**Sulfite lyes.** SOC. BARBOU ET CIE. Fr. 34,139, Aug. 4, 1927. Addn. to 642,270 (C. A. 23, 1269). In the recovery of sulfite lyes obtained in the manuf. of cellulose the amt. of  $\text{H}_2\text{SO}_4$  used is reduced by oxidizing the free sulfite in the lye by bubbling air therethrough, or the addn. of  $\text{H}_2\text{SO}_4$  may be avoided by forming  $\text{H}_2\text{SO}_4$  in the lye electrolytically.

**Wood-pulp-grinding plant.** FRIEDRICH GRÖSSLER (to Linke-Hofmann-Werke A.-G. Abteilung Fullnerwerk). U. S. 1,721,863, July 23. Structural features.

**Pulp from wood.** LINN BRADLEY and EDWARD P. MCKEEFE. U. S. 1,722,993, Aug. 6. Wood is subjected to a preliminary partial digestion with an acid cooking liquor contg.  $\text{SO}_2$  and the cooking is completed with a liquor contg. essentially normal alkali metal sulfite.

**Apparatus for screening paper pulp.** HAROLD D. WELLS. U. S. 1,722,874, July 30. Structural features.

**Apparatus for making paper.** LESTER KIRSCHBRAUN. U. S. 1,722,432, July 30. Structural features.

**Paper-making apparatus.** ALONZO ALDRICH. U. S. 1,723,834, Aug. 6. Structural features.

**Paper-making apparatus.** ALONZO ALDRICH (to Beloit Iron Works). U. S. reissue 17,381, July 30. See original pat. 1,595,593 (C. A. 20, 3349).

**Paper-making apparatus.** HERMAN L. KUTTER (one-half to Walter D. Randall). U. S. 1,721,699, July 23. Structural features.

**Paper-making apparatus and method.** WILLIAM H. MILLSPAUGH. U. S. 1,722,503, July 30. Mech. features.

**Apparatus for controlling the moisture content of paper on paper-making machines.** HERBERT L. BONE (to Atlantic Precision Co.). U. S. 1,722,655, July 30.

**Suction press roll for use in paper making.** GEORGE D. KILBERRY (to Downing Mfg. Co.). U. S. 1,723,181, Aug. 6. Structural features.

**Apparatus for screening paper stock.** GEORGE S. WITAM, JR. U. S. 1,722,693, July 30. Structural features.

**Paper manufacture from peat.** CHARLES C. ROTH (to Peat Products Co.). U. S. 1,721,974, July 23. Peat in the natural state is torn into fiber, mixed with about one-third its quantity of a half stuff formed from rag clippings, freed from surplus water, treated with rosin and alum, and formed into sheets. An app. is described.

**Waterproof paper.** LESTER KIRSCHBRAUN. U. S. 1,723,355, Aug. 6. A non-adhesive matrix such as colloidal clay is formed in an aq. vehicle with a waterproof adhesive pitchy binder, the particles of which are sufficiently finely dispersed that they will pass through a wire screen with 40,000 openings per sq. in.; this matrix is mixed with fibrous pulp, and the mixt. is formed into sheets.

**Non-glare writing paper.** WELLINGTON G. REYNOLDS. U. S. 1,721,576, July 23. Calendered paper suitable for use with a pen carries a filler and coloring comprising, together with sulfite stock, auramine double O and soluble blue in small proportions.

**Composition for waterproofing and greasproofing paper.** AARON RUDERMAN. U. S. 1,723,581, Aug. 6. Rubber latex is used with starch in a jelled state,  $\text{Na}_2\text{CO}_3$ , Na polysulfide or other sol. metal polysulfide and  $\text{CH}_2\text{O}$ .

## 25—DYES AND TEXTILE CHEMISTRY

L. A. OLNEY

**Interesting sources of natural dyestuffs.** C. D. MELL. *Textile Colorist* 51, 453-5 (1929); cf. C. A. 23, 1507.—The buttonwood tree, *Conocarpus erecta*, of extreme southern Florida and the tropics, may attain commercial importance as a source of tannin. Anthocyanin occurs in the flowers of *Plumeria*. Alcornoque, *Boudichia virgilioides*, is regarded as one of the important tannin-producing plants of Venezuela. R. K. W. Some considerations on the art of matching to shade. J. MOFFAT. *Dyer, Calico Printer* 62, 14-5, 74-5 (1929). RUBY K. WORNER

**Manufacture of silent fabrics for sound pictures presents new dye problems.** GEORGE RICE. *Textile Colorist* 51, 460-1(1929).—Harshness and stiffness must be avoided.

RUBY K. WORNER

**Improvement in the fixation of indanthrene and other vat dyes by printing.** KOECHLIN BROTHERS AND EUGENE EBERSOL. *Bull. soc. ind. Mulhouse* 95, 221-3(1929).—Sealed Note 2141, Dec. 30, 1911. The novelty of the process consists in that the dye (indanthrene, algol, etc.) is simply thickened, printed on the white fabric, jigged with  $\text{Na}_2\text{CO}_3$  or  $\text{NaOH}$  contg. a reducing agent (preferably rongalite) and finally finished in the usual way by steaming in a Mather-Platt in absence of air and boiling with soap soln. It can be modified by printing after treating the fabric with  $\text{Na}_2\text{CO}_3$  and the reducing agent. The advantages claimed are: it avoids the use of strongly alk. colors; the printed fabric can be allowed to stand indefinitely before jigging with alkali; multi-colored patterns can be printed simultaneously with oxidation dyes, such as aniline black or paramine brown, or with certain steam colors. A no. of formulas are given. **Report.** VICTOR SILBERMANN. *Ibid.* 224.—No anteriority for the process was found. The advantages claimed were substantiated. With certain vat dyes, it was found that the depth of shade varied according as the goods were jigged with the reducing soln before or after printing the color.

A. PAPINEAU-COUTURE

**Detection of indigosols on the fiber.** J. C. LIVINGSTON. *Bull. soc. ind. Mulhouse* 95, 230(1929).—In order to det. whether a given shade has been obtained by vat dyeing or by means of a corresponding indigosol, decolorize with alc. hyposulfite (F. Driessen, *Rev. gén. mat. colorantes* p. 178, June 1908), wash thoroughly, boil in methylene blue (0.25 g. per l.), wash and dry; if the sample is dyed blue, it was originally dyed with an indigosol. The same result is obtained whether the color is developed with  $\text{NaNO}_2$  or by steaming. As it is shown that the reaction cannot be due to the formation of oxycellulose or of hydrocellulose, it must be admitted that the cellulose fixes  $\text{HSO}_3$  as the latter is being liberated.

A. PAPINEAU-COUTURE

**Direct cotton dyes from 2,7-diaminofluorene.** GILBERT T. MORGAN AND H. AINSWORTH HARRISON. *J. Soc. Chem. Ind.* 48, 125-6T(1929).—The soln. of the diazonium salt (I) of 2,7-diaminofluorene and 1-amino-8-naphthol-3,6-disulfonic acid (H-acid) give a dark blue dye which is similar to the corresponding dye from benzidine and H-acid (Chlorazol Blue B) except that it is greener, faster to washing, and less fast to  $\text{H}_2\text{SO}_4$ . I and 1-amino-8-naphthol-2,4-disulfonic acid (2 S-acid) give a blue dye which is redder, inferior in affinity and fastness to washing and alkali, but otherwise similar in fastness to the dianisidine-2 S acid dye (Chlorazol Sky Blue FF).

FREDERICK C. HAHN

**Chromatable dyes on wool.** EMILIO NOELTING. *Bull. soc. ind. Mulhouse* 95, 217-9(1929).—Sealed Note 2367, Jan. 2, 1920. It is generally admitted that, in the chromating of chromotropes, oxidation takes place and the oxidized dye is fixed on the wool simultaneously with the Cr oxide formed, with production of a lake. Attempts to prep. and isolate the hypothetical oxidation product were unsuccessful and led to the conclusion that there is no oxidation, but merely formation of a lake with the Cr oxide produced by reduction of the chromic acid by the wool. This Cr oxide combines to form a complex salt with the chromotrope, and these salts were also prepd; e. g., on heating chromotropes 2R or 2B (obtained by coupling diazotized  $\text{PhNH}_2$  or  $p\text{-NH}_2\text{C}_6\text{H}_4\text{NO}_2$  with chromotropic acid) with Cr fluoride or formate, the soln., which is red at first, turns deep blue and the Cr no longer ppts. with  $\text{Na}_2\text{CO}_3$ ; on dyeing wool in acid bath with these solns., the same blue-black shade is obtained as on treating red chromotrope shades with dichromate, and the bath can be completely exhausted. These complex blue-black dyes are extremely sol. and can be obtained by evapg. their solns to dryness. Chromotropic acid itself can also give complex salts, not only with Cr, but also with Al and Fe; but the latter complexes have not yet been examd. The Cr complexes combine with diazos, so that the complex dyes can thus be obtained directly in a single operation. H acid also gives complexes, but none has as yet been obtained from the corresponding diamino acid. N. considers it probable that the *o*-hydroxy-sulfo compds. should also form complexes, but R acid has so far given neg. results. Chromatable dyes derived from *o*-aminophenols behave similarly to the chromotropes and give complex salts which, in acid bath, give the same shade as the chromated colors after dyeing. **Report.** M. BATTEGAY AND J. LICHTENBERGER. *Ibid.* 219-21.—N.'s results fully confirm the investigations of Rosenhauer (*Z. angew. Chem.* 41, 616(1929)), who succeeded in isolating in cryst. form the lakes obtained by the action of either chromic salts or dichromates, on dyes derived from chromotropic acid.

A. P.-C.

**Adsorption on wool fiber of organic dyes suspended in water.** M. IL'INSKII AND R. BURSTEIN. *Papers Pure and Appl. Chem. Karpov-Inst. (Moscow)* 1928, No. 8, 85-95; *Chem. Zentr.* 1929, I, 698.—Adsorption of indigo on wool fiber in acid soln. increases

with increasing quantities of adsorbed acid. Endosmotic expts. show that the adsorbed H ions reduce the neg. charge of the wool fiber and thus annul the repelling action on the dye particles likewise charged neg. The rapidity of cataphoresis is diminished and the sedimentation is accelerated with increasing concn. of the acid. In order to effect the coagulation on the fiber only it is advisable to have the acid first adsorbed by the fiber and not to acidify the suspension. The presence of methyl orange facilitates the quant. adsorption of the dye. The homogenization of the adsorption layer occurs only in the 2nd phase of the dyeing process.

**The problem of getting a satisfactory white on white woolens.** GEORGE WHITE. *Textile Colorist* 51, 443 (1929).—The loss of whiteness in spots during the hot pressing of some white woolens was traced to the fact that the raw material was made from skin wool which had been subjected to irregular temp. in the sweat box. The trouble was avoided by revamping the steam coil in the sweat chamber.

**The use of decolorizing agents before dyeing.** VALETTE. *T'iba* 7, 503-9 (1929).—Practical operating directions.

**Wool-silk and its treatment before dyeing.** THOMAS F. HUGHES. *Textile Colorist* 51, 437-41 (1929).—Gassing, crabbing, steaming, scouring and bleaching are briefly considered. The properties of wool and silk and their action toward dyestuffs are also discussed with reference to dyeing wool-silk union fabrics.

**Dyeing silk with vegetable colors.** JORRE. *Russa* 4, 549-53, 693, 695, 869, 871 (1929).—Practical operating directions on the dyeing of silk with logwood, with a number of formulas.

**Printing union fabrics containing rayon.** HERMANN KINDERMANN. *Russa* 4, 871, 873 (1929).—A brief discussion of the difficulties of printing such fabrics.

**Dyeing rayon and rayon-cotton mixtures.** H. HOZ. *Melliand Textilber.* 10, 206-8 (1929).—For exptl. purposes a quantity of narrow fabric was woven which had alternate stripes of pale and heavy dyeing viscose rayon. Tested against Chicago Blue 6B for example, this special fabric gave a very pronounced uneven effect. However, a number of com. dyestuffs were found which gave an even effect. As noted by Whittaker, the level-dyeing colors show max. affinity for the fiber at 60-70° rather than at 100°. Lists of current dyes which dye cotton and viscose rayon to the same depth are given as well as of colors which leave the rayon paler than the cotton.

**The uneven dyeing of rayon and the effect of hydrogen-ion concentration in scouring.** CHAS. E. MULLIN. *The Melliand* 1, 608-17 (1929); cf. *C. A.* 23, 2829.—Differences in the depth of shade of exptl. dyeings follow the use of scouring baths of varying  $p_H$  values. It appears that the more alk. scouring baths give rayon which dyes to a deeper shade. However, the temp. of scouring is important in this respect also, although in some cases high temp. led to pale shades and in others to deep shades. The necessity of uniformity and control is clear.

**Theory of dyeing acetate rayon.** HERBERT BRANDENBURGER. *Melliand Textilber.* 10, 215-7 (1929).—Additional exptl. data are given confirmatory of the soln. theory, the development of which is outlined.

**Dyeing of acetate rayon.** HERBERT BRANDENBURGER. *Kunstseide* 11, 98-106, 144-50 (1929).—B. reviews the history, theory, methods of production and properties of acetate rayon, including density, luster, fullness, optical properties and its behavior toward acids, alkali, inorg. salts and org. solvents. The development of the dyeing of acetate rayon is discussed in detail.

**New developments in beam and package dyeing.** ALBERT H. GRIMSHAW. *The Melliand* 1, 565-74 (1929).—Newer machines are illustrated and processes described.

**Researches on dyeing baths.** FRIEDRICH C. JACOBY. *Melliand Textilber.* 10, 121-4 (1929).—Several phys. chem. studies were made of dyeing baths contg. some of the newer dyeing assistants, such as Neomerpin, Tetracarnite, etc. But little measurable effect on viscosity was noted. The drop numbers varied greatly, as did the soly. of the dyestuff. Filtration studies showed remarkably high dispersing power for Tetracarnite and other pyridine derivs. In general, a retarding effect on the rate of dyeing was noted, believed to be beneficial.

**Fastness of dyed fabrics to dry cleaning.** A. S. EICHLIN. *Bur. Standards J. Research* 3, 39-51 (1929).—A number of representative dyestuffs on wool, silk, cotton, rayon and union fabrics were subjected to 2 tests. In the first a moisture-free solvent was used, and in the second the solvent contained 0.1% free moisture and 0.01% alkali. Description of app. is given.

**Fastness to washing of dyed acetate rayon.** HERBERT BRANDENBURGER. *Melliand*

**Textilber.** 10, 227-9(1929).—Since the dyeing of acetate rayon is a soln. process, some bleeding during washing is inevitable. In fact, when dyeings made from the  $H_2O$ -sol. Azetol, Cellite Fast and Setacyl are treated with  $H_2O$  at  $40^\circ$ , diln. is fairly rapid. So tested, the dispersion dyes of the Celliton, Celliton Fast, Cibacet and Duranol series seem more resistant, while the Ionamines are fairly fast. To soap soln., however, the dispersion types show more bleeding than the  $H_2O$ -sol. colors. E. R. CLARK

Fastness to stoving. RICHARD CAMERON. *Textile Colorist* 51, 462(1929).

Study of mercurochrome stains. C. C. HUBBARD. *Natl. Rev.* 5, No. 10, 18(1928). *Expt. Sta. Record* 60, 198.—Tests seemed to show that mercurochrome combines with the dressings and sizing on silks as well as with wool and to indicate the total insoly. of the stain on fabric under certain conditions. Observations suggested that S fumes had something to do with the permanency of the stain. H. L. D

Eruptions caused by dyestuffs derived from *p*-phenylenediamine hydrochloride and diaminophenol. L. BROCO. *Presse méd.* 36, 1115-6(1928).—Some clinical cases are described. For the treatment was used: lanolin 10, sweet almond oil 25 and lime water 25 parts. A. E. MEYER

Effect of temperature and barometric pressure as well as humidity on the moisture content of fibers. W. G. SCHAPOSCHNIKOFF. *The Melliand* 1, 385-8, 517-28(1929)

A new conditioning process for yarns and fabrics. FRED L. BRYANT. *The Melliand* 1, 397-400(1929).—Treating packaged yarns with "Hygrolit" greatly improves their condition and prevents moth or mildew damage. E. R. CLARK

Analytical control of (silk) loading baths. J. BRUYAS. *Russa* 4, 701, 703(1929).—The following detns. are recommended:  $^{60}Be$ ,  $Na_2HPO_4$ ,  $NaH_2PO_4$ ,  $NaCl$ ,  $Sn$ . Total  $PO_4$  can be detd. as  $Mg_3P_2O_7$ , by direct pptn. as  $MgNH_4PO_4$  in the case of fresh baths, and by preliminary pptn. as phosphomolybdate in old baths.  $Na_2HPO_4$  can be detd. by titration with standard  $H_2SO_4$  using methyl orange indicator, correcting (if desired) for the  $NaOH$  produced through hydrolysis of  $Na_2HPO_4$  by titrating a sep. sample with phenolphthalein as indicator.  $NaCl$  can be detd. gravimetrically by pptn. with  $AgNO_3$  in the cold to avoid interference of  $Sn$ . A. PAPINEAU-COUTURE

Processing silk before winding. T. P. SHERIDAN. *Textile World* 76, 223(1929).—The treatment of gum-silk yarn for glove-silk fabrics is described. RUBY K. WORNER  
Cleansing glove-silk fabric. T. P. SHERIDAN. *Textile World* 76, 495(1929).—Practical. RUBY K. WORNER

Differentiation of cuprammonium and viscose rayons. OTTO RÜNZI. *Kunstseide* 11, 158-60(1929).—Cuprammonium rayon (I) is dyed a deep blue and viscose rayon (II) a light blue in a soln. of Pelikantinte 4001. The test may be applied to dyed material after removing the dye with hyposulfite. Optical tests are conducted in doubtful cases. The edges of II cross-sections are notched more than those of I. In transmitted light under the microscope, I resembles clear glass rods, while viscose filaments show streaks and irregularities. FREDERICK C. HAHN

Differentiation of cuprammonium and viscose rayons. W. DISCHREIT. *Kunstseide* 11, 117(1929).—Cuprammonium rayon gives a deeper blue than viscose rayon, when dyed for 5 min. at  $25^\circ$  in a bath contg. 0.25 g. Neolan Blue G and 1.5 g. Neolan Yellow R per l. FREDERICK C. HAHN

Fastness of rayon shades. WILLY ALTEROFF. *Kunstseide* 11, 119-21(1929).—Eighteen types of fastness are discussed in detail. FREDERICK C. HAHN

Rayon cross-sections. E. VIVIANI. *Kunstseide* 11, 111-2(1929).—Cross-sections suitable for photographing are obtained as follows. A cotton thread is drawn through a cork by means of a needle, and then back again, in such manner that a loop is formed at one end. A bundle of rayon filaments is drawn through the loop and then pulled into the cork by pulling the opposite end of the thread. The cork is then cut in thin sections with a sharp knife or razor blade. FREDERICK C. HAHN

The washing and desulfuring of viscose. M. L. BADARELLI. *Russa* 4, 851-5(1929).—A description of the Donagemma system for the washing and desulfuring of viscose threads wound on Al bobbins. A. PAPINEAU-COUTURE

The prospect and goal of artificial wool. DURÉ. *Kunstseide* 11, 114-5(1929).

Rapidly correcting strength of cotton mechanical fabrics for regain. EDWARD R. SCHWARZ. *Textile World* 76, 362-7(1929).—The use of nomographs with Haven's

formula for correcting tensile strengths to any desired condition is described.

**Mercerization of cotton yarn and cloth.** FOSTER PICKLES. *Wool Record* 35, 1605-9, 1685-91(1929).—Some data are given showing the effect of mercerization on regain; a comparison of the strength and elongation of unmercerized, mercerized with tension and mercerized without tension yarns; the effect of the strength of NaOH used on the strength and elongation; the influence of differences in twist on the resultant mercerized yarn; and the effect of storage on the strength and elongation of mercerized and unmercerized yarns. No indication is given of whether the figures are based on one sample or an av.

**Spontaneous development of a pink color on bleached cotton.** CH. CARLOS CASANOVAS Y AMAT. *Tiba* 7, 493, 495(1929).—From a discussion of the results of Weber-Guth (*Bull. soc. ind. Mulhouse*, Nov.-Dec., 1885) and of Pinte (*C. A.* 21, 2066), it is concluded that when improperly bleached cotton contg. pectic derivs is placed in contact with  $\text{PhNH}_2$  vapors, the latter are absorbed with production, by oxidation, of a pink dye, which has not been studied or identified.

**Bleaching without chlorination.** CHARLES SUNDER. *Bull. soc. ind. Mulhouse* 95, 225-9(1929).—Report on Sealed Note 2178, deposited by Albert Dondain, May 21, 1912. According to Richard Müller's D.R.P. 240,037, Cl bleaching can be eliminated by prolonging the NaOH boil and injecting air until the soln. is almost decolorized. Dondain proposes improving the process by substituting nascent O generated electrolytically in the liquor for atm.  $\text{O}_2$ , and claims the process is thus accelerated without using catalysts. In order to do without Cl bleaching, the goods must be perfectly white when they come out of the NaOH; if all the gums, sugars and pectins have been dissolved, they can be oxidized in soln. without attacking the fiber, but if some of them remain on the fiber, they cannot be satisfactorily oxidized without at the same time attacking the fiber. On the other hand, if part of the incrustants remain on the fiber when it comes out of the NaOH liquor, bleaching with acid or  $\text{NaHSO}_3$ , as suggested by Müller, does not give a permanent white. S. concludes that the process cannot give a perfect white, but that it can give a sufficiently good color for many purposes.

**Dyes.** I. B. ANDERSON, R. F. THOMSON, J. THOMAS and SCOTTISH DYES, LTD. Brit. 303,454, June 24, 1927. Isodibenzanthrone and its derivs. are obtained from benzanthrone or its derivs. with free *peri*-positions, or from 2,2'-dibenzanthronyl, by heating with KOH and an alc., at not over about  $130^\circ$  in the presence of xylene,  $\text{C}_6\text{H}_6$ , a halogenated aromatic hydrocarbon such as  $\text{PhCl}$ , kerosene or "petrol." The products (of which examples are given and which may be purified by treating with aniline or other aromatic bases, pyridine,  $\text{H}_2\text{SO}_4$  or hyposulfite) dye cotton from the vat in blue shades, changing to violet on oxidation. The use of EtOH and iso-Pr alc. in the process is suitable.

**Dyes.** I. G. FARBERIND. A.-G. Brit. 303,538, Sept. 6, 1927. The alkali fusion of benzanthrone is effected in the presence of aliphatic aldehydes (other than sugars), their polymers, or sulfite or sulfoxylate derivs. Several examples are given.

**Dyes.** I. G. FARBERIND. A.-G. Brit. 303,838, Jan. 10, 1928. Monoazo dyes giving fast clear blue to violet dyeings are produced in substance or on the fiber by coupling an arylide of 2,3-hydroxynaphthoic acid with a diazotized 1,4-phenylenediamine or a homolog or substitution product, substituted in one amino group by an acetyl group from an aromatic carboxylic acid such as benzoic acid, its homologs or substitution products, naphthoic acid or terephthalic acid. Several examples are given.

**Dyes.** IMPERIAL CHEMICAL INDUSTRIES, LTD., and L. J. ALLCHIN. Brit. 303,234, Nov. 7, 1927. A 3,6-dichlorofluoran is condensed with an *o*-, *m*- or *p*-aminophenol, or a phthalic anhydride is condensed with a di(hydroxyphenyl)amine in which one OH group is in the *m*-position. The basic dyes thus obtained may be sulfonated. Examples are given.

**Azo dyes.** I. G. FARBENIND. A.-G. Brit. 302,965, Sept. 22, 1927. Azo dyes suitable for treatment, in substance or on the fiber either before, during or after the dyeing process, with metal compds. such as those of Cr or Cu are obtained by combining a diazotized 2-aminobenzene-1-carboxylic acid sulfonamide or a deriv. or substitution product with a coupling component. Numerous examples are given.

**Azo dyes.** I. G. FARBENIND. A.-G. Brit. 303,026, Dec. 24, 1927. BzCl or a substitution product is condensed with a secondary disazo dye of the type A-N:N-M-N:N-E or a trisazo dye of the type A-N:N-M-N:N-M'-N:N-E, in which A is a residue of an initial component, M and M' are middle components free from OH groups, and E is an amine coupled in *p*-position to the free amino group. The product is reduced to form an azo dye. When diazotized on the fiber and developed with  $\beta$ -naphthol, 1-phenyl-3-methyl-5-pyrazolone or acetoacetic arylides, brownish shades are produced. Several examples are given.

**Azo dyes.** I. G. FARBENIND. A.-G. Brit. 303,526, Jan. 5, 1928. The process described in Brit. 284,247 (C. A. 22, 4832) is modified by using as diazo components, for coupling in substance or on the fiber with 2,3-hydroxynaphthoic acid, monoarolyated *m*-phenylenediamines contg. alkyl or alkoxy groups in *o*-position to the amino groups. Several examples are given.

**Azo dyes on weighted silk.** RUDOLF KONRAD (to Grasselli Dyestuff Corp.). U. S. 1,723,183, Aug. 6. The weighed silk fiber is impregnated with the alk. soln. of an azo component of substantive character such as the anilide of 2,3-hydroxynaphthoic acid together with a sol. silicate and development is effected with a diazo soln. such as azotized *m*-nitro-*o*-anisidine-HCl.

**Trisazo dyes.** I. G. FARBENIND. A.-G. Brit. 303,424, Sept. 1, 1927. A black trisazo dye is obtained by diazotizing *p*-aminobenzeneazo-2-amino-8-naphthol-6-sulfonic acid obtained by acid coupling, coupling in alk. soln. with 2,8,6-acid, rediazotizing, and coupling with *m*-phenylenediamine. One of the components may carry an addnl. sulfonic group. The dyes have good fastness on cotton and viscose and similar artificial silks (but not on "acetate silk"). Details are given. Cf. C. A. 23, 4081.

**Vat dyes.** I. G. FARBENIND. A.-G. Fr. 34,190, Sept. 29, 1927. Addn. to 642,351 (C. A. 23, 1278). The nitro group of the nitrobenzanthrone referred to in the prior patent and prepd. according to Fr. 6,435 and 349,531, is replaced by an alkoxy group, which compd. is treated with alk. agents as in the prior patent for the production of vat dyes. Cf. C. A. 23, 4082.

**Dyes of the isoviolanthrone series.** I. G. FARBENIND. A.-G. Brit. 303,123, Dec. 28, 1927. Vat dyes are obtained by treating 1,4-dihalo-8-arylnaphthalenes or their substitution products with alk. condensing agents. Several examples are given, various of which form dyes giving reddish blue tints.

**Dyes of the naphthophenazine series.** WILHELM NEELMEIER and THEODOR NOCKEN (to General Aniline Works). U. S. 1,723,199, Aug. 6. Dyes producing red to violet shades on wool from an acid bath are obtained by condensing 3-arylamino-1,8-naphthosultams (such as the 6-sulfonic acids of such compds.) with *p*-nitrosoaminobenzene compds. or by oxidizing together *p*-diamines with the naphthosultam. Several examples are given. The starting material may be substituted by an alkyl group or the like. Cf. C. A. 22, 4833.

**Diazonium fluorosulfonates.** I. G. FARBENIND. A.-G. Brit. 303,527, Jan. 6, 1928. Diazonium fluorosulfonates, which are not sensitive to percussion and friction and may be used in dyeing or as insecticides, are produced by treating a diazonium compd. (such as that from 4-chloro-2-aminotoluene or a similar compd.) with fluorosulfonic acid. Several examples are given.

**Carboxylic acids.** I. G. FARBENIND. A.-G. Brit. 303,389, July 1, 1927. Carboxylic acids suitable for use as intermediates in the manuf. of dyes and pharmaceutical compds. are obtained by heating unsatd. acids such as acrylic acid,  $\alpha$ - or  $\beta$ -chloropropionic acid, maleic acid, cinnamic acid, crotonic acid, or esters, halides or anhydrides of these or similar acids, with hydrocarbons such as anthracene or chrysene or their halogen, alkyl, hydroxy or alkoxy derivs. The product thus obtained from 1-hydroxyanthracene and  $\beta$ -chloropropionic acid when coupled with diazotized *p*-nitroaniline yields an orange-yellow dye.

**Carboxylic acids.** GEORG KALISCHER and HEINZ SCHEYER (to I. G. Farbenind. A.-G.). U. S. 1,721,560, July 23. See Brit. 303,389 (preceding abstract).

**Halogenated dinaphthylidicarboxylic acids.** RICHARD HERZ and WERNER ZERWECK (to General Aniline Works). U. S. 1,723,167, Aug. 6. Dye intermediates which are dinaphthylidicarboxylic acids of the general formula:  $(C_{10}X_4)_2(COOH)_2$ , wherein the X's stand for H atoms, of which one or more may be replaced by a univalent substituent.

ent, are obtained if the diazo compds. of aminonaphthoic acids of the general formula:  $C_{10}X_n(NH_2)COOH$  wherein the X's stand for H atoms, of which one or more may be replaced by a univalent substituent, are treated with a suitable reducing agent, especially with an ammoniacal soln. of cuprous oxide. An example is given of the production of 4,4'-dibromo-1,1'-dinaphthyl-8,8'-dicarboxylic acid, a colorless powder, m. above  $300^\circ$ .

**Dyes and intermediates.** I. G. FARBENIND. A.-G. Brit. 303,095, June 27, 1927. Halogenated *ms*-benzodanthrones and *ms*-naphthodanthrones are prep'd. by direct halogenation under "mild conditions," in a dissolving or suspending medium, and preferably with addn. of halogenation catalysts. The halogenated *ms*-benzodanthrones may be further condensed to *ms*-naphthodanthrones by acid condensing agents or by oxidizing agents in  $H_2SO_4$  soln. *ms*-Benzodanthrones may be converted to halo-*ms*-naphthodanthrones by treatment with halogen under pressure or in the presence of S under oxidizing conditions. Several examples are given. The halogenated *ms*-benzodanthrones dye cotton strong yellow to orange shades from a vat. The halogenated *ms*-naphthodanthrones are mainly useful as intermediates.

**Dyes and intermediates.** I. G. FARBENIND. A.-G. Brit. 303,184, June 27, 1927. Allo-*ms*-naphthodanthrones are obtained from 2,2'-dimethyl-*ms*-benzodanthrones by the action of alk. condensing agents and as a class these products dissolve in strong  $H_2SO_4$  with a green-blue color, give violet to blue vats and dye orange to red shades. Various methods are mentioned of forming their halogen derivs. and various examples are given. *ms*-Anthradanthrones are made by the action of acid condensing agents or of light or oxidizing agents in  $H_2SO_4$  on the allo-*ms*-naphthodanthrones and also from 2,2'-dimethyl-*ms*-naphthodanthrones by the action of alk. condensing agents. Prepn. of their halogen derivs. also is referred to.

**Dyes and intermediates.** I. G. FARBENIND. A.-G. Brit. 303,203, Sept. 30, 1927. Benzanthrone derivs., including dibenzanthronyls and benzanthranyl sulfides, contg. one or more arylsulfamido groups, are prep'd. by the action of arylsulfonylchlorides on the corresponding amino compds., or of arylsulfonamides on the corresponding halogen compds. Several examples are given. Dibenzanthrone and isodibenzanthrone dyes are obtained by alk. condensation of such of the arylsulfonamido compds. as have the 2 and *Bz*-1 positions free, or one only of them occupied by an arylsulfonamido group (which is split off in the course of the reaction), a mercapto, sulfide, thio ether, sulfinic or etherified OH group, or a halogen atom, or by another 2- or *Bz*-1-benzanthronyl nucleus, having its other 2- or *Bz*-1-position free. Several examples of dyes thus produced are given.

**Dyes and intermediates.** I. G. FARBENIND. A.-G. Brit. 303,375, Dec. 30, 1927. Derivs. of the anthracene series are obtained by treating 2- $\alpha$ -naphthoylbenzoic acid or its derivs. with  $AlCl_3$  in the presence or absence of an org. or inorg. melting agent such as NaCl or trichlorobenzene, at temps. of about  $80-130^\circ$ . Several examples are given. The products appear to be derivs. of dihydrobenzanthrone. The products having the *Bz*-1 and 2- positions free are converted into vat dyes by fusing with caustic alkali at  $230-260^\circ$ . The 2- $\alpha$ -naphthoylbenzoic acid deriv. yields a dye giving violet tints on cotton which change to blue on exposure to the air.

**Dye intermediates.** I. G. FARBENIND. A.-G. Brit. 302,964, Sept. 22, 1927. Nitroanthraquinones and their derivs. are reduced by means of hydrogenated bases of the quinoline series, suitably in the presence of a diluent which may be the oxidized product of the hydrogenated quinoline in which case the hydrogenated quinoline is regenerated by catalytic hydrogenation. Various details and examples are given.

**Dye intermediates.** I. G. FARBENIND. A.-G. Brit. 303,901, Jan. 12, 1928. Hydroxycarboxylic acids of carbazole are prep'd. by the action of  $CO_2$  on an alkali compd. of a hydroxycarbazole or on a hydroxycarbazole in the presence of alkali hydroxide or carbonate. The products are suitable for use as intermediates in making dyes or pharmaceutical compds.

**Intermediates for dyes.** IMPERIAL CHEMICAL INDUSTRIES, LTD. Fr. 657,589, July 17, 1928. See Brit. 299,152 (C. A. 23, 3105).

**Dyeing.** SOC. ANON. POUR L'IND. CHIM. A BALE. Brit. 303,179, Dec. 29, 1927. In dyeing cotton, or producing variegated effects on mixed goods of cotton and "acetate silk," etc., fast dyeings are obtained by treatment with naphthols or coupling components having salts stable to steam, drying, steaming and developing with diazo compds. Several examples are given.

**Dyeing with mordant dyes.** SOC. ANON. POUR L'IND. CHIM. A BALE. Brit. 303,384, Dec. 30, 1927. Dyeings fast to rubbing, light, fulling and potting are produced on chrome-mordanted fibers by dyeing with Cr compds. of azo dyes. Several examples are given.

**Dyeing artificial silk.** SILVER SPRINGS BLEACHING & DYEING CO., LTD., and A. J. HALL. Brit. 303,958, Nov. 8, 1927. Yarns and woven or knitted fabrics, etc., having different depths or intensities of color are made by using alkali-treated and untreated regenerated cellulose artificial silks, and dyeing with direct or other dyes. Various details are given.

**Multicolor dyeing of artificial silk skeins, etc., while loosely held by clamping devices.** J. P. CAREY and I. B. HASBROUCK (to Eclipse Textile Devices, Inc.). Brit. 303,892, Jan. 12, 1928. Structural features.

**Dyeing cellulose formate or other similar cellulose esters.** GEORGE H. ELLIS (to Celanese Corp. of America). U. S. 1,723,271, Aug. 6. The material is dyed with an aq. dispersion of a relatively water-insol. coloring material prepd. by pretreating the coloring material with a solubilizing agent comprising Na sulforicinate or other suitable material of oily or fatty character and an auxiliary solvent such as xylene.

**Dyeing cones of yarn with bands of different color by injection of dye solution through grooved needles.** L. B. HASBROUCK (to Eclipse Textile Devices, Inc.). Brit. 303,893, Jan. 12, 1928. An app. is described.

**Printing silk.** CHARLES GALSTER. Fr. 657,966, July 23, 1928. Silk is printed with aniline dyes sol. in water exactly in the manner used in lithography. The aniline dye is dissolved in turpentine oil with the addn. of linseed-oil varnish and is then ready for printing. The silk or material is steeped in a soln. of gum arabic contg. glycerol and is pressed damp on a sheet of paper to which it sticks. When dry it is ready for printing.

**Nitrosamine printing colors.** I. G. FARBENIND. A.-G. Brit. 303,942, Oct. 28, 1927. Nitrosamine printing colors are purified by dissolving in a neutral org. solvent such as acetone, EtOH or MeOH which is an equally good solvent for both components, filtering the soln. and removing the solvent.

**Coloring agent for fabrics.** ANTON PICAREFF (to Anton Picareff Art Studios, Inc.) U. S. 1,722,392, July 30. A compn. suitable for coloring silk or other fabric comprises dyes and a viscous substance such as gum acacia in aq. soln. admixed with glacial HOAc.

**Colored cellulose acetate.** GEORGE H. ELLIS (to Celanese Corp. of America). U. S. 1,723,230, Aug. 6. The fastness to light of material colored with azo or other coloring agents is increased by treatment with diethylaniline-HCl or other simple org. amino compd.

**Dye salt.** I. G. FARBENIND. A.-G. Fr. 657,645, July 18, 1928. The diazonium fluoborate of 5-nitro-2-amino-1-toluene is used as a stable and easily sol. dyeing salt. The shades obtained on cotton by coupling it with arylides of 2,3-hydroxynaphthoic acid are identical with those obtained from freshly prepd. diazo solns. of 5-nitro-2-amino-1-toluene.

**Jigger apparatus for dyeing.** C. S. BEDFORD. Brit. 304,088, May 2, 1928.

**Spot-dyeing clamp.** ARTHUR H. ADAMS (to Herman Epstein). U. S. 1,722,781, July 30. Structural features.

**Skein-dyeing apparatus.** CHARLES E. KIMBALL. U. S. 1,723,624, Aug. 6. Structural features.

**Treating animal and vegetable fibers.** SOC. ANON. POUR L'IND. CHIM. À BAËLE. Fr. 657,974, July 23, 1928. See Erit. 294,890 (C. A. 23, 2001).

**Oil for treating textile fibers.** STANDARD OIL CO. Brit. 303,820, July 6, 1927. A compn. for treating rayon or other textile materials comprises a refined distillate mineral oil of low viscosity, oleic acid, an emulsifying agent such as an alkali metal soap of a (preferably oil-sol.) sulfonic acid obtained by treating a mineral oil with H<sub>2</sub>SO<sub>4</sub> and an "antioxidant" such as  $\beta$ -naphthol or diphenylamine. Cf. C. A. 23, 996.

**Lubricant for use in knitting, spinning or weaving rayon fibers.** STANDARD OIL CO. Brit. 303,841, July 6, 1927. Compns. are used similar to those specified in Brit. 303,820 (preceding abstract).

**Bowling, softening, oiling and finishing of-textile materials.** CHEMISCHE FABRIK, VORM. SANDOZ. Brit. 303,379, Dec. 30, 1927. Preps. stable against lime and acids, suitable for use in these operations, are obtained by mixing fatty acids and aromatic or hydrogenated aromatic sulfonic acids or salts, or amino or hydroxyamino derivs. of such acids, and neutralizing by alkali. Various suitable starting materials for the process are enumerated.

**Apparatus for treating tubular fabrics (on a perforated drum) with drying air and with steam.** M. M. KASANOF. Brit. 303,653, Jan. 10, 1928. Structural features.

**Apparatus for washing, scouring or other treatment of fabrics in long lengths.** MICHAEL F. ROONEY (to Rodney Hunt Machine Co.). U. S. 1,722,482, July 30. Structural features.

**Apparatus for rinsing yarn or fabric in rope form.** GEORGE J. MCGANN (to Slasher Rolls Co.). U. S. 1,722,813, July 30. Structural features.

**Removing stains from fabrics, etc.** T. E. THORPE, F. J. THORPE and P. H. WALLER. Brit. 303,089, Sept. 28, 1927. A compn. suitable for removing stains comprises  $\text{CCl}_4$  and oil of eucalyptus and may also contain other ingredients such as terebene, oleate aniline yellow and oil of cloves.

**Rotary permeable drum apparatus for drying, carbonizing or oxidizing fabrics, paper, cords, etc.** R. GLINKA. Brit. 303,572, Oct. 10 1927. Structural features.

**Loading silk.** R. CLAVEL. Brit. 303,128, Dec. 30, 1927. Natural or artificial silk in hanks, fabric or other form is loaded and dull-lustered by pptg. upon and within the fibers a usual metallic loading salt such as  $\text{SnCl}_4$  or Pb acetate, without washing, acidifying or neutralizing between the steps of the process. Treatment with an alkali phosphate of alk. reaction or with an alk. earth phosphate may precede or follow the pptn. and the silk may also be treated with solns. of alk. earth salts either before or during immersion in the metallic salt bath. Numerous details, modifications and examples of the process are given. Cf. C. A. 23, 2306. Brit. 303,129 describes an app. for similar treatments in successive baths.

**Weighting silk, etc.** HENRY DREYFUS. Fr. 34,391, Nov. 3, 1927. Addn. to 634,165. Threads, films, etc., of cellulose acetate to be weighted with metallic salts are treated with a swelling agent comprising an isothiocyanate, a cyanate or an isocyanate, particularly of the alkali metals or  $\text{NH}_4$ , or comprising one of the following: urea, urethan, thiourea, thiourethan, guanidine or their alkyl or aryl substitution products, or mixts. of these. Cf. C. A. 23, 1267.

**Mixing silk and artificial silk for fabrics.** MEINRAD F. THOMA. U. S. 1,722,829, July 30. Schappe silk is mixed with about twice its quantity of artificial silk, the mixt. is carded and schappe silk fibers are broken while surrounded by the artificial silk fibers, the mixt. is spun, the yarn is woven and the material is dyed in the piece.

**Delustering "acetyl silk," etc.** BLEACHERS' ASSOCIATION, LTD., W. KERSHAW, F. L. BARRETT and R. GAUNT. Brit. 303,286, Jan. 21, 1928. The fabrics are boiled with solns. of soaps or other suitable salts, or are padded with soap, steamed and then embossed. The luster may be locally regenerated.

**Apparatus for washing wool (especially samples).** F. J. COWIE. Brit. 304,050, Feb. 8, 1928. Structural features.

**Felt.** J. L. SOBRINHO. Brit. 303,017, Dec. 23, 1927. Felt is formed of silk, silk residues or artificial silk, alone or mixed with wool or hair or both, with or without the addn. of cotton also.

**Luminescent cloth.** JÉRÔME É. LUCK. Fr. 658,185, Dec. 7, 1927. Cloth is made luminescent by steeping it in a heated bath contg.  $\text{ZnS}$ ,  $\text{AcOAm}$ , clear glue, gelatin, glucose and water.

**Sulfonic acids.** I. G. FARBENIND. A.-G. Brit. 303,917, Sept. 12, 1927. Sulfonic acids suitable for use as *wetting, emulsifying or cleansing agents* are formed from unsatd. aliphatic hydrocarbons or their halogen derivs. or from unsatd. hydroaromatic compds. by treating them with sulfonating agents such as  $\text{H}_2\text{SO}_4$  or  $\text{SO}_3$  or chlorosulfonic acid and at least an equimol. quantity of an org. acid, acid anhydride or acid chloride or of  $\text{H}_3\text{PO}_4$  or of its anhydride or chloride. The treatment may be applied to individual hydrocarbons such as tetrahydrobenzene or propylene, or halogen derivs. such as trichloroethylene, or to hydrocarbon mixts. such as gas oil, "yellow oil" or solar oil.

**Mothproofing wool, fur, etc.** I. G. FARBENIND. A.-G. Brit. 303,092, Sept. 28, 1927. Various compds. are used in which P, As, Sb, Bi or Sn is directly linked to the C atom of one or more org. residues. Numerous details and examples are given. Cf. C. A. 23, 3112.

## 26—PAINTS, VARNISHES AND RESINS

A. H. SABIN

**Investigation of the usefulness of a simple torsion viscometer for testing paints.** W. BRCKS. *Farbe Lack* 1929, 344-5.—There is described a modified Couette or MacMichael viscometer in which the container is rotated. The angle through which the suspended cylinder is rotated is plotted against the speed of rotation of the container. Some typical results are given. G. G. SWARD

**Cadmium-base pigments.** ALBERT HUTIN. *Peintures, pigments, vernis* 6, 837-8 (1929).—There are discussed the qualities of a good pigment for cellulose varnishes. CdS is the best yellow. Lithopones of Cd ( $x\text{CdS} + y\text{BaSO}_4$ ) are now being produced,

but care must be employed in the prepn. in order to obtain the required permanency of shade. Cd yellows mixed with ultra-marine blues give brilliant and very stable greens. The lithopones of Cd are obtained by pptg. a soln. of  $\text{CdSO}_4$  with BaS. Cd thioselenides are employed in the ceramic industry. B. HAMILTON

Methods of analysis and of control in the varnish and paint industry. ANDRÉ MAUROU. *Peintures, pigments, vernis* 6, 830-4, 858-61(1929).—A review. B. H.

Nitrocellulose and its importance in the lacquer industry (STADLINGER) 23. Some properties of acetone-soluble cellulose acetate (WERNER, ENGELMAN) 23. Fossil resin of the Republic of Argentina (CORTELEZZI) 8. Plastometric studies of the formation of boundary layers (DE WAELE, LEWIS) 2. Kauri-resins (HOSKING) 10. *Carthamus tinctorius* oil. Safflower oil (TZUKERVANIK) 27. Soap production [Rosin size manufacture] (U. S. pat. 1,722,687) 27. The saturation capacity of rosin acids (MARGOSCHES, *et al.*) 10.

MARGIVAL, F.: *Encres spéciales*. Paris: Desforges, Girardot & Cie. 180 pp. F. 20. Reviewed in *Bull. soc. ind. Mulhouse* 95, 273; *Chimie & industrie* 21, 443 (1929).

MARGIVAL, F.: *Encres usuelles*. Paris: Desforges, Girardot & Cie. 178 pp. F. 20. Reviewed in *Bull. soc. ind. Mulhouse* 95, 275; *Chimie & industrie* 21, 443(1929).

Oil paint. MATTHEW W. SAUNDERS and JAMES J. HYNES. Australia 12,361, Mar. 19, 1928. To increase the bulk and covering quality of oil paint a soln. of NaCl and (or)  $\text{MgCl}_2$  heated to b. p. is added to the paint, also heated, to produce double decompn. between the salt and the drier of the paint and to liberate an emulsifier.

Paint and cement compositions. C. NITTINGER. Brit. 303,938, Oct. 24, 1927. See Fr. 643,772 (C. A. 23, 1763).

Mixing paint ingredients by forcing them through a fine orifice. R. C. P. WEBSTER (to British Thomson-Houston Co., Ltd.). Brit. 303,380, Dec. 30, 1927. An app is described.

White lead. FRANK T. BAILEY and WILSON AUSTIN. U. S. 1,723,001, Aug. 6. See Brit. 273,287 (C. A. 22, 1862).

Lithopone composition. JAMES E. BOOGE and MARION L. HANAHAN (to Grasselli Chemical Co.). U. S. 1,722,174, July 23. A pigment of good "paint-mixing properties" comprises a light resistant lithopone, to the particles of which adheres a water-sol. dispersing agent comprising a soap, *e. g.*, the  $\text{NH}_4$  soap of sulfonated castor oil.

Ink. B. KALISCHER. Brit. 303,200, Sept. 30, 1927. See Fr. 644,086 (C. A. 23, 1763).

Intaglio-ink composition. GEORGE D. KNIGHT (to Emory Winship). U. S. 1,722,925, July 30. A quick-drying ink for use in intaglio printing of relatively high fluidity and of a degree of homogeneity sufficient to cause it to enter and be retained in the depressions of a hard metal intaglio printing form after wiping the form, and to be withdrawn from the depressions by paper without spreading over or excessively penetrating the paper, consists essentially of a "sirup" of gilsonite and a hydrocarbon distillate intermediate gasoline and kerosene and a pigment.

Varnish. PIETRO ROSSI. Fr. 34,196, Oct. 1, 1927. Addn. to 609,515. A varnish is made by adding zinc white to a mixt. of gum lac and alc.

Lacquers or enamels. BRITISH THOMSON-HOUSTON CO., LTD., H. W. H. WARREN and A. T. WARD. Brit. 303,915, Sept. 5, 1927. A glycerol-phthalic resin, which may be plasticized with oleic acid, is used with lacquers such as those formed with nitrocellulose or other cellulose derivs.

Coating various surfaces with cellulose derivatives, etc. C. DREYFUS (to British Celanese, Ltd.). Brit. 303,898, Jan. 12, 1928. Mixts. are used comprising finely divided org. derivs. of cellulose such as cellulose acetate, cellulose butyrate, or other esters or ethers, and plasticizers, with or without fillers, dyes, pigments and modifying substances. The powders may be prepd. as described in Brit. 282,723 (C. A. 22, 3988) and the coatings may be applied to a wide variety of specified materials and surfaces. Numerous details are given. Cf. C. A. 23, 3098.

Coating composition comprising nitrocellulose and synthetic resins. HARRY M. WEBER (to Ellis-Foster Co.). U. S. 1,722,776, July 30. Nitrocellulose is used with a rosin phthalic glycerol resin sol. in nitrocellulose solvents.

Resinous coating compositions. W. H. MOSS (to British Celanese, Ltd.). Brit. 303,169, Dec. 29, 1927. Resins such as phenol-aldehyde or acetone-phenol resins or

natural resins may be darkened in color by adding dyes or pigments, exposure to suitable actinic rays, addn. of catalysts such as  $\text{HCl}$ ,  $\text{H}_2\text{SO}_4$  or benzoic or salicylic acid during manuf. of the resin, or by addn. of materials such as furfural or  $\text{PhNH}_2$  during prepn. These darkened resins may be mixed with cellulose esters, etc., in prepg. *lacquers* or other compns. Cf. C. A. 23, 3588.

**Coating composition containing rubber.** CHARLES M. STINE and COLE COOLIDGE (to E. I. duPont de Nemours & Co.). U. S. 1,721,930, July 23. In prepg. a compn. suitable for *lacquers*, *varnishes*, etc., rubber is dissolved in a volatile solvent such as  $\text{C}_6\text{H}_6$  or turpentine to form a soln. having a viscosity as high as 2700 sec. (Scott viscometer) and agitated with O until the viscosity has dropped as low as 80 sec. A metal drier may be added. U. S. 1,721,931 (Charles M. Stine to duPont Co.) specifies a compn. contg. at least 10% rubber and having a viscosity not over 80 sec. (Scott), contg. also a drying oil such as bodied Perilla oil, a drier such as Co linoleate, an org. nitro compd., e. g., dinitrobenzene, and benzine or other suitable solvent. Cf. C. A. 22, 1705.

**Coating composition containing rubber.** CHARLES M. STINE and COLE COOLIDGE (to E. I. duPont de Nemours & Co.). U. S. 1,723,632, Aug. 6. A compn. suitable for use on metal, wood, leather, cloth, etc., is prepd. by mixing rubber with a drying oil, a cellulose deriv. such as ethyl cellulose and a substance such as Co linoleate which acts as a mutual catalyst for the curing of the rubber and the drying of the oil. Various examples are given. Cf. C. A. 23, 1528.

**Colored protective finishes on rubber-coated and other fabrics.** W. S. GOCHER and A. N. PARRETT (to E. I. duPont de Nemours & Co.). Brit. 303,368, Dec. 31, 1927. A finish which does not crack or peel after baking is obtained on rubber-coated fabrics and the like by use of a hydrocarbon oil obtained by heating asphalt, petroleum residuum, stearin pitch or other suitable bituminous materials to a temp. such that decompn. occurs and an oil distills off which is usually a brownish fluid. Pigments, solvents, etc., may be added. Various examples and details are given.

**Coating wire with baked insulating enamel.** RICHARD D. JESSUP (to Western Elec. Co.). U. S. 1,722,797, July 30. An app. is described.

**Coating surfaces with bituminous water japan.** WHEELER P. DAVEY (to General Elec. Co.). U. S. 1,723,844, Aug. 6. The electrodeposition of a bituminous water japan contg. a metal alkali soap as the emulsifying agent is improved by adding 1-10%  $\text{NH}_3$  to the japan.

**Resins.** THE NEWPORT Co. Fr. 657,945, July 21, 1928. See Brit. 294,526 (C. A. 23, 2050).

**Composite resin ester.** CARLETON ELLIS. U. S. 1,722,566, July 30. A resinous product of low acid number and capable of blending readily with nitrocellulose is prepd. from rosin, glycerol and phthalic anhydride, by using more rosin than of the other ingredients.

**Phenol-aldehyde resins.** ALLGEMEINE ELEKTRICITÄTS-GES. (to International General Elec. Co.). Brit. 303,905, Jan. 12, 1928. An excess of  $\text{CH}_2\text{O}$  is used with a monohydric or polyhydric phenol and the final stage of reaction is effected under heat and pressure. The resin may be dissolved in glycerol to form a lacquer which may be baked after being applied. Various details are given.

**Artificial resins.** KUNSTHARZFABRIK FRITZ POLLAK G. M. B. H. Fr. 657,794, June 14, 1928. In the manuf. of condensation products of carbamides or their derivs., particularly urea, and aldehydes, particularly  $\text{CH}_2\text{O}$ , the 2 constituents react in acid soln. in the proportion of less than 2 mols. of  $\text{CH}_2\text{O}$  for 1 mol. of urea so that in each phase of the treatment, a relative excess of free  $\text{CH}_2\text{O}$  is present with respect to the amt. of urea momentarily introduced and still uncombined. The addn. of urea is made gradually and the amt. added is reduced as the action proceeds, but is regulated so that in the concn. of acid chosen all the urea has entered into reaction before gelatinization of the mass takes place. The acid treatment may be alternated with neutral or alk. steps, a neutral or alk. step preceding the acid treatment. Cf. C. A. 23, 3589.

**Synthetic resin composition.** THEODORE F. BRADLEY. U. S. 1,722,554, July 30. A compn. which is suitable for hot-press molding comprises a binder of a resinous complex contg. the reaction products of Congo resin, phthalic anhydride and glycerol.

**Synthetic resins.** P. CHESTAKOFF. Brit. 303,022, Dec. 22, 1927. The quality of condensation products from cresol and  $\text{CH}_2\text{O}$  is improved by adding to the liquid dehydrated intermediate product an org. sulfonic acid of high mol. wt. and high dispersive power such as octohydroanthracenesulfonic acid, isopropyl-naphthalenesulfonic acid, sulfo-aromatic fatty acids and the acids obtained by sulfonating mineral oils.

**Synthetic resins.** COMPAGNIE NATIONALE DE MATIÈRES COLORANTES ET MANU-

**FACTURES DE PRODUITS CHIMIQUES DU NORD RÉUNIES ÉTABLISSEMENTS KUHLMANN** Brit. 303,386, Dec. 31, 1927. A polyhydric alc. such as glycerol or glucose is heated together with a polybasic aromatic acid or anhydride such as phthalic anhydride and a natural resin or gum such as colophony, manilla, dammar or Congo. The products are sol. in esters such as Et, Bu, Am and benzyl acetates and Et, Bu and Am phthalates, and are suitable for use alone or with nitrocellulose or cellulose acetate in producing *varnishes or molded articles*. Brit. 303,387 relates to resinous compns obtained by the combination of an aliphatic polyhydric alc. with a mixt. of a polybasic aromatic acid or anhydride and one or more natural resins or gums, which may be condensed with linseed oil or other siccative oil by heating together in an autoclave. The products are suitable for making *insulating varnishes*, etc., which may be baked. Brit. 303,388 relates to synthetic resins obtained by reaction of a resin ester or a mixt. of one or more natural resins or gums with a condensation product of an aliphatic polyhydric alc. such as glycerol and a polybasic acid or anhydride such as phthalic anhydride, or obtained by reaction of a resin ester, already formed or in course of formation, with such an acid or anhydride, with or without a polyhydric alc. Several examples are given, and the products may be further condensed with a siccative oil such as linseed oil. The resultant materials are suitable for use in various mixts. for making *varnishes, lacquers, paints or molded articles*.

**Molding artificial resins.** HEROLD A.-G. Brit. 303,103, Dec. 28, 1927. Thin plates or other articles of artificial resin are formed by hardening the material by heating in the presence of Ni plates or the like inserted into the mass. These may afterward be removed and the spaces filled with material of different color if desired.

**Moldable mixture containing synthetic resin and cellulose ester.** CLARENCE A. NASH (to Bakelite Corp.). U. S. 1,721,742, July 23. A molding mixt. comprises a resin of the urea- $\text{CH}_2\text{O}$  type, a filler such as wood flour and a cellulose ester such as cellulose acetate. Cf. C. A. 23, 1517.

**Linoleum.** G. E. HEYL AND HYCOLITE LIQUID WALLPAPER MFG. CO., LTD. Brit. 303,292, Feb. 7, 1928. Finely disintegrated dry oil-resistant paper or fibrous pulp such as wood pulp is used instead of cork for making linoleum, together with a so-called "mineral lubricant," of which china clay and plaster of Paris are given as examples. Paper used may be preliminarily soaked in varnish or drying oil and dried. Various details are given.

## 27—FATS, FATTY OILS, WAXES AND SOAPS

E. SCHERUBEL

**American reindeer fat.** WALTER F. BAUGHMAN, GEORGE S. JAMIESON AND R. S. MCKINNEY. *Oil and Fat Ind.* 6, No. 8, 11-2(1929).—Five samples of reindeer fat representing the combined fats of kidney, rib, chuck and brisket, rump, buttock and flank, and loin end and short loin gave the following const.: m. p. 45.8-47.4°,  $d_{25}^0$  0.8981-0.8993,  $n_{20}^0$  1.4510, acid value 2-8.6%, sapon. no. 194.3-199.2, unsapon. 0.4%, I no. 33.7-39.4, acetyl no. 5-8, R. M. no. 0-0.3, Polenske no. 0.3-0.5, satd. acids 53.6-59.9%, unsatd. acids 35.2-41.4%, I no. of unsatd. acids 90. The % composition of reindeer fat: olein 36.8, myristin 6.7, palmitin 35.0, stearin 20.5, arachidin 0.7. E. S.

**Microchemical determination of the acetyl value.** F. PREGL AND A. SOLTYS. *Mikrochemie* 7, 1-9(1929).—The substance (3-5 mg.), preferably compressed into a pastille, is introduced into a small pear-shaped flask, the bulb of which is then filled with dry glass beads. The flask is connected by means of a side tube at the top of the bulb to a purifying and drying app. for air, and by means of a side tube in the neck with a U-tube packed with glass beads moistened with a satd. soln. of  $\text{KH}_2\text{PO}_4$  to absorb any  $\text{SO}_2$ . The other limb of the U-tube is connected by a Ag tube and condenser to the absorption flask contg. standard NaOH. The flask is heated in a water bath for 20-40 min. while 1 cc. of a 25% soln. of toluene-*p*-sulfonic acid is introduced by means of a dropping funnel. The flask is then cooled and a slow current of purified air is drawn through it by attaching the side tube of the absorption flask to a vacuum pump capable of exhausting the app. to 15 mm. pressure. After 10 min., 1 cc. of water is allowed to drop into the decompn. flask and the air current continued for another 10 min. without interrupting the suction. The U-tube is then immersed in hot water and the suction continued for a further 10 min. to ensure that all the acetic acid distills into the absorption flask. The soln. in the latter is finally titrated with HCl, in slight excess which is detd. by titration with 0.01 N NaOH. B. C. A.

**Nature, manufacture and general use of stearic acid.** D. F. CRANOR. *Ind. Eng. Chem.* 21, 719-21(1929).—Descriptive. C. C. DAVIS

**The constitution of the glycerides of the fatty oil of Guizotia oleifera.** A. STEIN AND F. ULZER. *Wissenschaftl. Mitt. Osterreich. Heilmittelstelle* 1928, VIII-X; *Chem. Zentr.* 1928, II, 1337.—By bromination of niger seed oil, the fatty oil of *Guizotia oleifera*, which is obtained from ramtilla or niger seed, S. and U. prepd. 2 bromoglycerides. The 1st one is liquid and probably is a triolein bromide, while the other one is solid and represents a mixt. of linoleic acid triglyceride bromide and dilinoleic acid monooleic acid glyceride bromide. G. SCHWOCH

**Chemical investigations on coconuts and oil palm.** C. D. V. GEORGI. *Malayan Agr. J.* 17, 127-39(1929).—The investigation being carried on is the establishment of standards for oil content of Malayan estate copra. The variations of oil on H<sub>2</sub>O-free basis for 17 samples were 62.3 to 66.9%. The prepn. of oil-palm products is described. E. SCHERUBEL

**Olive oil analytical method. II. The use of the ultra-violet ray in the detection of refined in virgin olive oil.** SIDNEY MUSER AND CARL E. WILLOUGHBY. *Oil and Fat Ind.* 6, No. 8, 15-6(1929); cf. *C. A.* 23, 1003.—The purpose of the work was to confirm the work of European labs. The ultra-violet lamp has proved successful in detecting refined in virgin olive oil down to a limit of 5% of the former. It is believed that the chlorophyll content det. the characteristic fluorescence of an oil, and that the bluish violet fluorescence of a refined oil is due to a change in the chlorophyll constituents brought about by the refining process. E. SCHERUBEL

**Piqui-a fruit oils.** C. D. V. GEORGI. *Malayan Agr. J.* 17, 166-70(1929).—Piqui-a fruit is similar to oil-palm fruit; it contains 2 oils, one in the pericarp of the seed and the other in the kernel. The const. of the pericarp oil are:  $d_{20}$  0.8622,  $n_D^{20}$  1.4726, sapon. no. 204.9, I no. 46.6, acidity 1.1% oleic acid, unsapon. 0.7. Fatty acids. Titer 48°, mean mol. wt. 274, I no. 48.5. The const. of the kernel oil are:  $d_{20}$  0.8617,  $n_D^{20}$  1.4726, sapon. no. 202.9, I no. 52, acidity 0.2% oleic acid, unsapon. 1.3. E. SCHERUBEL

**Oil from Hydnocarpus anthelmintica.** C. D. V. GEORGI AND GUNN L. TEIK. *Malayan. Agr. J.* 17, 171-4(1929).—Lack of seed prevented a detailed examn. of the fatty acids but const. found were: Oil  $d_{20}$  0.9429,  $n_D^{20}$  1.4726, sapon. no. 206.4, I no. 81.5, acid no. 1.0,  $\alpha_1$  (CHCl<sub>3</sub> soln.) 49.7°. Fatty acids, titer 39.1°, mean mol. wt. 260.5, neutralization no. 215.3, I no. 84.8,  $\alpha_{2-8}$  (CHCl<sub>3</sub> soln.) + 49.7°. The value of the oil from a medical point of view can only be ascertained when the proportions of the fatty acids present are known. E. SCHERUBEL

**Carthamus tinctorius oil. Safflower oil.** J. TZUKERVANIK. *Acta. Univ. Asiae Med.* 1928, Ser. 6, No. 2, 3-19.—The compn. of safflower is isolinoleic acid 0.05, linoleic acid 39-50, oleic acid 34-37, palmitic acid 5-6, stearic acid 3-4, glycerol radical (C<sub>18</sub>H<sub>37</sub>) 4.6, and unsapon. 0.5-1.0%. The wt. increase of this oil due to oxidation is 5.3-5.6%. The pressed oil may be used for edible purposes and it is also satisfactory for varnish. E. SCHERUBEL

**Fish oils. I. Some properties of commercial pilchard oil.** H. N. BROCKLESBY. *Can. Chem. Met.* 13, 212-4(1929).—Pilchard oil is highly unsatd. and contains 30% of solid acids. The unsatd. acids contain 8.5, 3.8 and 17.9%, resp., of tetra-, tri-, and di-ethylenic acids. The rest of the acids probably are of the mono-ethylenic type. The oil deposits up to 50% of semi-solid glycerides, depending on the temp. It can be bleached and partially sulfonated; and by the use of suitable catalysts it can be made to dry as quickly as boiled linseed oil. Pilchard oil films afford as good protection against H<sub>2</sub>O as linseed oil films. The pptd. semi-solid glycerides have been hydrogenated to a solid white, odorless and tasteless mass. E. SCHERUBEL

**Solvents for waxes.** O. A. PICKETT. *Ind. Eng. Chem.* 21, 767-8(1929).—The following waxes and solvents were used: Beeswax, candelilla, carnauba and montan wax, and V. M. and P. naphtha, turpentine, No. 22 thinner, solvenol, pine oil, sulfonated castor oil and equal parts by wt. of the latter two. Tests were made by weighing the wax and solvent into a 100-cc. Erlenmeyer flask, sealed with a cork contg. a thermometer. The flask was heated until the wax was in soln. and then the point at which the wax began to ppt. on cooling was detd. E. SCHERUBEL

**The polysaccharides as admixtures to soaps.** A. BEYRODT. *Allgem. Öl- u. Fett-Ztg.* 25, 411-3; *Chem. Zentr.* 1928, II, 1505. G. SCHWOCH

The factors in the process of oil formation in plants (IVANOV) 11D. The Bull method for the rapid estimation of the fat content in fish, meat and other animal or vegetable products through extraction (SREBELIEN) 12. The coagulation of Na soap (CIRÓ) 11A. Spray desiccation of soap solutions (Brit. pat. 303,576) 1. Apparatus for

vacuum distillation of oils (Brit. pat. 303,078) 1. [Soaps] from dibasic acids from products of mineral oil oxidation (U. S. pat. 1,721,958) 22. Oil filter (U. S. pat. 1,723,274) 22.

**Extraction of fat from cacao powder or similar extractions.** CLARENCE F. EDDY (to Proscio Oils Corp.). U. S. 1,721,858, July 23. An app. is described in which a solvent such as  $C_6H_6$  is caused to flow upwardly by displacement through a zone in which it is agitated with cacao powder or other material to be extd. and through a second zone where it is permitted to become relatively quiescent so that material in the latter zone acts as a filter for the solvent.

**Extracting fats from animal or vegetable materials.** J. A. S. VAN DEURS. Brit. 303,413, Jan. 2, 1928. The sepn. of fat or oil is assisted by heat, agitation, centrifugal action, etc., and the  $p_H$  may be brought below 5 by adding acid or acid-forming bacteria, in the treatment of materials such as fish liver, copra, olives, or mixts. of fats or oils and other substances such as mineral oils and fuller's earth, fat and hydrogenating catalyst. This treatment promotes the formation of a continuous phase of the oil or fat.

**Wool fat.** I. G. FARBERINDE. A.-G. Brit. 303,890, Jan. 13, 1928. Wool fat is refined by esterifying with an alc. such as MeOH or EtOH in the presence of concd.  $H_2SO_4$  or other suitable inorg. acid. Malodorous substances are thus removed.

**Dry-rendering fatty materials.** W. T. POWLING (to John W. Pittock). U. S. 1,722,015, July 23. In a treatment of material by dry-rendering to produce cracklings which are substantially water-free and which are sepd. by draining from rendered fat, the heated sepd. cracklings are subjected to the action of hot vapor to promote the extn. of their fat content, under pressure and temp. conditions which are substantially inhibitive of condensation of the vapors in the presence of the cracklings. An app. is described.

**Preserving fatty and oily materials.** J. A. S. VAN DEURS. Brit. 303,059, Dec. 27, 1927. Cod livers or other fish livers, herrings or other fish, oleaginous fruits and seeds, etc., are preserved by surrounding them with material having a  $p_H$  of less than 5.

**Fatty acids.** RAYMOND VIDAL. Fr. 33,131, July 23, 1927. Addn. to 633,922. Fats, oils or fatty acids are treated with alkali hypochlorites in the presence of a mineral or org. acid, and the products thus modified are treated with alkali hypochlorites or hypobromites either alone or in the presence of the org. compds. specified in the prior patent. Cf. C. A. 23, 4360.

**Extracting oleaginous grain.** JEAN MOTTE. Fr. 657,687, Dec. 1, 1927. Oleaginous grain is powd. and triturated with water and a solvent for albuminoid material to obtain an emulsion resembling milk, from which insol. substances are removed. The grain should contain sufficient fatty and albuminoid material to give a stable colloidal substance. The emulsion may be sepd. into its constituents in the same way as with milk.

**Pressure-roll apparatus for expressing oil from crushed seeds, etc.** H. NEWALL and CROSFIELD & SONS, LTD. Brit. 303,649, Jan. 5, 1928. Structural features.

**Hydraulic press for extracting oil from seeds or fruit.** DUCHSCHER ET CIE. Brit. 303,498, Jan. 6, 1928. Structural features.

**Apparatus for cooking palm fruits for the extraction of oil.** DUCHSCHER ET CIE. Brit. 303,497, Jan. 6, 1928. Structural features.

**Recovering oil from cottonseed or fish meal or other oleaginous meals.** ROBERT O. BOYKIN (to N. Russell Vail). U. S. 1,721,686, July 23. The meal is freed from moisture sufficiently to render it substantially dry, agitated with  $C_6H_6$  or other suitable water-insol. oil solvent of a sp. gr. not higher than the sp. gr. of the meal, for at least a half hr. and the mixt. is then distributed upon a supporting medium and the soln. of solvent and oil is removed, the meal is washed with fresh solvent and this is sepd. and the oil recovered from the solvent. An app. is described.

**Sulfonated oils.** ERBA A.-G. Fr. 657,799, June 21, 1928. See Brit. 292,574 (C. A. 23, 1520).

**Sulfonated oils.** ERBA A.-G. Fr. 658,094, July 26, 1928. Animal or vegetable fats or fatty acids or hydrocarbons, oils, mineral waxes, etc., are sulfonated in the presence of oxidizing or reducing bleaching agents, and before or after neutralization are given a subsequent bleaching treatment. As bleaching agents, sulfites, hyposulfites, persalts or  $H_2O_2$  may be used. Examples are given. Cf. C. A. 23, 2589.

**Soap production and other chemical reactions.** JACOB W. SPENSLEY. U. S. 1,722,687, July 30. By passing the reacting materials through a mill of the high-speed centrifugal type with intercalating pins mounted on disks, reactions are expedited such as soap manufacture, refining edible oils, manuf. of lubricants and greases, prepn. of

disinfectants from rosin and crude cresols, rosin size manuf., NaOH production from  $\text{Na}_2\text{CO}_3$  and milk of lime, and prepn. of accelerator and compounding mixts. for rubber vulcanization. Numerous details and examples are given and an app. is described.

## 28—SUGAR, STARCH AND GUMS

J. K. DALE

The trend in sugar technology. FR. NOSEK. *Listy Cukrovar* 47, 563-4(1929).

Possible economies in sugar technology. G. PARMA. *Listy Cukrovar* 47, 595 (1929).—Only a portion of the theoretical CaO is added with (0.25-0.30%)  $\text{CaCO}_3$  which yields a firm sediment and decreases the wear of filter cloths. FRANK MARESH

The lowering of the yield in sugar technology and denaturing of sugar. JOSEPH HERNYCH. *Listy Cukrovar* 47, 465-6(1929).—A discussion. FRANK MARESH

Sugar refining season for 1928-29. JAROSLAV MIKOLÁŠEK. *Listy Cukrovar* 47, 479-81(1929).—An av. sample showed: polarization 94.87, moisture 2.21, ash 0.93, org. matter 1.94, sugar according to Clerget = 94.73, CaO 0.020, alky. to phenolphthalein = 0.006, to litmus 0.016, reducing substances 40.1 mg. Cu per 10 g. sample, total N = 0.192. The ash of molasses showed: total  $\text{CO}_3$  = 9.66,  $\text{CaCO}_3$  = 0.72, KCl 0.80,  $\text{K}_2\text{SO}_4$  0.68,  $\text{K}_2\text{CO}_3$  5.74,  $\text{Na}_2\text{CO}_3$  1.47 and  $\text{K}_3\text{PO}_4$  0.25. FRANK MARESH

Amides in sugar refinery products and their relation to the decrease in alkalinity. JIŘÍ VONDRÁK. *Listy Cukrovar* 47, 419-23(1929).—Observations were made on factory juices in 4 mills. At 2 mills in a region of low rainfall a decreasing alky. was observed; at the next 2 the alky. and rainfall were high. Polarization, alky., CaO, total N,  $\text{NH}_3$ , amide N, and N after acid hydrolysis were detd. Diffusion juices from mills in a dry area showed a lower alky and a higher total N (about 50%), than juices from a region of higher rainfall. The amide content was high but alkalinity was low in juices from regions of low rainfall. By hydrolyzing the concn. juices, V. finds that glutamine predominates in juices from beets in the arid area and is present in small amounts in juices from regions of a high rainfall. Asparagine was not found in the hydrolyzates. FRANK MARESH

Indeterminate chemical losses of sugar in refining. M. I. NAKHMANOVICH. *Zhur. Sakharnoi Prom.* 1, 238-46(1927).—Expts. proved that total indeterminate losses are equal to 0.25-0.35%. A rational scheme for the movement of products, lowering of the temp. at certain stations, affination of raw sugars, decrease of amt. of waste water from bone-black filters, etc., will decrease chem. losses in refining. V. E. BAIKOW

Control of losses in the sugar house. AMAURY DOMOULIN. *Bull. assoc. chim. suc. dist.* 46, 218-25(1929).—D. discusses in detail the detn. of losses at various points in the factory and illustrates the calcn. of these losses. The true vol. of the juice from the battery is detd. by multiplying the observed vol. by 0.965 to correct for bubbles in the juice, and making a temp. correction of the vol. to 20° by means of a table given. From the diffusion loss and the av. sugar content of the beets and of the juice, and the true vol. of juice, a good estimate of the amt. of beets worked can be made. Methods for detg. the sol. and total sugar in muds are reviewed. A table is given for recalcul. the sugar content of thin muds to a 50% dry solids basis. Causes for the drop in purity between clarified juice and sirup are reviewed. F. CAMPS-CAMPINS

Microscopic observations on the saturation process. T. BREDT. *Z. Ver. deut. Zuckerind.* 79, 285-315(1929).—Fuchsin-stained photomicrographs are given of 1st satn. juices. Round bodies, slime particles, and crystals of  $\text{CaCO}_3$  are identified. In polarized light some of the round bodies show polarization crosses, while others show a tangled mass of polarization lines: these bodies contain  $\text{CaCO}_3$  crystals. Dry-limed satn. juices gave a similar photomicrograph. Juices with a high content of round bodies filter easily. Classen's observation that dry liming of juice gives a higher initial alky. than the use of milk of lime was confirmed. In both cases during satn., the juice alky.-time curve showed a distinct kink; the point of optimum filterability occurred after different periods of time and at different alkalinities in the two processes. The ability of a juice to settle in a stand glass is in no way connected with the rate of filtration; if the temp. is above 75° a good settling is always obtained but the rate of filtration is indifferently affected. In a factory test, a 1st satn. juice originally treated with 20% satn. juice prior to satn. showed no improved filterability. Slime and jelly particles have been observed in filtered 2nd carbonatation juice which seemed absolutely clear to the eye. It is probable that the addn. of carbonatation juice to the raw juice

prior to satn. helps the settling and gives a better 1st satn. filtered juice. For comparing rate of filtration hot or cold juices may be used provided the different samples are at the same temp. Press cakes have a higher sugar content if  $\text{CH}_3\text{COOH}$  is added beyond the neutral point than if the ordinary  $\text{CH}_3\text{COOH}$  method to neutrality is used; it is assumed that the excess of acid facilitates the diffusion of sugar from the round bodies. The effect of the amt. of  $\text{H}_2\text{O}$  used in digesting the press cake on the polarization of the press cake was studied. It is concluded that along with the process of sugar diffusing from the slime particles (cf. Spengler and Brendel, *C. A.* 23, 3367) there are other phenomena that favor or hinder the detn. of sugar in press cake. Again the rate of diffusion of sugar from the slime particles seems to be greatly retarded at 5%. Various explanations for the formation of the round bodies in the satn. juice are reviewed. F. C.-C.

**The heating of clarified juice under pressure in a juice heater and its proper application.** ERNST THIELEPAPE AND PAUL MEIER. *Z. Ver. deut. Zuckerind.* 79, 316-26 (1929).—The authors' methods for the detn. of the decompn.  $\text{CO}_2$ , carbonate  $\text{CO}_2$ , and bicarbonate  $\text{CO}_2$  are reviewed. The decompn.  $\text{CO}_2$  is formed by the breaking down of org. material accompanying the sucrose. The sugar destroyed is practically nil at 116–120° for the time of heating required in the factory. The greater portion of the  $\text{CO}_2$  is given off at the beginning of the heating. A drop in lime content during heating is explained by the sol. org. lime salts being decompd. and  $\text{CO}_2$  being given off. A table shows the various  $\text{CO}_2$  figures obtained during the 1928 campaign. When the 2nd satn. juices are properly heated the bicarbonate- $\text{CO}_2$  content of the juice should be very small and the decompn.- $\text{CO}_2$  value low. The practical phase of the question is discussed. Pressure heating splits off  $\text{CO}_2$  before the juice reaches the effects; thus the condensate waters from the effects can be used as boiler feed water. Temps of 116–120° further a double decompn. of org. lime salts with alk. carbonate causing  $\text{CaCO}_3$  to sep. In the factory an additional filter was required to remove material from the juice. The heating of the juice may further colloid coagulation. F. C.-C.

**Evaporation of sugar juices in the presence of activated charcoals.** V. SÁZAVSKÝ. *Listy Cukrovar.* 47, 448-9 (1929).—With the exception of some charcoal entering the filtrate, evapn. of sugar juices with the addn. of activated charcoal offered no technological difficulties. FRANK MARESH

**The significance of sampling in sugar analyses.** J. VONDRÁK. *Listy Cukrovar.* 47, 443-8 (1929).—A review. FRANK MARESH

**Diffusion juices from diffusion batteries.** J. SÝKORA. *Listy Cukrovar.* 47, 423-6 (1929).—A technological discussion. FRANK MARESH

**New concepts in diffusion.** KAREL ANDRLÍK. *Listy Cukrovar.* 47, 586-8 (1929). A discussion of colloid concepts in the beet. FRANK MARESH

**Laboratory apparatus for diffusion experiments.** VL. STANĚK. *Listy Cukrovar.* 47, 583-6 (1929).—Š. describes a cutter in which the beets are moved pneumatically over stationary knives. Diffusion cells also are described. FRANK MARESH

**The effect of sediment upon digestion and evaporation of light liquors.** VL. STANĚK AND P. PAVLAS. *Listy Cukrovar.* 47, 427-33 (1929).—The addn. of suspended particles of  $\text{CaCO}_3$  to liquors during digestion and evapn. decreased the amt. of incrustation. The particles of  $\text{CaCO}_3$  formed nuclei upon which other solid particles deposited in preference to the walls of the vessel. Aragonite prepd. by pptg. a Ca salt with  $\text{Na}_2\text{CO}_3$  at b. p. was more effective than the formation of a suspension in the sugar liquor directly. The favorable effect of aragonite was shown in distg.  $\text{H}_2\text{O}$ ; a suspension of 0.01% aragonite altered the compn. of the deposit upon the container; even in water high in  $\text{CaSO}_4$  the sediment was loose, sepd. from the walls spontaneously, and was easily removed by stirring with a rubber-tipped stirring rod. Without the addn. of aragonite a hard adherent crust formed which had to be removed by boiling alternately with  $\text{Na}_2\text{CO}_3$  and dil. acid. The discoloration of beet juices was not considered in this expt. FRANK MARESH

**Denaturing raw sugar.** K. ŠANDERA. *Listy Cukrovar.* 47, 452-6 (1929).—A discussion of methods by which raw sugar may be denatured for human consumption yet remain a food for cattle. Methods for controlling the denaturing process are discussed. FRANK MARESH

**The origin of reducing substances during the heating of an alkaline solution of sucrose and their analytical behavior.** MARIE HERLESOVÁ. *Listy Cukrovar.* 47, 467-72 (1929).—Ten g. of sucrose was dissolved in 50 cc.  $\text{H}_2\text{O}$  and digested with 0.5 g.  $\text{NaOH}$  from 0 to 120 min. The digestion gave rise to decompn. products which reduce Fehling soln., but cannot be invert sugar, for they are not decomposed further in alk. soln. The solns. became deeply colored, but the alky. was not reduced to neu-

trality or acidity. The quantity of reducing substances increased with the time of digestion and attained an equil. after 39 hrs. Only from  $\frac{1}{2}$  to  $\frac{1}{3}$  of the reducing substances are pptd. by Pb acetate, etc. During the refining of sugar, these reducing substances are concd. in the sirups and molasses. They are to be studied further.

FRANK MARESH

**The influence of some nitrogenous substances upon the determination of invert sugar in refinery products.** MARIE HERLESOVÁ. *Listy Cukrovar.* 47, 475-9(1929).—The presence of  $\text{NH}_3$  prevents the pptn. of  $\text{Cu}_2\text{O}$  from Fehling soln. Amides lower the quantity of  $\text{Cu}_2\text{O}$  pptd. and are more effective in this capacity than  $\text{NH}_3$  on a basis of equiv. N content. The decompn. of the amide by alkali is slow and progressive; The purine bases: adenine, guanine, hypoxanthine (in the form of hydrochloride) vernine, xanthine and guanidine were added (in 5 mg.) quantities to 20 mg. of invert sugar, made up to 50 cc., treated with 50 cc. of Fehling soln., boiled 2 min. and titrated. The pptd.  $\text{Cu}_2\text{O}$  was also detd. gravimetrically; the N in the ppt. was detd. All of the above bases caused a decreased pptn. of  $\text{Cu}_2\text{O}$ . Vernine was the most effective, guanidine least. The fraction of N found in the ppt. was: adenine 86%, xanthine 57%, guanine and hypoxanthine 29%, vernine 6% and guanidine 21%. Without invert sugar, blanks showed a N pptn. of 2-6%. The presence of reducing substances is necessary to ppt. Cu-purine compds. All of the purine N is not pptd.; the Cu salts of purine bases are more sol. in the soln. than  $\text{Cu}_2\text{O}$ . Asparagine and glutamine act like purine bases. About  $\frac{1}{4}$  of the purine bases may be adsorbed by activated charcoal, while decompn. products of sucrose in alk. soln. are also removed by this treatment.

FRANK MARESH

**Sugar beet experiments, 1927.** ANON. *J. Dept. Agr. Ireland* 28, 37-66(1929).—The percentages of sugar in a no. of varieties of sugar beets grown for exptl. purposes in Ireland are tabulated.

K. D. JACOB

**The storage of sugar beets.** KAREL ŽERT. *Listy Cukrovar.* 47, 433-4(1929).—Z proposes to increase the capacity of mills by storing beets in large heaps, over refrigerating coils, and maintaining a temp. from ( $1^\circ$  to  $8^\circ$ ) until ready for diffusion.

FRANK MARESH

**Drying of beets and influence upon digestibility.** B. ZIMMERMANN. *Listy Cukrovar.* 47, 436-9(1929).—Beets were sliced and others were hashed and dried in the air. The digestibility of the sliced was from 18.0 to 18.12% higher. The expt. was repeated with beets held at  $0-2^\circ$  and  $5-10^\circ$  during drying, the rate of drying being about  $\frac{1}{2}$  of the normal.

FRANK MARESH

**Effect of the drying of fresh beet cossettes on the content of nitrogenous compounds in the exhausted cossettes.** O. SPENGLER AND W. PAAR. *Z. Ver. deut. Zuckerind.* 1928, 796-800.—A 10 kg. batch of fresh beet slices was divided into 2 equal parts, one of which was dried on trays to a moisture content of 4%, and both were then extd. with hot water in a small battery of 3 glass vessels until the ext. run off contained only 0.4% of solids. The drying of the cossettes was found to have no effect on the amt. of total N or true proteins (precipitable by  $\text{Cu}(\text{OH})_2$  present. Extn. removed 49.8% of the total N and 25.7% of the true proteins from the fresh cossettes, and 42.2% of the total N and only 7.7% of the true proteins from the dried cossettes.

B. C. A.

**Treatment of low-grade beet-sugar products.** V. I. KUZNETZOV. *Zhur. Sakharnoi Prom.* 1, 235-8(1927).—Sugar obtained from the second crystn. (5-6% on wt. of beets) is dissolved in the juice of the second carbonation making  $60^\circ$  Brix and generally treated by one of the 3 following methods: (1) returned to thick juice without treatment; (2) sent to the second carbonation and treated with  $\text{CaO}$  and  $\text{CO}_2$  or (3) mixed with thin or thick sirup and sulfitated. K. made several expts. to det. a convenient method for treatment of this sugar. The remelt ( $16-18^\circ$  Brix) was heated to  $90^\circ$ , limed, defecated and then satd. with  $\text{CO}_2$ . Decrease of color was sufficient, but the purity remained unchanged. In the 3rd method by which the sugar is dissolved in thin sirup to  $60^\circ$  Brix, then heated to  $90^\circ$ , limed to an alky. of 0.06-0.07, sulfitated to an alky. of 0.005, then heated to  $95^\circ$  and filtered, the increase of purity is very slight, but the decrease of the color is 28.3%. Factory expts. verified the lab. results. V. E. B.

**Treatment of low-grade beet products.** G. S. BENIN AND B. F. KRASILSHCHIKOV. *Nauch. Zapiski Sakharnoi Prom.* 8, 73-90(1929).—Expts. were performed to det. the best treatment for remelt and green sirups. Carbonation of the liquors effects little decolorization. Sulfitation of the liquors at  $75^\circ$  gives good results and is advisable. A  $p_{\text{H}}$  of 7.0 for remelts and 6.5 for greens is advisable when liquors are heated at  $75-95^\circ$  during 5-10 hrs. At lower  $p_{\text{H}}$  under the same conditions inversion occurs. At a moderate temp. the  $p_{\text{H}}$  can be lowered to 4.0 without danger of inversion. Decolorization of liquors increases during sulfitation with a drop in  $p_{\text{H}}$ . No increase in surface

## 29—LEATHER AND GLUE

ALLEN ROGERS

**Comparative results of the International Society of Leather Trades Chemists Commission on the international official method of quantitative tannin analysis.** M. BERGMANN, *et al.* *Collegium* 1929, 233-47.—Several steps in the Provisional International Official method (cf. *C. A.* 21, 3139) were investigated. For filling desiccators  $\text{H}_2\text{SO}_4$  and  $\text{P}_2\text{O}_5$  gave approx. the same result for total solids and the wts. did not change overnight; results with  $\text{CaCl}_2$  were 0.5 to 3% high. Evapg. dishes of Ag, steel, half glazed and fully glazed porcelain gave identical results. Extns. of materials were made in the Koch app. to 1 l. and to 2 l. and in the Grasser-Allen app. (*C. A.* 6, 1383). Which method gave more nearly correct results could not be detd. but the 2 latter methods gave more uniform results. Soln. of exts. by the new method was compared with (a) dissolving in 1 l. of boiling  $\text{H}_2\text{O}$ , then heating on the steam bath for 5 min., (b) dissolving in 100 cc. of boiling  $\text{H}_2\text{O}$ , heating on the steam bath 0.5 hr. and then making to 1 l. with boiling  $\text{H}_2\text{O}$ . The new method did not give better results than the others. Moisture (in solid exts.) was the same whether the ext. was moistened with 3 cc. of  $\text{H}_2\text{O}$  before drying or not. Total solubles (total solids) by the Berkefeld candle-filter pump candle-filter tube or paper methods were nearly the same. There was a slight decrease on continued filtration, indicating clogging of the pores in all of the filters. A method proposed by Schmidt is considered promising: 75 cc. of ext. soln. and 1 g. of kaolin are shaken in a closed cylinder, then filtered through an S. & S. 590 folded filter, the filtrate is discarded; this filtration is repeated twice and the third filtrate is saved. Freshly chromed hide powder was compared with 6.25 and 6.5 g. of a ready-chromed powder shaken for 10 and for 15 min. Results with the 2 powders often differed but neither was consistently higher, so a ready-chromed powder should be as serviceable as a freshly chromed one. Changing the quantity of powder or time of shaking had little effect. The filter, old shake and new shake methods for nontannin were compared. The filter method gave the most uniform results. I. D. CLARKE

**Interferometric determination of tannin.** F. ENGLISH. *Collegium* 1929, 109-19. The method for detg. the factor for the instrument and for different tannins is described. This method gives satisfactory results for sol. solids and nontannin and is more rapid than the gravimetric method. I. D. CLARKE

**The determination of insoluble matter in tannin extracts.** C. RIESS. *Collegium* 1929, 103-4.—The method is similar to that of McCandlish and Atkin (*C. A.* 23, 3368). Suction is obtained, not with a pump, but by attaching a 2-mm. tube 1.2 m. long to the stem of the Buchner funnel. I. C. CLARKE

**The tanning properties of dyewood extracts.** H. A. BRECHT. *Collegium* 1929, 186-91.—The similarity in structure and properties of dyewoods and catechol tannins is pointed out. The dye exts. are not used for tanning principally because of the color they impart to the leather and their greater cost. I. D. CLARKE

**The distribution of chromium in one-bath chrome leather.** W. SCHINDLER AND K. KLANFER. *Collegium* 1929, 121-53.—Increasing basicity of the liquor increased the Cr content of both grain and middle splits; below 40% basicity the middle and above 40% the grain split was richer in Cr. Aging was of little importance with 22% basic liquors; with 45% basic liquors it was very important, the grain being richer in Cr with fresh liquors and the middle with aged liquors. The compn., especially pptn. no. and complex-bound  $\text{SO}_4$ , of 45% basic liquors was quite different even when they were prepd. in exactly the same way; the compn. of the leather depended on the compn. of the liquor. The pickle influenced Cr distribution greatly,  $\text{H}_2\text{SO}_4$  affecting principally the grain and formic acid the middle split. Change of Cr concn. (15 to 35 g.  $\text{Cr}_2\text{O}_3$  per l.) had no influence, temp. had considerable influence on Cr distribution. Addn. of soda to the liquor near the end of the tanning period increased the Cr content of the grain greatly but that of the middle very little. I. D. CLARKE

**Coloring leather with nitrocellulose lacquers.** H. ROSE. *Collegium* 1929, 262-4.—To obtain a satisfactory lacquer coating on leather the following points must be observed: the leather must first be dyed to the proper shade; it must be wiped with the diluent to remove fat just before applying the finish; a suitable plasticizer must be added to the lacquer; the spray gun should operate under at least 3 atm. pressure and the compressor should have oil and water separators. Two coats give a better finish but the second coat must be applied while the first is still moist. I. D. CLARKE

**The analysis of artificial leather bates.** II. V. KUBELKA AND J. WAGNER. *Collegium* 1929, 247-62; cf. *C. A.* 23, 1303.—The Kubelka-Wagner method is described in

detail. The following differences between this and the Schneider-Vlcek method are discussed: concn. relations, method of expressing the results, temp. of extg. the bate and influence of ammonium salts. K. and W. do not add a const. quantity of ammonium salts to develop max. activity but consider the salt content as one of the properties of the bate. Diagrams are given of a thermostat, a battery of 10 1-cc. pipets for delivering enzyme soln., water or acetic acid, an automatic pipet for delivering 5 cc. of the casein soln. and a box with light for detecting turbidity in the tubes. I. D. CLARKE

Glue testing. OTTO GERNGROSS. *Collegium* 1929, 119-21, 191-207; cf. C. A. 22, 3315.—See C. A. 23, 1523. I. D. CLARKE

Studies on adsorption and swelling (KUBEKKA, WAGNER) 2.

GRASSER, GEORG: *Handbuch für gerbereichemische Laboratorien*. 3rd ed., revised. Vienna: Verlag von J. Springer. 434 pp. Bound, M. 29.

Depilating carcasses. CHARLES T. WALTER (to Swift & Co.). U. S. 1,721,610, July 23. A mixt. of melted waxy and adhesive substances such as pitch, resin and paraffin is applied and allowed to congeal and then removed with attached hair and extraneous matter.

Tanning. FRANK S. LOW. U. S. 1,723,568, Aug. 6. Anhyd. chromic chloride is used with a metal capable of reducing it such as ferrochrome or Zn. Cf. C. A. 22, 2854.

Tanning. ALLEN ROGERS and ROBERT YUN HUA LEE. U. S. 1,722,594, July 30. Hides are treated with material contg. a simple non-condensed  $\alpha$ -naphthol group in the presence of a labile metal salt such as  $\text{FeCl}_3$  in small proportion.

Tanning. WILLIAM S. SHAW. U. S. 1,722,398, July 30. Hides are treated first with a soln. of relatively low tannin strength and subsequently in a soln. of high tannin strength. The spent soln. from the later stage treatment is treated with a reagent such as a sulfite which converts a portion of the non-tans into tans, and a hide-swelling agent such as lactic acid is added to this soln. and it is then used for the first stage of the treatment.

Condensed aromatic sulfonic acids for use in tanning, as mordants, etc. IAN C. SOMERVILLE (to Rohm & Haas Co.). U. S. 1,722,904, July 30. Use is made of the  $\text{CH}_2\text{O}$  condensation product of iso-Pr naphthalenesulfonic acid or similar compds. in which the radical substituted in the naphthalene is such that the C atom linked to the naphthalene nucleus is further linked to 2 (and 2 only) other C atoms and the fourth linkage is to H. These compds. are tanning agents and may also serve as mordants for certain dyes and as wetting or emulsifying agents or in fat-liquoring.

Dyeing chamois leather. CHEMICAL WORKS, formerly SANDOZ. Brit. 303,523, Jan. 5, 1928. Chamois leather is treated with oxidizing agents and dyed with vat or S dyes, and the dyeings may be finished by an after-treatment in an oxidizing bath such as an alkali dichromate or acidulated nitrite soln. Examples are given.

Belt dressing. ARMAN E. BECKER (to Standard Oil Development Co.). U. S. 1,721,762, July 23. A mineral oil of lubricating grade is used with an oil-sol. "Na sulfonate" and neat's-foot oil. Cf. C. A. 23, 3827.

Agglomerated leather. JOSEPH M. GONNISSEN. Fr. 657,765, July 11, 1928. See Belg. 351,717 (C. A. 23, 2598).

Carboxylic acids (suitable for use as softening agents in nitrocellulose coating compositions) produced by oxidation of petroleum hydrocarbons. ALOX CHEMICAL CORP. Brit. 303,560, Oct. 6, 1927. See Can. 283,892 (C. A. 23, 704).

Coating compositions for making "artificial leather." ALOX CHEMICAL CORP. Brit. 303,566, Oct. 6, 1927. See Can. 283,892 (C. A. 23, 704).

## 30—RUBBER AND ALLIED SUBSTANCES

C. C. DAVIS

The utilization of vulcanized latex (Revultex). L. Sr. *Gummi-Ztg.* 43, 2325-6 (1929).—The chief disadvantages of dried vulcanized latex are its tendency to adsorb water and to swell in org. solvents. After contact with water, films of dried vulcanized latex are easily disintegrated by rubbing. Quant. tests, in which films of Revultex [prepd. 2 mm. thick by drying at 45-50° and then over  $\text{H}_2\text{SO}_4$  to const. wt.] were swelled in water at 16.5-18.0° and the progressive increases in wt. during a period of 640 min.

detd. are described. During the early stages adsorption was relatively rapid, *e. g.*, 6.8% after 90 min., while after 640 min. it was 12.5% and had not reached a max. C. C. DAVIS

**Report on the effect of different dilutions of latex and strengths of coagulant on the plasticity, vulcanizing and mechanical properties of rubber.** ANON. *Trop. Agr. (Ceylon)* 71, 36-9(1928).—Two sets of thin crepe were prepared from latex contg. 15 and 30% dry rubber, with varying proportions of AcOH, HCO<sub>2</sub>H and Na<sub>2</sub>SiF<sub>6</sub>. Plasticity and vulcanization tests were made at the Imperial Inst. 6 mos. later. The results indicate that varying the concn. of the coagulant does not cause variation in plasticity or in vulcanizing and mech. properties. A. L. MEHRING

**Time and temperature-plasticity relations for crude rubber as measured with the Goodrich plastometer.** E. O. DIETERICH. *Ind. Eng. Chem.* 21, 768-70(1929).—Quant data are presented to show the applicability of the Karrer plastometer (*cf. C. A.* 23, 4106) to raw rubber and to uncured rubber mixts., including the relative plasticities at 100° of different types of rubber after different periods of mastication, the relative plasticities of batches of pale crepe of different sizes at 100° after different periods of mastication, and the relative plasticities of masticated smoked sheets at various temps. (the temp. coeff.). C. C. DAVIS

**The stretching and contracting of rubber lamella, the critical slipping temperature and its shifting by admixture.** M. KRÖGER AND WAN-NIEN YAO. *Z. Elektrochem.* 35, 358-62(1929).—It is shown that the unhindered inflation of rubber membranes to an approx. sphere represents a deformation especially favored by slipping. The energy increase in the case of the unhindered expansion of a sphere is as great as in longitudinal expansion. In spite of the difference of the outer deformation, the mol. processes accompanying the deformation are the same. The optical behavior also shows this. A crit. slipping temp. is obtained, which is shifted to a higher temp. by admixt. This gives a quant. measure of the "activity" of the added substance. R. I. RUSH

**Early experiments with stearic acid in rubber compounding.** W. F. RUSSELL. *Ind. Eng. Chem.* 21, 727-9(1929).—See U. S. patent 1,467,197 (*cf. C. A.* 17, 3808, 3809). C. C. DAVIS

**Stearic and oleic acids as rubber-compounding ingredients.** R. P. DINSMORE. *Ind. Eng. Chem.* 21, 722-3(1929).—The expts. which are described show the relative effects of stearic acid and of oleic acid in representative rubber mixts., the influence of stearic acid on chem. and phys. vulcanization, and the different effects obtained with different accelerators. The most important function of stearic acid is to convert ZnO to a form which will react with the accelerator, aside from which it acts as a softener and as a retarder of chem. and phys. vulcanization. C. C. DAVIS

**Effect of stearic acid on various crude rubbers.** E. W. FULLER. *Ind. Eng. Chem.* 21, 723-5(1929).—Since the total acid content of a rubber mixt. has considerable influence on the phys. properties of the cured mixt., uniform quality cannot be obtained by the addn. of a const. porportion of stearic acid, because the stearic acid content of the raw rubber varies. Data show the phys. properties of different types of rubber mixts. contg. rubber with different total acid contents (detd. by the method of Whitby and Evans (*cf. C. A.* 22, 3064), with and without the addn. of stearic acid. The effect depended not only upon the type of rubber, *i. e.*, upon the quantity of stearic acid furnished by the rubber, but also upon the other ingredients, particularly upon the accelerator. There is probably a well-defined state of acidity for each accelerator, and perhaps in turn for each combination of accelerator and other ingredients, which gives the best phys. properties of the resulting vulcanizates. This shows the importance of allowing for the natural acid content of the raw rubber in formulating mixts. which are to contain any desired proportion of stearic acid. C. C. DAVIS

**Stearic acid in lithargy-cured rubber compounds.** J. R. SHEPPARD. *Ind. Eng. Chem.* 21, 732-8(1929).—Expts. on the curing of different rubber mixts. with PbO under various conditions are described, and the quant. results are shown in graphs and tables. Though an org. acid is essential to vulcanization with PbO, smoked sheets usually contain a large enough proportion of natural org. acids for full activation. Rubber mixts. contg. PbO, mercaptobenzothiazole and gas black, of the character of tire treads, showed high tensile strengths over a wide range of cures, whether or not stearic acid was present. C. C. DAVIS

**Effect of stearic acid on reclaimed rubber.** H. A. WINKELMANN AND E. B. BUSENBURG. *Ind. Eng. Chem.* 21, 730-2(1929).—Expts. are described which show the effect of stearic acid (1) in the heating process of the manuf. of reclaimed rubber; (2) as a plasticizing agent during the milling and refining of reclaimed rubber, and (3) on the properties of vulcanized rubber mixts. contg. reclaimed rubber. Stearic acid is far less effective than other softeners in its plasticizing action on vulcanized rubber scrap during

devulcanization (in the alkali process because of its conversion into soap). On the other hand when added to devulcanized rubber on mills previous to the refining operation, it has a very beneficial effect by increasing the plasticity, by improving the tubing and calendering properties of mixts. contg. the reclaimed rubber, by reducing the "nerve" without producing tackiness, by improving molding properties, and by promoting the dispersion of fillers or pigments, thus improving the phys. properties of vulcanizates contg. the reclaim. In rubber mixts. contg. reclaimed rubber, stearic acid improves the vulcanization, diminishes the tendency to "blow" from reversion, and activates the acceleration with mercaptobenzothiazole.

C. C. DAVIS

**Effect of increased quantities of stearic acid on tread abrasions.** C. OLIN NORTH. *Ind. Eng. Chem.* **21**, 725-6 (1929).—The tensile strength and modulus at 300% elongation diminished progressively with increase in stearic acid, but the resistance to abrasion was greatest at 10-15% stearic acid and was greater with 30% stearic acid than with 2% stearic acid. A similar series with paraffin in place of stearic acid gave much the same results, showing that on the Graselli abrasion app. (cf. Williams, *C. A.* **21**, 2573) stearic acid has a lubricating action which renders a direct comparison with service on the road highly misleading.

C. C. DAVIS

**Adsorption of stearic acid by carbon.** J. T. BLAKE. *Ind. Eng. Chem.* **21**, 718-9 (1929).—The theory of pigment reinforcement previously advanced (cf. *C. A.* **22**, 4876) is discussed further from a different point of view. Phys.-chem. calcs. based upon the assumption that the adsorbed mols. are dipoles and are adsorbed with a definite orientation indicate the validity of the theory, and that the dispersing agent is oriented on the surface of the filler particle. The center of the dipole axis is 4.2 Å. U. from the surface of the filler, and since this is only 20% of the length of a stearic acid mol., the  $\text{CO}_2\text{H}$  group is the chief contributor to its dipole moment. The mechanism of the dispersion of fillers other than C black should be essentially the same. The theory explains the importance of fatty acids in the dispersion of pigments like C black in rubber. Discussion. C. R. BOGGS. *Ibid* 719.—A reinforcing pigment which is an elec. non-conductor is needed in the rubber industry for rubber insulation. There is also lacking a lab. test to det. the behavior of a filler or pigment in rubber, and particularly to det. the action of dispersing agents. Deflocculation of a kerosene paste of the substance by dispersing agents does not give comparable results.

C. C. DAVIS

Nature, manufacture and general use of stearic acid (CRANOR) **27**. Cracking natural gas (YUNKER) **21**. A root growth experiment with *Hevea* (BERTRAND) **15**. Adhesive containing rubber latex (U. S. pat. 1,722,553) **18**. Soap production [Preparation of accelerator and compounding mixtures for vulcanization] (U. S. pat. 1,722,687) **27**. Spray desiccation of latex (Brit. pat. 303,576) **1**.

**Rubber.** THE ANODE RUBBER CO. (ENGLAND), LTD. (Robert F. McKay and Wilfred H. Chapman, applicants in England). Fr. 657,611, July 17, 1928. Rubber, etc., sheets or coated or impregnated fabrics are made by obtaining a creamy deposit electrophoretically on a drum, etc., drying and removing. The aq. dispersion used preferably includes a protective colloid such as casein or gelatin in amt. greater than formerly used.

**Rubber.** I. G. FARRENIND. A.-G. Fr. 657,584, July 17, 1928. Rubber is pptd. from its latex by mixing it rapidly with acid, e. g., HCl of such concn. that the  $p_H$  value of the mixt. is less than 2 and preferably less than 1. Substances which lower the surface tension may be added after the acid treatment.

**Treating rubber latex.** AKTIEBOLAGET SEPARATOR. Brit. 303,895, Jan. 13, 1928. The liquid poor in rubber obtained by dividing latex into 2 portions by centrifuging is centrifuged again to remove impurities before coagulating the rubber.

**Electrodeposition of rubber from latex.** S. O. COWPER-COLES. Brit. 303,214, Oct. 3, 1927. An app. is described having a perforated cathode arranged so as to permit any gas generated to escape through the perforations. Various structural details are described. Cf. *C. A.* **23**, 1309.

**Electrodeposition of rubber together with sulfur.** SAMUEL E. SHEPPARD and LEON W. EBERLIN (to American Anode, Inc.). U. S. 1,723,083, Aug. 6. Deposition is effected, from an admixture of a colloidal dispersion of S and an alk. aq. emulsion of unvulcanized rubber, in the form of droplets.

**Electric deposition of rubber.** IMPERIAL CHEMICAL INDUSTRIES, LTD., A. J. HAILWOOD, W. J. S. NAUNTON and A. SHEPHERDSON. Brit. 303,564, Oct. 7, 1927. In elec. deposition of rubber or the like from an aq. emulsion, there is added to the emulsion used an org. compd. adapted to form on oxidation at the anode a vulcanization accelerator.

Na diethyldithiocarbamate, hydroquinone or a dimercaptan may be used. Leuco vat dyes, and other modifying ingredients also may be added.

**Rubber deposition.** DUNLOP RUBBER CO., LTD. and W. H. PAULL. Brit. 303,765, Oct. 7, 1927. Material for shoe soles or heels, tire treads, etc., is formed by electrophoresis or dipping from latex admixed with a viscose or oxycellulose soln., with fillers, vulcanizing agents, etc.

**Rubber deposition.** THE ANODE RUBBER CO. (ENGLAND), LTD. Fr. 657,948, July 21, 1928. In the electrophoretic deposition of rubber or like substances from aq. dispersions, the dispersion is treated in such a way that the particles have a pos charge, after which the deposition is carried out on a support mounted at the cathode.  $H_2SO_4$  or  $AcOH$  may be used, and the H liberated may be fixed by using a cathode having an oxidizing action or by adding oxidizing substances to the dispersion.

**Rubber tubing.** DUNLOP RUBBER CO., LTD., D. F. TWISS and E. A. MURPHY. Brit. 303,546, Oct. 5, 1927. A core is passed (several times if desired) through an aq dispersion of rubber, the coating is dried on the core, and the core may then be sepd from the tubing formed by use of compressed air. Various details are given.

**Mixing machine for treating rubber, etc.** RICHARD C. LEWIS (to Farrel-Birmingham Co.). U. S. 1,721,962, July 23. Structural features.

**Rubber facings on various surfaces.** L. P. F. F. CRESSON. Brit. 303,400, Sept 2, 1927. In applying rubber facings to cement or concrete floors, walls, table tops, etc., an excess of S above that required to form hard rubber is provided either in the base or in the rubber, so that a polysulfide is formed which permeates the interfacial surfaces and firmly unites the rubber to the cement. The cement may be mixed with various fibrous materials and the process is also applicable to materials such as felt or woven fabric impregnated with cement. Various details are given.

**Freeing rubber deposits from water.** DUNLOP RUBBER CO., LTD., E. A. MURPHY and D. F. TWISS. Brit. 303,544, Oct. 5, 1927. Various rubber deposits produced from either natural or artificial dispersions are treated, for removal of water, with a soln. of a salt or mixt. of salts such as  $NaCl$ ,  $NH_4Cl$ ,  $NH_4OAc$ ,  $CaCl_2$ , alums or  $MgSO_4$ , with or without an acid such as  $HOAc$  or mixt. of acids or with fused substances which m below  $100^\circ$  such as  $NaOAc$  or  $Na_2S_2O_3$ , acetamide, or  $NH_4$  acetate or formate. Dehydration is effected by continuous penetrative osmotic action. Insol. or gelatinous thickening agents, etc., may be added to the solns.

**Transparent vulcanized rubber.** DUNLOP RUBBER CO., LTD., D. F. TWISS and E. A. MURPHY. Brit. 303,545, Oct. 5, 1927. Transparent vulcanized rubber is obtained without the use of a Zn activator by forming a deposit by electrophoretic or chem means, or by dipping, spreading, coating, molding or extrusion from natural latex (which may be concd. in various specified ways) with addn. of S and of an "ultra accelerator" such as Zn dialkyldithiocarbamate, Zn piperidine carbothionolate or a Zn alkyl xanthate, with or without various stabilizing and softening agents, etc. The product may be vulcanized in boiling water or in a hot soln. of  $CaCl_2$  or  $NH_4OAc$  used for removing water as described in Brit. 303,544 (cf. preceding abstr.) and is finally treated in a 10% boiling  $NaOH$  soln. to remove free S and accelerator.

**Rubber vulcanization accelerators.** IMPERIAL CHEMICAL INDUSTRIES, LTD, W. J. S. NAUNTON and J. B. PAYMAN. Brit. 303,535, Aug. 31, 1927. Dithiocarbamates and thiuram sulfides of morpholine and its C-substituted derivs. which serve as accelerators are formed by treating morpholine or its C-substituted derivs. with  $CS_2$ . Examples are given of the production of Zn morphyldithiocarbamate, morpholine morphyldithiocarbamate, dimorphylthiuram disulfide, dimorphylthiuram monosulfide and dimorphylthiuram "tetrasulfide."

**Vulcanization accelerators.** AMERICAN CYANAMID CO. Fr. 657,807, July 18, 1928. Vulcanization accelerators are obtained by heating org. compds. contg. O with S and P. The S and P may be combined as  $P_2S_4$ , and the org. compds. may be of the aliphatic or aromatic series, preferably contg. OH groups such as  $BuOH$  or  $AmOH$ . Better results are obtained if a metallic oxide and a N compd. such as guanidine are also added. The reaction products are probably dithiophosphates.

**Vulcanizing and preserving rubber.** J. TEPPEMA (to Goodyear Tire & Rubber Co.). Brit. 303,827, Jan. 10, 1928. Reaction products of mercaptothiazoles with nitroso compds. (such as the reaction products of mercaptobenzothiazole with nitrosodimethyl-aniline or with nitrosonaphthol) are used as vulcanization accelerators and also serve to improve "aging qualities." Cf. C. A. 23, 4376.

**Timing and recording devices, etc., for rubber molding and vulcanizing apparatus.** DUNLOP RUBBER CO., LTD., H. WILLSHAW, W. A. DAVIS and H. SMITH. Brit. 303,075, Aug. 22, 1927. Structural features.

Vol. 23.

OCTOBER 10, 1929

No. 19

## 1—APPARATUS AND PLANT EQUIPMENT

W. L. BADGER

Chemical apparatus and chemical processes at the 1929 Berlin "Gas and Water" exposition. ALBERT SANDER. *Chem. Fabrik* 1929, 331-3, 343-5. J. H. M.

Review of the development of industrial dust-collecting equipment. OTTO SCHOTT. *Zement* 18, 666-9(1929). H. F. KRIEGE

Methods and apparatus used in the cryogenic laboratory. XXII. A cryostat for temperatures below 1° K. W. H. KEESOM. *Proc. Acad. Sci. Amsterdam* 32, 710-4 (1929). E. H.

Mechanical handling of materials in and about the chemical plant. III. Other types of conveyors and mechanical handling equipment. A. K. BURDITT AND W. F. SCHAPHORST. *Ind. Eng. Chem.* 21, 844-50(1929); cf. *C. A.* 23, 3829. E. H.

A laboratory heater. L. J. N. MOTHERSILL. *Chemist-Analyst* 18, 17(1929).—The conversion of an elec. toaster into a lab. heater is described. W. T. H.

Laboratory generator for making hypochlorite. RALPH E. GOODE. *Chemist Analyst* 18, 18(1929).—Connect 3 Woulfe bottles in series and generate  $\text{Cl}_2$  in the first one by adding concd.  $\text{HCl}$  through a thistle tube to solid  $\text{KMnO}_4$  in the bottle. The evolved  $\text{Cl}_2$  passes into warm water in the second bottle to remove  $\text{HCl}$  and thence to the third bottle contg.  $\text{NaOH}$  soln. The last bottle has a relief valve to control the pressure. W. T. H.

An acid digester. HERMANN YAGODA. *Chemist-Analyst* 18, 18(1929).—A dish of cold water is recommended as a cover for the beaker contg. the heated acid so that the loss by evapn. is reduced to a min. W. T. H.

Handy cork gage. RAYMOND B. WAILES. *Chemist-Analyst* 18, 20(1929).—The use of a string of numbered corks is recommended. W. T. H.

A simple constant-level indicator. C. W. EDDY. *Chemist-Analyst* 18, 20(1929).—A simple arrangement for keeping the water level const. in a water bath is described. W. T. H.

Wash bottles for special purposes. HERMANN YAGODA. *Chemist-Analyst* 18, 21(1929).—A wash bottle head is placed in a test tube. Instead of blowing into the test tube through the usual tubing, a side-arm test tube can be used, connected with the reservoir of wash liquid. By raising or lowering the tube, the wash liquid is forced out or the flow is stopped. W. T. H.

A simple percolator. J. M. D. BROWN. *Chemist-Analyst* 18, 22(1929).—A 20-mesh brass screen is suspended in a beaker and the substance to be treated with solvent is placed on the screen. W. T. H.

Improvement in apparatus for the determination of total fatty acids in soap stock. E. MARTIN. *Chemist-Analyst* 18, 22(1929).—Provide an ordinary stopcock at the bottom of the flask for draining off the water and excess acids when the fatty acids have been liberated from soap stock. W. T. H.

To remove grease from a buret tip. C. J. SCHOLLENBERGER. *Chemist-Analyst* 18, 15-6(1929).—If stopcock lubricant gets into the tip of the buret during a titration and thus dams the flow of liquid, heat the tip somewhat with the flame of a match and let the soln. run quickly into the titrated soln. W. T. H.

Improved differential dilatometer. MAX HAAS AND DENZO UNO. *J. Inst. Metals*, Advance copy, No. 504, 5 pp.(1929).—The accuracy of Chevenard's optical differential-dilatometer has been improved by mounting the app. on a triangular rail, by using one dilatometer tube instead of two, and by replacing the spring that holds the mirror by a magnet coil arrangement. Provision is also made for working in any special atm. and for sketching purposes. M. C. ROGERS

Apparatus for gasometric determinations in technical analysis. J. HÜBSCHER. *Süddeut. Apoth. Ztg.* 68, 447-8(1928). H. L. D.

**New apparatus for electrolytic analysis.** HENRY J. S. SAND. *Analyst* 54, 275-82 (1929).—The designs now submitted are distinct improvements over those previously devised by S. with respect to economy in the use of Pt. The outer electrode surrounds the inner one everywhere except at the bottom, which is to be placed near the bottom of the beaker contg. electrolyte. The stem of the inner electrode revolves inside a quartz glass guide-tube, which forms an integral part of the outer electrode, thus insuring good alignment even when there is but slight clearance between the 2 electrodes. The 2 electrodes can be removed together without danger of a short circuit. Both electrodes are usually mounted on quartz glass frames, or on frames of rubber and glass. A rotating anode is also described, which is designed to be used with a revolving partition consisting of a parchment thimble. The original paper should be consulted regarding further features concerning these excellent and very practical designs. W. T. H.

**Low-pressure gas apparatus for temperatures up to 1000°.** H. R. HEMS. *Gas World* 91, No. 2346; *Ind. Gas Suppl.* 1, No. 10, 9-12(1929).—The design and advantages of 3 types of gas furnace (direct-fired, semi-recuperative and recuperative) are discussed. The direct-fired furnace is satisfactory for the majority of heat treatments requiring temps. up to 1000°. The semi-recuperative type is more economical for long-day or continuous working. The recuperative furnace is generally of more massive construction and will enable maintenance of 900-1000° under varying working conditions more economically than is possible with the other types and will maintain 1500° evenly over comparatively large areas without the introduction of air under pressure. J. B. C. JR.

**An improved stopcock for gas analysis burets.** WARD E. KUENTZEL. *J. Am. Chem. Soc.* 51, 2759-60(1929). E. H.

**Sampler for granular substances.** I BRIL. *Masloboino-Zhirovoe Delo* 1928, No. 7, 4-5. V. KALICHEVSKY

**New apparatus for softening-point determinations.** FISHER SCIENTIFIC CO. *Instruments* 2, 277-8(1929). E. H.

**A continuous circulator for a corrosion test or continuous filter.** J. M. D. BROWN. *Chemist-Analyst* 18, 16-17(1929).—From the side tube of a 2-l. percolator, liquid falls by gravity into a vessel placed below, where, as soon as it reaches a definite height, it is aspirated up into an inverted suction flask from which it falls again into the percolator. The uptake tube should be of 8 mm. inside diam., the air outlet 8 mm., the return tube 5 mm. and the overflow tube 4 mm. for the best results. W. T. H.

**Making stoneware cocks safe.** O. STEGMEYER. *Chem. Fabrik* 1929, 361.—A device is described for reducing the danger of breakage when manipulating cocks J. H. MOORE

**A rugged type of calomel electrode vessel.** L. V. SORG. *Cereal Chemistry* 6, 344-6(1929).—Photograph and drawing show the construction. The vessel is made of 2 pieces of pyrex tubing, one of larger diam. than the other. One end of the larger tubing is drawn down to the size of the smaller tubing and sealed to it. L. H. B.

**Venturi meters and standing wave flumes.** C. C. INGLIS. *Eng. News-Record* 103, 112(1929). R. E. THOMPSON

**A nitrometer without rubber hose for semi-microchemical work.** E. BERL, K. HOFMANN AND R. BREMMANN. *Chem. Fabrik* 1929, 359-60.—Description of the app. and directions for operating, with 6 cuts and a table of results, which are within about 1% of the theoretical. J. H. MOORE

**An electron-tube potentiometer for the determination of  $p_H$  with the glass electrode.** WM. C. STADIE. *J. Biol. Chem.* 83, 477-92(1929).—A null method for the measurement of the e. m. f. of glass electrodes, with an electron-tube potentiometer, is described. The app. is free from electrostatic disturbances, and in measuring e. m. f. through resistance of 20 to 600 megohms its sensitivity is 1 to 4 mm. of deflection per 0.001 v. ARTHUR GROLLMAN

**A two-circle x-ray spectrometer.** W. A. WOOSTER. *Trans. Faraday Soc.* 25, 401-2(1929).—This instrument bears the same relation to the Bragg spectrometer as does the two-circle to the one-circle goniometer. It consists, in addn. to the usual slits and crystal holder, of a small combined ionization chamber and electrometer, mounted on a vertical circle, which in turn is carried on the horizontal circle. A platinized piece of mica replaces the usual gold leaf in the electroscope, whereby the rigid mica acts as a mirror to reflect a light beam and thus largely magnify the movement of the leaf. H. W. WALKER

**Registering spectrometer for the infra-red.** P. LAMBERT AND J. LECOMTE. *Compt. rend.* 189, 156-8(1929).—The spectrometer consists of 2 prisms of rock salt. One is fixed and the other movable around a vertical axis on which is also a mirror and a thermoelec. cell. The rays are made parallel by a concave mirror, pass through the prisms

and are connected by the concave mirror connected with the axis on the thermocouple. The thermocouple is connected with a galvanometer. The sensitive paper on which the movement of the galvanometer is registered is moved by an elec. motor. The axis in the first part of the app. is connected with the motor. E. SCHOTTE

Selecting a viscometer an interesting problem. C. E. FAWKES. *Paint, Oil & Chem. Rev.* 88, No. 8, 12(1929).—A brief review of the principle types of viscometers with 51 references. G. G. SWARD

Capsule for incinerating (organic materials). KÖNIG. *Chem.-Ztg.* 43, 130(1929).—The ordinary small porcelain capsule is provided with an outside flange so as to permit the operator to grip it with the crucible tongs without danger of touching the contents of the capsule. B. C. A.

The Dufton column and its use in preparing anhydrous alcohol. K. PETRÍK. *Chem. Listy* 23, 193–5(1929).—The column consists of a core, closed at both ends, made of Cu with an internal diam. 21 mm., and wound with a Cu spiral wire 6.5 mm. thick. The length of the wave of the helix is 20 mm. The core is inserted into a Cu tube 1400 mm. long, 35 mm. internal diam., which connects the boiler with the dephlegmator. The boiler is 300 mm. in diam. and 300 mm. high and is heated indirectly by steam through Cu tubing—a manometer tube 6–8 mm. internal diam. suffices. The dephlegmator has a diam 100 mm., a height 300 mm. and contains a hose for water. The dephlegmator also contains a screen shaped like a cone upon which anhyd.  $\text{CaCl}_2$  (granulated) may be poured. A glass tube is attached to the 2 nipples protruding from the column. The distg. vapors are condensed. FRANK MARESH

Thermostat. M. MATSUI, S. OGURI, S. KAMBARA AND K. KATO. *J. Soc. Chem. Ind., Japan* 32, 360–467(1929); Suppl. Binding 32, 108B(1929).—Each part of the water thermostat, i. e., bath, elec. heater, thermoregulator, relay, etc., was examd. in detail. A water thermostat covered with a wooden box and constructed carefully worked automatically with an accuracy of  $\pm 0.002^\circ$ . KOBAYASHI

#### Carrying out investigations at high temperatures (COHN) 2.

Cover for laboratory crucible. STAATLICHE PORZELLAN-MANUFAKTUR. Ger. 478,891, Nov. 27, 1926. The cover is dish-shaped with a pair of diametrically opposite notches.

Crucible for analytical use. JOHN D. M. SMITH and WM. J. GEORGE. Ger. 478,890, June 6, 1926. The cover has notches and fits within the crucible.

Thermometer suitable for remote positioning. FRANKLIN W. SPRINGER (to Motometer Co.). U. S. 1,724,528, Aug. 13. Structural features.

Thermometer for measuring the temperatures of flat or curved surfaces. SIEMENS & HALSKE A.-G. Brit. 304,556, June 5, 1928. Structural features.

Viscometer (with coaxial cylinders or disks). F. YACCO SOC. ANON. Brit. 305,242, Feb. 3, 1928. Structural features.

Filters. WILHELM MAUSS. Ger. 478,794, Jan. 18, 1927. A device is described for washing the cakes of a rotary drum filter.

One-piece laboratory suction filter. STAATLICHE PORZELLAN-MANUFAKTUR. (Gerhard Müller, inventor). Ger. 479,489, Feb. 14, 1926.

Laboratory suction filter of adjustable capacity. STAATLICHE PORZELLAN-MANUFAKTUR. (Alfred König and Gerhard Müller, inventors). Ger. 479,488, Jan. 20, 1926.

Filter and thickener. ERNEST J. SWEETLAND (to Oliver United Filters, Inc.). U. S. 1,724,436, Aug. 13. Structural features.

Filter for separating condensate and dirt from compressed air or other fluids. SIDNEY C. PARKER. U. S. 1,725,474, Aug. 20. Structural features.

Sand filter and flushing system for cleaning the filter. BAMAG-MEQUIN A.-G. Brit. 304,967, Feb. 20, 1928. Structural features.

Centrifugal filter suitable for treating continuous filtrations. CHARLES G. HAWLEY (to Centrifix Corp.). U. S. 1,725,712, Aug. 20. Structural features.

Fabric for filtering. VAL. MEHLER SEGELTUCHWEBEREI A.-G. Ger. 478,983, May 1, 1925. A fabric for filtering finely divided materials is prepd. by treating the surface with ammoniacal  $\text{CuO}$ , weak acid and washing with water.

Centrifugal separator. BERGEDORFER EISENWERK A.-G. Ger. 479,259, Aug. 5, 1923.

Centrifugal apparatus for separating solid particles from gases. C. H. CRAGO and A. E. HAMILTON. Brit. 304,952, March 26, 1928. Structural features.

Device for gravity separation of liquids such as benzene and water. W. LINN-MANN. Brit. 304,595, Jan. 21, 1928. A device with a float-controlled outlet is described.

**Pervious table, etc., for separating solid materials.** K. C. APPLEYARD, P. W. BEWICKS, J. F. LAYCOCK, M. R. PORTALL and W. E. MANNERS. Brit. 305,608, Nov. 5, 1927. Structural features.

**Distillation apparatus.** C. W. STRATFORD. Brit. 305,205, Feb. 2, 1928. Liquids to be heated, vaporized or distd. are discharged in jets at high velocity onto the surface of flues heated internally by burners. Various structural details of the app. are described.

**Bubble still or scrubber.** CARL F. BRAUN. U. S. 1,725,052, Aug. 20. Structural features.

**Fractionating ring suitable for use in fractionating or scrubbing columns.** ROBERT H. VAN SCHAAK, JR. U. S. 1,725,429, Aug. 20. Fractionating rings are made of sheet metal or ceramic material in cylindrical form with a diametrical partition extending entirely across the cylinder.

**Drying and distillation head for generators, etc.** FRANKFURTER GAS GES. and ERNST SCHUMACHER. Ger. 479,180, Oct. 22, 1925. Addn. to 455,365.

**Lixiviation apparatus.** W. H. CAMPBELL. Brit. 304,387, Oct. 25, 1927. Structural features.

**Rotary screw stirrer.** THE PFAUDLER CO. Ger. 479,103, Jan. 20, 1928.

**Apparatus (beater) for dispersing amorphous aggregates in liquids.** W. H. WHATMOUGH. Brit. 304,178, Oct. 14, 1927. Structural features.

**Mixing or emulsifying apparatus, especially for viscous liquids.** OTTO J. BUDTZ. Ger. 479,281, Sept. 7, 1928.

**Rotary-vane apparatus for mixing liquids with liquids or solids.** JOHN G. Y. DELMAR-MORGAN. Ger. 479,160, Mar. 31, 1927.

**Evaporator (with steam heating tubes) for treating sugar or salt solutions, etc.** W. RUSIECKI. Brit. 304,670, Jan. 23, 1928.

**Container for pasteurizing apparatus with overflow device.** GEBRÜDER SCHAFFLER. Ger. 478,539, June 10, 1927.

**Multi-chambered apparatus for pasteurizing milk or other liquids.** H. HOLTE. Brit. 304,473, Jan. 21, 1928. Various structural features are described.

**Light-sensitive cells.** A. JOFFE. Brit. 304,132, Jan. 14, 1928. The dielectric used may be formed of: (1) linseed-oil varnish and its oxidation product, or (2) mica and glass or porcelain, or (3) metallic or other conducting or semi-conducting material interleaved with insulating material.

**Light-sensitive cell and relay system for control of apparatus.** L. N. CRITCHON (to Metropolitan-Vickers Electrical Co., Ltd.). Brit. 304,211, Jan. 16, 1928. Elec. features.

**Light measurement by electrolytic action of a light-controlled electric current.** LEWIS R. KOLLER (to General Elec. Co.). U. S. 1,725,651, Aug. 20. An app. is described.

**Shaft furnace.** BRUNO BECK. Ger. 478,838, Nov. 29, 1927. Details of loading are described.

**Shaft furnace.** SÜDDEUTSCHE WAGGONFABRIK G. M. B. H. & Co. KOMM.-GES. Ger. 478,839, July 15, 1927. Details of tapping are given.

**Rotary tube furnace with two or more coaxial cooling drums.** AMME-LUTHER WERKE BRAUNSCHWEIG DER "MIAG" MÜHLENBAU UND INDUSTRIE A.-G. Ger. 479,326, Feb. 1, 1927.

**Soaking-pit furnace.** SAMUEL G. WORTON. U. S. 1,724,058, Aug. 13. Structural features.

**Tunnel furnace.** EESTI PATENDI AKTSIASELT. Brit. 304,238, Jan. 17, 1928. Structural features.

**Coal-dust furnace.** CURT HARTMANN. Ger. 477,960, Mar. 25, 1927. A device for regulating the supply of coal dust is described.

**Coal-dust furnace.** ERNST JÜRGES. Ger. 479,000, Sept. 23, 1924. Details of construction and operation are given.

**Coal-dust burner for regenerative furnaces, etc.** GOTTFRIED KEHREN. Ger. 479,087, Aug. 7, 1926.

**Coal-dust furnace.** KOHLENSCHIEDUNGS-G. M. B. H. Ger. 477,961, Oct. 26, 1924. Details of arrangement are given.

**Fuel-dust furnace with manifold fire tubes.** CARL HOLD. Ger. 478,547, June 17, 1927.

**Gas-fired furnaces.** MAX NUSS. Ger. 479,086, Jan. 20, 1925. A combustion chamber coaxial with the burner is arranged between the burner and the heating space.

**Reversible regenerator for furnaces.** W. DYSSSEN (to Milliken Bros. & Blaw-

Knox, Ltd.). Brit. 304,755, Jan. 26, 1928. Regenerator chambers contain banks of heat-exchanging material of different heat-resisting qualities; at the hotter end sheets of high Cr steel may be used and at the other portions steel with less Cr or ordinary steel. Numerous structural details are described.

A device for automatically regulating the supply of fuel to furnaces. SIEMENS & HALSKE A.-G. (Max Ulrich Büchting, inventor). Ger. 478,957, July 9, 1927.

Loading device for shaft furnace. ERNST KNÖRINGER and KARL WOLSKY. Ger. 478,532, Apr. 22, 1928.

Mechanical furnace-regulating device for steam boilers. SIEMENS-SCHUCKERT-WERKE A.-G. (Ferdinand Köhler, inventor). Ger. 478,548, Nov. 16, 1926.

Furnace cover. BERNHARD VERVOORT. Ger. 478,743, Mar. 29, 1928. Details are given.

An adjustable cover for the fire chamber of furnaces. ALBERT REPPMAN. Ger. 477,986, May 9, 1928. A description is given.

A traveling-grate furnace. WALTHER & CIE. A.-G. Ger. 478,741, Nov. 9, 1926.

A traveling-grate furnace for moist fuel such as peat is described.

Furnace roof construction with cooling fins and pipes for circulating water. JOHN D. MACKENZIE and RICHARD W. SINGER (to American Smelting & Refining Co.). U. S. 1,724,098, Aug. 13. A construction is described suitable for roofs of reverberatory furnaces.

Flue section construction for rotary furnaces. C. P. DEBUCH. Brit. 304,937, Feb. 22, 1928.

Gas burner. THOMAS G. ARROWSMITH. U. S. 1,723,988, Aug. 13.

Gas burner (with automatic igniter). DANTE RASO (one-third each to Angelo Melucci and Constantino Pellegrino). U. S. 1,724,221, Aug. 13.

Gas burner. MILLARD J. ROBERTS (to Roberts-Gordon Appliance Corp.). U. S. 1,725,304, Aug. 20. Structural features.

Gas burner. V. H. RICHARD. Brit. 304,938, Feb. 23, 1928.

Gas burner. ALLGEMEINE ELEKTRICITÄTS-GES. Brit. 304,142, Jan. 13, 1928.

Vapor burners for alcoholic or hydrocarbon fuels, etc. T. LANDI. Brit. 304,651, Jan. 23, 1928. Close-mesh cloth of Al or Al alloy is used as a filter gauze to prevent fouling.

Heat-exchange apparatus. HERBERT HENDERSON and JOHN G. GLASGOW (to Gulf Refining Co.). U. S. 1,724,351, Aug. 13. Structural features.

Heat-exchange apparatus. R. SAMESREUTHER and G. KRANZLEIN. Brit. 305,172, Feb. 1, 1928. Structural features.

Tubular heat-exchange apparatus. E. F. A. D. BECK. Brit. 304,272, Jan. 18, 1928. Structural features.

Tubular heat-exchange apparatus. ANCIENS ÉTABLISSEMENTS M. P. VELUT. Brit. 304,728, Jan. 25, 1928. Structural features.

Tubular heat-exchange apparatus suitable for use as a condenser. FRANK J. SWENSON (to Foster Wheeler Corp.). U. S. 1,725,549, Aug. 20. Structural features.

Tunnel kiln. H. M. ROBERTSON. Brit. 305,025, Jan. 28, 1928.

Annular kiln with chambers connected by inner doors. ALFONS WEYAND. Ger. 478,530, Nov. 23, 1928. Details of arrangement.

Gas-heated drying oven (with means for preheating the combustion air). FRANZ LEICHER, GELDSCHRAUK- & METALLSCHRAUBENFABRIK. Ger. 479,074, Nov. 24, 1927.

Gas-washing tower. H. A. BRASSERT and F. W. BARRETT (to H. A. Brassert & Co.). Brit. 304,753, Jan. 27, 1928. Superposed sections of the tower have successively decreasing diams. Various structural details are described.

Leveling bottle for use with gas-analysis apparatus, etc. CHARLES B. FRANCIS. U. S. 1,724,013, Aug. 13. Structural features.

Apparatus for cooling gases. CHEMISCHE WERKE "LOTHRINGEN" G. M. B. H. (Fritz Rottmann and Fritz Brohmeyer, inventors). Ger. 478,984, June 20, 1925. A double-walled tower for cooling hot gases is described.

Cooling device with multi-stage compressor. ATLAS-WERKE A.-G. Ger. 477,955, Mar. 19, 1927.

A cooling drum for annealing. G. POLYSIUS A.-G. Ger. 478,937, Mar. 12, 1925. A double-walled cooling drum is described, which is constructed so that the heat of the goods cooled is utilized to warm the cooling gas.

Acetylene generator (water to carbide type). MESSER & Co. G. M. B. H. Ger. 479,374, May 8, 1926. Addn. to 465,119.

Apparatus for lighting objects for the ultramicroscope. CHARLES SPIERER. U. S. 1,724,527, Aug. 13.

- Low-water alarm device for boilers, etc.** A. BUTLER and R. BUTLER. Brit 304,476, Jan. 24, 1928. A thermostatic elec. switch operates the alarm.
- Surface condenser.** JOHN F. KIRGAN (to Ingersoll-Rand Co.). U. S. 1,724,138, Aug. 13.
- Surface condenser.** PAUL H. MÜLLER. Ger. 470,478, May 28, 1927.
- Thermostat suitable for use in incubators.** E. L. GODFREY and G. W. WRENT MORE. Brit. 304,619, Oct. 15, 1927. Structural features.
- Thermostat suitable for control of electric circuits.** FLETCHER SCHAUM. U. S. 1,724,425, Aug. 13. Structural features.
- Thermostatic device for electric circuits.** CHARLES H. HODGKINS (to Westinghouse Elec. & Mfg. Co.). U. S. 1,725,518, Aug. 20. Structural features.
- Thermostatic electric switch.** R. P. JACKSON (to Metropolitan-Vickers Electrical Co., Ltd.). Brit. 304,724, Jan. 25, 1928. Structural features.
- Thermostatic temperature-control system for radiator-valve control.** CHARLES L. FORTIER (to Johnson Service Co.). U. S. 1,724,347, Aug. 13. Structural features.
- Thermostatic control system for superheated system.** BRITISH ARCA REGULATORS, LTD., and T. LINDSAY. Brit. 305,564, Nov. 7, 1927.
- Thermostatic valve for controlling oil fuel.** R. MACLAREN. Brit. 304,340, Sept. 21, 1927. Structural features.
- Thermostatic device suitable for carburetor control.** MERL R. WOLFARD (to Charles F. Hopewell and Helen C. Hopewell). U. S. 1,725,607, Aug. 20. Structural features.
- Thermostatically-controlled mixing device for hot and cold water, etc.** ALEXANDER MERDOCH, JR. U. S. 1,724,504, Aug. 13.

## 2—GENERAL AND PHYSICAL CHEMISTRY

FREDERICK L. BROWNE

- Swante Auguste Arrhenius.** J. BABOROVSKY. *Chem. Listy* 21, 469-7(1927).  
A review of the work and theories of Arrhenius. FRANK MARESH
- Richard Lorenz.** W. FRAENKEL. *Z. angew. Chem.* 42, 801-2(1929).—Obituary

- A question of scientific terminology.** A. CLEMENTI. *Boll. soc. ital. biol. sper.* 3, 1269(1928).—C. proposes the Italian term "smorzare" for the English "pufferare" (buffer) or the French "tamponare" (tamponer). PETER MASUCCI
- Activator, promoter or strengthener.** E. PIETSCH. *Z. Elektrochem.* 35, 366-7 (1929).—A contribution to the discussion of terminology suggested by Mittasch (cf. *C. A.* 23, 3133). R. I. RUSH
- Chemical valency considered as an electrostatic phenomenon.** X. A. E. VAN ARKEL and J. H. DE BOER. *Chem. Weekblad* 26, 402-6(1929); cf. *C. A.* 23, 4384. F. DE LEEUW
- Salinity of the water of Chesapeake Bay.** R. C. WELLS, R. K. BAILEY and E. P. HENDERSON. *U. S. Geol. Survey Professional Paper* 154-C, 105-52(1929).—The salinity of

the  $\text{H}_2\text{O}$  of Chesapeake Bay increases toward the mouth and with depth at any one point. The values on the east side of the Bay are higher than on the west. A. H. E.

The decomposition of water by iron hydroxide and the occurrence of hydrogen in potassium salt mines. HUGO DITZ. *Z. Elektrochem.* 35, 392-3(1929).—Attention is called to the fact that the recent work of Schikorr (cf. C. A. 23, 3148, 3149) offers a possible explanation of the presence of  $\text{H}_2$  in the Stassfurt mines. Previous explanations are briefly reviewed.

Excitation of frictional electricity. LOTHAR WOLF. *Ann. Physik* [5], 1, 260-88 (1929).—Frictional electricity arises largely from the transference of metallic ions in soln. in the film of water on the insulator. Friction of an earthed metallic "needle" against a rotating plane surface of specially prepd. shellac results, in the absence of an elec. field, in an equil. between soln. tension and the pressure of dissolved ions. Application of an elec. field sets up a new equil. characterized by a smaller concn. of ions in the film, reversion to the first equil. being possible by reducing the field strength. The sign of the frictional electricity can be reversed by adjusting the field to neutralize the pressure of the ions. Artificially increasing the ionic concn. also reverses the sign. By increasing the surface of contact, the amt. of electricity excited with const. capacity increases to a limiting value. It is also shown that the speed of the moving surface has no influence on the quantity of electricity excited.

Nephelometric and colorimetric measurements with a photoelectric current. E. CUBONI. *Boll. inst. sieroterap. milanese* 1927, No. 6, 3 pp.—The observations are made by means of a photoelectric cell.

Measurements of ozone in the higher atmosphere in 1928. H. BUISSON. *Compt. rend.* 188, 647-8(1929).—Diurnal detns. of  $\text{O}_3$  in the higher atm. during 1927 by the method previously described (C. A. 22, 2690) have confirmed the observations made in 1927, the max. (spring), 3.75 mm., and min. (autumn), 2.25 mm., being slightly less pronounced. The irregular variations are strongest at the beginning and the end of the year and disappear in summer. The measurements are in agreement with those made at Arosa (Switzerland) at 1800 m. and for the period January to October the figures at each station are 0.16 mm. lower than those of 1927.

The determination of the conductivity of electrolytes with an alternating current of low frequency. A. H. W. ATEN AND FRL. L. M. BOERLAGE. *Rec. trav. chim.* 48, 698-710(1929).—Measurements of resistances by an a. c. galvanometer with a frequency of 50 were compared with those made by a telephone circuit with frequencies of 1100 and 2300. With the galvanometer a relative accuracy of 0.01% was attained in the measurement of resistances over 200 ohms. Resistances greater than 10,000 ohms could be measured better with the galvanometer than with the telephone circuit because, at higher frequencies, errors arose from electrostatic capacity which could not be removed in a simple way.

Carrying out investigations at high temperatures. WILLI M. COHN. *Metallwirtschaft* 8, 599-602, 623-30(1929); cf. C. A. 23, 3608.—Furnaces for use at temps. of 1500-3000° are now important. Materials of construction, theories of operation and descriptions of various types involving the use of gaseous liquid and solid fuels, elec. resistance, induction and high-frequency furnaces are given. For obtaining temps. above 3000° arc furnaces of 4 types and cathode-ray furnaces are explained. No materials are available that will remain in the solid condition at atm. pressure above 4000° abs. The use of elec. sparks, one or several explosions of solid or gaseous materials, etc., give such temps., but only for a short interval and cause difficulty in measuring the temps. attained.

Atomic weight of helium. AUG. UPMARK. *Z. Physik* 55, 569-74(1929).—U. calcs. on the basis of his own electrostatic theory of at. structure that He has 3628 electrons and an at. weight of 4.00106. Aston's (C. A. 21, 3543) higher value of 4.00216 is explained as being partially due to neg. He ions.

Numerical regularities in the atomic weights of elements. S. M. LOZANIĆ. *Bull. acad. sci. Bohême*, 1928, (reprint), 9 pp.—Regularities of the type  $a = 2m + b$ , where  $a$  is the at. wt.,  $m$  the at. no. and  $b$  is 0, 1, 2 or 3, appear in the first part of the periodic table. As the at. wt. increases, regularities of the same type appear to persist, with high values for  $b$ . These considerations are regarded as supporting the view that the at. wts. are whole nos. The no. of isotopes possessed by a given element is connected with its place in the table.

The transmutation of elements. K. ŠANDERA. *Chem. Listy* 21, 270-1(1927).—Š. considers 2 sources of error in the transmutation expts.: (1) the difference in evolution of  $\text{He}$  by  $\text{Pd}$  in an atm. of air,  $\text{H}_2$  and  $\text{O}_2$ ; (2) the relative difference in permeability of glass to  $\text{H}_2$ ,  $\text{He}$  and  $\text{Ne}$  at different temps.

FRANK MARSH

The heat capacity of oxygen from 12°K. to its boiling point and its heat of vaporization. The entropy from spectroscopic data. W. F. GIAUQUE AND H. L. JOHNSTON, *J. Am. Chem. Soc.* 51, 2300-21(1929).—The heat capacities of the 3 cryst. forms of solid  $O_2$  and of the liquid have been measured from 11.75°K. to the b. p. The transition temps. and the heats of transition are:  $23.66 \pm 0.10^\circ K.$ ,  $22.42 \pm 0.1$  cal. per mol.;  $43.76 \pm 0.05^\circ K.$ ,  $177.6 \pm 0.5$  cal. per mol. The m. p. was  $54.39 \pm 0.05^\circ K.$ ; the b. p.  $90.13 \pm 0.05^\circ K.$  The heats of fusion and vaporization were  $106.3 \pm 0.3$  and  $1628.8 \pm 1.6$  cal. per mol., resp. The entropy of the gas at  $298.1^\circ K.$  was  $49.03$  cal. per mol. per deg. The method of prepn. of the  $O_2$  is described. J. B. AUSTIN

The formation and decomposition of ozone. E. H. RIESENFELD, *Z. angew. Chem.* 42, 729-34(1929).—A lecture summarizing the theoretical explanations for the formation and decompn. of  $O_3$  by all known methods. The quantum theory, chain-reaction concept, thermodynamics, mass-action laws, activated mols. and free atoms, are called upon to account for the phenomena observed. Bibliography. W. C. F.

Specific resistance and purity of sodium electrolyzed through soda-glass. J. RUD NIELSEN, *Phys. Rev.* 31, 304(1928).—The sp. resistance of solid Na between  $30^\circ$  and  $90^\circ$  was found to be  $4661 \times 10^{-9} \times (1 + 0.00484 t)$ ; and for liquid Na below  $160^\circ$   $9828 \times 10^{-9} \times (1 + 0.00354 (t-100))$ . The measurements were made in a U-shaped capillary tube first filled with Hg and then with Na. H. R. MOORE

Contribution to the chemistry of sulfur. I. The system sulfur-chlorine. MAX TRAUTZ, H. ACKER, L. E. VON BROECKER, A. RICK, A. HOFFMANN, H. KLIPPEL AND O. LOTH, *Z. Elektrochem.* 35, 110-34(1929).—The literature on compds. of S with Cl is summarized. Manometric measurements of the gas phase equil. between S and Cl at  $140^\circ$  and  $250^\circ$  showed at most only traces of reaction involving any compds. other than  $SCl_2$ .  $S_2Cl_2$  combines with dissolved Cl according to a first-order reaction. The combination is catalyzed by higher chlorides. Cl dissolves in liquid  $S_2Cl_2$ , but the reaction is catalyzed by  $SCl_2$ . The mol. heat of soln. is approx. 3.5 cal. The measured heat of formation of  $S_2Cl_2$  from S +  $Cl_2$  is 14.5 cal. The heat of formation of  $SCl_2$  from  $S_2Cl_2$  +  $Cl_2$  is 9-10 cal; that of  $SCl_2$  is estd. as 12-14 cal. The vapor pressures of  $S_2Cl_2$  were measured between  $37^\circ$  and  $137^\circ$ . Frequent sudden reversion to  $SCl_2$  was observed several times at  $100^\circ$  or above. The mol. heat of soln. of S in  $S_2Cl_2$  was between -1.3 and -3 cal. The phase-rule diagram indicates the existence of  $S_2Cl_2$ . The sp. heats, ds. and viscosities of  $S_2Cl_2$  and solns. of S and Cl in  $S_2Cl_2$  are given. R. L. DODGE

The oxidizability of silicon and the allotropic variety of Moissan and Siemens. A. SANFOURCHE, *Compt. rend.* 188, 1672-5(1929).—The reported soly. of Si in HF [cf. *Compt. rend.* 138, 1299(1904)] is explained as due to the oxidation of Si in a fine state of division to  $SiO_2$  or  $Si_2O_3$ , and  $Si_2O_4$ . When Si, crystd. in Ag, or Al or obtained by reduction of  $SiO_2$  by Mg, of 98.4% purity is moistened with HF and evapd. in a Pt dish at  $150^\circ$ , it becomes incandescent in spots just as it becomes dry; these incandescent areas spread;  $SiO_2$  is formed. If a given sample of Si is subjected to this treatment repeatedly (45 times) as much as 98% Si may be oxidized. The colors usually attributed to Si sol. in HF may in reality be due to sub-oxides. E. R. SCHIBRZ

Nitrogenation of manganese. L. DUPARC, P. WENGER AND CH. CIMERMAN, *Helv. Chim. Acta* 12, 806-17(1929).—Nitrogenation of Mn has variously been reported as leading to the nitrides  $Mn_3N_2$ ,  $Mn_2N_2$ ,  $Mn_7N_2$ , or their mixt. The effect of variables was investigated by heating Mn from 3 different sources in a current of  $N_2$  at varying temps. and pressures. The absorption thresholds for different materials were  $500^\circ$  and  $740^\circ$ , resp., these differences being ascribed to varying percentages of the impurities, Si and Al. The absorption of  $N_2$  was a function of the temp. passing through a max. The time factor was unimportant; equil. was reached within 1-2 hrs., there being no formation of satd. crusts. Increase of pressure above 10 atm. caused a continuous rise in absorption curves. The addn. of 10%  $Li_3N$  lowered the absorption threshold to  $360^\circ$ , and caused a decided increase in absorption. K. H. ENGEL

Specific heat of lead at the temperature of liquid helium. W. H. KEESOM AND N. VAN DEN ENDE, *Physik. Z.* 29, 896-7(1929).—The work of Keesom and Andrews (C. A. 21, 2091) has been repeated with an improved technic. For the region  $10-20^\circ$  abs. the earlier data are confirmed. The present work is in agreement with the Debye curve with  $\theta = 88$  even in the region  $3-6.5^\circ$  abs. to which the  $T^3$  law applies, so that discrepancies in the earlier work now disappear. At  $7^\circ$  abs. a marked deviation persists, but since a similar deviation occurs when Bi is studied instead of Pb, the discrepancy may be due to an instrumental defect. B. C. A.

The evaporation of thorium from tungsten. MARY R. ANDREWS, *Phys. Rev.* [2], 33, 454-8(1929).—The rate of evapn. of Th from pure W and from carbonized W

was measured between 2000° and 2500°K. The Th was deposited on these surfaces by evapn. either from thoriated filaments or from metallic Th. Evapn. from both surfaces varied directly with the fraction covered, being more rapid from pure W than from carbonized W. The heat of evapn. from W was calcd. to be 177,000 cal./g. mol. and from carbide 202,000 cal./g. mol.

BERNARD LEWIS

A new chemical theory and its thermodynamic consequences. A. GOSSELIN. *J. chim. phys.* 26, 288-90(1929).—Atoms, groups and mols. can combine by means of polar, steric or mixed forces or valences. Formulas are written for  $\text{NH}_3$ ,  $\text{O}_3$ , etc., and heats of formation calcd.

ARTHUR FLEISCHER

Structure of water molecule. R. SÄNGER AND O. STEIGER. *Helv. Phys. Acta* 1, 369-84(1928); *Science Abstracts* 32A, 193-4.—S. and S. calc. from the dielec. consts. of water vapor that if the mol. of  $\text{H}_2\text{O}$  present the form of an isosceles triangle with the O atom at its apex, the 2 equal angles of the triangle are 58° each, and the two equal sides are each  $1.07 \times 10^{-8}$ . This gives an elec. moment of  $1.34 \times 10^{-18}$ .

H. L. D.

General principles in the consideration of oxidation-reduction reactions, and the question of the existing chemical bond. I. BR. JIRGENSONS. *Z. Elektrochem.* 35, 352-8(1929).—A no. of new principles concerning covalent structure are expounded.

F. E. WALSH

Dielectric constants of benzene, carbon disulfide and carbon tetrachloride, and of dilute solutions of alcohols in these solvents. J. D. STRANATHAN. *Phys. Rev.* 31, 156(1928); cf. *C. A.* 22, 2320.—The temp. variations of the dielec. consts. of the 3 org. compds. were detd. from f. p. to b. p., and also dil. solns. of  $\text{MeOH}$  in  $\text{C}_6\text{H}_6$  and in  $\text{CCl}_4$ , and of  $\text{C}_6\text{H}_{11}\text{OH}$  in  $\text{C}_6\text{H}_6$ . An extrapolation method was used to obtain the elec. moments in the undissoc. state, and the applicability of the Debye theory examd. H. R. M.

Dielectric constants of electrolytic solutions for various concentrations. A. P. CARMAN AND C. C. SCHMIDT. *Phys. Rev.* 31, 157(1928); cf. *C. A.* 22, 534.—The electrometer method, previously developed, was used to measure the dielec. consts. of  $\text{NaCl}$  solns. up to 0.02 *M*, and for solns. of  $\text{KCl}$ ,  $\text{BaCl}_2$  and  $\text{CuSO}_4$  concns. up to 0.01, 0.022 and 0.026 *M*, resp. The dielec. const.—conc. curves show definite minima, and it does not seem that Walden's theory is wholly adequate to explain them. H. R. MOORE

The effect of tension and a longitudinal magnetic field on the thermoelectromotive forces in permalloy. ALPHEUS W. SMITH AND JOY DILLINGER. *Phys. Rev.* 33, 398-402(1929).—Measurements are made on the combined effect of tension and a longitudinal magnetic field on the thermo-e. m. f. in 3 wire specimens of permalloy, of compn. 78, 81 and 84% Ni and the rest Fe. In all cases the magnetic field produces a decrease in the thermo-e. m. f. Annealing at 1000° increases the change of thermo-e. m. f. produced by a longitudinal magnetic field. In an alloy contg. 78% Ni, tension decreases the max. value of the change in thermo-e. m. f. In an alloy contg. 81% Ni the max value of  $\Delta E/E$  is relatively insensitive to tension. In an alloy contg. 84% Ni tension decreases the change in the thermo-e. m. f. at low magnetic fields but increases it for magnetic fields greater than about 10 gauss. In all 3 cases the max. value of  $\Delta E/E$  is relatively insensitive to changes in tension beyond about 10 kg./sq. mm. There is a parallelism between the change in length and the change in thermo-e. m. f. under the combined action of tension and a longitudinal magnetic field. In high Ni permalloys tension decreases the intensity of magnetization for low magnetic fields but increases the magnetostrictive contraction and the change of thermo-e. m. f. In low-Ni alloys tension increases the intensity of magnetization for low magnetic fields but decreases the magnetostrictive expansion and the change of e. m. f. B. L.

Piezoelectric amorphous and crystalline substances in an electric field. A. V. SHUBNIKOV AND B. K. BRUNOVSKI. *Bull. acad. sci. union rép. soviét. social.* 1928, 367-74.—Exptl. results are given which indicate that every dielectric, when placed in an elec. field, owing to orientation of its mols. or other structural units, becomes more or less markedly piezoelec. When such dielec. is subjected to shock, it assumes a state of vibration, that is, of periodic compression and expansion, the result being the establishment of an internal subsidiary elec. field, which changes its direction during the vibration and so alternately strengthens and weakens the original elec. field.

B. C. A.

The Hall effect in nickel-steel alloys. UMBERTO SALERNO. *Rend. accad. sci. (Napoli)* [3], 34, 159-65(1928).—S. studied the Hall effect in pure Ni, in steel and in alloys of Ni steel varying from 8% Ni to 49% Ni and with variation in field intensity from 450 to 12,850 gauss. The same characteristics in Hall effect are shown by Ni steel alloys that are apparent with other ferromagnetic metals. The nature of the secondary electrode influences the phenomenon to some extent. The min. effect is

shown in the 22% alloy and rises to a max. at 36% Ni. The data indicate that an inversion of sign should occur at a compn. of about 80% Ni. L. T. FAIRHALL.

**Crystal structure defects and physical-chemical properties.** ADOLF SMEKAL. *Z. angew. Chem.* 42, 489-94(1929); cf. *C. A.* 20, 683; 21, 1385; 22, 907, 2301; 23, 2862.—S. discusses the properties of solids which may be technically influenced and uninfluenced by mechanical or chem. action. The crystal properties which are uninfluenced are lattice properties. The relation between the properties influenced and crystal structure defects is discussed. All actual crystals contain "loose spaces" and crystals prepd. in different ways have systematically different loose space numbers and also the expected property differences. A theory of the ionic conduction in solids is given. Conclusions for physical-chemical processes such as mixed-crystal formation, disintegration, powder reactions and recrystn. are connected with diffusion processes. Crystal structure defects give rise to active centers of catalytically active surfaces. H. W. W.

**Crystal properties and crystallization conditions.** ADOLF SMEKAL. *Z. Physik* 55, 289-303(1929).—S. distinguishes between two groups of crystal properties: those properties that remain const. and those that change with the change in number of single crystals in the whole crystal mass. The first set are called "lattice properties" as they depend only on the pure crystal and the second set are called "interstitial properties" depending on the number and kind of spaces between the single crystals making up the total actual crystal. NaCl crystals obtained from solns. and from a melt, resp., show differences in their ionic cond. The crystals obtained from a melt show a cond. 1000 times greater than the crystals obtained from solns. Cf. Gingold (*C. A.* 22, 4343) and Joffé and Zechnowitzer (*C. A.* 20, 1553).

**Preferred orientation in tungsten crystals caused by mechanical working.** H. B. DEVORE AND WHEELER P. DAVEY. *Phys. Rev.* 31, 160(1928).—A sheet of rolled W was heated nearly to the m. p., thus causing those crystals which had a preferred orientation to grow at the expense of the fragments of other crystals. Diffraction patterns of the foil revealed a deviation of  $\approx 3^\circ$  from the mean orientation. H. R. MOORE.

**Stretching of copper and  $\alpha$ -brass crystals.** v. GÖLER AND G. SACHS. *Z. Physik* 55, 581-620(1929).—Mech. deformation of Cu and brass crystals is studied as a function of Zn content and crystal orientation. The lattice const. of the alloys as a function of Zn content are given.

**Recrystallization in stretched tin strips.** PAUL BECK. *Z. Physik* 55, 374-7(1929).—The dependence of the no. of recrystn. centers on the degree of deformation is discussed.

**Sudden deformation of crystals under strain.** M. CLASSEN-NEKLUDOVA. *Z. Physik* 55, 555-68(1929).—The mechanism of the plastic deformation of crystals is studied. The deformation occurs in sudden jumps of a few thousandths of a mm. and is accompanied by a uniform noise like the ticking of a watch. The interval between jumps may be a few sec. and the rate of deformation in this interval is zero for the whole crystal.

**The hindrance of crystal growth by electrolytic polarization.** HERBERT BRANDES. *Z. physik. Chem., Abt. A*, 142, 97-112(1929).—The theory is given at length. Expts. with "depolarization-free" electrodes (blank Pt in metallic salt solns.) show that the potential change (brought about by an impressed a. c. of rather high frequency) is directly proportional to the impressed current; thus the cell behaves as a perfect condenser. This is explained on the assumption of a Helmholtz double-layer formed upon the electrode by the migrating ions. Expts. with neutral  $\text{ZnSO}_4$  solns. with cryst. Zn electrodes show a different behavior and it is assumed that the variation from the results with the "depolarization-free" electrodes gives a measure of the degree of polarization. This latter series of expts. was conducted at different temps. ( $8^\circ$  to  $73^\circ$ ) and it is shown that the relationship between velocity of crystal growth (depolarization) and polarization tension depends upon temp.

**Notes on conduction of electricity in crystals.** O. U. VONWILLER. *Proc. 3rd Pan-Pacific Sci. Congr.* 1926, II, 1284-5(Publ. 1928).—Ohm's law appears to hold, and contact resistance varies with direction and magnitude of current for very small currents.

**The axial ratio of alundum as obtained by the Laue spot method.** SHORI TAKANI. Tohoku Imp. Univ. *J. Petrol., Mineral. and Ore Deposits (Japan)*, 1, 71-2(1929).—A small alundum crystal was sectioned parallel to the axial plane and x-rays were directed upon it almost perpendicularly to axial plane. The axial ratio calcd. from the pattern is  $a:b:c = 0.521:1:0.954$ . Kokscharo's value is therefore (0.52854:1:0.95375) more nearly correct than that given by Dana and Haumann (0.52854:1:0.4769).

K. SOMEYA

**Optical and thermal investigation of alundum from Naegi.** SHUKUSUKU KOZU AND JUN'ICHI UEDA. *J. Petrol., Mineral. and Ore Deposits (Japan)* 1, 52-60(1929).—The alundum produced at Naegi, Gifu Prefecture (Japan), was divided into 2 groups, A and B, on the basis of their *ns*, optical axes and double refraction. The internal *ns* of group A are,  $\alpha = 1.6152$   $\beta = 1.6179$ ,  $\gamma = 1.6249$  and are a little smaller than the external *ns*. For the B group the internal indices ( $\alpha = 1.6148$ ,  $\beta = 1.6174$ ,  $\gamma = 1.6244$ ) are a little larger than the external. Values of  $2V$  are, for A,  $62^{\circ}20'8''$  for B,  $63^{\circ}15'$ , from which the content of F and OH can be calcd. From the thermal data the coeffs. for the linear expansion parallel, resp., to the *a*, *b*, *c* axes, are  $l_a = 0.00044635 t + 0.00000025 t^2$ ,  $l_b = 0.00035854 t + 0.00000018 t^2$ ,  $l_c = 0.00059547 t + 0.00000030 t^2$ , (*t* measured from  $20^{\circ}$  as standard). The vol. expansion calcd. from these data is 0.84% at  $500^{\circ}$ , 2.08% at  $1000^{\circ}$ . From the change in wt on heating, it is shown that decompn. is most rapid at  $1250-1300^{\circ}$ . Sometimes fissures are formed on heating the mineral to  $400^{\circ}$ , but the cause is not very clear. It is not due to the escape of volatile matter. The change of the axial ratio on heating was also measured.

K. SOMEYA

**Thermal equilibrium and temperature.** E. WERTHEIMER. *Z. Physik* 55, 395-408 (1929).—The temp. of a gas cannot be defined by kinetic theory but it is necessary to consider the situation from the point of view of the electromagnetic radiation field. Cf. C. A. 19, 3056.

GEORGE GLOCKLER

**The measurement of low pressures.** FRIEDRICH HALLE. *Z. angew. Chem.* 42, 448(1929).—The nature of the light emitted in the field of a Tesla transformer depends on the pressure of the gas in the field. On this principle a manometer can be constructed that is particularly well adapted to the measurement of low pressures in different parts of an enclosed app.

J. G. McNALLY

**Determination of the specific heats of nitrogen and carbon dioxide at elevated temperatures.** MARCEL CHOPIN. *Compt. rend.* 188, 1660-2(1929).—By using a method of temp. measurement previously described (cf. C. A. 22, 3340) values were obtained for *Q*, mol heat, for  $N_2$  and  $CO_2$  at 10 temp. intervals between  $312^{\circ}$  and  $1042^{\circ}$  from which formulas for the mean mol. sp. heat of these gases are derived:  $N_2$  ( $C_p = 6.82 + 0.00058 t$ ) cal.;  $CO_2$  ( $C_p = 8.9 + 0.61 \left(\frac{t}{100}\right)^{0.673}$ ) cal. These values agree

with those of other workers at some temps. At  $500^{\circ}$  the sp. heat of air is practically the same as that of  $N_2$ ; at  $1000^{\circ}$  it is 1% higher.

E. R. SCHIERZ

**The effect of a gas upon the pressure of a vapor.** LEONARD A. SAYCE AND HENRY V. A. BRISCOE. *J. Chem. Soc.* 1929, 1302-7.—Several investigators have shown that the pressure of a satd. vapor in equil. with its liquid is lowered in the presence of an indifferent gas. Campbell (C. A. 9, 2614) has shown that this effect attains a considerable magnitude. C. attributed the low values obtained to adsorption of gas at the liquid-gas interface, a view which implies that in the absence of a liquid a gas should have no effect on the pressure of a vapor. S. and B sought to test the validity of this view. They measured independently both the concn. and the pressure of a vapor in the presence of and in the absence of a gas, using  $CO_2$  as the gas and either ether or pentane for the vapor. The results contradict the view that the diminution of the vapor pressure of a liquid in the presence of a gas can be wholly attributed to the effects of soln. or adsorption of gas in the liquid. The results, although not as consistent as expected, show a definite lowering of the unsatd. vapor pressure in the presence of  $CO_2$ . The effects of adsorption of ether on the flask walls are evident.

L. L. QUILL

**Variation with direction of the capillary constant of smectic substances.** ROBERT GIBRAT. *Compt. rend.* 188, 183-5(1929).—Gauss' theory of capillarity is applied to smectic substances, and expressions are obtained for the capillary const. which indicate the existence of 2 min. values, corresponding with planes passing through the axis and perpendicular to it.

B. C. A.

**Contributions to the study of mesophases (intermediate states of aggregation).**

II. The comparative configurations of a mesophase. H. ZOCHER AND V. BIRSTEIN. *Z. physik. Chem., Abt. A*, 142, 113-25; cf. C. A. 23, 4387.—The arrangement of the axis parallel or vertical to the surface of contact depends on variations of the interfacial surface tension. The surface of ordinary glass treated with acid causes a vertical instead of a parallel arrangement in the case of *p*-azoxyanisole. Alkali reverses the change. The elastic deformability of the mesophases is greater than that of crystals under conditions calling forth neither compressional nor dilatational resistances. In regions of homogeneous orientation, the lines given by the axial directions at each point are divergent or convergent curves for the nematic state; divergent or convergent straight lines for the smectic state. Points of instability exist in both states of aggregation.

III. The aqueous mesophase of arspenamine. *Ibid* 126-38.—The aq. phase of arspenamine is nematic. The suspended droplets are made up of optically negative vol. units. Addn. of an optically active compd. produced the same honeycomb structure with its accompanying strong optical activity, as is found in various other nematic phases. Even without such addition, layers often show such a honeycomb, so that the rotation may be either clockwise or counter-clockwise. I. J. PATTON

Floating mercury on water. N. K. ADAM. *Nature* 123, 413(1929).—Finely divided Hg may float on water, even when the surface tension is reduced to about 46 dynes per cm. by the addn. of a drop of oleic acid. Since the tensions of clean Hg against water differ by more than the surface tension of clean water, it would be impossible for clean Hg to float on clean water. Treatment of the Hg with  $H_2SO_4$  and chromic acid had apparently reduced the Hg-air tension by 100-200 dynes per cm. B. C. A.

Internal friction of binary liquid systems containing allyl mustard oil and dimethyl-, diethyl- and ethyl-aniline. N. A. TRIFONOV AND K. I. SAMARINA. *Bull. inst. recherches biol. Univ. Perm* (Russia) 6, 291-302(1929).—The classification of binary systems into 4 classes as proposed by Dunstan and by Kurnakov is recalled, the 4 classes being: ideal ( $asC_6H_5 + C_7H_8$ ), semi-ideal ( $asMe_2CO + CS_2$ ), irrational (pyridine + AcOH) and rational ( $CSNC_2H_5 + PhNH_2$ ). The internal friction and the density of mixts. of  $CSNC_2H_5$  with  $Me_2NPh$ ,  $Et_2NPh$  and  $EtHNPh$  were detd. at various temps and concns. The system  $CSNC_2H_5$  is nearly ideal: the max. deviation from a straight line is 6%, for a 50% mixt. (internal friction) or 0.5% (sp. gr.). The system  $CSNC_2H_5$  is semi-ideal, the max. deviation being 10% (internal friction) or 1% (sp. gr.). The system  $CSNC_2H_5 + EtHNPh$  is rational: it shows the existence of allylethylthiourea, at 50% concn. The system  $CSNPh + MeHNPh$  is analogous to the precedent, and is now investigated. ALBERT L. HENNE

The electroconductivity of double liquid systems. N. A. TRIFONOV AND S. I. CHERBOV. *Bull. inst. recherches biol. Univ. Perm* (Russia) 6, 247-59, in English 259-60(1929).—The following systems were studied: (1) aniline-AcOH, which gave a max. in the cond. curve for 17 mol. % aniline at 21°; (2) dimethylaniline-allyl mustard oil, having a max. near 20 mol. % amine at 25°; (3) ethyl aniline- $H_2O$ , having a max. at 25 mol. % amine and a smaller one near 60 mol. %, both at 25°; (4)  $Ac_2O-H_2O$ , having max. for 50 and 95 mol. %  $H_2O$  at 25°; (5) pyridine-AcOH, with a max. near 80 mol. % AcOH at 28° and 50°. The max. is always displaced toward the component of smaller mol. wt. and inner friction. E. G. VANDEN BOSCH

The evolution of our present ideas on the nature of salts. N. B. BJERRUM. *Fysisk Tidsskrift* 26, 101(1928).—The Oersted lecture. KRISTIAN HØJENDAL

The solidification of sucrose. Catalyzed by water. A. TIAN. *Compt. rend* 188, 1675-7(1929).—The physico-chem. properties of the solid form of sucrose (I) prepd. from rapidly melted sugar were studied. (Cf. *Bull. soc. chim* [4], 35, 634(1924).) I is vitreous, completely colorless and contains only a few thousandths % of reducing sugars. In a dry atm. it retained its transparency for 5 yrs.; in an ordinary atm. it changes to opaque crystals in 1 day. To verify the hypothesis that a satd. soln. of I is supersatd. with respect to cryst. sugar, the catalytic effect of water on the transformation of vitreous to cryst. I was detd. by (a) gravimetric and (b) calorimetric methods. (a) 9 samples of (I) were placed in atm. of varying vapor pressures controlled by aq. solns. of  $H_2SO_4$  (3-11 mm.) at temp.  $15.9 \pm 0.1^\circ$ . When the pressure exceeded 5 mm. the wt. increased, passed through a max. after 10 hrs. then decreased slowly, the crystals became opaque. In atm. of 3 and 4 mm. the sugar remained transparent and did not change in wt. (7 months). This indicates that the solidification of sugar is catalyzed by moisture due to the fixation of water by the sugar. Fixation is impossible below 4 mm. and temporary below 13 mm. (b) By means of a microcalorimeter (cf. C. A. 18, 1070) the thermal changes were measured which occur when I is placed in an atm. of vapor pressure controlled at 9 mm. (Na phosphate hydrate) There is first absorption of heat (decompn. of hydrate) followed after an hr. by liberation of heat (crystn. of sugar—reformation of hydrate) which reaches a max. in 3 hrs., finally becoming imperceptible. The net quantity of heat liberated represents the heat of solidification of sugar. E. R. SCHIEZ

Absolute calorimetric measurement of electrolytic conductivity for high-frequency currents. E. JUSTI. *Ann. Physik* [5], 2, 65-93(1929).—The theory and exptl. practice of inductive heating by high-frequency currents are discussed. Pb, Hg, brass and solns. of NaCl, KCl, KBr, BaCl<sub>2</sub> and LiCl are treated exptly. WILLIAM E. VAUGHAN

Sedimentation and heat of adsorption. B. IL'IN AND B. ROSANOV. *Z. Physik* 55, 285-8(1929).—The heat of wetting of wood charcoal and glass powders in solns.

of  $\text{CH}_3\text{OH}$  in  $\text{H}_2\text{O}$  of various concns. was studied exptly. as a function of concn. Cf. B. Il'in, C. A. 21, 1577.

**The electrical condition of hot surfaces during the adsorption of gases.** III. A platinum surface at temperatures up to  $850^\circ$ . G. I. FINCH AND J. C. STIMSON. *Proc. Roy. Soc. (London)* A124, 356–65(1929); cf. C. A. 22, 4027.—It is concluded from the results on the elec. charging of Au, Ag and Ni surfaces and of a Pt surface that the "normalizing" of a metal surface involves a rearrangement of the surface atoms by a process related to sintering and Pt does not combine directly and form chem. compds. with  $\text{O}_2$ ,  $\text{H}_2$ ,  $\text{CO}$ ,  $\text{CO}_2$ , A,  $\text{N}_2$  and mixts. of these gases. Some adsorbed gaseous mols. were condensed and formed an electrically neutral layer on the surface and others were held by weak elec. attraction, whereby one bond between the constituent atoms of each mol. was weakened.

**Adsorptive properties of silica gel.** A. P. OKATOV. *Zhur. Prikladnoi Khim.* 2, 21–84(1929).—Adsorptive properties of  $\text{SiO}_2$  gel are independent of the coagulating temp. and of the concn. of  $\text{SiO}_2$  in the sol. At temps. above  $25^\circ$  it is difficult to obtain sols contg. more than 12.5%  $\text{SiO}_2$ . The rate of coagulation increases with the increase in concn. of  $\text{SiO}_2$  and with the increase in temp. Quick coagulation hinders development of the internal structure. Monobasic acids increase the coagulating rate. Solid, semi-solid and liquid phases can be differentiated during coagulation. *Syneresis* is a good measure of the maturity of the gel. Excess of  $\text{NH}_3$  tends to produce gels with a slow adsorption rate, but gels produced by incomplete neutralization with  $\text{NH}_3$  are satisfactory. Internal structure of these gels is independent of their water content provided it does not exceed 80%. Treatment with water improves the rate of adsorption but does not increase the adsorptive capacity of the gels. Adsorptive properties of gels which were not treated with activating solns. are almost independent of the temp. changes during drying and activation. Adsorption of  $\text{C}_6\text{H}_6$ ,  $\text{Et}_2\text{O}$  and  $\text{EtOH}$  vapors by the gel follows the law of Freundlich, but adsorption of  $\text{H}_2\text{O}$  vapor is entirely different. More heat is evolved in adsorption of vapors of org. substances by charcoal than by  $\text{SiO}_2$  gel. Charcoal also liberates 62% more heat than  $\text{SiO}_2$  gel in adsorption of  $\text{Br}_2$ , and 146% more heat in adsorption of  $\text{Cl}_2$ . Of the  $\text{Cl}_2$  adsorbed by charcoal 11% is retained even after heating at  $260\text{--}80^\circ$  in a stream of air. If this  $\text{Cl}_2$  displaces  $\text{H}_2$  which is present in C, only  $1/3$  of the  $\text{H}_2$  is affected. Charcoal poisoned with  $\text{Cl}_2$  loses some of its adsorptive capacity.  $\text{H}_2$  and  $\text{O}_2$  in C are not impurities, but active substances which are indispensable constituents of its colloidal particles.

**Osmosis of liquids.** II. F. A. H. SCHREINEMAKERS. *J. Gen. Physiol.* 12, 555–69 (1929); cf. C. A. 23, 320.—A further consideration of osmosis in which the theoretical osmosis path, exptl. osmosis path, and the path of the membrane are discussed. Examples are given in which water contg.  $\text{Na}_2\text{CO}_3$  and  $\text{NaCl}$  was sepd. from pure water by a membrane of pig bladder. It is shown that the nature of the membrane influences the form of the path of osmosis as calcd. from theoretical considerations. C. H. R.

**Internal pressures in adsorbed films.** P. G. NUTTING. *J. Wash. Acad. Sci.* 19, 295–300(1929).

**The stability of unimolecular films.** I. Conditions of equilibrium. C. G. LYONS AND ERIC K. RIDEAL. *Proc. Roy. Soc. (London)* A124, 322–33(1929).—An examn. of the force-area curves and equil. spreading pressures of unimol. films of palmitic acid on a series of acid and alk. solns. shows that the tendency to spread into the expanded state is increased by an increase in the acidity of the soln. This view is confirmed by the latent heats of spreading on acid and alk. surfaces. The conversion of condensed to expanded films in the case of pentadecylic acid by altering the H-ion concn. has been achieved. II. The mechanism of film expansion. *Ibid* 333–43.—The transition from a solid condensed film to a liquid condensed film and expansion to the vapor state are due to an increasing tilt of the mols. affected by the adhesion of the polar head and hydrocarbon chain for the water and the hydrocarbon chains for one another. The state of liquid condensed films is compared with the smectic state of liquid crystals and the mols. are considered to be freely tilted in this state. An approx. measure of the asymmetry of various head-groups is made from the observed limiting areas. The force-area curves of heptadecylamine are shown to conform with these views. III. Solution in alkaline solution. *Ibid* 344–55.—A study of the rates of soln. of unimol. films of palmitic acid on alk. solns. reveals that over a wide range of alky. a new form of film is stable and this form is believed to consist of a bimol. leaflet. The lower layer of the bimol. film on weakly alk. solns. is less closely packed than the upper layer, the closeness of packing increasing with increased alky. The process of soln. of a unimol. film is given.

H. W. WALKER

**Superficial films and superficial solutions of myristic acid.** FAHNE EMIR. *Compt. rend.* 188, 1667-70(1929).—To verify the hypothesis of Marcelin (cf. C. A. 20, 854) the surface tension produced by films of myristic acid (I) in water and 0.05 N HCl were studied. When the film is produced by dropping a soln. of I in BzH on the surface of water, the surface tension, on standing, asymptotically approaches the value 14 dynes/cm. irrespective of the initial tension or temp. (11-20°). Its rate increases with temp. This value is obtained when I is allowed to spread spontaneously on water at 19°. After some time this value slowly decreases, indicating slight soly. If the film is formed on 0.05 N HCl this decrease will be less marked. The best conditions for measuring the film are on 0.05 N HCl at 19-21°. The surface occupied by the mol. is 26 sq. A. U. The thickness of the film, 16 A. U., is just half that obtained by the x-ray examn. of the solid myristic acid.

E. R. SCHIERZ

**The influence of size, shape and conductivity of microscopically visible particles on cataphoretic mobility.** H. A. ABRAMSON AND L. MICHAELIS. *J. Gen. Physiol.* 12, 587-97(1929).—"The electrophoretic mobility of microscopically visible particles is independent of size, shape and cond. of the particles within the limits of the exptl. error. This is valid for extreme variations in size, shape and cond." The particles used in this study were droplets of a highly refined petroleum oil (Nujol), benzyl alc., castor oil, a paraffin oil and cacao butter in media (alc.-water, sucrose-water mixts. contg. traces of electrolytes) of approx. the same sp. gr. as the oils. C. H. RICHARDSON

**The structure of colloids.** P. P. VON VEIMARN. *Rev. gén. colloïdes* 7, 153-8(1929).—V. expresses his conception of the colloidal states of matter as belonging to 2 main groups: the dispersoidal and the solutoidal states. The first of these is thermodynamically unstable and the second one stable. These 2 states are often distinguished from each other with great difficulty because of the existence of extremely stable dispersoidal systems. This condition is due to the presence of highly solvated compds. on the surface of the colloidal particles. Conclusion: It is not possible to build a theory of stability based upon a single quality of energy, as, e. g., elec. energy. L. B. M

**A method of characterizing colloidal solutions by the state of polarization of their Tyndall light.** R. O. HERZOG AND B. LANGE. *Ber.* 62B, 491-5(1929).—With const. wave length and  $n$ , the polarization angle of Tyndall light is proportional to particle size. With cellulose acetate dissolved in AcOMe, the polarization angle decreased as the soln. aged, indicating a decrease in av. particle size. The change was more marked in dil. solns. (0.08%) than in concd. (2 1/4%). The change in polarization angle on standing is given for solns. of cellulose acetate and nitrate, glycogen, inulin, rubber, polystyrol, gelatin, Congo red and  $V_2O_5$  soln.

J. G. McNALLY

**A collection of references in the field of technical colloids.** XI. The stability and preparation of colloidal solutions. ERICH HEYMANN. *Kolloid-Z.* 48, 195-206(1929).—In the theory of stability of colloidal solns., the work of Tammann, Zsigmondy and others is contrasted with that of von Veimarn. The general theory proposed by A. March is discussed, which leads directly to the dipole nature of most mols. as pictured by Debye. Other factors affecting stability such as viscosity, size of particles, polydispersion, presence of electrolytes, etc., are reviewed. Methods of prepn. of general interest are given for disperse systems. Methods of condensation in the absence of protective colloid are discussed in which the nucleus method and non-aq. sols are included. Condensation in the presence of protective colloids includes reduction, double decompn. and vaporization methods. Some comment is made on purification of sols. Over 100 references are given.

RAYMOND H. LAMBERT

**The autoreduction of sodium silver sulfite.** A. STRIGMANN. *Koll.-id-Z.* 48, 193-4(1929).—When a 2%  $AgNO_3$  soln. is slowly poured into a 10%  $Na_2SO_3$  soln. which is being stirred rapidly the  $NaAgSO_3$  obtained is autoreduced. This action is strongly catalyzed by traces of Cu. The result is obtained with or without excess sulfite present.

RAYMOND H. LAMBERT

**Chemical antagonism of ions. III. Effect of salt mixtures on gelatin activity.** HENRY S. SUMMS. *J. Gen. Physiol.* 12, 511-28(1929); cf. C. A. 23, 4236.—Gelatin solns. were brought to  $p_H$  7.203-7.367 with KOH or NaOH and various concns. of NaCl, KCl and  $MgCl_2$  were added.  $MgCl_2$  and NaCl alone lower the  $p_H$  of Na or K gelatinate. KCl first lowers the  $p_H$  and then with increasing concn. raises it. Mixts. of NaCl and KCl raise the  $p_H$ , then with an increase of either salt lower it and finally the mixt. behaves like KCl alone. Mixts. of  $MgCl_2$  and NaCl raise the  $p_H$  up to 0.1 M  $Na^+$  and lower it up to 0.15 M  $Na^+$ , irrespective of the amt. of  $MgCl_2$ . Higher concns. of NaCl have little effect but increase of  $MgCl_2$  lowers the  $p_H$ . Mixts. of  $MgCl_2$  and KCl behave like those of  $MgCl_2$  and NaCl. Under these conditions the free groups of the dicarboxylic acids and of lysine in the gelatin are practically all ionized. The

arginine group is about 84% ionized whereas the prearginine and histidine groups are essentially non-ionized. The soln. therefore contains 2 ionic species in equil., one with the arginine group ionized the other with it non-ionized. The effect of each salt upon the  $pH$  of the gelatin soln. depends upon the effect of the cation on the activity of the 2 ionic species due to combination. Anomalous effects of cation mixts. may be accounted for if one or both the ionic species fail to combine in the mixt. in proportion to the relative combination in solns. contg. only a single cation. C. H. R.

**Chemical and physical changes in gelatin solutions during hydrolysis.** JOHN H. NORTHROP. *J. Gen. Physiol.* 12, 529-35(1929).—A study of the change in viscosity, and corresponding increase in the carboxyl groups in gelatin solns. showed that marked viscosity changes result from very slight chem. changes. If viscosity is increased by the addn. of acid a greater change in viscosity or vol. of solute is caused by the same % change in no. of carboxyl groups. This change is independent of the gelatin concn. The results support the idea that the high viscosity of gelatin solns. is due to the presence of swollen micelles; a slight chem. hydrolysis may suffice to rupture a micelle and so cause a large change in viscosity. C. H. RICHARDSON

**The swelling of gelatin and the volume of surrounding solution.** JOHN H. NORTHROP AND M. KUNITZ. *J. Gen. Physiol.* 12, 537-42(1929).—The swelling of iso-lec. gelatin added to various vols. of HCl soln. was studied at 5°. Swelling of pure gelatin was detd. by the concn. of the supernatant soln. at equil. and was independent of the vol. of acid; in solns. of unpurified gelatin, swelling is a function of both vol. and the concn. of acid due to the presence of neutral salts. The results are predicted by the Procter-Wilson-Loeb theory for the swelling of gelatin. Cf. *C. A.* 19, 996. C. H. R.

**Colloid chemical reactions between sols of albumin substances and polymeric carbohydrates.** I. WO. OSTWALD AND R. H. HERTEL. *Kolloid-Z.* 47, 258-68(1929).—When a starch and an albumin sol are mixed, 2 physically distinct phases result. A study of the lower "demixed phase (I)" shows that it is either a liquid or a flaky solid consisting mainly of more or less hydrated starch. The vol. of I varies with the concns. of the sols. For const. starch concns. ( $C_s$ ) and varying gelatin concns. ( $C_g$  from 1 to 8%), a max. vol. of I is obtained at intermediate values of  $C_g$ . Four types of starch (maize, rice, wheat and potato) show practically the same effect except that the max. occurs at different  $C_s$ , 1, 2, 3-4 and 5%, resp. With const.  $C_g$  an increasing  $C_s$  (0.25-5%) is always accompanied by an increase of the vol. of I. Maize, rice and wheat starch always form white flakes which become more and more solid with increasing  $C_g$ . Up to 5%  $C_g$  potato starch yields flakes, in higher  $C_g$  large transparent and colorless liquid layers, which in aging undergo a secondary spontaneous "demixture" and form a white paste. With const.  $C_g$  and variable  $C_s$ , flake-like sediments were always obtained. The upper phase (II) is liquid. It becomes more transparent with increase of either  $C_g$  or  $C_s$ . Expts. with agar gave results similar to those obtained with starch, whereas inulin gave only neg. results. J. WIERTELAK

**Coefficient of magnetism and structure of a solution of gelatin.** MAURICE FALLOT. *Compt. rend.* 188, 1498-1500(1929).—Curves showing the relation between the coeff. of magnetization and the dielec. const. of solns. of gelatin of varying concn. (Marinesco, *C. A.* 23, 4393) indicate an increase in both properties from zero concn. to 0.8 g. per 100 cc. At this max., the dielec. const. drops, while the coeff. of magnetization rises more abruptly up to the highest concn. that could be measured. The results suggest the possible existence of 2 forms of gelatin mols., which combine to form 1 mol. at a concn. of 0.8 g. gelatin per 100 cc. N. M. NAYLOR

**Cystine in systems of noble metals protected by gelatin.** A. STEIGMANN. *Kolloid-Z.* 48, 194-5(1929).—When metal sulfite is added to a  $AgNO_3$  soln. in the presence of gelatin, cystine tends to check the reducing action similarly to its effect on NaAg,  $S_2O_8$  and hyposulfite when gelatin is present. Little effect was noted with Hg salt in place of Ag salt. Au showed the effect and by replacing cystine with albumin reduction was nearly stopped.  $NH_3$  speeds up reduction and pyridine slows it down. The color of the dispersed metal is affected by presence of cystine in consequence of its effect on particle growth. A comparison of "Ostwald ripening" of AgBr grains in gelatin soln. with and without cystine present shows that cystine greatly retards ripening. RAYMOND H. LAMBERT

**The dispersion of cellulose in solution.** K. HESS. *Kolloid-Z.* 48, 191-3(1929).—The mass-action formula for the reaction between cellulose and Cu in Schweizer's reagent and the formula for the adsorption isotherm as derived by Baur contain consts. that are fundamentally different. The inconstancy of  $\phi$  (the amt. of Cu adsorbed by 1 mg. mol. of cellulose in 100 cc. soln.) observed by Zeise would lead to the belief that an adsorption formula does not fit. Calcn. on the assumption, that the cuprammon-

ium ion is a tetrahedron and that the dimension of the micelle of cellulose is known leads to an adsorbed layer 4 mols. thick of such ions on the surface of the micelle. Reasoning from results obtained with sugar instead of cellulose would lead the author firmly to believe in the stoichiometrical relation of chem. action rather than an adsorption hypothesis.

RAYMOND H. LAMBERT

Contribution to the theory of vegetable tanning. IV. Phenomena of separation into 2 liquid phases in systems: hydrophil colloid plus water plus polyphenol. H. G. BUNGENBERG DE JONG. *Rec. trav. chim.* 48, 494-503(1929).—It is suggested that the mechanism of dehydration of hydrophil colloids by tannins or simpler phenols is a sepn. of the dispersion medium into 2 liquid phases at the boundary surface of the colloidal particle. When portions of 2.5% gelatin soln. at 42° are treated with equal vols. of resorcinol soln. of increasing concn., the viscosity decreases rapidly to a min., then is const. over a considerable concn. range, and then increases again at higher concns. The effect is most marked at the isoelec. point of gelatin. With the decrease in viscosity, the soln. becomes milky, and eventually the microscopic drops coalesce and settle to form a well-marked layer. It is believed that the sepd. phase is a soln. of resorcinol in H<sub>2</sub>O, surrounding the gelatin particles. The sepd. layer was richer in resorcinol than the upper layer. The same effect was observed with other phenols, including tannin and gelatin, and with colloidal carbohydrates.

H. B. MERRILL

Solution volume. F. WRATSCHKO. *Pharm. Presse* 34, 36, 116-8, 132-4, 256-8, 274-8(1929); cf. C. A. 23, 1553.—“The simplest solns. are those in which the 2 components consist of liquid, org. nonelectrolytes, each chemically inactive with respect to the other, but presenting ideal systems together for the observation of primitive solvent conditions. The following types are differentiated: (a) in which the d. of the soln. is equiv. to the arithmetical mean of the ds. of the resp. components; (b) in which the sp. vol. of the soln. is equiv. to the arithmetical mean of the resp. sp. vols. of the components (isofluid solns., true mixts.); (c) in which the d. and sp. vol. resp. of the soln. are equiv. to the geometric mean of the resp. ds. and sp. vols. of the components (true solns.). The vol. type is characteristic for each soln. pair, and independent of the temp. Among normal solns. type (b) occurs most frequently (true mixt.), much less often type (c) (true soln.), and most rarely type (a).

W. O. E.

The salting out of ethyl acetate. N. SCHLESINGER AND V. KUBASOVA. *Z. physik. Chem., Abt. A*, 142, 25-36(1929).—In order to test the “salting out” theory of Tanmann (cf. C. A. 21, 678, 680) the soly. of neutral EtOAc (*b*<sub>73.8</sub> 76.6-77.1°) in water and 0.1, 0.25, 0.5, 1 *N* NaCl, KBr, KI aq. solns. was detd. at 18 temps. between 15° and 52° by the optical method of Alexeyev. The temp. of formation and disappearance of turbidity did not vary more than 0.1° for any concn. In all cases soly. curves were parabolas with a min. between 50° and 60°. The av. variation of interpolated values from detd. values was 0.47% with a max. of 0.86%. Because of pptn. of I, no detns.

were made for 1 *N* KI solns. The mol. soly. depression  $\lambda$  as well as the const  $\frac{\Delta l}{\Delta c}$  depends on concn. and temp.;  $\frac{\lambda n}{\Delta k} \cdot 10^4$  for the several salts was not const. These

results are not in accord with T's. theory. A preliminary detn. of salting out by use of mixts. of 2 salts indicated additive effects only.

E. R. SCHIERZ

The effect of gases on the color of iodine vapor and the solvent action of various vapors on solid iodine. ROBERT WRIGHT AND THOMAS MCGREGOR. *J. Chem. Soc.* 1929, 1364-7.—Dewar's observation that the color of I<sub>2</sub> vapor was less dense in an evacuated flask than in one contg. air at the same temp. has frequently been cited as an example of the soly. of a solid in a gas under ordinary conditions of temp. and pressure. W. and McG. repeated Dewar's expt by sealing I<sub>2</sub> in a flask, evacuating, heating to 90°, and then allowing air to enter the flask. The I<sub>2</sub> vapor deepened and became more purple with the inrush of air. The expt was repeated with less I<sub>2</sub> than would sat. the space with I<sub>2</sub> vapor at the temp. of the expt., and the same effect was observed. Conclusion: Since no excess solid I was present the effect cannot be attributed to the soly. of I<sub>2</sub> in air. A spectroscopic examn. of the effect was made by photographing the spectrum of the I<sub>2</sub> in the vacuum flask, both an excess of I<sub>2</sub> and an insufficient quantity being used, and also in the presence of air, of N<sub>2</sub>, O<sub>2</sub>, CO<sub>2</sub> and A. An increase of absorption, with the head of the absorption in the green moving to the red, was observed in the presence of the gases. The spectra were identical for all the gases, indicating that the color change is not due to the soly. of the I<sub>2</sub> in the gas used or to a chem. action between the gas and the I<sub>2</sub> vapor, but possibly due to the effect of pressure on the I<sub>2</sub> vapor. The spectra are reproduced. Detn. of the relative volatility of I in air and in a vacuum at 100° showed that it is more volatile in a vacuum, although the results

were not as const. as when air was present. There was no indication of the  $I_2$  being sol. in air. Measurements were carried out to detn. whether  $I_2$  is sol. in the vapors of those solvents in which, as liquids, it is readily sol. Benzene, toluene, alc., ether,  $CCl_4$  and  $CHCl_3$  were used. No const. results could be obtained for these vapors. After prolonged exposure to an air-vapor mixt., the surface of the  $I_2$  frequently became moist, and in some cases all of the  $I_2$  melted. It seemed that the  $I_2$  was absorbing some of the solvent vapor, forming a soln. which would thus have a lower  $I_2$  vapor pressure than pure  $I_2$ , which effect would thus mask any solvent action in the vapor phase.

I. I. QUILL

**Theory of solution of metals and alloys.** M. TZENTNERSHVER. *Z. physik. Chem.*, Abt. A, 141, 297–320 (1929).—A consideration of soln. phenomena from the standpoint of reaction velocity. A primary necessity for comparable results is uniformity of method. For record, results may be reduced to equations of certain reaction orders, or graphic methods used. In the simplest case the reaction may have the mechanism:  $M \rightarrow M^n + n\theta$ ;  $H^+ + \theta \rightarrow H$ ;  $2H \rightarrow H_2$ . This is governed by the diffusion coeff. as shown by the proportionality of its velocity to that of stirring, and its lack of any marked temp. coeff. In the cases such as Al, T. postulates:  $Al + 3Cl^- \rightarrow AlCl_3 + 3\theta$ ;  $3\theta + 3H^+ \rightarrow 3H$ ; with after reactions:  $AlCl_3 \rightarrow Al^{+++} + 3Cl^-$  and  $2H \rightarrow H_2$ . This is chem., being independent of stirring velocity and having a temp. coeff. It reduces to a third-order equation. Cd and Sn show 4th order, attributed to formation of complex ions. Overvoltage and passivity are considered as results of a delay in ion formation and consequent reduction of the soln. pressure ( $p$  in the Nernst equation). These can be lowered by activation (roughening or etching) of surfaces. During the induction period ordinarily observed in metallic soln. self activation is taking place. In metallic mixt. local elements are formed in which the potential of the dissolving metal is pos. and approaches a limit, characteristic of the acid anion. Soln. velocity is proportional to the cond. of the acid and only rarely affected by stirring. The log of the c. d. is proportional to time and follows the temp. coeff. of the cond. of the acid. In alloys, or with metallic coverings applied directly or through pptn. from salt solns., the nobler metal forms a continuous cathode through which the electrolyte diffuses, this diffusion velocity governing the speed of reaction. G. M. E.

**The theoretical evaluation of the entropies of aqueous ions.** WENDELL M. LATIMER AND CHARLES KASPER. *J. Am. Chem. Soc.* 51, 2293–9 (1929).—Calcs. are made which indicate that the entropy of hydration of aq. ions arises largely from the enormous pressures developed about the ion and the resulting decrease in the entropy of the water due to the compression. The entropies of soln. of the halide ions are shown to be in agreement with the estd. electron affinities of these elements. J. B. A.

**The nature of Kucera's anomalies.** P. HERASYMENKO. *Chem. Listy* 23, 121–4 (1929).—The max. of current during electrolytic reduction observed on polarigraphic curves accompany every reducing process including the electrodeposition of metals and various cathode potentials. About 50 reduction reactions have been studied which show a max. of current on the polarity curve; the no. of such reactions is unlimited. All max. of current flow are of the same character; the explanation must be a general one. The accumulation of  $O_2$  at the interface of Hg causes the interfacial tension to rise. Pure Hg has a surface tension of 440 *in vacuo*; in an atm. of  $O_2$ , the tension rises to 504, indicating an adsorption of  $O_2$ . If the rate of reduction is exceeded by the rate of adsorption, the reducing matter in the interface is decreased; the current falls, and the polarization increases.

FRANK MARESH

**Electrochemical reduction of benzoic acid.** FR. FICHTER AND ISRAEL STEIN. *Helv. Chim. Acta* 12, 821–6 (1929).—Baur and Müller (cf. *C. A.* 22, 1894) have reported the electrochem. reduction of  $BzOH$  to 1,3-dihydrobenzoic acid. Older references, apparently at variance, are now confirmed. An 80% yield of benzyl alc. with only traces of hydroaromatic compds. was obtained upon reduction of  $BzOH$  in alc. and concd.  $H_2SO_4$ , with a very pure Pb-cathode and a c. d. of 0.1 amp./sq. cm. Conclusion: Nuclear reduction, as observed by B. and M., was due to the lower c. d., they used, 0.01 amp./sq. cm.

K. H. ENGEL

**The conductivity of ethylmagnesium iodide in ether solns.** N. V. KONDIREV AND A. K. SUSL. *Ber.* 62B, 1856–61 (1929); cf. *C. A.* 19, 2636.— $K$  (= sp. cond.) and  $\lambda$  (= equiv. cond. =  $\phi K$  where  $\phi$  = cc. soln. contg. an equiv. in g. [ $\frac{1}{2}$  EtMgI]) curves were detd. at concns.  $\phi$  = 150 to  $\phi$  = 800 at 0°, 5°, 10°, 15° and 20°. The max. of  $K$  and  $\lambda$  for different temps. varies with concn. Each concn. of EtMgI in  $Et_2O$  corresponds to a different degree of assocn. of the complex between EtMgI and  $Et_2O$ .

**Measurement of the conductance of electrolytes. II. Improvements in the os-**

illator and detector. GRINNELL JONES AND GILES M. BOLLINGER. *J. Am. Chem. Soc.* 51, 2407-16(1929); cf. *C. A.* 22, 1892.—An oscillator to give low voltage and an improved amplifier of vacuum-tube type for use on precision a. c. bridge for elec. cond. are described. G. B. TAYLOR

Some properties of the electromotive forces developed by contact of metals with solutions of various acid and salt concentrations. F. VLKS AND A. UGO. *Compt. rend.* 188, 1550-2(1929).—The e. m. f. of various metals and non-metals in solns. of their salts of varying strength and acidity against the calomel electrode are discussed. The values follow long complex curves. The final value is a function of the acidity and the salinity, and the curves show points of inflection at certain crit. points (equipotential) which when initially imposed yield const. values. The e. m. f. for some metals is more sensitive to changes in acidity and for others more so to changes in salinity. With certain metals at certain acid concns. the soln. appears to be buffered. These points are the equipotential points and may be considered as the isoelec. point of the amphoteric substance. V. F. HARRINGTON

The potentiometric determination of hydrogen ions. J. VELÍŠEK. *Chem. Listy* 22, 97-100(1928).—A theoretical discussion (general). FRANK MARESH

The influence of neutral salts on the  $p_H$  of phosphate buffer mixtures. HOWARD W. ROBINSON. *J. Biol. Chem.* 82, 775-801(1929).—The influence of neutral salts on  $p_H$  was studied throughout the range of the phosphate buffer solns. The effect is predominantly that of the cations and increases in the order  $K < Na < Li$ . It is independent of the total concn. of  $PO_4$  but is a function of the ionic strength. The equation

$p_H = p_K + \log \frac{Na_2HPO_4}{KH_2PO_4} - \frac{1.5\sqrt{\mu}}{1 + 1.5\sqrt{\mu}}$  is valid at 38° for concns. of  $PO_4$  up to

$M/15$ . For  $PO_4$  mixts. contg. neutral salts, the equation may be corrected by adding a term which is a function of the ionic strength of the neutral salt. A graphic method of calcn. is given. ARTHUR GROLLMAN

Limits to the applicability of indicators in simple  $p_H$  determinations. J. EISENBRAND. *Pharm. Zig.* 74, 989-92, 1009-10(1929).—Exptl. evidence indicates that no satisfactory detn. of  $p_H$  is practicable in buffer-free solns. by the aid of color indicators. W. O. E.

Permanence of color standards for  $p_H$  control work. W. A. TAYLOR. *Ind Eng. Chem., News Ed.* 7, 7(1929).—A reply to Schroder (*C. A.* 23, 2853). It is claimed that solns. rather than color standards of glass or color charts give best results, and that such solns. are available with a stability required by the analyst. If protected from light they retain their color for 4 or 5 yrs. W. C. EBAUGH

A method of determining hydrogen-ion concentration by means of the antimony electrode. I. I. SHUKOV AND G. P. AVSEYEVICH. *Z. Elektrochem.* 35, 349-52(1929).—A new method is described for prep. an Sb electrode, consisting of electroplating amalgamated Pt wires in a 25%  $SbCl_3$  soln. in acetone. These electrodes are characterized by permanence of potential and by reproducibility. The relationship between the electrode potential,  $E$ , and the H-ion concn.  $p_H$  is:  $E = 0.009 + 0.053 p_H$ . F. E. W.

The equilibrium  $Fe(NO_3)_3 \cdot KNO_3 \cdot HNO_3 \cdot H_2O$  at 25°. G. MALQUORI. *Atti accad. Lincei* [6], 9, 414-6(1929).—The above system has been studied and the equil. curves are shown; the compd.  $Fe(NO_3)_3 \cdot 2KNO_3 \cdot 4H_2O$  was sepd. from the mother liquors. A. W. CONTIERI

Equilibrium between double sulfates and aqueous solutions of sulfuric acid at various concentrations. II. C. MONTEMARTINI AND L. LOSANA. *L'industria chimica* 4, 107-10(1929); cf. *C. A.* 22, 529.—The systems  $Li_2SO_4 \cdot H_2SO_4 \cdot H_2O$ ,  $Na_2SO_4 \cdot H_2SO_4 \cdot H_2O$  and  $K_2SO_4 \cdot H_2SO_4 \cdot H_2O$  are studied and tables as well as the equil. curves are shown. III. *Ibid* 199-205.—The systems  $MgSO_4 \cdot H_2SO_4 \cdot H_2O$ ,  $MnSO_4 \cdot H_2SO_4 \cdot H_2O$ ,  $NiSO_4 \cdot H_2SO_4 \cdot H_2O$ ,  $CoSO_4 \cdot H_2SO_4 \cdot H_2O$  and  $ZnSO_4 \cdot H_2SO_4 \cdot H_2O$  are studied and complete equil. curves shown. A. W. CONTIERI

The velocity of oxidation of amines by potassium permanganate under various conditions. B. V. TRONOV AND L. S. NIKONOVA. *J. Russ. Phys.-Chem. Soc.* 61, 541-9(1929).—The oxidation of amines presents a more complex problem than that of alcs. and ethers (cf. *C. A.* 22, 3335, 3336, 3627) since N forms a larger variety of compds. than does O and also can exist in several valence states. The course of the oxidation is largely affected by the agent used and the concn. of H ions. The generalizations in the literature concerning the conditions facilitating amine oxidation conflict with one another. In the present investigation were studied triethylamine (I), piperidine (II), pyridine (III),  $\alpha$ -picoline (IV), quinoline (V), isoquinoline (VI) and N-tetrahydroquinoline (VII). The group  $CH_3$  in amines when adjacent to trivalent N reacted very readily

with  $\text{KMnO}_4$  in the presence of alkali. Satd. radicals, e. g., the Me in picoline, when further removed from the N, reacted with more difficulty. Unlike the O compds. studied, the  $\text{CH}_3$  in amines was quite as easily oxidized by  $\text{KMnO}_4$  in absence of alkali. This may be explained by the alk. reaction of the amines themselves. The CH group in pyridine derivative was scarcely attacked by  $\text{KMnO}_4$  alone or with alkali. In this regard exception is taken to the rule of Vorländer, and the case considered analogous to the difficult oxidation of such compds. as PhH by  $\text{CrO}_3$ , where, because of the unsatd. nature of the C atoms, the C—H bond is very stable. Satd. amines oxidized with difficulty in acid environment. It appears to be an exception to this but it may have been impure. In each case these amines oxidized with more difficulty than alcs. contg. the group  $\text{CH}_2$  linked to O. This difference may be explained in 2 ways: either the H attached to N is less mobile making the first phase of the reaction difficult, or the subsequent decompn. proceeds less easily. III in acid soln. is oxidized more easily than I, and much more easily than III in alk. soln. Thus with salt formation the oxidizability increases; this is due perhaps to the role of H attached to N. The present expts. partly confirm this view, since the mobility of this H would increase with an increase in the electronegativity of the remainder of the mol. Varying the acid concn. had little effect on the rate of oxidation. On the other hand the salts of  $\alpha$ -phenyl- and  $\alpha$ -benzylpyridine are more resistant to oxidation. This anomaly could be explained by assuming a kind of ring closure between the mobile H attached to N and a C atom of the ring of the substituent group, in keeping with Lowry's theory of the polarity of the double bond. The oxidation expts. were carried out at 16–18°, either with  $\text{KMnO}_4$  alone, or in the presence of equimol. amts. of NaOH or  $\text{H}_2\text{SO}_4$ . With III, various concns. of  $\text{H}_2\text{SO}_4$  were used ranging from 0.5 to 15 M, and also AcOH 0.5 and 1 M. The amine and  $\text{KMnO}_4$  were taken in equimol. amts.; the concn. of the  $\text{KMnO}_4$  was 0.03 mol. per l. The rate of reaction was measured by titration of unutilized oxidant remaining after various intervals of time. The rates were expressed as relative coeffs., that of III in alk. soln. being taken as unity. With VII titration was impossible because of formation of dark-colored products, although oxidation was very rapid in acid soln., less so under other conditions. The relative rates of oxidation follow: with  $\text{KMnO}_4$  alone; II, 10<sup>6</sup>; III, 4; IV, 21; V,  $6.2 \times 10^3$ ; VI,  $1.5 \times 10^3$ ; with  $\text{KMnO}_4$  and NaOH; I, 10<sup>6</sup>; II,  $2.8 \times 10^5$ ; III, 1; IV, 21; V,  $5.2 \times 10^3$ ; VI,  $9.5 \times 10^3$ ; with  $\text{KMnO}_4$  and  $\text{H}_2\text{SO}_4$ ; I, 3.3; II, 92; III, 74; IV, 126; V,  $1.4 \times 10^4$ ; VI,  $3.8 \times 10^4$ . In the addnl. expts. with III, change in concn. of  $\text{H}_2\text{SO}_4$  had a negligible effect. With III and 0.5 mol. AcOH, the rate is 43; with mol. AcOH, it is 71. The rates of oxidation of the phenyl- and benzylpyridines have not yet been detd.

LEWIS W. BUTZ

Studies on hydrazine; the velocity of the oxidation of hydrazine by ferricyanide. E. C. GILBERT. *Z. physik. Chem.*, Abt. A, 142, 139–50 (1929).—The oxidation was investigated at a temp. of 20° and in a buffer soln. of 0.6 M succinic acid, which has a  $p_H$  of about 6. The reaction gives  $\text{N}_2$ ,  $\text{Fe}(\text{CN})_6^{---}$ , and  $\text{H}_2\text{O}$  and is of the third order between hydrazine, OH ion and ferricyanide (simply of second order between hydrazine and ferricyanide).  $K = 1.72 \times 10^7$  for the third-order reaction. Conclusion:  $\text{N}_2\text{H}_4$ , rather than  $\text{N}_2\text{H}_5^+$  is the reacting material and the first step of the process is  $\text{N}_2\text{H}_4 - e \longrightarrow \text{N}_2\text{H}_3 + \text{H}^+$ .

WILLIAM E. VAUGHAN

Studies of catalysis by the action of subdivided metals. IV. Isotherms of adsorption of hydrogen, ethylene and ethane. B. FORESTI. *Gazz. chim. ital.* 59, 243–58 (1929); cf. *C. A.* 19, 2633.—The isotherms of adsorption of  $\text{H}_2$ ,  $\text{C}_2\text{H}_4$  and  $\text{Me}_2$  by catalytic Ni at 20° were studied. The Ni was first evacuated at 255° and at 21°, and the isotherms were then detd. by a volumetric method which was based on measurements of the quantity of gas adsorbed at different pressures when equil. was reached. The app. was almost the same as that used in detg. the heats of adsorption of various gases on Ni (cf. *C. A.* 18, 1224), with the addn. of a Bourdon manometer. Only  $\text{C}_2\text{H}_4$  conformed to the relation:  $L = K\sqrt{p}$ , when the metal was evacuated at 21°, and when the metal was evacuated at 255°, even  $\text{C}_2\text{H}_4$  followed the law only approx. and within a limited range of pressures. Certain data of Schmidt (cf. *C. A.* 20, 1017; 22, 4332), according to which  $\text{H}_2$  is always adsorbed by Ni in proportion to the square root of the pressure, are corrected. Various cases of adsorption are then discussed from the point of view of the Langmuir theory, the conclusion being reached that the quadratic relation also holds independently for the disson. of the adsorbed gas; in fact non-dissociable gases sometimes follow this quadratic relation. For at. adsorption, the validity of the same relation depends upon the pressure and upon the value of  $\delta$ , the isotherms of which however, have a different form from the form of the exptl. isotherms. The theoretical discussion and the exptl. data together favor the idea of the "heterogeneity" of the sur-

face of the Ni catalyst. Such a surface would be constituted of centers of different values distributed in groups, and the smaller the activity of the centers pertaining to each group, the greater the no. of these groups. At pressures where adsorption isotherms are ordinarily detd., it is possible to obtain curves which obey the quadratic relation without the necessity of assuming that the adsorbed gas is in the at. state. The isotherms for  $C_2H_4$  also show that the quadratic relation is valid for mol. adsorption. The characteristic form of the isotherms for  $H_2$  and Ni indicate to a certain extent the constitution of the adsorbing surface of the metal, for they show that the greater part of the gas is adsorbed at low pressures (not over 50 mm.) with the result that there are 2 branches differently inclined with respect to the ordinates. Curves of the same type can be obtained from the equation:  $\theta = B_1(\delta_{1\mu}/[1 + \delta_{1\mu}]) + B_2(\delta_{2\mu}/[1 + \delta_{2\mu}]) + \dots$ , by assigning to it values of  $\delta_1 = 10^\circ$ ,  $\delta_2 = 10^\circ$ ,  $B_1 = 0.30$ ,  $B_2 = 0.70$ . This is in favor of the heterogeneity of the active surface, with at least 2 types of adsorbing centers distributed so that there are fewer strong ones than weak ones. The form of the isotherms of  $C_2H_4$  and of  $Me_2$  indicates that the bonds established between the gas mols. and Ni catalyst are weaker than those of adsorbed  $H_2$ . As a result  $C_2H_4$  is more readily evolved, and this in turn is in accord with the ease with which  $C_2H_4$  may be hydrogenated in the presence of Ni. The results also show that to obtain data on the adsorption of  $H_2$  by Ni by exptl. detns. of the isotherms, it is necessary to work at the lowest practicable pressures. For simple mol. adsorption on homogeneous or heterogeneous surfaces, the quantity of gas adsorbed is, at low pressures, proportional to these pressures, while the quadratic relation holds for at. adsorption. This should also be true if it is assumed that only a small part of the adsorbed  $H_2$  is dissoed. If the dissoen. is attributed to the more active centers, at low pressures these centers will be covered to the greater degree and therefore will follow the quadratic relation at least to a close approximation. C. C. DAVIS

**Nickel catalyzer. I. Catalyzer prepared from nickel chloride.** TOKISHIGE KUSAMA AND YUKIO UNO. *Bull. Inst. Phys. Chem. Research (Japan)* 8, 461-6(1929); *Abstract sect. 2*, 50-1.—The reason for the fact that a Ni catalyst prepd. from  $NiCl_2$  is generally less active than one prepd. from  $Ni(NO_3)_2$  is discussed. The authors prepd. a basic carbonate from  $NiCl_2$  with  $Na_2CO_3$  and, after washing it thoroughly changed it into an oxide at  $480^\circ$ . The oxide still contained 0.023% Cl. It was reduced in a  $H_2$  current at  $350^\circ$ . The Ni thus prepd. had the same catalytic effect as a batch prepd. from  $Ni(NO_3)_2$  in reducing naphthalene, benzene, phenol and aniline. ALBERT L. HENNE

**Generalized two-dimensional Gibb's statistics.** KULESH CH. KAR AND R. MAZUMDAR. *Z. Physik* 55, 546-54(1929).—Mathematical. GEORGE GLOCKLER

**Ternary systems. VIII. Potassium carbonate, potassium sulfate and water at  $25^\circ$ .** ARTHUR E. HILL AND SAMUEL MOSKOWITZ. *J. Am. Chem. Soc.* 51, 2396-8(1929); cf. C. A. 22, 4336.—The soly. of  $K_2SO_4$ , expressed as g. per 100 g. of satd. soln., at  $25^\circ$  decreases from 10.7 in pure water to 0.03 in satd. solns. of  $K_2CO_3$ . Solid soln. does not occur in the system at  $25^\circ$  to a measurable extent. K. D. JACOB

**A study of the system: sodium bicarbonate-potassium bicarbonate-water.** N. E. OGLESBY. *J. Am. Chem. Soc.* 51, 2352-62(1929).—The ternary system:  $NaHCO_3$ - $KHCO_3$ - $H_2O$  was studied at temps. of  $19.97 \pm 0.01^\circ$ ,  $25 \pm 0.03^\circ$  and  $30.01 \pm 0.04^\circ$  under the fixed condition that the sum of the partial pressures of  $CO_2$  and  $H_2O$  vapor was equal to the atm. pressure. The only solid phases that exist at these temps. are  $NaHCO_3$  and  $KHCO_3$ , the absence of hydrates, solid solns. and double salts being definitely established. The soly. of  $KHCO_3$  at  $20^\circ$ ,  $25^\circ$  and  $30^\circ$  was 33.3, 36.57 and 39.92 g. per 100 g. of water, resp., the values being somewhat higher than the best values previously reported. The values for the soly. of  $NaHCO_3$  checked very closely with the best values previously given in the literature. K. D. JACOB

**Double salt isotherms.** R. M. CAVEN AND WM. JOHNSTON. *J. Roy. Tech. Coll. (Glasgow)* 2, No. 1, 30-5(1929).—The following systems were studied: (1)  $Na_2SO_4$ - $ZnSO_4$ - $H_2O$ , at  $0^\circ$  and  $25^\circ$ ; (2)  $K_2SO_4$ - $CoSO_4$ - $H_2O$ , at  $25^\circ$ ; (3)  $Na_2SO_4$ - $MnSO_4$ - $H_2O$ , at  $0.25$  and  $35^\circ$ . In (1) the double salt  $Na_2SO_4 \cdot ZnSO_4 \cdot 4H_2O$  was found at  $25^\circ$  but not at  $0^\circ$ . In (2) the double salt  $K_2SO_4 \cdot CoSO_4 \cdot 6H_2O$  exists at  $25^\circ$ . In (3) the double salt  $Na_2SO_4 \cdot MnSO_4 \cdot 2H_2O$  occurs at  $25^\circ$  and  $35^\circ$  but not at  $0^\circ$ . Isotherms are plotted for the various double salts. R. H. FERGUSON

**Binary azeotropes. XII.** M. LECAT. *Ann. soc. sci. Bruxelles* 48B, i, 113-26(1928); cf. C. A. 23, 1800.—A further list of binary org. mixts. is given contg. 161 pos. and 11 neg. azeotropes, 27 eutectic mixts., and a large no. of euzotropes. The mixt. of phenetole and isoamyl ether constitutes the first established case of azeotropy in which both the components are oxides. B. C. A.

**Thermic analysis of the system: phenylhydrazine-acetic acid.** N. A. TRIFONOV AND S. I. CHERBOV. *Bull. inst. recherches biol. Univ. Perm (Russia)* 6, 313-8(1929).—The curve m. p. vs. concn. was detd. for the system:  $\text{PhNHNH}_2 + \text{AcOH}$ . The diagram presents one dystectic point at  $61.5^\circ$  for a 50% mol. concn. and 2 eutectic points, at  $15.7^\circ$  for 5% mol. AcOH and at  $-8.8^\circ$  for 85% mol. AcOH. The dystectic point shows the formation of a 1:1 addn. compd. ALBERT L. HENNE

**Decomposition velocity of solids. V. Mercurous carbonate and some metal salt hydrates.** B. BRUŽS. *Z. physik. Chem., Abt. B*, 3, 427-39(1929); cf. *C. A.* 20, 3623.—A curve was drawn and all time elements were reduced to the basis of the time at which the max. velocity was reached. At this point decompn. in  $\text{Hg}_2\text{CO}_3$  had reached 40%. The reaction mechanism was independent of the temp. and pressure. The reaction velocity was proportional to the difference between the internal and external  $\text{CO}_2$  pressure. Equil. in the reaction,  $\text{Hg}_2\text{CO}_3 = \text{Hg}_2\text{O} + \text{CO}_2$ , lies at  $116 \pm 0.5^\circ$ . Efflorescence of the hydrates varied greatly with the condition and area of the surface exposed. Spontaneous procedure of decompn. under const. external conditions is accounted for by local variations in pressure within the crystal lattice. GREGG M. EVANS

**The thermal decomposition of methyl isopropyl di-imide: a homogeneous unimolecular reaction.** The thermal decomposition of hydrazoic acid and methyl azide. HERMAN C. RAMSPERGER. *J. Am. Chem. Soc.* 51, 2134-43(1929); cf. *C. A.* 23, 1877.—The thermal decompn. of  $\text{CH}_3\text{—N=N—C}_3\text{H}_7$  in the range of temp. 250-332° and of pressure 0.0058-13.12 cm. Hg takes place by the main reaction  $\text{CH}_3\text{—N=N—C}_3\text{H}_7 \rightarrow \text{N}_2 + x \text{C}_2\text{H}_6 + y \text{C}_4\text{H}_{10} + z \text{C}_6\text{H}_{14}$  with the probable side reaction  $\text{CH}_3\text{—N=N—C}_3\text{H}_7 = \text{N}_2 + \text{CH}_4 + \text{C}_3\text{H}_6$ . The reaction is homogeneous and first order at high pressures. At pressures below several cm the rate const. falls off. Theory 2 of Rice and the author fits the data if the mol. be assumed to have 33 degrees of freedom. The thermal decompn. of anhyd.  $\text{NH}_3$  takes place at  $290^\circ$  with measurable velocity. Expts. at  $290^\circ$  and 4 cm. pressure show 9-11%  $\text{HN}_3$  to be decompd. in 25 min. The decompn. is catalyzed by the Pyrex walls of the reaction vessel. The thermal decompn. of  $\text{CH}_3\text{N}_3$  was carried out at  $245^\circ$ . The reaction was homogeneous, and of the first order during a given expt., but the rate const. becomes lower at lower initial pressures. E. S. W.

(London) A122, 589-98(1929).—It is shown that, although the series of perturbations does not in general converge, yet it usually possesses the same asymptotic character as in the classical theory, and its use can therefore be justified. The investigation is limited to systems possessing only discrete spectra, and the method does not seem adequate to deal with systems with continuous spectra.

**Determination of crystal potentials by diffraction of high-voltage electrons.** A. G. EMSLIE. *Nature* 123, 977-8(1929).

A. L. HENNE

**The excitation potentials of the mercury atom.** RAMON G. LOYARTE. *Anales soc. cient. Argentina* 107, 498-510(1929).—Several of the excitation potentials found by Franck and Einsporn (*C. A.* 14, 3360) may be obtained by adding the potential of 1.4 or its multiples to the normal series of potentials of Hg. It remains to be detd. whether this potential belongs to the abnormal series or is caused by a very small quantity of impurity in the tube.

R. D. BUMBACHER

**Experiments with rays of atomic hydrogen. I. The technical production of rays of atomic hydrogen, and their effect on a Schumann plate.** HANS KERSCHBAUM. *Ann. Physik* [5], 2, 201-12(1929).—A Woods tube run by d. c. was employed; the new feature was the use of celluloid pierced with fine holes for the 3 parallel slits to define the beam of rays of at. H. On exposing a Schumann plate glass side toward the source, a point image was obtained, but on exposing the emulsion side for the same length of time, an image 4-5 times as large was obtained. It was experimentally proved that blackening of the Schumann plate was due solely to H atoms. The image obtained by exposure of the emulsion side of the plate was due to the H atoms, and was enlarged by a slight scattering of the atom. The fuzzy edges were due to non-circular holes (in the slits) with rough edges. **II. Reflections of hydrogen rays from crystals.** *Ibid* 213-20.—Expts. on the reflection of H atoms of thermal velocity by mica, gypsum and celluloid over 2 angular regions, viz., 45-50°, and 5-10° are reported. The angle of incidence is equal to the angle of reflection, referred to the normal to the crystal. With the thinnest possible films of celluloid and of mica, only irregular scattering in the film was observed. When the gas in the observation chamber was air at a pressure of 0.001 mm. the Schumann plates blackened without the formation of an image of the H atom rays, but when the air was replaced by Ne, a very distinct image of the rays was obtained (save for fuzzy edges) even at a pressure of 0.0014 mm. No explanation of this fact was found.

LOUIS WALDBAUER

**Aggregates of radioactive atoms. II.** JEDRZEJOWSKI. *Compt. rend* 188, 1043-5 (1929). A photographic study of the formation of recoil aggregates in radioactive decompn. under various conditions. Sources prepd. by direct activation in Rn, or by activation *in vacuo* by recoil particles, both from  $\alpha$  and  $\beta$  ray changes, show the existence of at. aggregates, but in sources prepd. by distn., aggregates are absent. Increase of temp. is without influence on aggregation.

W. WEST

**The recoil.** L. WERTENSTEIN. *Compt. rend.* 188, 1045-7(1929); cf. preceding abstr.—A study of the recoil particles of Ra C in the  $\beta$ -ray change of Ra B. The mode of prepn. of the source does not influence the yield; increase in temp. and age of source lowers it. Bi, isotopic with Ra C, is the best receiver for the recoil particles; Al, which is the best substance on which to deposit the source, is the least efficient receiver.

W. WEST

**Radium, with special reference to luminous paint.** A. T. PARSONS. *J. Oil and Colour Chem. Assoc.* 12, 3-25(1929).—A general account of the chem. and radioactive properties and the manipulation of Ra is given, and its applications to medical practice and chem. investigations are indicated. Radioactive luminous paints consist of a phosphorescent substance, e. g., suitably prepd. ZnS, etc., the luminescence of which is excited by radioactive material, e. g., Ra, meso-Th, etc. The manuf. of luminous ZnS is described. Work on the permanence of luminous paint and the recovery of Ra therefrom is summarized.

B. C. A.

**The modification of colloids by the action of the rays from radioactive substances.** J. LOISELEUR. *Compt. rend.* 188, 1570-2(1929).—The rays of Ra and Rn reduce the protective power and cause the flocculation of gelatin and other colloidal solns. Certain salts aid this action.

B. C. A.

**Eddington's hypothesis and the electronic charge.** E. BACKLIN. *Nature* 123, 409-10(1929).—The distribution of individual values of the electronic charge,  $e$ , obtained by Millikan, Wadlund and the author, resp., is examd., and the probable error is estd. It is not possible to decide whether 136 or 137 is the better value for Eddington's relation  $hc/2\pi re^2$  (*C. A.* 23, 1809).

B. C. A.

**Low-voltage sparks as spectroscopic sources.** A. OCCHIALINI. *Atti accad. Lincei* [vi], 8, 339-93(1928). E. J. C.

**Further remarks concerning thermionic "A" and "b," a revision and extension.** EDWIN H. HALL. *Proc. Natl. Acad. Sci.* 15, 504-14(1929).—H. disagrees with the proposal that the thermionic-work function and photoelec.-work function are equal. The equation  $\phi = \phi_0 - (\lambda^1 - \theta)$  is derived, wherein  $\phi$  and  $\phi_0$  are the thermionic and photoelec.-work functions, resp.,  $\lambda^1$  is the energy to ionize an atom in the metal and  $\theta$  a term to account for the thermal energy of the electron after emission. H. insists on the possibility of a variation of the thermionic-work function with temp. even in cases where the corresponding photoelec. term is independent of temp.  $b = \phi/k$  and H. proposes  $b = b_0 - aT$ ,  $b_0$  and  $a$  being const. It is stated that Bridgman is using a definition of work function essentially different from that of H. In cases where the photoelec.-work function varies with temp.,  $I = \epsilon \gamma A_0 T^2 e^{-b_0/T}$  where  $\gamma$ ,  $A_0$  and  $b_0$  are const.  $\phi$  may also be expressed as  $\phi_0 - akT$ ,  $k$  being the Boltzmann const. W. D. V.

**Some applications of electric moments to electronic theories of valence.** CHARLES P. SMYTH. *J. Am. Chem. Soc.* 51, 2380-8(1929).—Electronic moments are used as a test of electronic theories of valence requiring a polar mol. Lack of elec. moments in the paraffins shows no alternating polarity in the chain or inherent dissymmetry in the electron linkages of alkyl radicals. Uniformity of moments of the higher ketones and alkyl halides indicates the same and shows that in these chains no measurable polarity is transmitted through more than 2 atoms. The ethylene double bond has no measurable polarity but may have if different radicals are attached to opposite sides of the bond. The difference in moment between the *cis* and *trans* isomers of acetylene dihalides indicates a lack of rotation about the double bond. Effects commonly attributed to differences of polarity may be due to differences of energy levels of the valence electrons. C. L. READ

**Emission of electrons from metals.** F. ROTHER AND E. MÜNDE. *Physik. Z.* 30, 65-8(1929).—Millikan and Eyring (*C. A.* 20, 1353) found the pulling out of electrons from a thoriated W cathode by intense elec. fields to be independent of temp., and Gossling (*C. A.* 20, 1944) found the temp. effect up to 1700° abs. on electron emission to be negligibly small. Gossling, in contrast to Millikan and Eyring, observed sudden changes in the characteristic curves for the discharge. According to Schottky's theory (*C. A.* 17, 2078), the relation between  $\log i$  ( $i$  being the current) and the root of the voltage gradient  $(v./cm.)^{1/2}$  should be linear; but Millikan and Eyring did not obtain such results. Repetition of the work shows that  $\log i$  is proportional to the sq. root of the field strength rather than to the reciprocal of the field strength (cf. Fowler and Nordheim, *C. A.* 22, 3829). The origin of the exptl. discrepancies is discussed and the validity of Schottky's theory is accepted. B. C. A.

**Influence of the level of origin of the photoelectrons on the distribution in space of their initial directions.** P. AUGER. *Compt. rend.* 188, 447-550(1929); cf. *C. A.* 21, 1591, 23, 1050.—Electrons from the *K*-level behave as if they possess no motion before their photoelec. expulsion, while those from the *L*-level show a considerable supplementary dispersion, appreciable even for low values of this level, which indicates the existence of electronic motion in the atom itself before excitation. B. C. A.

**Technic of the Röntgen methods.** FRITZ KASTNER. *Sprechsaal* 62, 263-4, 294-6, 316-7, 335-8(1929).—Photographs of x-ray app. and parts, with a thorough description of each, and sketches of the set-up for different methods of x-ray analysis are given. C. H. LORIG

**The formation of addition compounds in the crystalline state.** W. KRINGS. *Z. anorg. allgem. Chem.* 181, 298-308(1929).—A theoretical treatment of complex compds. and coordination nos. K. calcs. the energy required for the addn. of 1 mol. of  $NH_3$  to a lattice mol. of the uni-uni salt type as  $4.95 \times 10^{-12}$  ergs on the basis of the charges and potential of the ions. This corresponds to 71,700 cal. mol. The lattice furnishes 38,400 cal., which leaves 33,300 cal. necessary from external sources. 'It is thought that this figure is high. K. theorizes on the meaning of coordination nos. W. E. V.

**Penetrating radiation. II.** J. CLAY. *Proc. Acad. Sci. Amsterdam* 31, 1091-7(1928); cf. *C. A.* 22, 4359.—An accurate detn. of the capacity of the electrometers has shown that the values previously used were incorrect. A redetn. has been made of the residual ionization and of the const. of the penetrating radiation. The origin of the latter is discussed, and its intensity is shown to decrease as the equator is approached. B. C. A.

**The Stark effect of higher atoms and its interpretation according to the quantum theory.** R. LADENBURG. *Physik. Z.* 30, 369-83(1929).—Summary and bibliography. F. R. BICHOWSKY

**Photodichroism and photoanisotropism. III. Quantitative measurements of induced photodichroism.** FRITZ WEIGERT. *Z. physik. Chem., Abt. B*, **4**, 83-112 (1929); cf. *C. A.* **23**, 4146.—W. presents a detailed paper on the phases of induced photodichroism. Various types of plates and emulsions and 8 different filters to isolate portions of the spectrum were employed. The phenomenon is best shown under the stimulation of red light. The measurements are definitely reproducible but are sensitive to even slight variations in exptl. app. and technic. The effects of variation of time of exposure (over a range of from 1 sec. to 4 min.) with time of development (30 sec. to 240 min.), both "physical" and "chemical" developers (metolhydroquinone and iron oxalate) being used, has been fully investigated and it is found that the degree of dichroism is greater with the longer periods of exposure and developing. Influence of period of fixation also was studied. In some cases when a wet plate was exposed to red radiation the dichroism was first neg and then became pos. Blue-green light was effective but red gives the greatest results. The Ag formed may be yellow, vel. low-brown, red-brown, brown, olive-green or black. AgCl shows the most pronounced effects in fixed periods of time of exposure, while AgBr is nearly as sensitive and AgI the least.

WILLIAM E. VAUGHAN

**Elimination of stray radiations in an infra-red spectrometer.** J. LECOMTE. *Compt. rend.* **188**, 622-5(1929).—The proportion  $d$  ( $d < 1$ ) of stray radiation passing into the instrument at each point of the spectrum beyond  $10\mu$  is detd. by the transparent-shutter method, and the gross transmission of the substance is then detd. by the usual opaque-shutter method. The true transmission of the radiation above  $10\mu$  is given by the formula  $T = (T' - d)/(1 - d)$ , where  $T'$  is the gross transmission of the radiation in the presence and absence of the absorbent. The true absorption is given by  $1 - T$ . The variation of  $d$  with wave length is usually a straight line.

B. C. A

**Secondary radiations in light diffused by quartz.** J. CABANNES. *Compt. rend.* **188**, 249-50(1929).—An attempt is made to verify the author's hypothesis that the action of light on a mol. depends on its orientation, by the study of the Daure diffusion spectra and the polarization of the secondary radiations produced by quartz crystals in which the mols. are oriented in a small no. of fixed directions. The Daure spectra always comprise the same radiations, whatever the orientation of the crystal.

B. C. A

**Absorption of the carboxyl group in the short ultra-violet.** H. LEY AND B. ARENDS. *Z. physik. Chem., Abt. B*, **4**, 234-8(1929).—Values of the extinction coeffs. of AcOH, glacial and in aq. soln., of AcOEt and of NaOAc soln. are given from about 2350 to 1850 Å. U. Measurements were made by V. Henri's photographic method, a condensed spark between Ag and W being used as source. The acid and ester, pure or in soln., show an absorption max. at about  $204\mu\mu$ ; the Na salt has no max. here, but continues to absorb the shorter wave lengths with a regular increase of intensity.

W. WEST

**Ultra-violet absorption curves of semiterpene alcohols.** J. SAVARD. *Bull. soc. chim.* **45**, 398-402(1929).—Absorption curves for linalool, geraniol, rhodinol and citronellol (in hexane soln.), have been detd. These support the traditional formulas,  $\text{Me}_2\text{C}:\text{CHCH}_2\text{CH}_2\text{CH}(\text{Me})\text{CH}_2\text{CH}_2\text{OH}$  (I) for rhodinol, and  $\text{CH}_2:\text{C}(\text{Me})\text{CH}_2\text{CH}_2\text{CH}_2\text{CH}(\text{Me})\text{CH}_2\text{CH}_2\text{OH}$  (II) for citronellol. They are not in accord with the conclusions of Grignard, *et al.* (*C. A.* **18**, 659), from ozonization methods, that rhodinol consists of 55% of I and 45% of II, citronellol of 80% of I and 20% of II.

K. H. ENGEL

**Apparatus for strong ultra-violet and infra-red light; photographing with heat rays.** I. PLOTNIKOV. *Z. Elektrochem.* **35**, 434-8(1929).—Three types of app., called the UVR large and small models and luminoscope, for the prepn. of strong ultra-violet and ultra-red light for investigations with the help of excited fluorescence and heat-shadow photographs are described in detail with diagrams. The Görz-Beck carbon arc light, strong sunlight and Mg light are used as light sources. The equipment is adapted for biol., medicinal, photochem., paleontological, archeological and criminological investigations.

H. W. WALKER

**An integrating microphotometer for x-ray crystal analysis.** W. T. ASTHURY. *Trans. Faraday Soc.* **25**, 397-401(1929).—See *C. A.* **23**, 3404.

H. W. WALKER

**The Raman spectrum of some organic and inorganic compounds.** A. PETRIKALIN AND J. HOCHBERG. *Z. physik. Chem., Abt. B*, **4**, 299-311(1929).—The Raman spectrum was detd. for benzonitrile, benzyl chloride, benzotrifluoride, phenol, cyclohexanol, paraldehyde, acetone, acetaldehyde, benzaldehyde, chloral, chloral hydrate, allyl chloride, toluene, Me cyanoacetate,  $\alpha$ -tolunitrile,  $\text{SnCl}_4$  and KCN. For H attached to a double-bonded C, the results agree very closely with previous work (A. Petrikalin, *C. A.* **23**, 3855) giving infra-red wave lengths, 3.25-3.27 $\mu$ . For H attached to a single-bonded C the results vary widely; this is attributed to the effect of other groups in

the mol. The C=N bond gives concordant results, 4.41-4.48 $\mu$ , and the C=O bond, 5.81-6.02 $\mu$ . KCN gave a line at 4.80 $\mu$  and SnCl<sub>4</sub> two widely sepd. doublets.

**Studies of the Raman effect. I. The Raman spectra of organic substances (fatty acids and their esters).** A. DADIEU AND K. W. F. KOHLRAUSCH. *Monatsh.* 52, 220-40; *Sitzb. Akad. Wiss. Wien., Abt. IIa*, 138, 41-61 (1929); cf. following abstr.—The importance of Raman spectra is emphasized, as a means of investigating the mol. Fifteen fatty acids and their esters were investigated. The ultra-red frequencies thus found correspond partially to those found by direct measurement, but certain strong bands in the direct absorption expts. are not found in the Raman spectra.  $\nu = 2940$  is present only when the mol. contains a C-H group;  $\nu = 1700$ , when the C-O group is present;  $\nu = 440$ , always when the O-H group is present, but occasionally when it is not (the authors believe that it depends rather on the presence of a C-H grouping);  $\nu = 1050$  appears in the aromatic series, with  $\nu = 1000$  for benzene, toluene, xylene and monochlorobenzene, but is not present with *p*-xylene. Values between 1000 and 1100 are generally found in the aliphatic series, with the exception of AcOH and Me acetate. The change from acid to ester is not clearly marked; from acid to acid is 7-10, and from ester to ester 12-14. The line-group 840, with values from 760-890, appears in almost all compds. The line-groups 600 and 400 are somehow connected with the group 840. Further investigations are being carried on.

HELEN G. WEIR

I. J. PATTON

**Contribution to the study of the Raman effect.** A. DADIEU AND K. W. F. KOHLRAUSCH. *Physik. Z.* 30, 384-91 (1929)—The Raman frequencies are given for 25 org. compds., aliphatic and aromatic, and briefly discussed with reference to the linkages in the mol. In addn. to the frequency  $\nu' = 3050$ , characteristic of the aromatic CH linkage, the authors claim the frequency  $\nu' = 2940$ , ordinarily present only in aliphatic CH linkages, for benzene. The frequent indefiniteness in the arrangement of the displaced lines is pointed out and more fully discussed in the case of benzene. The unmodified superposition of Raman spectra in mixts. of different compds. is confirmed and applied to the observation of dissolved substances (naphthalene in CCl<sub>4</sub>). Attempts to find any frequency characteristic of the presence of disocin. in a soln. of AcOH in water gave neg. results. The influence of temp. on the intensity of Raman frequencies and the classically scattered exciting lines has been detd. qualitatively.

I. J. PATTON

**Fundamental processes of phosphorescence.** R. TOMASCHIEK. *Apoth. Ztg.* 44, 909-10 (1929).—An address dealing with the phenomena underlying the excitation and emission processes of phosphorescence.

W. O. E.

**A method of measuring luminescent light.** I. PLOTNIKOV. *Z. Elektrochem.* 35, 132-4 (1929).—By means of the polarization colorimeter of KRUSS, a quartz lamp, adjustable liquid filter frame, absorption vessels, black wire gauzes and graduated transparent circle, P. measures quantitatively luminescent light including fluorescence, phosphorescence, chemiluminescence, triboluminescence and luminescent bacteria. The method of interchange eliminates app. errors and in first detg. the "weakening" coeff. of the wire gauzes with a spectrophotometer and with P.'s fluorometer the av. error is less than 0.05%. A diagram of the app. and a trial detn. are given.

H. W. WALKER

**The primary process of light absorption and activation in photochemical reactions.** KALI P. BASU. *J. Phys. Chem.* 33, 1200-3 (1929).—An atom or mol. absorbs part of the quantum of incident effective radiation and is distorted, an electron being removed to a higher quantum orbit. The energy level is raised to initiate chem. action. The remainder of the quantum is scattered by the mol., a part of which is again absorbed by another mol. so that more than one mol. is activated. A photochem. reaction should have a lower energy of activation than the corresponding dark reaction. This explains the diminution of temp. coeff. with increase in frequency and the increase of photochem. efficiency with increase in frequency.

MARY E. LEAR

**Photochemical oxidation with potassium dichromate.** D. S. MORTON. *J. Phys. Chem.* 33, 1135-41 (1929).—In an effort to det. the correctness of Luther and Forbes' conclusions, (cf. *C. A.* 3, 2404) that in the reaction between quinine and K dichromate in a soln. contg. H<sub>2</sub>SO<sub>4</sub> only the light absorbed by the quinine was active, it was found that dichromate solns. are photochemically active for light absorbed. But with increasing acidity, the oxidizing power increases and the apparent action of light decreases. With EtOH, K<sub>2</sub>Cr<sub>2</sub>O<sub>7</sub> and varying amts. of acid, the light reaction can be made none or all. Method and data are given.

MARY E. LEAR

**Photochemical decomposition of benzaldehyde.** A. DE HEMPTINNE. *Ann. soc.*

*sci. Bruxelles* 48B, 98-100(1928); cf. *C. A.* 23, 4408.—It is concluded that the photolysis of BzH by light of wave lengths less than 2600 Å. U., which was previously observed (*C. A.* 22, 2717), takes place as follows:  $\text{BzH} = \text{C}_6\text{H}_5 + \text{H} + \text{CO}$ , the H then reacting with the Ph group to form  $\text{C}_6\text{H}_6$ . The energy necessary for this decompn. is calcd. to be 115,780 g.-cal., corresponding with light of wave length 2461 Å. U. This is the wave length at which the total absorption band of the BzH spectrum begins. For BzH there is a complete parallelism between the appearance of total absorption and the possibility of photochem. decompn. B. C. A.

**Complementary and critical researches on the subject of dissolved and irradiated cholesterol. Role of an antioxidant.** E. ROUSSEAU. *Compt. rend. soc. biol.* 100, 823 (1929).—Irradiated abs. alc. displaces I from an iodide. The addn. of cholesterol reduces, and the addn. of phloroglucinol prevents this effect. The substance formed in the alc. is thought to be ozone, though no conclusive demonstration of its presence could be made. B. C. BRUNSTETTER

**Ionization and the chemical combination of gases.** A. DE HEMPTINNE *Bull. sci. acad. roy. Belg.* [5], 14, 450-4(1928); *Chem. Zentr.* 1929, I, 16.—Earlier expts were continued on the relation between ionization in a mixt. of  $\text{H}_2$  and  $\text{O}_2$  and chem. reaction under the influence of silent discharges. Very small pressures (about 1 mm. Hg) and d. c. were employed. The decrease in pressure of the static system was measured. The ionization was estd. galvanometrically and the approx. no. of ions present in the discharge was calcd. The comparison of the no. of ions with the no. of mols. obtained by the chem. reaction allows the conclusion that a close relation exists between these 2 factors. The probable explanation of this relation is discussed. The first product in the reaction between  $\text{H}_2$  and  $\text{O}_2$  is  $\text{H}_2\text{O}_2$ . The conditions are still more complicated with the formation of  $\text{NH}_3$  from  $\text{N}_2 + \text{H}_2$  by silent discharge. G. SCHWOCH

**Use of thermionic valve in measurements of ionization currents.** J. A. C. TEGAN *Nature* 124, 91-2(1929). E. H.

**The activation of oxygen by electron impact.** ROBERT H. DALTON. *J. Am. Chem. Soc.* 51, 2366-74(1929).—Crit. potentials of O were studied at pressures of 0.05-0.4 mm. by means of current-potential measurements, and the rate of reaction with solid C. Crit. values were found at 7.9 and 10.6 v. T. H. CHILTON

**Formulas for sensitized photolyses.** EMIL BAUR *Helv. Chim. Acta* 12, 793-806(1929).—Theoretical formulas are developed covering photolyses occurring under different conditions of inhibition, autocatalysis, etc., on the basis of his theory of photosensitization, wherein the catalyzer is assumed to act as an oxidizing and reducing agent. The effect of anodic depolarizers is analyzed from the 3 standpoints of strong, moderate and no inhibition and equations are deduced for these conditions. Desensitization and the stationary state also are considered. Many examples are cited of work which has characteristics and reaction rates which corroborate the equations

**Studies of overvoltage on metals.** P. SLDERHOLM AND C. BENEDICKS. *Trans. Am. Electrochem. Soc.* 56 (preprint) 14 pp.(1929).—It was empirically established that the regular, half-immersed, H electrode is completely reversible along a straight v.-amp. line, even within the region of O discharge, at least with anodic-currents below 1 milliamp. It has also been found that the same condition prevails when the H electrode is totally immersed; in this case, however, the reversible portion of the v.-amp. curve for the discharge is a very restricted one. A smooth, bright Pt gauze electrode is shown to give the same potential as an electrode of platinized Pt, provided some O has been pptd. on it, the O acting as a depolarizer. In the same manner as overvoltage occurs on the liberation of H, overvoltage also occurs on the discharge of O, and is, in the case studied, about twice as large as that for H. As for H, so also for O, the v.-amp. curves obtained exhibit reversibility, corresponding to the oxygen electrode. In this case H is acting as a depolarizer. The potential difference between the "oxygen electrode" and the "hydrogen electrode" in a given soln. has been found to be 1.48 v. The corresponding value, 1.23 v., given by Nernst, is merely the result of some theoretical considerations. There is, during electrolysis, a complete polar symmetry between the behavior of H and that of O, a fact not properly brought out by earlier experimenters, but a fact which might reasonably be expected. Some theoretical interpretations of the nature of overvoltage are presented. C. G. F.

**Insoluble sulfates and passivity.** LEON McCULLOCH. *Trans. Am. Electrochem. Soc.* 56 (preprint) 4 pp.(1929).—Fe, Ni and Cr have anhyd. sulfates which go into soln. with difficulty. These sulfates may compose the films which cause the passivity of these metals in H<sub>2</sub>SO<sub>4</sub>. Co and Cr anodes dissolve readily because they have easily sol. anodic products. It is suggested that any slowly sol. anode product may be the cause of passivity. C. G. F.

**Effect of current density upon the hardness of electroposited chromium.** ROBERT J. PIERSON. *Trans. Am. Electrochem. Soc.* 56 (preprint) 6 pp.(1929).—With various current densities, from 16 to 109 amp./sq. dm., it is found that Cr has a max. hardness when plated at about 62 amp./sq. dm. The value of this is approx. 43 times as great as that obtained at a normal plating c. d. of 16 amp./sq. dm. as shown by abrasion tests. C. G. F.

**Electroplating of cadmium from cyanide baths.** I. R. WESTBROOK. *Metal Ind.* (London) 35, 83-6, 136(1929).—See C. A. 23, 2664. E. C. M.

**The measurement of  $p_H$  in nickel plating solutions.** W. BLUM AND N. BEKKEDAHL. *Trans. Am. Electrochem. Soc.* 56 (preprint) 27 pp.(1929).—In recent years it has been found that very slight differences in the acidity of Ni plating solns. may affect the character of the deposited Ni. It is therefore the common practice to measure and control the acidity, which is expressed on a scale known as the  $p_H$  scale. In general, this has been done by simple colorimetric methods, which depend upon the color of indicators. Recently, other methods including the use of "the quinhydrone electrode" have come into use. This investigation has shown that while the results with colorimetric methods are sufficiently reproducible to maintain the desired uniformity of the baths, they are numerically somewhat higher than the true value. It is therefore sug-

gested that in future work and publications, when colorimetric methods are used, the results should be corrected to agree with the accepted standard values. C. G. F.

**Oxygen and hydrogen in industry.** W. P. DOBSON AND A. S. L. BARNES. *Trans. Am. Electrochem. Soc.* 56 (preprint) 10 pp.(1929).—The present uses for O and H are reviewed and a no. of the more important new applications that have been suggested in the past are enumerated. It is shown that the com. production of electrolytic O and H is feasible, providing both of the gases are utilized in large quantities. Emphasis is laid on the feasibility of operating oxy-hydrogen cells with off-peak power. Single oxy-hydrogen cells capable of taking 10,000 to 15,000 amp. are now available. C. G. F.

**Oxidation of the depolarizer in preparing standard cells.** W. CECIL GARDINER AND GEO. A. HULETT. *Trans. Am. Electrochem. Soc.* 56 (preprint) 11 pp.(1929).—Cells have been made up in oxidizing and inert atm. by the methods of Vosburgh and Eppley. Any effect of the O of the air on  $\text{HgSO}_4$  in cells set up by the standard method does not appear to be detrimental. Special methods of prepg. cells to prevent oxidation have caused decreasing electromotive forces, showing that care must be taken to expose the depolarizer as little as possible to the hydrolyzing action of  $\text{CdSO}_4$  soln. Cells with a small quantity of  $\text{H}_2\text{SO}_4$  in the electrolyte are very const., and a satd soln of  $\text{CdSO}_4$  in 0.001 N  $\text{H}_2\text{SO}_4$  is recommended. C. G. F.

**Hydrolysis of mercurous sulfate by cadmium sulfate solution in the Weston normal cell.** W. CECIL GARDINER AND GEO. A. HULETT. *Trans. Am. Electrochem. Soc.* 56 (preprint) 17 pp.(1929).—The cathode system of the Weston normal standard cell has been rotated with an excess of neutral  $\text{CdSO}_4$  soln. in an effort to hydrolyze completely the  $\text{Hg}_2\text{SO}_4$ . Analysis of the solid obtained shows that only the outside of the  $\text{Hg}_2\text{SO}_4$  particles hydrolyzes. An exact detn. of the compn. of the final product is therefore impossible under the conditions. The H-ion concn. has been detd. in neutral solns. of  $\text{CdSO}_4$  and in solns. that have been rotated with Hg and  $\text{Hg}_2\text{SO}_4$ . Hydrolysis causes a decrease in  $p_{\text{H}}$  from 4.5 to 4.1. Water brought to equil. with  $\text{Hg}_2\text{SO}_4$  and Hg has a  $p_{\text{H}}$  of about 2.2, but is increased to a  $p_{\text{H}}$  of 4.1 when the soln. is satd. with  $\text{CdSO}_4$ . This soln. is still capable of reacting with  $\text{Hg}_2\text{SO}_4$ . A gain in constancy of the Weston normal cell is obtained by washing the  $\text{Hg}_2\text{SO}_4$  with water that has already been brought to equil. with  $\text{Hg}_2\text{SO}_4$  and Hg. This precaution excludes hydrolyzed salt from the depolarizer, and an electrolyte made by satg. the above soln. with  $\text{CdSO}_4$  provides a reproducible method of obtaining a slightly acid soln. which retards hydrolysis in the Weston normal cell. C. G. F.

**Accumulator acid.** H. S. WILLIAMSON. *Pharm. J.* 121, 618-9(1928).—To avoid the danger in dilg. the strong acid to a required sp. gr., W. recommends the use of 2 stock solns. of  $\text{H}_2\text{SO}_4$ , d. = 1.2 (A) and d. = 1.4 (B). A table of 33 mixts. is given for definite quantities of A and  $\text{H}_2\text{O}$ , and of A and B giving dil. acids varying in d. from 1.125 to 1.300. S. WALDBOFT.

**Electrolytic metal recovery. Present processes and their practical application.** GEORG EGER. *Chem. Fabrik* 1929, 323-4, 333-5, 351-2; *Z. angew. Chem.* 42, 518-22 (1929).—A review. J. H. MOORE.

**Cathodic halogen; the electrolysis of halogenyl amides.** H. R. L. STREIBERT AND E. G. HALLONQUIST. *Trans. Am. Electrochem. Soc.* 56 (preprint) 8 pp.(1929).—Fourteen halogenyl amides or imides were electrolyzed in acetonitrile and pyridine solns. between Ag electrodes. Cathodic Cl was obtained for the first time by electrolyzing chloryl succinimide, dichloryl urea and chloryl phthalimide in a pyridine soln., the Cl going entirely to the cathode. Cathodic Br and I were obtained by the electrolysis of bromyl and iodyl amides. The halogenyl amides behave as electroners; the halogen reacting negatively, on electrolysis, in most solvents but entirely positively in pyridine. An explanation is given for the relative conductance of the aliphatic iodyl amides based on the electron displacement theory. *Iodyl n-butyramide* was prepd. for the first time, and some of its properties were determined. It m.  $97^\circ$ . C. G. F.

**The electrolytic reduction of acetone at a mercury cathode.** CECIL J. HAGGERTY. *Trans. Am. Electrochem. Soc.* 56 (preprint) 4 pp.(1929).—A Hg cathode was used in a weak  $\text{H}_2\text{SO}_4$  soln. contg.  $\frac{1}{8}$  mol. of acetone per l. A pale yellow, oily, mercury diisopropyl was obtained. The catholyte was then distd. and the distillate satd. with  $\text{K}_2\text{CO}_3$ , but only small quantities of isopropyl alc. were obtained. However, the investigation is being continued. C. G. F.

**Electrolytic preparation of 2,4-diaminophenol.** W. E. BRADY AND O. W. BROWN. *Trans. Am. Electrochem. Soc.* 56 (preprint) 13 pp.(1929).—The published work dealing with the electrolytic reduction of 2,4-dinitrophenol is outlined. Reductions of the nitro compd. were conducted in open and closed electrolytic cells. Tabulated results

are included, which show the effect of several variable factors on the current efficiency and material yield. The yield was detd. by diazotization of the amine with standard  $\text{NaNO}_2$  soln. A max. material yield of 94.4% of 2,4-diaminophenol was obtained.

C. G. F.

**New evidence in favor of the peroxide theory of Kolbe's electrosynthesis.** FR. FICHTER. *Trans. Am. Electrochem. Soc.* 56 (preprint) 8 pp.(1929).—Kolbe's electrosynthesis may be duplicated by powerful chem. oxidizing agents like  $\text{F}$ . If  $\text{F}$  or persulfate acts in alk. soln. on a salt of a fatty acid, it is possible to duplicate the electrolytic production of alcs. developed by Hofer and Moest. Chemically prepd. peroxides of a certain mol. wt. are regularly decompd. when heated, and furnish fair yields of synthetic hydrocarbons. At a well-cooled anode  $\text{K}$  caproate is oxidized to the corresponding peroxide and the peracid. When electrolyzed,  $\text{NH}_4$  acetate gives, as a by-product, acetamide, due to the action of  $\text{NH}_3$  on acetyl peroxide. Kolbe's electrosynthesis has to be compared with the formation of persulfates, perphosphates and percarbonates; it differs from them by the particular lability of the first product.

LAVASSEUR, A.: *L'électrochimie et l'électrometallurgie*. 3rd ed., revised and enlarged. Paris: Dunod. 361 pp., F. 75. Reviewed in *Bull. British Non-Ferrous Metals Research Assoc.* No. 26, 24(1929).

**Electric battery.** E. WOLFF. Brit. 305,009, Jan. 28, 1928. Structural features.

**Electric battery with a copper oxide negative element.** MARTIN L. MARTUS, EDMOND H. BECKER and JAMES G. ROSS. U. S. 1,725,716, Aug. 20. Structural features.

**Electric battery terminals and connections.** EDWARD S. MILLER. U. S. 1,724,214, Aug. 13. Structural features.

**Electrodes for dry cell electric batteries.** CLARENCE N. MERTES (to General Dry Batteries, Inc.). U. S. 1,725,592, Aug. 20. Structural features

**Gas vents for electric batteries.** PRITCHETT & GOLD & E. P. S. Co., LTD., and C. R. D. PRITCHETT. Brit. 305,330, Dec. 16, 1927. Structural features.

**Storage battery.** FURUKAWA DENKI KÔGYÔ KABUSHIKI KAISHA. Brit. 304,231, Jan. 17, 1928. Active material for lead-storage batteries is formed by adding  $\text{Pb}$  oxides such as  $\text{PbO}$  or  $\text{Pb}_2\text{O}_3$  to molten  $\text{Pb}$  and stirring the mixt. or by stirring molten  $\text{Pb}$  alone with free access of air. The product is pulverized and made into a paste with  $\text{H}_2\text{SO}_4$ .

**Storage batteries.** J. BACSA. Brit. 305,680, Aug. 8, 1927. Electrodes of  $\text{Ni}$ ,  $\text{Co}$  or  $\text{Fe}$  are made by first electrolytically depositing the metal on a carrier of sheet metal or wire fabric, using a neutral salt soln., then making the carrier and its deposit the anode in an alk. soln. so that the deposited metal is oxidized, and then reducing the oxidized metal by making it cathode in a neutral salt soln.  $\text{Ni}$  or  $\text{Co}$  pos. electrodes thus prepd. may be used with alk. electrolytes and with neg. electrodes of  $\text{Fe}_2\text{O}_3$  or  $\text{Cd}$ .

**Electric storage batteries.** JULIUS DIAMANT. Ger. 477,977, June 16, 1928. Arrangement of plates is described.

**Electric storage batteries.** ALBERT STRASSER and CARL MÜLLER. Ger. 477,978, Nov. 15, 1925. The cores of the electrodes are made from a  $\text{Pb}$ -alkali metal alloy.

**Storage-battery electrodes comprising compressed lead wool.** K. NISHIMOTO. Brit. 304,190, Jan. 16, 1928.

**Storage battery grid manufacture.** C. A. VANDERVELL & Co., LTD., R. C. PATERSON and P. J. BEDDOUS. Brit. 305,302, Nov. 17, 1927. Mech. features.

**Storage-battery plates.** BENJAMIN HEAP (to Electric Storage Battery Co.). U. S. 1,725,734, Aug. 20. In order to prepare charged neg. pole plates of  $\text{Pb}$  secondary batteries for storage in dry condition, without material loss of capacity, the wet charged plates are dipped into a soln. of gelatin contg.  $\text{CH}_3\text{O}$  and without previous drying; the plates are then dried by heating in a nonoxidizing atm. such as steam, which provides them with an oxidation inhibitor sol. in the electrolyte.

**Storage-battery** jar. CARL J. DUNZWEILER (to Willard Storage Battery Co.). U. S. 1,725,260, Aug. 20. Structural features.

**Galvanic cells.** R. SACHS G. M. B. H. Ger. 478,867, Feb. 10, 1928. Details of forming a complete battery of a number of elements.

**Rectifier for charging storage batteries of low voltage at low charging rates.** CLARENCE W. BALKE (to Fansteel Products Co.). U. S. 1,724,065, Aug. 13. An electrode formed of an alloy of Ta and W is used with another electrode such as Pb and with an electrolyte which may be formed from  $H_2SO_4$ .

**Rectifier for alternating current.** SIEMENS-SCHUCKERTWERKE A.-G. and G. SCHAROWSKY. Brit. 304,579, Nov. 14, 1927. Structural features of a rectifier of the metal-oxide type are described.

**Rectifier for alternating currents.** SIEMENS-SCHUCKERTWERKE A.-G. Brit. 305,171, Feb. 1, 1928. Graphite, preferably in the form of "Aquadag," is applied to the surface of the layer of metal compd. in a dry surface-contact rectifier to provide a low resistance connection between the layer of metal compd. and the metallic conductor. A small proportion of finely divided metal may be added to the graphite compn.

**Electrodes for alternating current rectifiers.** SIEMENS-SCHUCKERTWERKE A. G. Brit. 304,748, Jan. 27, 1928. An electrode for a dry surface-contact rectifier is formed by placing layers of Cu sulfide powder and pulverized Cu in a mold and subjecting to a pressure of several thousand kg. per sq. cm. The counter electrode is made of Al or Mg and the electrodes are assocd. under much less pressure than that used for forming the first-mentioned electrode. Se or Te compds. of a metal may be used instead of sulfide.

**Precipitating electrode (comprising a series of tubes or rods) for electric gas cleaners.** OSKI-A.-G. (Erich Oppen, inventor). Ger. 479,015, Feb. 6, 1926

**Electrical resistances.** A. JOFFE. Brit. 304,131, Jan. 14, 1928. Layers of mica may be interposed between layers of another material such as paraffin or glass. Insulation oxidized at the surface may be used. Linseed-oil varnish may be dried so that the outer surface only is oxidized. Various structural details are described.

**Electric condensers.** E. W. JODREY. Brit. 305,515, Nov. 3, 1927. A dielectric of cellulose ester is used as a coating and sealing medium in making condensers of metal foil and tissue paper.

**Electrolytic cells.** MASCHINENFABRIK OERLIKON. Ger. 478,725, Jan. 17, 1928. A method and device is described for securing the porous diaphragms of electrolytic cells for the decompn. of water.

**Porous products for electrolytic diaphragms, etc.** SIEMENS & HALSKE A. G. Brit. 305,022, Jan. 28, 1928. A silicate (suitably of metals of the alkali or alk earth group or of Al) or other similar acid- and alkali-proof substance is partially set, the mass is ground to a suitable size of grain, and then compressed and molded. Metal oxides or other substances may be added, including such substances as naphthalene, which may be subsequently burnt out to increase the porosity of the product.

**Purification of electrolytic baths.** FRANZ VON WURSTEMBERGER. Ger. 478,770, Dec. 15, 1927. See Swiss 129,293 (C. A. 23, 2667).

**Depositing metals by electrolysis.** SIEMENS & HALSKE A.-G. (Herbert Hom, inventor.). Ger. 478,511, Mar. 7, 1928. Layers of deposited metal having identical phys. properties are obtained by adjusting the active surface of a cathode formed by a series of rods to that of the one-part anode.

**Electrolytic production of heavy metal hydroxides.** ACCUMULATOREN FABRIK A.-G. Brit. 305,092, Jan. 30, 1928. A soln. of a salt of a heavy metal, e. g., a dil. Ni sulfate soln., free from foreign ions, is electrolyzed using an anode of the heavy metal such as Ni or one formed of an inert material coated with a combination of the heavy metal sol. during electrolysis; such a high current d. is used that H instead of the metal is liberated at the cathode, and the hydroxide of the metal is pptd in the soln. Various details are given of the formation of Ni hydroxide.

**Electrolytic production of aluminum.** ALUMINIUM INDUSTRIE A. G. Brit. 305,458, Feb. 4, 1928. Ribbed or grooved anodes are used in a process such as is described in Brit. 265,170 (C. A. 22, 195).

**Ferro-vanadium, etc.** B. D. SAKLATWALLA (to Vanadium Corp. of America) Brit. 305,201, Feb. 2, 1928. Ferro-V contg. 85-95% V is made in an elec furnace by use of Si as reducing agent, or, preferably, by thermo-reduction of high grade  $V_2O_5$  by use of Al. A product is obtained contg. less than 1.25% Si and less than 0.5% C. Cf. C. A. 23, 3655. Brit. 305,202 describes a V alloy contg. about 40-90% V, 3-15% Al 5-30% Si and the remainder principally Fe; or similar alloys may be substantially

free from Fe, and the C present may be less than 0.5%. These alloys may be made by thermo-aluminic reduction of  $V_2O_5$  and may be used for introducing V into molten steel baths in which the Al and Si serve as deoxidizing agents.

**Pickling metal surfaces.** Q. MARINO. Brit. 305,036, Jan. 28, 1928. Iron or steel surfaces are cleaned by anodic treatment in an electrolyte formed by adding  $Na_2SO_4$  or  $K_2SO_4$  to a soln. obtained by treating pulverized Ca phosphate or similar phosphate with  $H_2SO_4$  of 10–20° Bé. Various details of treatment are described.

**Electrolytic desulfonation of anthraquinonesulfonic acids.** ANTHONY J. HARTWOOD (to British Dyestuffs Corp., Ltd.). U. S. 1,724,928, Aug. 20. In the manuf. of oxanthrol derivs. from anthraquinone compds. contg.  $\alpha$ -sulfonic acid groups, reduction and removal of the  $\alpha$ -sulfonic acid groups is effected by electrolytic reduction in alk. soln. An app. is described.

**Apparatus for electrodeposition of metals such as silver, chromium or nickel.** A. POULVEREL. Brit. 305,130, Jan. 31, 1928. Structural features.

**Electrodeposition of metals.** WESTERN ELEC. CO. Brit. 304,354, Oct. 19, 1927. An alloy of uniform compn. throughout is deposited from an electrolyte of such compn. that the cathode potentials of the constituent metals are substantially equal over the operating range of current density; at least one anode is made of the constituent metals. An electrolyte compn. for deposition of an alloy of Ni 79 and Fe 21% is given, with various details of procedure.

**Electrodeposition of cadmium.** A. W. YOUNG and G. STINSON (to C. H. Humphries). Brit. 304,668, Jan. 23, 1928. A Cd plating bath contains a salt such as  $CdSO_4$  together with  $H_2SO_4$  and a "brightening agent" such as animal glue. Cd or graphite anodes may be used. Cf. C. A. 22, 735.

**Electrodeposition of zinc.** Q. MARINO. Brit. 305,035, Jan. 28, 1928. In coating iron, steel or other articles, an electrolyte is used contg.  $ZnSO_4$ , 220–250,  $ZnCl_2$ , 50–60 and  $Al_2(SO_4)_3$ , 20–25 g. per l. Na or K borobenzoate 2–5% may be added to prevent formation of  $ZnO$  at the anode; formation of a smooth and brilliant deposit may be promoted by the addn. of glycerol 2–5% together with 5–10 g. per l. of dextrin or glucose.

**Coating large objects with a chromium layer.** SIEMENS & HALSKE A.-G. (Colin G. Fink, inventor). Ger. 478,769, July 21, 1927. See Fr. 638,238 (C. A. 23, 46).

**Electroplating apparatus of the rotary barrel type.** LANGBEIN-PFANHAUSER-WERKE A.-G. Brit. 305,623, Feb. 8, 1928. Structural features.

**Electric ozonator.** HUGH V. MCPARTLAND (one-half to Oswin C. Moll). U. S. 1,725,661, Aug. 20. Structural features.

**Electric furnace.** D. F. CAMPBELL. Brit. 304,162, Sept. 15, 1927.

**Electric induction furnace.** E. F. NORTHRUP. Brit. 305,620, Sept. 8, 1927. Structural features.

**Coils for high-frequency electric induction furnaces.** G. E. TAYLOR and ELECTRIC FURNACE CO., LTD. Brit. 304,432, Dec. 7, 1927. Structural features.

**Melting chamber for induction furnaces.** R. F. RUSS. Brit. 305,388, March 2, 1928.

**Electric resistance furnace.** L. D. J. TISSEYRE. Brit. 305,631, Feb. 8, 1928. Structural features are described of a furnace suitable for heating high-speed steels up to 1400°, either directly or in an Al or other bath. A refractory crucible is surrounded by a "carbon" or graphite resistance embedded in refractory insulating material.

**Electric resistance furnace.** HERAEUS VACUUMSCHMELZE A.-G. and H. HIEMENZ. Brit. 304,646, Jan. 23, 1928. Structural features.

**Electric resistance furnace.** SIEMENS-SCHUCKERTWERKE A.-G. Brit. 305,470 Feb. 4, 1928. Structural features.

**Electric resistance furnace for heat treatment of metals.** CARL I. HAYES. U. S. 1,724,583, Aug. 13. A stream of combusted gases under pressure is used to form an air-excluding curtain across the furnace opening.

**Electric resistance heaters.** BRITISH THOMSON-HOUSTON CO., LTD., H. W. H. WARREN and R. G. GREEN. Brit. 305,160, Sept. 11, 1928. Heating units of refractory material such as silicon carbide are provided with molded or pressed-on terminal caps which may be formed of a mixt. of graphite 6, "Aquadag" 3, carborundum 1 and waterglass 3 parts, used as a thick aq. paste and baked. Various details are given.

**Muffle and muffle furnace heated by electric resistance heaters.** PHILIP H. P. MONCKTON (to Wm. H. Cross). U. S. 1,724,956, Aug. 20. Structural features.

**Agitating mechanism for materials in electric furnaces.** SOC. ÉLECTRO-MÉTALLURGIQUE DE MONTRICHTER. Brit. 305,569, Feb. 7, 1928.

**Electric immersion heater for heating liquids.** SANTON, LTD., and H. C. SANDERS. Brit. 304,928, April 26, 1928. Structural features.

**Mechanical charging means for electric furnaces.** AKT.-GES. BROWN, BOVERI & CIE. Ger. 479,147, Nov. 24, 1925.

**Effecting chemical reactions with silent electric discharges.** I. G. FARBERINID A.-G. Brit. 304,623, Oct. 20, 1927. In producing various products such as  $H_2O_2$ , the efficiency of the process is stated to be increased by preventing deposition of the products on the walls of the discharge chamber. Mention is made of the production of formic acid,  $CH_3O$  and  $Ac_2O$ .

**Electric discharge tube for treating water or other liquids with ultra-violet rays.** N. V. PHILIPS' GLOEILAMPENFABRIEKEN. Brit. 304,423, Nov. 23, 1927. Structural and elec. features.

**Treating hydrocarbons with electric discharge.** P. H. HULL and IMPERIAL CHEMICAL INDUSTRIES, LTD. Brit. 304,914, Jan. 21, 1928. Gaseous hydrocarbons are passed through an arc discharge between electrodes made from or coated with W, Mo, Os, Ta or their alloys or compds. such as carbides.

**Apparatus for gas purification.** SIEMENS-SCHUCKERTWERKE A.-G. (Otto Körber, inventor). Ger. 478,842, Dec. 19, 1926. An arrangement is described for subjecting the electrodes of an elec. gas filter to a periodic percussion by a suspended hammer.

**Diaphragms for electric endosmose, etc.** SIEMENS & HALSKE A.-G. Brit. 305,020, Jan. 28, 1928. Porous material suitable for use as diaphragms for elec. endosmose is made by stirring acid- and alkali-proof inorg. compds. such as  $BaSO_4$ , Cr oxide or  $Al_2O_3$  in a hardening soln. of a substance such as celluloid or natural asphalt, which is also acid- and alkali-proof, pressing and heating to eliminate the solvent. Greater porosity may be obtained by adding sol. or volatilizable substances.

**Electrophoresis.** SIEMENS-ELEKTRO-OSMOSE GES. Brit. 305,630 Feb. 8, 1928. In the electrophoretic deposition of various substances from dispersions, the dispersion is modified by addn. of suitable colloids or compds. comprising multivalent cations so that particles normally moving to the anode are directed to the cathode. Reversal of rubber latex (suitably after partial removal of  $NH_3$  from com. latex) may be effected with Th nitrate soln. and reversal of a yeast paste is effected by adding a bovine serum.

**Single crystal electromagnetic body.** RICHARD SWINNE (to Siemens & Halske A.-G.). U. S. 1,725,026, Aug. 20. Single crystals of magnetic material such as Fe, Ni and Co are used for cores of electromagnetic relays and other elec. app.

**Electrical ignition for coal-dust burners.** KOHLENSCHIEDUNGS-GES. M B H Ger. 479,432, Mar. 18, 1926.

**Electric thermometer.** DINSHAH P. GHADIALI. U. S. 1,724,469, Aug. 13

**Fusible cut-outs for electric circuits.** R. H. D. BARKLIE. Brit. 305,243, Nov. 1, 1927. A film of metal such as Au, Ag or Cu, so thin as not to be self-supporting, is mounted on an insulating backing such as paper or celluloid. Various alternative methods of manuf. are described. Cf. C. A. 22, 196.

## 5—PHOTOGRAPHY

C. E. K. MEES

**Some modern applications of photography.** W. CLARK. *Brit. J. Phot.* 76, 378-80 (1929).—New applications of photography in industry are reviewed, *i. e.*, the production of talking films and the development of amateur cinematography and its com. and educational uses. The various photographic methods of examn. of paintings of doubtful authenticity, and of charred and illegible documents are briefly mentioned. A discussion follows of medical, industrial and general applications of x-ray photography, with an indication of the possible lines of future developments in this field. A. B.

**New preservative for the photographic industry.** W. LESZYNSKI. *Phot Ind.* 27, 426-7 (1929).—For the prevention of bacterial infection of gelatin soln. and photographic emulsions, a new material, Nipagin, is of value. It is odorless and contains no free acid but is of limited soly. It has a strong germicidal action and apparently no effect on the photographic properties of an emulsion. C. E. MEULENDYKE

**Nature and structure of the photographic image as present in various forms of intensification.** H. D'A. POWER. *Camera Craft* 46, 319-25 (1929).—To reduce graininess, the negative image can be so altered that (1) the av. grain size is smaller; (2) the grains are enlarged at the expense of the interlying clear spaces, and so approximate the conditions of a continuous image; or (3) the interspaces can be colored and so approximate a continuous image. Expts. illustrated with photomicrographs indicate how each condition can be realized. R. A. PURDY

**Effect of environment on photographic sensitivity. II. Effect of certain salts.** S. E. SHEPPARD AND E. P. WIGHTMAN. *Phot. J.* 69, 134-41(1929); cf. *C. A.* 23, 1578.—The action of certain neutral salts on the formation of the latent image has been studied. K citrate has no detectable effect; KCl has a slight effect on developability; KBr has a very considerable depressing effect on the formation of the latent image. Contrary to the behavior with the visible image, acid  $\text{AgNO}_3$  does not accelerate latent image formation, at least with fairly high-speed plates. The results are discussed in terms of the transfer of electrons from bromide ions to Ag ions of the lattice, and it is suggested that the electrostatic field of the adsorbed double layer is a modifying factor of differing importance for visible and latent image formation.

**Function of gelatin in photographic emulsions.** S. E. SHEPPARD. *Phot. J.* 69, 330-6(1929).—The protective colloid action of gelatin in relation to pptn. and reduction of Ag halides is discussed in terms of the chem. constitution of gelatin. It is suggested that imino-( $\text{:NH}$ ) groups of the protein play a direct part by coordination of Ag. The existence of keto-piperazines in gelatin is also considered, and it is suggested that reversible  $p_n$  control of sensitivity might be connected with this.

**Method of increasing the printing speed of dichromated gelatin.** F. J. TRITTON. *Phot. J.* 69, 281-5(1929).—The method of increasing the printing speed of dichromated gelatin by addn. of certain salts to the dichromate bath is discussed. To increase the light sensitivity of any dichromate colloid mixt., it is necessary to know the  $p_n$  of the colloid and then to select a metallic salt, the chromate or hydroxide or which is pptd. at a  $p_n$  slightly greater than that of the colloid. With autotype tissue the best results obtained with the materials so far examd. were with La and Ce salts. The possible applications of this hypersensitizing process are outlined, and formulas and details of procedure are given.

**Variation of the threshold speed of an emulsion according to the developer and conditions of development. III.** E. R. BULLOCK. *Sci. ind. phot.* 9, 24-8(1929); cf. *C. A.* 21, 1067.—But little, if any, influence on the max. threshold speed has been observed on varying (1) the interval between exposing and developing, (2) the interval between prepg. and using the developer, (3) the temp. of the developer, (4) the temp. and (5) the humidity of the sensitive film at the time of exposure. Use of the developer at a lowered temp. shows, however, the effect of a diminution in fog. Some of the ways in which a sensitive film is permanently affected by treatment with  $\text{AgNO}_3$  soln. have been examd. in detail. In general, latent fog is produced, and with this an increase in the max. threshold speed, consistently observed under suitable exptl. conditions, appears to be associated.

**New collodion method.** W. T. WILKINSON. *Penrose's Annual* 30, 134-5(1928).—W. suggests that, if his collodion process with I and Br be used, and the plate washed free from  $\text{AgNO}_3$ , the plate can be color-sensitized and used for 3-color work. After washing, the plate should be immersed in the following preservative: fish glue 100 cc., thiocarbamide 0.5 g. or thiosinamine 0.05 g.,  $\text{H}_2\text{O}$  1 l. Pinaverdol or chlorochrome can be used for the green sensitizer and pinacyanol or erythrochrome for the red.

**Super-sensitizing of autochrome plates.** L. D. TALAMON. *Brit. J. Colour Supp.* 23, 26-8(1929).—Pantochrome is recommended as being simple to use for sensitizing autochromes. Working directions and formulas are given for the use of a sensitizer contg. this dye and ammoniacal  $\text{AgNO}_3$ . The method of washing and drying is described in detail. When used in conjunction with a Lumière S filter, the exposure necessary is cut down to about 0.1 by hypersensitization. After exposure, the plates are desensitized and developed in a metoquinone bath. The keeping qualities of the hypersensitized plates are not good. The lower the proportion of ammoniacal  $\text{AgNO}_3$  in the bath, the better are the keeping qualities of the plates, on the other hand, the sensitizing effect is then less.

**Reversal-like phenomena of the secondary and the tertiary discharge figures impressed on photographic plates.** T. TERADA. *Memoirs Kyoto Coll. Sci.* 11, 355-60(1928).—Two photographic plates were placed in contact with each other on their plain glass sides. Another photographic plate was so supported that the sensitive emulsion was toward the other 2 plates and at a short distance from them. The 3 plates were placed between the 2 electrodes of a discharging condenser, so arranged that the negative pole was in contact with the sensitive side of the first plate. A series of discharge-figures was produced on the 3 photographic plates. These figures are called primary, secondary and tertiary figures. When the spark gap was placed parallel to these plates, Yoshida observed that the primary discharge figures showed reversal-like phenomena. T. discovered that those phenomena also occur in the secondary and in the tertiary discharge figures similarly as in the primary ones.

A. P. H. TRIVELLI

**Practical method of silver recovery from fixing baths.** ANON. *Photographie* 16, 264-5(1929).—Ag is recovered by pptn. with Zn from an exhausted fixing bath slightly acidified with  $H_2SO_4$ . The operations are simple and the Ag is recovered from the sludge by melting.

C. E. CLIFTON

**Cystine in systems of noble metals protected by gelatin (STEIGMANN) 2.**

**Photography.** ROTOGRAVUR, DEUTSCHE TIEFDRUCK-G. M. B. H. (Kurt Wolfsohn, inventor). Ger. 477,965, Sept. 11, 1927. An absorptive cover of cloth, felt or cellulose is impregnated with hygroscopic salts for drying colloid layers such as on photographic plates and films.

**Photography.** AKT.-GES. FÜR FILM-FABRIKATION. Ger. 477,503, Dec. 16, 1927. Photographic copies are produced on both sides of an opaque film coated with Ag salt emulsion.

**Photography.** HEINRICH TAPPESER. Ger. 478,831, Mar. 6, 1928. Addn to 437,240. Colored photographic tracings are prep'd. after the manner of the prior patent wherein the picture is covered, except the part to be colored. This part is then sprayed with coloring matter. The covering material is absorbent.

**Color photography.** SOC. DU FILM EN COULEURS KELLER-DORIAN. Brit. 301,643, Jan. 23, 1928. Optical features.

**Color photography.** WM R. WHITEHORNE. U. S. 1,724,445, Aug. 13. A pair of sensitized surfaces have a common color insensitiveness in one region of the spectrum and a different color insensitiveness in another part of the spectrum.

**Photographic sensitive material.** C. ROEHRICH. Brit. 304,597, Jan. 21, 1928. In impregnating colloid layers with chromate compns., a 10% alc. soln. is used to prevent formation on drying of crystal sediment on the surface of the colloid layer.

**Photographic films.** J. CHAMBERLAIN and H. PERIAM. Brit. 304,632, Oct. 20, 1927. A substratum of ethyl cellulose compn. or the like is used between the celluloid or like support and the light-sensitive layer, and this substratum may carry coloring substances, a multicolor dot screen for color photography, etc.

**Testing photographic plates, etc., spectrographically.** DEUTSCHE VERSUCHSANSTALT FÜR LUFTFAHRT E. V. (Ullrich Schmiescheck, inventor). Ger. 479,392, July 8, 1928. An improved method and app. designed to give const. exptl. conditions are described.

**Photographic emulsions.** I. G. FARBENIND. A.-G. Brit. 305,143, Jan. 31, 1928. An org. compd. which forms a stable Ag salt of a soly. not greater than that of  $AgCl$  is added to a Ag emulsion or one of its constituents. Examples are given.

**Photographic emulsions.** I. G. FARBENIND. A.-G. (Rudolf Robl and Walter Frankenburg, inventors). Ger. 479,275, Nov. 25, 1927. Layers prep'd. from colloidion emulsions are improved by adding to the emulsion, during or after its prep'n., a wetting agent such as a salt of propyl- or butylnaphthalene sulfonic acid. Other usual addns, *e. g.*, sugar, glycerol and protective colloids, may also be made. Examples are given.

**Printing on gelatin films, etc.** I. G. FARBENIND. A.-G. Brit. 304,767, Jan. 27, 1928. Indelible prints are obtained by use of an aq. soln. of a dye contg.  $CH_2O$ ,  $K_2Cr_2O_7$  or other gelatin hardening agent, to which a wetting agent such as Na phenylacetate or saponin also may be added. To protect prints on cinematographic films or the like from dissoln. by liquids such as alc. or  $C_2Cl_6$ , used for cleaning films, a lyophile colloid insol in such liquids may be added to the printing compn.

**Apparatus (with density and temperature controls) for developing photographic films.** M. TANATAR and D. KOKISOFF. Brit. 305,681, Aug. 8, 1927. Structural features.

**Developing photographic diazotypes.** M. RENKER. Brit. 305,104, Jan. 30, 1928. Papers sensitized with diazo-compds. are developed by treatment with an excess of developing liquid, and the excess is immediately removed. The paper may be sensitized with 3-diazocarbazol and developed with an ammoniacal soln. of the Na salt of  $\beta$  naphtholsulfonic acid. An app. is described.

**Superposed photographic images of different planes of sharpness.** L. M. DIETERICH. Brit. 304,703, July 25, 1927. Optical features.

**Pictures in light-sensitive layers.** GUSTAV KÖGEL. U. S. 1,724,666, Aug. 13. Org. light-sensitive compds. such as Na 2,7-anthraquinone disulfonate are incorporated in layers of material such as gelatin and after exposure of the layer to light it is treated with a chromate soln. such as  $K_2Cr_2O_7$ .

**Relief effects in cinematographic images.** L. M. DIETERICH. Brit. 304,711, Nov. 12, 1927. Optical and mech. features.

**Fireproofing cinematographic films.** SOC. INDUSTRIELLE D'APPLICATIONS PHOTOGRAPHIQUES SOC. ANON. Brit. 305,653, Feb. 10, 1928.  $\text{NH}_4\text{Br}$ , alone or with other compds. such as  $(\text{NH}_4)_2\text{SO}_4$ ,  $\text{NH}_4\text{F}$  and  $\text{NH}_4\text{I}$ , is used in the sensitizing bath or added to the film during or after manuf. Cf. C. A. 23, 4155.

**Hardening colloid masses or films.** TECHNICOLOR MOTION PICTURE CORP. Ger. 479,131, Mar. 31, 1928. The hardening of colloid masses or films, particularly gelatin films, is controlled by incorporating with the masses not only a hardening agent, e. g., a dichromate, and an activating agent, e. g., a sol. sulfite, but also a restraining agent, e. g.,  $\text{NH}_4\text{OH}$ . The restraining agent is afterward removed or rendered ineffective.

**Photomechanical processes.** ERICH LOENING. Ger. 478,776, Feb. 28, 1928. A positive print form is prepd. from a halogen-Ag-colloid layer by using the undeveloped part of the layer as the etching base after decompn. of the Ag colloid.

## 6—INORGANIC CHEMISTRY

A. R. MIDDLETON

**The chemistry of lithium. VII. Specific heat, heat of formation, decomposition pressure, and density of lithium halogenide hydrates.** CH. SLONIM and GUSTAV F. HURTTIG. *Z. anorg. allgem. Chem.* 181, 55-64 (1929).—The halogenide hydrates studied were  $\text{LiCl} \cdot \text{H}_2\text{O}$  (I),  $\text{LiBr} \cdot \text{H}_2\text{O}$  (II),  $\text{LiBr} \cdot 2\text{H}_2\text{O}$  (III),  $\text{LiI} \cdot \text{H}_2\text{O}$  (IV),  $\text{LiI} \cdot 2\text{H}_2\text{O}$  (V) and  $\text{LiI} \cdot 3\text{H}_2\text{O}$  (VI). Decompn. pressure ( $p$ ) in mm. is given as follows: for I, between  $37.7$  and  $69.4^\circ$ ,  $p$  runs from 1.18 to 12.68; for II, between  $85^\circ$  and  $100.1^\circ$ ,  $p$  runs from 2.48 to 6.94; for III, between  $23^\circ$  and  $39.94^\circ$ ,  $p$  runs from 0.52 to 2.49; for IV, between  $102^\circ$  and  $131.5^\circ$ ,  $p$  runs from 1.10 to 7.75; for V, between  $70.5^\circ$  and  $78.8^\circ$ ,  $p$  runs from 4.91 to 7.89; for VI, between  $60^\circ$  and  $72^\circ$ ,  $p$  runs from 3.76 to 9.41. The mean sp. heat is given as follows: for LiCl, 0.2852; for I, 0.3898; for LiBr, 0.1435; for II, 0.2152; for LiI, 0.0984; for IV, 0.1555; for V, 0.1934; for VI, 0.2997. Heat of soln. is detd. at  $17^\circ$  except for the chlorides which are detd. at  $19.5^\circ$ . It is as follows in cal.: for LiCl, 8371; for I, 4367; for LiBr, 11511; for II, 5285; for III, 2069; for LiI, 14810; for IV, 6831; for V, 3343; for VI, 254. Density is detd. at  $25^\circ$  in a pycnometer with Hg and a petroleum fraction boiling between  $200^\circ$  and  $220^\circ$ . The following values are obtained: for LiCl, 2.068; for I, 1.73; for LiBr, 3.463; for II, 2.51; for III, 2.20; for LiI, 4.06; for  $\text{LiI} \cdot 0.5\text{H}_2\text{O}$ , 3.50; for IV, 3.13; for V, 2.64; for VI, 2.32. Mol. vol. at  $25^\circ$  is as follows: for LiCl, 20.5; for I, 34.9; LiBr, 25.08; II, 41.8; III, 55.9; LiI, 33.0; IV, 48.5; V, 64.4; VI, 81.0.

**Lithium chlorate and its hydrates.** LEO BERG. *Z. anorg. allgem. Chem.* 181, 131-6 (1929); cf. C. A. 21, 214; 22, 737.—There is a change of phase at  $44^\circ$  in heating or cooling  $\text{LiClO}_3 + \text{H}_2\text{O}$  but none with  $\text{LiClO}_3$ . The microscope shows in heating a mixt. of  $3\text{LiClO}_3 \cdot \text{H}_2\text{O}$  and  $\text{LiClO}_3$  that above  $44^\circ$  only the latter is present. This is presented to show that the  $\gamma$  form of  $\text{LiClO}_3$  of Kraus and Burgess (cf. C. A. 21, 2214) is  $3\text{LiClO}_3 \cdot \text{H}_2\text{O}$ .

**Study of beryllium and its chloride.** J. M. SCHMIDT. *Ann. chim.* [10], 11, 351-446 (1929).—See C. A. 23, 2381.

A. P. SACHS

**Bismuth salts and hypophosphorous and phosphorous acids and their sodium salts.** ORESTE CALCAGNO. *Semana méd.* (Buenos Aires) 35, 1042-70 (1928).—As  $\text{H}_3\text{PO}_3$  and  $\text{H}_3\text{PO}_2$  reduce in heat, an intermediate formation of  $\text{PH}_3$  is supposed. The reactions between  $\text{Bi}(\text{OH})_3$  and  $\text{BiO}(\text{OH})$  and the reducing acids, the intermediate substances as formation of salts between Bi and the acids themselves, the varying effects of the amts. of the reagents, hydrolysis, etc., are discussed and equations given. In the same way, the possibilities of reaction of the Bi and BiO salts of tartaric acid, the double salts with Na, of alk. and acid Bi soln. with  $\text{H}_3\text{PO}_3$  and  $\text{H}_3\text{PO}_2$  are enumerated. In presence of  $\text{HNO}_3$  a previous hydrolysis or treatment with  $\text{AcONa}$  is required.  $\text{Bi}(\text{H}_2\text{PO}_2)_3$  and  $\text{BiOH}_2\text{PO}_2$  are decompd. in the presence of  $\text{H}_2\text{O}$  or O. Equations of the formation of all the possible salts and their structural formula are given.

A. E. MEYER

**Oxygen compounds of rhenium.** J. NODDACK and W. NODDACK. *Z. anorg. allgem. Chem.* 181, 1-37 (1929); cf. C. A. 23, 1833.—None of the Re oxides is as well defined as the disulfide ( $\text{ReS}_2$ ). The oxides are therefore not suitable for at. wt. detn. Re is in group VII in the periodic system and its highest oxide is  $\text{Re}_2\text{O}_7$ . This is prepd. by passing a stream of cold  $\text{O}_2$  over heated solid Re, the oxide being formed as a fine white vapor which is easily condensed. Its d. was not detd. but is probably about 8.4. It is quickly converted by ultra-violet light, by reduced pressure or by heat into  $\text{Re}_2\text{O}_7$ .  $\text{Re}_2\text{O}_7$  has a m. p. of about  $150$ - $155^\circ$ , is easily sol. in  $\text{H}_2\text{O}$ , from which  $\text{Re}_2\text{O}_7$  seps. on

evapn. The aq. soln. is easily reduced, colors Ti and V solns. yellow and decolorizes  $\text{KMnO}_4$ . Anhyd.  $\text{Re}_2\text{O}_7$  is colored violet by  $\text{SO}_2$  gas, as is also its soln. in concd.  $\text{H}_2\text{SO}_4$ , a blue ppt. being formed on long standing. This violet soln. is decolorized again on heating to boiling. After  $\text{H}_2\text{S}$  is passed into an aq. soln. of  $\text{Re}_2\text{O}_7$  for some time, S seps. and on warming a gray-black sulfide.  $\text{Re}_2\text{O}_7$  is prepd. by heating Re metal in  $\text{O}_2$  at a temp. above  $150^\circ$ . It is a bright yellow powder which is easily sublimed, melts at about  $220^\circ$  and has a marked cryst. character. Its d. is about 8.2. It is easily sol. in  $\text{H}_2\text{O}$  and alc., very little sol. in  $\text{Et}_2\text{O}$ . Cond. measurements give values for  $\lambda$  between 366 and 385. An acid is produced on soln. in  $\text{H}_2\text{O}$  according to the equation:  $\text{Re}_2\text{O}_7 + \text{H}_2\text{O} = 2\text{HReO}_4$ . This dissolves hydrates of Al, Zn, Fe as well as metallic Zn or Fe with evolution of  $\text{H}_2$  and is reduced to  $\text{ReO}_2$  by Zn and  $\text{H}_2\text{SO}_4$ .  $\text{Re}_2\text{O}_7$  is reduced to lower oxides by CO or  $\text{SO}_2$ ;  $\text{H}_2$  reduces it at  $300^\circ$  to the dioxide and at  $800^\circ$  to metal. Lower oxides are formed by heating it in a vacuum at  $300^\circ$ . Dry  $\text{Re}_2\text{O}_7$  is converted by dry  $\text{H}_2\text{S}$  into black sulfide. If  $\text{H}_2\text{S}$  is passed into concd.  $\text{HReO}_4$ , a yellow color is produced followed by pptn of the sulfide. If  $\text{NH}_4\text{OH}$  and  $(\text{NH}_4)_2\text{S}_x$  are added to dil.  $\text{HReO}_4$  nothing is pptd., but on acidifying with HCl or  $\text{H}_2\text{SO}_4$  a deep rose color is formed and then the gray-black sulfide is pptd. The reactions of  $\text{HReO}_4$  with various reagents are given in a table. The salts of  $\text{HReO}_4$  are colorless, sol. in  $\text{H}_2\text{O}$  and are more stable than permanganates. *Perrhenates* of non-volatile bases can be ignited in  $\text{O}_2$  without decompn.  $\text{NaReO}_4$  (m. p.  $200^\circ$ ) is sol. to the extent of 250 g. per l., and crystallizes in hexagonal, colorless tables.  $\text{KReO}_4$  (m. p.  $350^\circ$  soly. 12.1 g./l.) crystallizes free of  $\text{H}_2\text{O}$ , gives for  $\lambda$  105 and is reduced to  $\text{ReO}_2$  by  $\text{H}_2$ .  $\text{NH}_4\text{ReO}_4$  (soly. 120 g./l.) is first reduced to  $\text{ReO}_2$  by heating in  $\text{H}_2$  at  $150^\circ$  and finally to metallic Re, which is deposited as a mirror on the walls of the reaction flask.  $\text{AgNO}_3$  gives a white ppt. of  $\text{AgReO}_4$ , sol. in  $\text{H}_2\text{O}$  to the extent of 3.2 g./l., with  $\lambda = 100$ .  $\text{Ba}(\text{ReO}_4)_2$  is sol. in  $\text{H}_2\text{O}$  to the extent of 150 g./l.  $\text{Nd}(\text{ReO}_4)_3$  is prepd. by pptn. of the hydrate with  $\text{NH}_4\text{OH}$  and by reaction between this and  $\text{HReO}_4$ . It crystallizes in rose colored prisms, extremely sol. in  $\text{H}_2\text{O}$ . The trioxide,  $\text{ReO}_3$ , was not isolated, but its salts are analogous to the manganates. Their solns. in  $\text{H}_2\text{O}$  are bright yellow and are not very stable, decomp. as follows:  $3\text{K}_2\text{ReO}_4 + 2\text{H}_2\text{O} = 2\text{KReO}_4 + \text{ReO}_2 + 4\text{KOH}$ . The violet and blue oxides produced by reduction of higher oxides are probably intermediate between  $\text{ReO}_3$  and  $\text{ReO}_2$ , similar to the lower oxides of W and Mo. They are unstable, particularly the violet oxide. On strong reduction of any O compd. of Re the black dioxide,  $\text{ReO}_2$ , is formed. It is quickly oxidized to  $\text{Re}_2\text{O}_7$  in acid soln., but is stable in the presence of alkali.  $\text{ReO}_2$  is easily reduced to metal in the absence of H-O. This reduction is easier than the reduction of the dioxides of Mn, Mo or W, but more difficult than with Os, placing Re between W and Os. The crystal structure of metallic Re is hexagonal as is Os, and it can probably be numbered with the Pt metals. H. S.

Pure aluminum ortho-hydroxide in gelatinous and finely powdered form. P. A. THIESSEN AND K. L. THATER. *Z. anorg. allgem. Chem.* 181, 417-24 (1929).— $\text{AlEt}_2$  was hydrolyzed by adding a dil. soln. in abs. alc. to water and by passing the vapor in dry  $\text{N}_2$  over water. The ppts. so produced were proved to be  $\text{Al}(\text{OH})_3$  by the break in the water vapor pressure-absorption curves at  $17^\circ$ . T. H. CHILTON

Phosphorous trioxide. LUDWIG WOLF AND HERMANN SCHMAGER. *Ber* 62B, 771-86 (1929).—The prepn. of  $\text{P}_2\text{O}_5$  has been considerably improved by carrying the combustion of very pure P at low pressure, in a 75% O + 25% N atm., in a quartz reaction tube, and by cooling the reaction products immediately to  $50^\circ$ . The best yield obtained refers to a gas rate of 30 l. per hr., a pressure of 90 mm and amounts to 49 g.  $\text{P}_2\text{O}_5$  from 50 g. P. The decompn. temp. of  $\text{P}_2\text{O}_5$  decreases rapidly with increasing O pressure. The details of the operations and the app. are extensively described.

ALBERT L. HENNE

The oxidation of carbon monoxide. M. PRETTE AND P. LAFFITTE. *Compt. rend.* 189, 177-9 (1929); cf. C. A. 23, 3810.—A dry mixt. of CO and air is introduced into a container which has been evacuated and heated to a temp. above the ignition temp. The mixt. does not ignite at once but for a few sec. an intense red-violet luminescence is observed. If the temp. is  $50^\circ$  to  $60^\circ$  below the ignition temp. the luminescence lasts for about a min. When suction is applied to the vessel the mixt. ignites with a blue flame. With lower pressure the ignition temp. is lowered. To study the phenomenon quantitatively different mixts. are passed through a heated quartz tube with varying velocity and temp. At the suction end the mixt. is cooled and analyzed. The luminescence observed below the ignition temp. corresponds to a slow oxidation of CO. E. SCHOTTE

Nickel hydride. THEODOR WEICHSSELFELDER AND MAX KOSSODO. *Ber* 62B, 769-71 (1929).— $\text{NiH}_2$  is prepd. by treating anhydrous  $\text{NiCl}_2$  with  $\text{PhMgBr}$  first, then with H. It has been assumed that  $\text{NiPh}_2$  is formed as an intermediate step, and that it decomposes into  $\text{NiH}_2$  and  $\text{C}_6\text{H}_6$  under the influence of H. When the H treatment is

omitted, the hypothetical  $\text{NiPh}_2$  decomposes into Ni and diphenyl, and no benzene is formed. When the H treatment is delayed 4 hrs., 70% of the theoretical quantity of H will be absorbed;  $\text{NiH}_2$  and diphenyl are obtained. If the delay is only 2 hrs.,  $\text{NiH}_2$ ,  $\text{C}_6\text{H}_6$  and diphenyl are obtained. This shows that after about 3 hrs. the decompn. of  $\text{NiPh}_2$  is complete.  $\text{NiH}_2$  has no measurable vapor tension. It plays an important part in the catalytic hydrogenation in the presence of Ni. A suspension of  $\text{NiH}_2$  in  $\text{Et}_2\text{O}$  gives its H completely away to reduce  $\text{C}_2\text{H}_4$ ; the reaction is slow. A suspension in  $\text{EtOH}$  reacts much more rapidly. The presence of  $\text{NiH}_2$  causes a mixt. of  $\text{C}_2\text{H}_4$  and  $\text{H}_2$  to react completely in a very short time. It is concluded that the catalytic power of Ni cannot be referred to the formation of an addition compd. with  $\text{C}_2\text{H}_4$ , nor a surface compd.

ALBERT L. HENNE

**Influence of the temperature on precipitation of nickel carbonate.** M. SERGEEV *Mashoboino-Zhirovoe Delo* 1928, No. 11, 15.—Pptn. of  $\text{NiCO}_3$  from  $\text{NiSO}_4$  soln. is best effected in presence of excess of  $\text{Na}_2\text{CO}_3$  at the b. p. of the mixt. V. KALICHEVSKY

**The reduction of cuprous chloride.** SAILENDRA N. SEN. *Z. anorg. allgem. Chem.* 181, 427-8(1929).—A satd. soln. in  $\text{NH}_4\text{OH}$  of  $\text{CuCl}$  from  $\text{CuO}$ , Cu wire and  $\text{HCl}$ , washed with  $\text{H}_2\text{O}$  and  $\text{NH}_4\text{OH}$ , was prepd. To this was added 1 cc. satd.  $\text{KNaC}_4\text{H}_4\text{O}_6$  soln. and  $\text{HCHO}$  (40%) until a complete green color was reached. The vessel was then immersed in boiling water for 1.5 hrs., when reduction was complete. The Cu was sepd., washed with distd.  $\text{H}_2\text{O}$  and dried. GREGG M. EVANS

**Properties of the chlorides of sulfur. II. Molecular extinction coefficients.** THOMAS M. LOWRY AND GILBERT JESSOP. *J. Chem. Soc.* 1929, 1421-35; cf. C. A. 21, 2230.—The red component of the chlorides of S is  $\text{S}_2\text{Cl}_2$ ; this can be estd. by absorption of light of wave length 5200 or 5400 Å. U., to which the  $\text{S}_2\text{Cl}_2$  and Cl are completely transparent. Colorimetric analysis shows that the liquid  $\text{S}_2\text{Cl}_2$  is dissoed. to the extent of about 16% at atm. temp.  $\text{S}_2\text{Cl}_2$  shows a strong max. of selective absorption in the ultra-violet,  $\log \epsilon = 3.8$  at 2660 Å. U., but cannot be estd. photometrically on account of the absorption of ultra-violet light by the  $\text{S}_2\text{Cl}_2$ .  $\text{S}_2\text{Cl}_4$  is not formed in appreciable quantities in the liquid chlorides of S, which behave as ternary equil. mixts., to which the law of mass action can be applied in accordance with the equation,  $2\text{S}_2\text{Cl}_2 \rightleftharpoons \text{S}_2\text{Cl}_2 + \text{Cl}_2$ . Data are given in tables and curves. C. J. WEST

**The reduction of sodium tungstate with hydrogen.** J. A. M. VAN LIEMPT. *Z. anorg. allgem. Chem.* 181, 425-6(1929).—Total reduction takes place not lower than  $1100^\circ$  and according to the equation  $\text{Na}_2\text{WO}_4 + 3\text{H}_2 = \text{W} + 2\text{NaOH} + 2\text{H}_2\text{O}$  instead of at  $900^\circ$  and according to the equation  $\text{Na}_2\text{WO}_4 + 4\text{H}_2 = 2\text{Na} + \text{W} + 4\text{H}_2\text{O}$ , according to Spitzin (C. A. 20, 156). GREGG M. EVANS

**The action of carbon dioxide under high pressure on metallic iron.** ERNST MÜLLER AND HANS HEINECKA. *Z. anorg. allgem. Chem.* 181, 159-71(1929).—Under 50 atms. of  $\text{CO}_2$  the soly. of Fe in  $\text{H}_2\text{O}$  as  $\text{Fe}(\text{HCO}_3)_2$  is greatly increased. The total soly. increases to  $60^\circ$  and then decreases. At  $30^\circ$  and higher the soly. passes through a max. of  $\text{Fe}(\text{HCO}_3)_2$  and then decreases due to decompn. to  $\text{FeCO}_3$ . At  $60^\circ$  this max. is reached in 2.25 hrs. Fe did not react with  $\text{H}_2\text{O}$  at 50 atms.  $\text{N}_2$ . At  $30^\circ$  the soly. reached is the same with 30, 40 and 50 atms.  $\text{CO}_2$ , the time to reach it varying. The soly. curve resembles that in dil.  $\text{H}_2\text{SO}_4$  and therefore depends on the  $\text{H}^+$  concn. with reaction ceasing at about  $3 \times 10^{-6}$  mol.  $\text{H}^+$  per l. At 50 atms. the disocn. const. to  $\text{H}^+$  and  $\text{HCO}_3^-$  is estd. at 0.25 and the  $\text{H}_2\text{CO}_3$  concn. about 22 times that at 1 atm. F. D. S.

**The systems  $\text{Al}(\text{NO}_3)_3$ - $\text{Fe}(\text{NO}_3)_3$ - $\text{H}_2\text{O}$ , and  $\text{KNO}_3$ - $\text{Fe}(\text{NO}_3)_3$ - $\text{H}_2\text{O}$  at  $0^\circ$  and  $40^\circ$**  G. MALQUORI. *Atti accad. Lincei* 9, 569-72(1929); cf. C. A. 22, 530.—Soly. data and curves are given. A. W. CONTIERI

**System:  $\text{NaNO}_3$ - $\text{Na}_2\text{SO}_4$ - $\text{MgCl}_2$ - $\text{H}_2\text{O}$  in the neighborhood of  $0^\circ$ ,  $10^\circ$ ,  $25^\circ$ ,  $75^\circ$  and  $100^\circ$ .** G. LEIMBACH AND A. PFEIFFENBERGER. *Caliche* 10, 447-68(1929).—A detailed study has been made of the system at  $0^\circ$ ,  $10^\circ$  (and  $25^\circ$ ) and the results have been compared with those of other observers. B. C. A.

**Nickelammine complex salts. III. Nickel, potassium and ammonium hexammine double salts.** E. KOCSSIS. *Magyar Chem. Folyóirat* 34, 213-7(1928); cf. C. A. 23, 788.—Various K and  $\text{NH}_4$  nickelammine double salts were prepd. They all decompose on dissolving in water. In the air, they lose  $\text{NH}_3$  more rapidly than simple salts consisting of the same anions. The nitrate and nitrate-sulfate are the most labile, and salts of Cl and I are the most stable compds. S. S. DE FINÁLY

**Polyhalides. I. Chloroiodous acid:  $\text{HICl}_4 \cdot 4\text{H}_2\text{O}$ .** V. CAGLIOTI. *Atti accad. Lincei* 9, 563-8(1929).—Powd. I added to  $\text{HCl}$  (d. = 1.19), and a current of  $\text{Cl}_2$  passed through until the I was completely dissolved, gave a heavy red-orange soln., which, when immersed in ice, crvstd. almost completely, giving  $\text{HICl}_4 \cdot 4\text{H}_2\text{O}$ . Addn. of concd. solns.

of KCl, CsCl,  $C_2H_5NH_2Cl$ ,  $MgCl_2$  and  $ZnCl_2$  to soln. of the acid causes the corresponding salts to crystallize out. A. W. CONTIERI

**Difluophosphoric acid and formation from it of salts similar to those of perchloric acid.** WILLY LANGE. *Ber.* 62B, 786-92(1929).—The hydrolysis of  $POF_3$  occurs through 2 intermediate steps, *i. e.*,  $F_2PO_2H$  and  $FPO_2H_2$ . If the hydrolysis is carried out in a weakly basic soln., it is possible to isolate these compds. by means of their salts. The formation of the nitron salt gives the best result, but the isolation remains a tedious task. The best method to obtain  $F_2PO_2H$  or its derivs. is to melt 1 mol.  $P_2O_5$  and 3 mols.  $NH_4F$  in a Ni or Cu crucible;  $F_2PO_2NH_4$  is thus formed, which is easily extd. with boiling EtOH and recrystd. from hot  $H_2O$ ; it m.  $213^\circ$ . Dil. solns. of the  $NH_4$  salt treated with a sol. salt of tetramethylammonium, strychnine, brucine, morphine, cocaine or nitron give a cryst. ppt. of the corresponding difluophosphate. In concd. solns., K or Cs difluophosphate can be obtained in a similar way. To obtain other salts the best method is to treat a hot aq. soln. of nitron difluophosphate with a metallic nitrate; nitron nitrate is filtered off and the other salt is obtained by evap. the filtrate *in vacuo*. Difluophosphates are stable, but are hydrolyzed at high temp., specially in the presence of agents causing the formation of insol. compds. Their general behavior is similar to that of the perchlorates, but their cryst. characteristics are not the same. In contradistinction with the easy formation of *o*-toluenediazonium and pyridine perchlorates, the corresponding difluophosphates could not be obtained. A. L. H

**Tartrate cobaltinitrites.** MYKOLA WIKUL. *Z. anorg. allgem. Chem.* 181, 121-30 (1929); cf. *C. A.* 20, 1771; 22, 931.—The formula  $C_4H_4O_6NaCoO_7 \cdot 7K_2NaCo(NO_3)_6 \cdot H_2O$  is justified with  $CoO$  as the central group, on the assumption that the coordination no. is 7. The K reagent ppts.  $C_4H_4O_6Co \cdot 2H_2O$  on standing several months. This dissolves in 33%  $NaNO_2$  readily, if  $H_2O_2$  is added to oxidize  $Co^{++}$  to  $Co^{+++}$ . From soln. of the complex in  $H_2SO_4$ ,  $(CoO)_2SO_4 \cdot NaHSO_4 \cdot 9H_2O$  is pptd. Quant. results could not be obtained in pptn. of Rb as the tartrate cobaltinitrite, and with Cs the errors were large. FOSTER DEE SNELL

**Uranium tetroxide dihydrate.** ARTHUR ROSENHEIM AND HERBERT DAHR. *Z. anorg. allgem. Chem.* 181, 177-82(1929).—The tetroxide pptd. from 10%  $UO_2(NO_3)_2$  or  $(NH_4)_2(UO_2)(C_2O_4)_2$  soln. by 30%  $H_2O_2$  and dried at room temp. corresponds to  $UO_4 \cdot 3H_2O$ . At  $100^\circ$   $UO_4 \cdot 2H_2O$  is obtained. By heating over  $100^\circ$  a pure  $UO_4$  was not obtained. FOSTER DEE SNELL

O and H in industry (DOBSON, BARNES) 4. Contribution to the chemistry of S. I. The system S-Cl (TRAUTZ, *et al.*) 2.

## 7—ANALYTICAL CHEMISTRY

W. T. HALL

**New methods in analytical chemistry. Rapid determination of various elements after precipitation according to the procedures of classic methods.** I. J. DICK. *Z. anal. Chem.* 77, 352-63(1929).—The results are given of 76 expts., all with remarkable concordance, in the rapid detn. of Ni as diacetyldioxime salt, Hg as  $HgS$ , Ag as  $AgCl$ , Pb as  $PbSO_4$ , Ba as  $BaSO_4$ , Ca as  $CaC_2O_4 \cdot H_2O$ , Cl, Br, I and CNS as Ag salts,  $SO_4$  as  $BaSO_4$  and  $C_2O_4$  as  $CaC_2O_4 \cdot H_2O$ . The improvements consist in using König's Prussian porcelain filtering crucibles, washing with alc. and finally with ether and drying in a vacuum at room temp. In many cases a complete analysis can be made in half an hr. W. T. H.

**Solubility effects and quantitative analysis.** ERWIN WENDEHORST. *Z. angew. Chem.* 42, 723-4(1929). L. DEDE. *Ibid* 724.—A polemical discussion concerning the pptn. and ignition of  $CdCO_3$ . Cf. *C. A.* 22, 4079. W. T. H.

**Experimental notes on quantitative emission-spectral analysis.** W. GERLACH AND E. SCHWERTZER. *Z. anal. Chem.* 77, 213-7(1929).—The recent paper by Thurnwald and Hüttig (*C. A.* 23, 2387, 2900) is criticized. It is shown as a result of expts. that with properly constructed electrodes and the proper application of the method of homologous pairs, metal salt solns. can be analyzed spectrally quite independent of the presence of other ions. W. T. H.

**Colorimetry in ultra-violet light with the aid of fluorescent substances.** J. EISEN-

BRAND. *Z. angew. Chem.* **42**, 445-8(1929); cf. *C. A.* **23**, 2119.—If a narrow tube confg. a substance which is fluorescent in ultra-violet light, such as a dil. soln. of quinine sulfate

or invisible if the tested soln. absorbs ultra-violet light. Since this effect is proportional to the concn. of the soln. it is possible to utilize the principle in the examn. of nitrite solns. and alkaloids such as colchicine.

Colorimetric carbon test improved. H. L. CAMPBELL, *Iron Age* **124**, 157-8 (1929).—An improved water bath and a suitable colorimeter can be constructed very easily, as is here described. Full directions are given for carrying out an analysis.

A new volumetric method: mercurimetry. AL. IONESCO-MATHIU *Mon. prod. chim.* **11**, No. 109, 1-6; *Chem. Zentr.* **1928**, II, 920; cf. *C. A.* **22**, 3733, 4203.—The ability of the Hg salts to produce quant. ppts. was used to work out new volumetric methods. The detn. of  $\text{Me}_2\text{CO}$  was carried out in the following manner: the  $\text{Me}_2\text{CO}$  soln. was placed in a 200-cc. flask with reflux condenser and 10 cc.  $\text{H}_2\text{SO}_4$ , 10 cc.  $\text{H}_2\text{SO}_4$  soln. and 100 cc. of  $\text{H}_2\text{O}$  were added. The mixt. was boiled for 20 min. and the  $\text{Me}_2\text{CO}$ -Hg ppt. was filtered after cooling. The ppt. was washed with 200 cc.  $\text{H}_2\text{O}$ , transferred with the aid of  $\text{H}_2\text{O}$  into an Erlenmeyer flask and dissolved by slow heating with 25 cc. of  $\text{HCl-HNO}_3$ . To destroy the N compds. formed, a few drops of 10%  $\text{KMnO}_4$  were added until the red color was permanent. Then 12 drops of 10% Na nitroprusside were added, which caused a ppt. The mixt. was titrated with 0.1 N  $\text{NaCl}$ , until the ppt. disappeared. One cc. of 0.1 N  $\text{NaCl}$  corresponds to 0.0028 g.  $\text{Me}_2\text{CO}$ . The alkaloids, quinine, morphine, strychnine, codeine and cocaine could be detd. by similar methods. Expts. were undertaken to det. the proteins by mercurimetric. G. S.

Note on the significance of sampling for the chemical analysis of metal alloys. ZWICKER. *Chem.-Ztg.* **53**, 546-7(1929).—Considerable variance in the Cu, Sn, Pb and Zn contents of bronze and white bearing metal shows the need of sawing through the entire casting to get a representative sample for chem. analysis.

Stable molybdate solution. C. J. SCHOLLENBERGER *Chemist-Analyst* **18**, 14 (1929).—To 217 cc. of cold water add 115 cc. of concd.  $\text{NH}_4\text{OH}$  and slowly introduce while stirring 80 g. of 85%  $\text{MoO}_3$ , rotating the liquid until complete soln. is obtained. In another bottle put 918 cc. of water and 391 cc. of concd.  $\text{HNO}_3$  and cool. Filter the first soln. and add it slowly, from a separatory funnel, to the second soln., keeping the latter in const. rotary motion. Gradually reduce the rate of adding the molybdate soln. and cool thoroughly before adding the last 30 cc. Dissolve 0.02 g. of  $\text{Na}_2\text{HPO}_4$  in a little water, add to the soln. and mix well. Let stand overnight and filter. It is well to add 4% more of  $\text{HNO}_3$  by vol. (The original directions call for 10 times as much of each reagent.)

The potentiometric standardization of ceric sulfate. KIN'ICHI SOMEYA. *Z. unorg. allgem. Chem.* **181**, 183-8(1929).—Excellent results were obtained in the electrometric titration of  $\text{K}_4\text{Fe}(\text{CN})_6$  with  $\text{Ce}(\text{SO}_4)_2$  in either direction. The method of Willard and Fenwick for standardizing  $\text{Ce}(\text{SO}_4)_2$  with  $\text{KIO}_3$  or  $\text{KI}$  was also found satisfactory.

Experiments on quantitative oxidation with ceric sulfate. A. J. BERRY. *Analyst* **54**, 461-4(1929).—If a  $\text{Ce}(\text{SO}_4)_2$  is standardized in the same way it is used in the analysis, the following procedures give good results: *Titration of ferrocyanides*—Dil. the soln. to make it about 0.01 N, add a few drops of diphenylamine indicator soln. and titrate with 0.1 N  $\text{Ce}(\text{SO}_4)_2$  soln. (25 g.  $\text{Ce}(\text{NO}_3)_3$  heated with concd.  $\text{H}_2\text{SO}_4$  until  $\text{HNO}_3$  is expelled completely and then dild. with cold water). *Titration of tartrates*.—In the titration, one mol. of tartaric acid reacts with 7 mols. of  $\text{Ce}(\text{SO}_4)_2$ . *Titration of thallous salts*.—Take a little  $\text{I}_2$  in  $\text{CHCl}_3$  in a stoppered bottle, add 50 cc. of concd.  $\text{HCl}$  and just sufficient Ce sulfate soln. to decolorize the soln. on shaking. Use this soln. of  $\text{ICl}$  as indicator. Add a measured vol. of  $\text{Ti}_2\text{SO}_4$  soln. and titrate with ceric sulfate until the  $\text{CHCl}_3$  is once more colorless.

Preparation of organic reagents in the analytical laboratory. I. Diphenylcarbazide and diphenylcarbazone. K. H. SLOTTA AND K. R. JACOBI. *Z. anal. Chem.* **77**, 344-8(1929).—(I) Dry 14 g. of powd. urea at  $100^\circ$  and mix with 40 g. of freshly distd. phenylhydrazine in a 250-cc. flask. Heat with an upright tube condenser in an oil bath at  $155^\circ$  for 2.5 hrs. Then take the flask from the bath and 3 min. later add to the golden yellow, oily contents 250 cc. of 96% alc. Pour into a 600-cc. beaker and heat about 15 min. at the b. p. until complete soln. is obtained. After 30 min., cool rapidly with salt and ice, filter with suction and wash twice with ether. Yield = 33 g. of diphenylcarbazide m.  $170^\circ$ . By evapg. the filtrate under diminished pressure

7 g. more of crystals can be obtained. (II) Dissolve 24 g. of diphenylcarbazine by boiling 15 min. with 200 cc. of 95% alc. in a 1. flask. To the hot soln., add at one time 20 g. of powd. KOH while stirring and follow with 20 cc. of 3%  $\text{H}_2\text{O}_2$ . Allow to stand 5 min. and add 250 cc. of 2 *N*  $\text{H}_2\text{SO}_4$  while stirring. Pour the paste into a 3-l. vessel and add 1500 cc. of water to dissolve the  $\text{K}_2\text{SO}_4$ . Cool thoroughly, filter, wash thoroughly with water and dry. Yield 15-17 g. of diphenylcarbazone, decomp. at  $150^\circ$ . (III). Since the desired reagent is the oxidized compd., it is advantageous to prep. it directly instead of in 2 stages as above. Treat as in I until after the boiling with 320 cc. of 96% alc. Transfer to a 3-l. dish and introduce, while stirring, 35 g. of powd. KOH and then, while still stirring, 30 cc. of  $\text{H}_2\text{O}_2$ . Continue as in II. W. T. H.

Note on the breaking down of potassium permanganate in oxidation reactions in which solid manganese oxides are formed. B. REINITZER AND F. HOFFMANN. *Z. anal. Chem.* 77, 407-41(1929).—The oxidation of manganous, chromic and arsenious salts by  $\text{KMnO}_4$  under various conditions was studied to det. what oxides of Mn were obtained in the ppt. The results do not support the primary oxide theory. It appears that  $\text{Mn}_2\text{O}_3$  is often produced by the oxidation of the bivalent Mn and by the reduction of the  $\text{MnO}_4^-$  and that the reaction between  $\text{Mn}^{++}$  and  $\text{MnO}_4^-$  sometimes takes place in 2 stages whereby trivalent Mn is formed and then oxidized to quadrivalent state, but under other conditions the bivalent and 7-valent Mn are at once changed to  $\text{MnO}_2$ . The conclusions were drawn largely from expts. in which a preliminary pptn. was accomplished by adding less than the theoretical vol. of  $\text{KMnO}_4$ , filtering and then titrating the filtrate. W. T. H.

Use of 8-hydroxyquinoline in separations of aluminum. G. E. F. LUNDELL AND H. B. KNOWLES. *Bur. Standards J. Research* 3, 91-6(1929).—Oxine will cause complete pptn. of Al and sepn. from  $\text{PO}_4$ ,  $\text{AsO}_4$ , F and  $\text{BO}_3$  anions in ammoniacal solns. If Ta, Nb, Ti or Mo is present,  $\text{H}_2\text{O}_2$  must be added. With  $\text{UO}_2$  compds., a good sepn. is made if  $(\text{NH}_4)_2\text{CO}_3$  is added instead of  $\text{NH}_4\text{OH}$  and the sepn. of Al from Be can be accomplished in dil.  $\text{AcOH}$  solns. In the analysis of Fe-V alloy, however, only 12.1% Al was obtained with a sample contg. 12.5%. W. T. H.

Use of aluminum for the detection of arsenic. ELMER B. SVENSON. *Chemist-Analyst* 18, 5(1929).—Al can be used in place of Zn in the Marsh test with HCl as acid. With  $\text{H}_2\text{SO}_4$  it is necessary to activate the Al by immersing it in a slightly acid Cu or Hg salt to give it a light coating. The metal is free from As. W. T. H.

Notes on the determination of arsenic by the Marsh-Berzelius method. ALBERT T. W. COLLEY AND HAROLD C. LOCKWOOD. *J. Soc. Chem. Ind.* 48, 226T(1929) — Zn mirrors can be eliminated by using 5 *N* HCl, instead of more concd. acid and 20 cc. of water with 20 g. of Zn. A tight plug of cotton wool and a small plug of  $\text{Pb}(\text{OAc})_2$  wool can replace the usual  $\text{CaCl}_2$  drying tube, but should be filled freshly in each expt. A small piece of hardened, thin, sheet brass, wedged into position 0.25 in. from the heated portion and in contact with wet lint, serves to cool the tube and aid in obtaining uniform mirrors. W. T. H.

The determination of small quantities of beryllium in rocks. B. E. DIXON. *Analyst* 54, 268-74(1929).—If an HCl soln. of  $\text{TiCl}_4$  and  $\text{BeCl}_2$  (5-10 mg. of  $\text{TiO}_2$ , 5-40 mg. of  $\text{BeO}$  in 250 cc.) is heated to boiling, neutralized with  $\text{NH}_4\text{OH}$  until a turbid appearance is obtained and then treated with 1-1.5 g. of *p*-chloroaniline, all of the Ti and no Be will be pptd. by boiling 3 min. In 15 expts. the max. error was 0.5 mg. of  $\text{TiO}_2$ . To apply this new method for sepg. Be from Ti to rock analysis, take the twice pptd. Fe-Al-Ti-Be, etc., hydroxide ppt. (obtained with  $\text{NH}_4\text{OH}$  and  $\text{NH}_4\text{Cl}$  in the usual way), fuse it with  $\text{Na}_2\text{CO}_3$  and leach with water. The residue will contain the Be and Ti. Dissolve in HCl and sep. the bulk of the Ti from the Be by the  $\text{NaHCO}_3$  treatment recommended by Parsons and Barnes. Then, in view of the heavy Na salt content, ppt. with  $\text{NH}_4\text{OH}$ . Dissolve the ppt. in HCl and carry out the chloroaniline pptn. Filter and ppt.  $\text{Be}(\text{OH})_2$  with  $\text{NH}_4\text{OH}$ . In this way excellent results were obtained in the analysis of a synthetic mixt. of about 25 mg. each of  $\text{Fe}_2\text{O}_3$ ,  $\text{Al}_2\text{O}_3$ ,  $\text{TiO}_2$  and  $\text{BeO}$ . W. T. H.

Determination of minute quantities of bismuth. A. PORTNOV AND V. SKVORZOV. *Farm. Zhur.* 1928, 534-9; *Chem. Zentr.* 1929, 1, 114.—The colorimetric method is recommended for the detn. of minute quantities of Bi. The org. substances are destroyed, the resulting product is dissolved in HCl and the excess of HCl is evapd. on the water bath. The  $\text{BiCl}_3$  formed is converted into  $\text{K}_2\text{BiI}_6 \cdot 4\text{H}_2\text{O}$  and the Bi detd. colorimetrically. The best way of removing the free  $\text{I}_2$  formed during the conversion of  $\text{BiCl}_3$  into  $\text{K}_2\text{BiI}_6 \cdot 4\text{H}_2\text{O}$  is by shaking the mixt. with  $\text{CHCl}_3$ . Addn. of glycerol to the soln. of  $\text{K}_2\text{BiI}_6 \cdot 4\text{H}_2\text{O}$  inhibits to a large degree the sepn. of free  $\text{I}_2$ , because the dissocn. is retarded. An excess of acid has to be avoided in making the  $\text{K}_2\text{BiI}_6 \cdot 4\text{H}_2\text{O}$

soln. The soln. has to be protected against light. The destruction of the org. substances according to Fresenius and Babo as recommended by several authors (Authenrieth and Meyer, *C. A.* 19, 2216) is believed by P. and S. to be too complicated. The most practical way is to destroy the compd. by igniting it. The sensitiveness of this method is given as 0.0025 mg. in 1 cc.

A new and rapid method for determining cadmium. G. SPACU AND G. SUCIU. *Z. anal. Chem.* 77, 340-3(1929). See *C. A.* 23, 3184.

Gravimetric method for the determination of chromium in steel. WM. F. POND. *Chemist Analyst* 18, 11(1929).—Heat 0.5-1.5 g. of steel with 25 cc. of 6 *N* HCl, add 5 cc. of 6 *N* HNO<sub>3</sub> and 1 cc. of 6 *N* H<sub>2</sub>SO<sub>4</sub>. Reduce the vol. to 10 cc., add 100 cc. of hot water and heat a few min. Cool and add Na<sub>2</sub>O<sub>2</sub> very cautiously, using about 2 g. in excess. Heat 30 min. just below boiling. Filter, wash with hot water, boil the filtrate 30 min., make acid with AcOH and ppt. as PbCrO<sub>4</sub> with Pb(OAc)<sub>2</sub> soln.

The determination of cobalt in driers, japans, alloys, etc. OSCAR HEIM. *Analyst* 54, 464-5(1929).—See *C. A.* 23, 4161.

Potassium cyanate as a reagent for the detection of cobalt. B. J. F. DORRINGTON AND A. M. WARD. *Analyst* 54, 327-32(1929).—If a satd. soln. of KCNO is substituted for NH<sub>4</sub>CNS in the Vogel test for Co, an equally-intense blue color is obtained which is not so seriously interfered with by the presence of Fe, because this element can be pptd. by boiling the soln. and then the Co test will be obtained by adding more reagent.

A new sensitive color reaction of copper. S. G. CLARKE AND B. JONES. *Analyst* 54, 333-4(1929).—To the faintly acid, chloride-free Cu soln., add 1 g. of (NH<sub>4</sub>)<sub>2</sub>S<sub>2</sub>O<sub>8</sub>, 1 cc. of satd. soln. of diacetyldioxime in alc., 0.5 cc. of 0.5% AgNO<sub>3</sub> and 2 cc. of 10% aq. pyridine. Compare the reddish violet color with that similarly produced with known amts. of Cu. 0.1 mg. of Cu is the max. which should be detd. and 1 part of Cu in 10 million of water can be detected. Other oxidizing agents can replace the persulfate.

The determination of copper and nitrite in solutions of cuprammonium hydroxide. E. BUTTERWORTH AND H. A. ELKIN. *J. Soc. Chem. Ind.* 48, 127-8T(1929).—Ten cc. cuprammonium soln. (I) is acidified with dil. H<sub>2</sub>SO<sub>4</sub>, boiled 5 min. (to remove nitrous fumes), cooled, made slightly alk. with ammonia, acidified with AcOH and the Cu is detd. in the usual manner with KI and Na<sub>2</sub>S<sub>2</sub>O<sub>3</sub>. The nitrite is detd. as follows: 10 cc. I is run into a Lunge nitrometer, treated with 20 cc. dil. H<sub>2</sub>SO<sub>4</sub> (25% by vol.), and, after a few min., with 10 cc. concd. H<sub>2</sub>SO<sub>4</sub>, and the nitrous acid is detd. in the usual way.

Presidential address—method in the gold bullion assay. ROBERT LAW. *Proc. Soc. Chem. Ind. Victoria* 28, 130-46(1929).—Details are given concerning the elementary operations involved in assay work.

Potentiometric determination of gold and platinum with stannous chloride. ERICH MULLER AND RUDOLF BENNEWITZ. *Z. anorg. allgem. Chem.* 179, 113-24(1929).—0.0004 *M* solns. of H<sub>2</sub>AuCl<sub>4</sub> and H<sub>2</sub>PtCl<sub>6</sub> were prepd. by dissolving the metals in aqua regia and expelling the HNO<sub>3</sub> by repeated evapn. with HCl. The metals were detd. potentiometrically with 0.04 *N* SnCl<sub>2</sub> soln. in an atm. of N<sub>2</sub>. The titration curve for Au in solns. contg. excess Cl<sub>2</sub> shows 2 breaks, the first corresponding to the reduction of excess Cl<sub>2</sub> and the second to the reduction of AuCl<sub>4</sub><sup>-</sup> by Sn<sup>2+</sup>. In the detn. of Pt, the excess Cl<sub>2</sub> was titrated at 18°, and the PtCl<sub>6</sub><sup>2-</sup> was reduced to Pt at 75°. By using KBrO<sub>3</sub> as the oxidant and conducting the entire titration at 75° results were obtained which were 7% too high. Either of the metals may be detd. at lower concns. but when both are together there is no end point until both Au and Pt are reduced to metal.

Rapid spectroscopic methods for the determination of iridium, rhodium and palladium in platinum. WALTHER GERLACH AND EUGEN SCHWEITZER. *Z. anorg. allgem. Chem.* 181, 103-10(1929); cf. *C. A.* 21, 3172, 3851.—In examn. of the emission spectrum of an alloy in which a substance Z has been added to a base substance G, that part of the field is sought where with a definite compn. of G + a%Z, a pair of lines is found (one from each element) having equal intensity. This is called a *homologous pair*, and where a no. of these pairs can be found covering a sufficient range of concn. of Z in G, a good quant. method is available for detn. of Z. These pairs can be detected simply by using a magnifying glass, photometric methods being unnecessary. With Rh in Pt sufficient lines are found to cover 0.5, 0.6, 0.8, 1.0, 1.1, 1.2, 1.4, 1.5, 2.5, 3.0, 4.0, 5.0 and 7.5% Rh; with Ir in Pt 0.3, 1.56, 1.64, 2.0, 5.0, 6.0, 7.0 and about

10.0% Ir. In the case of Pd, analytical samples were not available, but suitable lines were found at 3609.6 and 3634.7 A. U.

**Spectroscopic identification of lead in gold-copper-silver alloys.** VII. WALTHER GERLACH AND EUGEN SCHWEITZER. *Z. anorg. allgem. Chem.* **181**, 101-2(1929); cf. C. A. **22**, 3112.—Pb can be identified spectroscopically in an alloy contg. Au + 10% Cu + 10% Ag + 0.09% Pb by using a large glass spectrograph, the dispersion of which is about 13 A. U. per mm. in the vicinity of wave length 4060. The Pb line at 4057.8 is sharp and easily distinguished even with only 0.005% Pb. It is very improbable that elements which show lines in this vicinity would be present in sufficient quantity to interfere.

**Non-sulfide lead determinations.** H. K. HANSEN. *Chemist-Analyst* **18**, 10-11 (1929).—To det. Pb in sulfates, oxides and carbonates, treat 2.5-5 g. of very fine sample with 20 cc. of concd.  $\text{NH}_4\text{OAc}$  soln. contg. 5 cc. of excess  $\text{AcOH}$ . Simmer 5 min., filter and to the filtrate add 1-2 cc. of satd.  $\text{Na}_2\text{S}$  soln. Boil, filter and wash with cold water. Treat the ppt. with  $\text{HNO}_3$  and  $\text{KClO}_3$ , and fume with 5-7 cc. of  $\text{H}_2\text{SO}_4$ . Continue as usual. Another procedure is given in which the  $\text{H}_2\text{SO}_4$  is added directly to the first filtrate. To det. Zn in an ore, decomp. with  $\text{HNO}_3$ , fume with  $\text{H}_2\text{SO}_4$  and  $\text{HCl}$  and treat the fumed soln. with 15-20 ml. of water, a large spoonful of  $\text{NH}_4\text{Cl}$  and 5 cc. of  $\text{HCl}$ . Boil, make ammoniacal, add a pinch of  $\text{NH}_4$  persulfate, boil, filter and continue in the usual manner. Another procedure when no sulfide is present, is to dissolve in 25 cc. of water and 5 cc.  $\text{AcOH}$ , boil, filter, add  $\text{Br}_2$  and 5 cc. of  $\text{HCl}$ , boil off  $\text{Br}_2$ , add a spoonful of  $\text{NH}_4\text{Cl}$  and continue as above. To det. Fe, dissolve pptd.  $\text{Fe}(\text{OH})_3$  in 2.5 N  $\text{HCl}$ , reduce with a small spoonful of test Pb, filter, wash by 3 decantations with 50-cc. portions of cold water and titrate with  $\text{K}_2\text{Cr}_2\text{O}_7$ , diphenylamine being used as indicator.

**The determination of manganese by the Volhard method.** F. J. WATSON. *Chem. Eng. Mining Rev.* **21**, 352-3(1929).—The expt. was tried of adding an excess of  $\text{KMnO}_4$  in the Volhard titration and titrating the excess with  $\text{Na}_2\text{S}_2\text{O}_4$ , assuming it to be oxidized to  $\text{SO}_4^{--}$  but since more than the anticipated vol. of thiosulfate was required for 10 cc. of 0.1 N  $\text{KMnO}_4$  soln., the conclusion is drawn that this method is applicable only when the excess of  $\text{KMnO}_4$  is small. In running a Volhard titration when the approx. position of the end point is unknown, it is well to reserve a part of the soln. and add it to the main soln. after the end point has been over-run. Another method is to prep. a  $\text{MnSO}_4$  soln. as follows: Take 500 cc. of 0.1 N  $\text{KMnO}_4$ , make acid with  $\text{H}_2\text{SO}_4$  and reduce with  $\text{H}_2\text{O}_2$ . Boil with an excess of  $\text{ZnO}$  and make up to 1 l. Add 3 cc. to the titrated soln. (= 1 cc. of  $\text{KMnO}_4$ ) and get a new end point.

**Volumetric determination of manganese as manganous salt by a new method.** RUDOLF LANG AND FRANZ KURTZ. *Z. anorg. allgem. Chem.* **161**, 111-20(1929).—The method depends on the induced oxidation of  $\text{Mn}^{++}$  to  $\text{Mn}^{+++}$  by means of dichromate-arsenite mixt. and titration of the  $\text{Mn}^{+++}$  with  $\text{FeSO}_4$ -diphenylamine. Make the  $\text{Mn}^{++}$  soln., contg. not more than 0.2 g. Mn, slightly alk. with  $\text{Na}_2\text{CO}_3$ , add 5-10 cc. of  $\text{HF}$  and 5-10 cc. of sirupy  $\text{H}_3\text{PO}_4$ . Then add 45 cc. of 1.5%  $\text{K}_2\text{Cr}_2\text{O}_7$  soln. and 50 cc. of arsenite soln. (15 g.  $\text{As}_2\text{O}_3$  and 10 g.  $\text{Na}_2\text{CO}_3$  per l.). After 2-3 min., add 3 drops of 1% diphenylamine soln. and titrate with  $\text{FeSO}_4$  soln. (28 g. copperas and 10 cc.  $\text{H}_2\text{SO}_4$  per l.) until the color of the soln. changes from dark blue to grass green. To det. Mn in Mn-steel, dissolve 4.981 g. of metal in 60 cc. of 6 N  $\text{HCl}$  and boil the resulting soln. for 5 min. with some 3%  $\text{H}_2\text{O}_2$ . Dil. to 200 cc., mix and use 40 cc. for the Mn titration, neutralizing with  $\text{Na}_2\text{CO}_3$  until an abundant pptn. of  $\text{Fe}(\text{OH})_3$  takes place and then adding the reagents as described above. The titration can be repeated if desired. Hg solns., considerable  $\text{NH}_4$  salt, Al, Ca and other elements which form insol. fluorides, interfere, by causing adsorption of  $\text{Mn}^{++}$ , thus preventing its oxidation to  $\text{Mn}^{+++}$ .

**A new, rapid method for determining mercury.** G. SPACU AND G. SUCIU. *Z. anal. Chem.* **77**, 334-40(1929). See C. A. **23**, 3184.

**The volumetric determination of mercury.** H. B. DUNNICLIFF AND H. D. SURI. *Analyst* **54**, 405-10(1929).—A bibliography with notes on previous volumetric methods is given. The following method using  $\text{SnCl}_2$  is recommended: Mix a measured vol. of standard  $\text{SnCl}_2$  soln. with an equal vol. of 25% Na tartrate in a graduated cylinder through which  $\text{CO}_2$  is passing. Neutralize with the calcd. amt. of  $\text{NaHCO}_3$  and dil. to 80-90 cc. Stir and standardize by the Fe-alum- $\text{TiCl}_3$  method. Do the same thing with  $\text{HgCl}_2$  added but filter into a buret in an atm. of  $\text{CO}_2$  after dilg. the mixt. to 80-85 cc. Add 10 cc. of the filtrate to an excess of standard Fe-alum soln. which has been heated on the water bath and contains an excess of  $\text{HCl}$ . Titrate the excess Fe with  $\text{TiCl}_3$  soln. which is standardized daily. The  $\text{HgCl}_2$  soln. should be 0.025-0.125 N,

more than enough  $\text{SnCl}_2$  soln. added to reduce the  $\text{HgCl}_2$  to metal and air must be excluded as indicated above. For filtering, 2 layers of  $\text{BaSO}_4$  paper and some asbestos are recommended. Instead of  $\text{Fe}$  alum and  $\text{TiCl}_3$  solns.,  $\text{I}_2$  and  $\text{Na}_2\text{S}_2\text{O}_3$  can be used equally well.

**Mercury poisoning and its chemical detection.** FRIEDERICH AND BUHR. *Süddeut. Apoth.-Ztg.* **68**, 702-3 (1928); *Chem. Zentr.* **1928**, II, 2739.—In cases of  $\text{Hg}$  poisoning the chem. detection in the excreta was carried out in the following way. A  $\text{Cl}$  current was passed in 1000 cc. of urine and the urine evapd. to about 150 cc., with  $\text{Cl}$  passing steadily through the fluid. The excess of  $\text{Cl}$  was removed by means of  $\text{CO}_2$  passed through the fluid in a slow current. Then the liquid was filtered in the cold. A few drops of  $\text{CuSO}_4$  soln. (German Pharmacopeia 6) was added, the mixt. was slightly acidified with  $\text{HCl}$  and pptd. with  $\text{H}_2\text{S}$ . The centrifugized ppt. was suspended in  $\text{H}_2\text{O}$  and dissolved with  $\text{Cl}$ .  $\text{CO}_2$  was passed through and the dil. soln. was again treated with  $\text{H}_2\text{S}$ . The ppt. formed was once more treated with  $\text{Cl}$  and  $\text{CO}_2$  as described above. The soln. was filtered and finely powdered  $(\text{NH}_4)_2\text{C}_2\text{O}_4$  was added until the  $\text{CuC}_2\text{O}_4$  first pptd. dissolved again.  $\text{Hg}$  was then pptd. by introduction of a  $\text{Cu}$  wire into the blue soln. The  $\text{Hg}$  was identified as the iodide. The  $\text{HgI}_2$  was dissolved by passing  $\text{Cl}$  into the aq. suspension. The excess of  $\text{Cl}$  was removed and the soln. electrolyzed after addn. of  $(\text{NH}_4)_2\text{C}_2\text{O}_4$  and  $(\text{CO}_2\text{H})_2$ . The quantity of  $\text{Hg}$  present was calcd. from the wt. of the cathode. The method proved to be very exact.

G. SCHWOCH  
**Determination of small quantities of potassium in the presence of considerable sodium salt by a direct, gasvolumetric method.** GERHART JANDER AND HERMANN FABER. *Z. anorg. allgem. Chem.* **181**, 189-92 (1929).—Directions are given for modifying the method so that 1 mg. of  $\text{K}$  can be detd. in the presence of 1.0 g. of  $\text{Na}$  salt.  $\text{K}_2\text{Na}_3[\text{Co}(\text{NO}_2)_6]_2$  is pptd., the ppt. is filtered and decompd. with  $\text{FeSO}_4$  and the resulting  $\text{NO}$  measured in an azotometer. The results are very accurate. W. T. H.

**Note on the determination of silicon.** THEODOR HECZKO. *Z. anal. Chem.* **77**, 327-8 (1929).—In volatilizing  $\text{SiF}_4$  with  $\text{HF}$  and  $\text{H}_2\text{SO}_4$ , time can be saved if filter paper is put into the crucible to absorb the liquid. It is then easier to evap. to dryness.

W. T. H.  
**Microchemical detection of silver as sulfate.** O. HACKL. *Mikrochemie* **6**, 106-7 (1928); *Chem. Zentr.* **1928**, II, 923.—The crystals obtained on adding  $\text{H}_2\text{SO}_4$  of various concns. or solid  $(\text{NH}_4)_2\text{SO}_4$  are described. The limit of sensitiveness is 0.001 mg. per cc.

G. SCHWOCH  
**Investigations into the analytical chemistry of tantalum, columbium and their mineral associates.** XIV. A new method for the separation of small quantities of tantalum from columbium and from titanium. W. R. SCHOELLER. *Analyst* **54**, 320-6 (1929); cf. *C. A.* **23**, 55.—Tartaric acid hydrolysis on a small scale is a good pptn. reaction of the earth acids; a fraction of a mg. is recovered from a bulk of 2 cc. by boiling with 1 cc. of  $\text{HNO}_3$  and at the same time a good sepn. from  $\text{Ti}$  is obtained. A concn. of 0.1-1.0 mg. of  $\text{M}_2\text{O}_3$  should be chosen. This reaction is the final stage of the new procedure. When a soln. contg. oxalates of  $\text{Ti}$  and  $\text{NH}_4$  with a small quantity of oxalo-earth acids is treated with an excess of  $\text{Na}$  salicylate, the characteristic, orange color of the salicylic- $\text{Ti}$  complex is obtained. If, now, the oxalate ion is removed by addn. of  $\text{CaCl}_2$ , the bulky oxalate ppt. carries down the earth acids while the  $\text{Ti}$  complex remains unaffected. Since, however, this pptn. of rare earths is not quite quant., it is necessary to recover  $\text{Ti}$  from the filtrate and repeat the treatment. The oxalate ppts. can then be dissolved in  $\text{HCl}$ , the oxalate destroyed with  $\text{KMnO}_4$ , and the earth acids pptd. as tannin complexes. Then the ignited ppts. can be submitted to the tartaric acid hydrolysis described above. The entire procedure is as follows: Fuse 0.2-0.3 g. of the mixed oxides with 2 g. of  $\text{KHSO}_4$  in a silica crucible and treat the melt with 250 cc. of a hot soln. of 2 g.  $(\text{NH}_4)_2\text{C}_2\text{O}_4$ . To the boiling soln. add 5 g. of  $\text{Na}$  salicylate dissolved in hot water and 20%  $\text{CaCl}_2$  soln., in small portions, until all oxalate is pptd. Allow to settle 5 min. on the steam bath and make sure that the pptn. was complete. Filter while hot, using suction. Wash with hot 2%  $\text{Na}$  oxalate soln. until the washings are colorless. Dissolve the ppt. in 40-50 cc. of 6  $N$   $\text{HCl}$ , heat to boiling and add  $\text{KMnO}_4$  cautiously. When the oxalate is decompd. and the soln. is clear, dil. to 300-350 cc. with boiling water, add 1 g. of recently dissolved tannin, boil 10 min. and allow the resulting ppt. to settle on the steam bath. Filter, wash with 2%  $\text{NH}_4\text{Cl}$  soln. contg. a little tannin and ignite the ppt. ( $\text{TP}_1$ ) in a porcelain crucible. Evap. the previous salicylate filtrate to about 150 cc., add 40 g. of  $\text{NH}_4\text{Cl}$  (forming a copious yellow ppt.) and let stand overnight. This causes the nearly complete pptn. of  $\text{Ti}$  as yellow crystals. Filter and wash with satd.  $\text{NH}_4\text{Cl}$  soln. Boil the mother

liquid from this last ppt. with 5 g. of  $\text{NH}_4\text{OAc}$  and 0.5 g. tannin. Filter off the ppt. and wash with 2%  $\text{NH}_4\text{Cl}$ -tannin soln. Ignite and fuse with a little  $\text{KHSO}_4$ . Dissolve the melt in a hot soln. of 2 g.  $(\text{NH}_4)_2\text{C}_2\text{O}_4$  and rinse the liquid into the beaker contg. the yellow Ti crystals. On being heated they dissolve, leaving a white ppt. of  $\text{CaC}_2\text{O}_4$ , which should not be removed at this stage. Add 5 g. of Na salicylate, dil. to 250 cc. and ppt. the boiling soln. with  $\text{CaCl}_2$  as in the first part of this procedure, obtaining, as before, an ignited tannin ppt. ( $TP_2$ ). Fuse the  $TP_1$  ppt. with 0.25 g. of  $\text{KHSO}_4$  and carry out the tartaric acid hydrolysis as described above, but filtering before adding the  $\text{HNO}_3$  if there is any siliceous residue. Unite any siliceous residue after ignition, with  $TP_1$ . Treat with HF and  $\text{H}_2\text{SO}_4$ , fuse with a fragment of  $\text{K}_2\text{S}_2\text{O}_7$ , dissolve in about 1 cc. of tartaric acid soln. and add to the above soln. of  $TP_1$ . Boil with  $\text{HNO}_3$  as described above, filter, ignite and weigh. Fuse with  $\text{KHSO}_4$  and correct for any Ti present by the  $\text{H}_2\text{O}_2$  test. The errors in this procedure are consistently neg., a few mg. of rare earth oxide escaping detection. XV. A new method for the separation of tantalum and columbium from titanium and zirconium (1: qualitative). W. R. SCHOELLER. *Analyst* 54, 453-60(1929).—To sep. Ta and Cb from Ti and Zr, fuse 0.1-0.2 g. of the mixed oxides with 2-3 g. of  $\text{KHSO}_4$  in a silica crucible. Make the melt solidify in a thin layer around the sides of the crucible. To the contents add a part of a soln. of 1 g. tannin in 100 cc. of 1.8 N  $\text{H}_2\text{SO}_4$  and heat gently with a moving flame until the melt disintegrates into small detached fragments. By this treatment, the molecularly dispersed sulfates of K, Ti and Zr are able to diffuse through the meshes of the tannin colloid whereas the larger aggregates of  $\text{Ta}_2\text{O}_5$  and  $\text{Cb}_2\text{O}_5$  are entangled and coagulated by the colloid as soon as they are formed by disintegration of the melt. This prevents the Ti and Zr from forming complex compds. with the Ta and Cb. Transfer the contents of the crucible to a 400-cc. beaker and rinse the crucible with the rest of the 100 cc. of tannin soln. referred to above. Heat to boiling and allow to stand on a hot plate, or water bath, until the ppt. has coagulated (about 15 min.). To detect Ti and Zr, add 5 cc. of concd.  $\text{H}_2\text{SO}_4$  and evap. till the liquid darkens and foams. Then clarify by adding small portions of concd.  $\text{HNO}_3$ , finally evapg. to dense fumes, adding more  $\text{HNO}_3$  if necessary. Cool, add 50 cc. of cold water and test for Ti with  $\text{H}_2\text{O}_2$  and Zr with  $(\text{NH}_4)_2\text{HPO}_4$ . Wash the ppt. of earth acids and tannin with 2%  $\text{H}_2\text{SO}_4$  contg. a little tannin, ignite and fuse with  $\text{KHSO}_4$ . Dissolve the melt in a hot concd. soln. of tartaric acid. Dil. to 20 cc. for each 0.01 g. of oxide and treat while boiling with 0.2 of its vol. of concd.  $\text{HNO}_3$ ; a white flocculent ppt. is pos. proof of the identity of the earth acids. Fuse with  $\text{KHSO}_4$  again and identify Ta and Cb by the method of Powell and Schoeller (*C. A.* 20, 721). Three reagents are suitable for differentiating between Ta and Cb: (1) Tannin in oxalate soln. gives a yellow ppt. with Ta and a red ppt. with Cb. (2) Zn dust in  $\text{H}_3\text{PO}_4$  soln. gives no coloration with Ta and a dark coloration with Cb. (3) KF in HF soln. gives a cryst. ppt. with Ta and no ppt. with Cb. The results obtained in the quant. anal. of 13 artificial mixts. show that the above qual. sepn. can probably be adapted to quant. work. W. T. H.

The determination of tin by rapid electrolysis. J. ŠVÉDA AND R. UZEL. *Collection Czechoslov. Chem. Comm.* 1, 203-22(1929).—The rapid electrolytic detn. of Sn from neutral stannous oxalate solns. gives good results although the deposits are powdery. In acid oxalate solns. the results are likely to vary and in stannic solns. good results cannot be obtained either in acid or alk. solns. On the other hand, Sn of either valence can be deposited rapidly from an acid oxalate soln. in the presence of  $\text{NH}_4\text{OH}$ . Solns. of  $\text{NH}_4$  thiosalts gave fairly good results in the presence of  $\text{Na}_2\text{SO}_3$  and  $\text{NH}_4$  salts but solns. of Na thiosalt were not so good. Sn can be deposited from HCl soln. in the presence of  $\text{NH}_4\text{OH}$  as depolarizer. Over 100 electrolytic analyses were made in connection with the above conclusions, mostly in testing known procedures. W. T. H.

A rapid method for determining vanadium in unalloyed and in alloyed steels. KARL RIES. *Chem.-Ztg.* 53, 527(1929).—Dissolve 1-2 g. of metal in dil.  $\text{H}_2\text{SO}_4$ , adding 10 cc. of  $\text{H}_3\text{PO}_4$  if W is present. Oxidize with  $\text{HNO}_3$  and evap. to fumes. Cool, add water and reduce V with  $\text{FeSO}_4$ . Decomp. the excess of  $\text{FeSO}_4$  with a little  $(\text{NH}_4)_2\text{S}_2\text{O}_8$  and titrate the cold soln. with  $\text{KMnO}_4$  until an end point will last 1-2 min. If much Cr or W is present, correct for the color effect. W. T. H.

Detection of small quantities of vanadium. JULIUS MEYER. *Chem.-Ztg.* 53, 366(1929).—Fölsner (*C. A.* 23, 3185) was unable to get sensitive color tests for V with  $\text{H}_2\text{O}_2$  and this was undoubtedly because he did not use proper concns. of  $\text{H}_2\text{SO}_4$  and  $\text{H}_2\text{O}_2$ . To test for  $\text{H}_2\text{VO}_4$  it is best to make the soln. contain 15-20%  $\text{H}_2\text{SO}_4$ , wait a moment and then add 1 drop of 3%  $\text{H}_2\text{O}_2$ . W. T. H.

Determination of gases in metals and in particular the determination of oxygen in

**iron and steel by the hot extraction method.** HANS DIERGARTEN. *Arch. Eisenhüttenw.* 2, 813-28(1929).—This paper contains valuable information with respect to the detn. of gases in metals in graphite crucibles heated in a vacuum. To decrease the cost of app., several new furnaces were constructed to replace the expensive high-frequency furnace. The attempt was made to utilize crucibles of special oxidic materials but the results were not satisfactory. Improved methods were worked out for introducing pieces of metal in a vacuum. Expts. showed that CO is not absorbed appreciably in a high-frequency furnace, and not more than 5% in a C-spiral furnace. N<sub>2</sub> is recovered completely. The recovery of H<sub>2</sub> is perfect in the high-frequency furnace but only 50% is recovered in the C-spiral furnace. Fe or steel samples contg. 0.7% Mn gave too low O values because of CO absorption by the Mn volatilized but expts. to det. the seriousness of this error are not yet finished. Numerous results are given of O detns. in various materials showing the applicability of the hot extn. method.

W. T. H.

**Methods of determination of sulfur.** R. P. HUDSON. *Blast Furnace & Steel Plant* 17, 873-6(1929).—The well-known methods for detg. S in Fe and steel are explained in detail.

W. T. H.

**Rapid method for dissolving high-chromium steels for the determination of sulfur.** B. S. EVANS. *Analyst* 54, 286-7(1929).—In the detn. of S by the gravimetric, oxidation method, some difficulty is encountered in dissolving stainless steel samples. This can be overcome by using HCl alone in such a way that the escaping gases are passed into aqua regia so that all H<sub>2</sub>S is oxidized to H<sub>2</sub>SO<sub>4</sub>. A flask with ground-glass connection to a tapped funnel and to an exit tube is shown and directions are given in detail for dissolving the sample in HCl and finally causing the aqua regia to be drawn back into the flask by alternately heating and chilling the contents.

W. T. H.

**The assumed influence of copper on the determination of sulfur in iron and steel.** H. PINSL. *Die Giesserei* 16, 453-8(1929).—It has been stated that the presence of Cu in Fe metals causes low results in the usual evolution method for the detn. of S, probably with the idea that insol. CuS is present in the metal. The study of polished specimens shows, however, that CuS is present in the alloyed metal as CuS only when the Mn content is low and that, moreover, the CuS is then present in such small particles that it is decompd. by concd. HCl, which is used in German practice for the detn. of S by the evolution method. Comparative tests by 3 different methods show that the evolution method, using 12 N HCl, gives correct results when any likely quantity of Cu is present in the various kinds of Fe and steel, provided the sample is not heated too quickly so that too much HCl is distd. off before the samples are sufficiently attacked. With respect to whether the Cu is appreciably dissolved by the treatment with concd. HCl in the evolution method, expts. show that all the Cu in steel, with even 0.88% of Cu, dissolves in concd. HCl but with cast Fe, a small part of S remains in the residue. This should be taken into consideration if the Cu is to be detd. after the evolution S detn. The soln. should be treated with H<sub>2</sub>S without filtering off the residue and the resulting ppt. and residue should be treated with HNO<sub>3</sub> to dissolve the CuS and a second pptn. made with H<sub>2</sub>S before the Cu is finally detd. as CuO.

W. T. H.

**The significance of the inner-complex salts in the analytical chemistry of metals.** O. SCHMITZ-DUMONT. *Metallwirtschaft* 7, 281-5(1929).—An interesting theoretical discussion, based on the valence theory of Werner, of important analytical reactions with org. substances such as diacetyldioxime, o-hydroxyquinoline, pyridine, alizarin, glyocoll, tetrahydroxyanthraquinone, α-nitroso-β-naphthol, dicyandiamidine, isonitrosophenylhydroxylamine, furildioxime, cyclohexanedioxime, etc.

W. T. H.

**Reactions of the metals of the hydrogen sulfide group.** ALEXANDRE SERGUEEFF. *Ann. chim. anal. chim. appl.* 11, 161-5(1929).—It is recommended to place some metal filings in a sachet of cigaret paper for carrying out sensitive displacement tests. To detect Cd.—Use Zn filings in the sachet and have the soln. nearly neutral, using some KCN if Cu is present. If a thin deposit of Cd is obtained, place the sachet and the deposit in a soln. of SnCl<sub>2</sub>; the immediate pptn. of Sn proves the deposit to be Cd. Tin solns. give characteristic crystals when treated with Ag. Zn ppts. Sn easily but in an acid soln. the H<sub>2</sub> is likely to cause the ppt. to fall off so that Cd is a better test. In the presence of Sb, the nature of the metallic deposit is changed. Pb solns. give good deposits with Zn or Cd. This, and the fact that a concd. soln. of Sn in KOH serves to ppt. only Pb, Bi and Sb will often help to identify Pb. Zn gives a dark deposit with Cu solns. except in the presence of KCN. Bi(NO<sub>3</sub>)<sub>3</sub> solns. do not give a ppt. with Cu but a soln. of KBiI<sub>4</sub> gives a ppt. of Bi with Cu and this serves to distinguish Bi from all other metals except As, Sb and Sn. A sensitive test for Bi is described in which crystals of Sn on 10 mg. of Cd are first obtained; the excess SnCl<sub>2</sub> soln. is

removed so as to expose the crystals above the residual liquid in a small test tube, and then the Bi soln. is added: the Sn crystals become darkened. Sb behaves like Bi with Zn, Sn, etc. To detect Ag, add to the  $\text{HNO}_3$  soln. an excess of  $\text{NH}_4\text{OH}$ , heat and filter. Heat with Sb or Bi. All these tests and other replacement reactions are described in detail.

**Analysis of aluminum alloys.** HENRY GIBB. *Ind. Chemist* 5, 286-8(1929).—Methods are given in detail for the detn. of Si, Cu, Sn, Zn, Mn, Cr, Pb, Fe, Ca, Mg and Ni. The methods are well chosen and are suitable for use in a lab. attached to a small foundry.

**Determination of oxidic inclusions in iron and steel by the analysis of the residue left after heating the metal in chlorine.** ROLAND WASMUHT AND PAUL OBERHOFFER. *Arch. Eisenhüttenw.* 2, 829-42(1929).—The effect of heating various oxides in pure  $\text{Cl}_2$  at various temps. was studied with the oxides alone and with other substances present. To get an idea of the amt. of  $\text{FeO}$  in a sample of Fe alloy it is recommended to heat at  $350^\circ$  and then det. the quantity of trivalent Fe in the residue, assuming, as the results of the expt. indicate, that all of the  $\text{FeO}$  has been oxidized but no O lost. In the presence of phosphide and sulfide, however, there is a very noticeable loss of O. Oxide of Mn behaves similarly: there is an oxidation but little if any loss of O in the absence of P and S.  $\text{Al}_2\text{O}_3$  and  $\text{SiO}_2$ , on the other hand, are obtained best by heating the sample in dry  $\text{Cl}_2$  at  $500$ – $600^\circ$ . The C present serves to make the reactions with  $\text{Cl}_2$  take place more readily. The app. used is described in detail and considerable painstaking work is discussed.

**Application of thermomagnetic analysis to the study of the oxides and minerals of iron.** J. HUGGETT. *Ann. chim.* [10], 11, 447-510(1929); cf. C. A. 22, 1934.—Anomalies were found in the systems  $\text{Fe}_2\text{O}_3$ - $\text{Fe}_3\text{O}_4$ ,  $\text{Fe}_3\text{O}_4$ - $\text{FeO}$  and  $\text{FeO}$ -Fe. Malaguti's oxide (I), the magnetic oxide obtained by calcining the ferruginous deposits left by mineral waters, liberates heat on conversion to the ordinary form of  $\text{Fe}_2\text{O}_3$ . The transition occurs at  $300$ – $800^\circ$  depending on the stability of (I) which in turn varies inversely as the purity of the material from which it was obtained. Goethite ( $\text{FeO} \cdot \text{H}_2\text{O}$ ) and its variety lepidocrocite on dehydration gives (I). (I) is also an essential constituent of rust.

**The determination of total and available lime.** N. SHILKIN. *Chem. Eng. Mining Rev.* 21, 354-5(1929).—Some work carried out with well-known methods is outlined very briefly.

**Determination of the purity of "yellow potash" and "yellow soda" by titration with zinc sulfate solution.** FARB-SALZ GESELLSCHAFT M. B. H. *Chem.-Ztg.* 53, 390(1929).—The terms "yellow potash" and "yellow soda" refer to the alkali salts of ferrocyanic acid which are best analyzed by titration with  $\text{ZnSO}_4$  soln. The procedure recommended is the following: Dissolve 28.76 g. of  $\text{ZnSO}_4$  in water and dil. to 1 l. Dissolve 10 g. of pure  $\text{K}_4\text{Fe}(\text{CN})_6$  in water and dil. to exactly 500 cc. Take 50 cc. of the latter soln., add 100 cc. of water and 10 cc. of 0.1 N  $\text{H}_2\text{SO}_4$  and titrate with the Zn soln. at  $20^\circ$  until a drop of the soln. placed on filter paper, and then after 30 seconds allowed to come in contact with a spreading drop of 15% ferric alum soln. in the paper, will show no Prussian blue color. In carrying out this test, give time for the soln. to spread out and not let the ferric alum soln. come in contact with the  $\text{K}_4\text{Zn}[\text{Fe}(\text{CN})_6]$  ppt. Titrate a soln. of the sample in the same way. To det. water in ferrocyanides dry in an oven at  $125^\circ$  to const. wt.

**The analysis of fluorspar.** G. E. F. LUNDELL AND J. I. HOFFMAN. *Bur. Standards J. Research* 2, 671-83(1929).—The procedures found best for the detn. of  $\text{CO}_2$ ,  $\text{SiO}_2$ ,  $\text{CaF}_2$ , S, Ba, Pb and Zn are described. Det.  $\text{CO}_2$  by treating with acid and absorbing the dried, escaping gas in ascarite or heat the sample in a combustion tube if it is known that no org. matter is present. To det.  $\text{SiO}_2$ , treat 1 g. of sample with 3 cc. of a mixt. of 20 cc.  $\text{Br}_2$  and 80 cc.  $\text{AcOH}$ . Digest 10 min. on the steam bath, add 10 cc. of water and 10 cc. of satd. 20%  $\text{KBr}$  soln. (which has been satd. with  $\text{Br}_2$ ) and digest 40 min. Finally add 5 ml. of 50%  $\text{NH}_4\text{OAc}$  and digest 10 min. Add paper pulp, filter and wash with hot water. Dry, ignite, weigh and det. the loss in wt. by treatment with HF and  $\text{H}_2\text{SO}_4$ . To det.  $\text{CaF}_2$ , digest 0.5 g. of sample with 15 cc. of 10%  $\text{AcOH}$  in a Pt crucible on the steam bath for 30 min. Filter and wash thoroughly with hot water. Dry and ignite the residue at a dull red heat. Treat with HF and either  $\text{H}_2\text{SO}_4$  or  $\text{HClO}_4$  to remove  $\text{SiO}_2$ . Dissolve the residue in 150 cc. of 0.6 N  $\text{HCl}$  and, if there is any residue of  $\text{BaSO}_4$ ,  $\text{PbSO}_4$  or undecompd.  $\text{CaF}_2$ , filter it off and weigh it. Pass  $\text{H}_2\text{S}$  into the clear filtrate, add  $\text{NH}_4\text{OH}$ , filter and wash with a soln. contg. 5 cc. of  $\text{NH}_4\text{OH}$  and 10 g.  $\text{NH}_4\text{Cl}$  per l. and satd. with  $\text{H}_2\text{S}$ . Filter, remove  $\text{H}_2\text{S}$  by making acid, boiling, and adding  $\text{KBr}$ - $\text{Br}$  soln. and ppt. the Ca as  $\text{CaC}_2\text{O}_4$ , weighing as  $\text{CaO}$  or titrating with

**KMnO<sub>4</sub>.** Almost equally good results can be obtained by removing the SiO<sub>2</sub> with HF and HClO<sub>4</sub>, repeating the evapn., heating the residue with a little HCl, adding 3-5 ml. of HClO<sub>4</sub> and again evapg. to dryness. Filter if necessary, make alk. to methyl red by adding NH<sub>4</sub>OH, add oxalic acid to acid reaction, with 10 ml. of 10% oxalic acid in excess and 50 cc. of 4% (NH<sub>4</sub>)<sub>2</sub>C<sub>2</sub>O<sub>4</sub> soln., finally titrating the CaC<sub>2</sub>O<sub>4</sub> ppt. with KMnO<sub>4</sub>. *To det. S*, fuse 1 g. of sample with 10 g. K<sub>2</sub>CO<sub>3</sub> and 0.5 g. KNO<sub>3</sub> in an elec. muffle or over an alc. or petroleum ether flame. Continue as in the Fresenius method for detg. S in pyrite. *To det. Ba*, remove SiO<sub>2</sub> by treatment with HF, HNO<sub>3</sub> and HClO<sub>4</sub>, evapg. to dryness, adding more HClO<sub>4</sub> and repeating the evapn. If an insol. residue remains, filter, wash with warm water, ignite at as low a temp. as possible, and treat with HF and H<sub>2</sub>SO<sub>4</sub>. Evap. to dryness and fuse the residue with Na<sub>2</sub>CO<sub>3</sub>. Leach out all Na salts with hot water, dissolve the insol. residue in HCl and ppt. BaSO<sub>4</sub> in the usual manner. Test the ppt. for PbSO<sub>4</sub> by treating with NH<sub>4</sub>OAc soln., adding a drop of HCl and H<sub>2</sub>S until satd. Ignite and weigh as PbSO<sub>4</sub>, allowing for this wt. in both the Ba and Pb detns. *To det. Pb*, pass H<sub>2</sub>S into the filtrate from the BaSO<sub>4</sub> pptn., add NH<sub>4</sub>Cl-(NH<sub>4</sub>)<sub>2</sub>S soln., filter and discard the filtrate. Dissolve the sulfide ppt. in hot, dil. HNO<sub>3</sub> and det. the Pb as PbSO<sub>4</sub> in the usual way. *To det. Zn*, boil the filtrate from the above pptn. of PbS, make 0.01 N in H<sub>2</sub>SO<sub>4</sub> and sat. with H<sub>2</sub>S. Filter, ignite and weigh as ZnO. (If Fe or Al is present it is necessary to remove them first.)

W. T. H.

**Iodometry of a mixture of sulfide, sulfite and thiosulfate.** ROBERT WOLLAK *Z. anal. Chem.* 77, 401-6(1929).—An improved procedure is: To a part of the soln. add an excess of 0.1 N I<sub>2</sub> soln. and titrate the excess with Na<sub>2</sub>S<sub>2</sub>O<sub>4</sub>. The I<sub>2</sub> consumption corresponds to the sum of the S in the 3 states. To another portion add 15 cc. of 10% Zn(OAc)<sub>2</sub> soln. and dil. with water to about 150 cc. Then, without filtering, add 5 cc. of 35-40% HCHO soln. and make acid with 20 cc. of 10% AcOH. Add an excess of standard I<sub>2</sub> soln. and titrate the excess with Na<sub>2</sub>S<sub>2</sub>O<sub>4</sub>. The I<sub>2</sub> consumption now corresponds to the sulfide and thiosulfate. Take a third part of the original soln. and add it slowly to a dil. soln. of I<sub>2</sub> and H<sub>2</sub>SO<sub>4</sub> and titrate the excess with approx. 0.1 N sulfite soln., using starch as indicator. Then make alk. to methyl red by adding 0.1 N NH<sub>4</sub>OH, add 7 cc. of 10% KCN and allow the mixt. to stand 10-15 min. Add 25-50 cc. of 9 N H<sub>2</sub>SO<sub>4</sub> and titrate with I<sub>2</sub> to the first permanent blue color. The I<sub>2</sub> consumption in this last titration corresponds to 0.5 of the original thiosulfate content. Under the above conditions, the following reaction takes place:  $3\text{KCN} + \text{Na}_2\text{S}_2\text{O}_3 + \text{H}_2\text{O} \rightarrow \text{Na}_2\text{S}_2\text{O}_3 + \text{K}_2\text{SO}_4 + \text{KCNS} + 2\text{HCN}$ .

W. T. H.

**Detection and determination of carbon disulfide in the air.** E. SELIVOUNOFF. *Ann. chim. anal. chim. appl.* 11, 133-5(1929).—To det. less than 0.01 mg. per l. of CS<sub>2</sub> in air the following method has been used: Pass the gas at 10 l. per hr. through 2 bottles of 10% aq. KOH or NaOH, one with 2.5% H<sub>2</sub>SO<sub>4</sub> and then through 2 bottles contg. 5% KOH in alc. The first 2 wash bottles serve to remove H<sub>2</sub>S, SO<sub>2</sub>, CO<sub>2</sub> and HCN, the H<sub>2</sub>SO<sub>4</sub> removes NH<sub>3</sub> and other bases, but the CS<sub>2</sub> is absorbed by the KOH in alc. to form K xanthate. Evap. the soln. at 80° to half its vol., neutralize exactly to phenolphthalein with dil. AcOH, treat with 0.5-1 cc. 0.5 1% soln. of guaiac resin in alc. and titrate with 0.002 N CuSO<sub>4</sub> soln.; 1 cc. of the reagent = 0.011 mg. of CS<sub>2</sub>. One mol. CS<sub>2</sub> = 1 mol. CuSO<sub>4</sub> in the presence of the resin.

W. T. H.

**Some analytical applications of sodium hyposulfite.** (Antimony, bismuth, lead, cadmium.) B. S. EVANS. *Analyst* 54, 395-405(1929).—*To det. Sb in Cu alloys rich in Sb*.—Proceed as follows: Dissolve 1 g. of alloy in 15 cc. HCl, 5 cc. HNO<sub>3</sub>, 20 cc. of water and 20 cc. of 50% citric acid soln. and make the resulting soln. slightly ammoniacal. To a satd. soln. of KCN, add aq. Br until a drop removed gives no violet color with Na<sub>2</sub>FeNO(CN)<sub>5</sub> and add the resulting soln. to the ammoniacal soln. of the alloy, until the blue color is discharged and 20 cc. in excess. Heat to the b. p. Add 50 cc. of 20% NH<sub>4</sub>Cl and 7 g. of Na<sub>2</sub>S<sub>2</sub>O<sub>4</sub>. Heat just to the b. p. and allow to stand on the steam bath 1 hr. to ppt. all Sb, add 2 g. more of Na<sub>2</sub>S<sub>2</sub>O<sub>4</sub> and cool under running water. Filter with paper pulp and wash with a cold soln. of 4 g. NH<sub>4</sub>Cl and 2 g. Na<sub>2</sub>S<sub>2</sub>O<sub>4</sub> in 400 cc. of water. Dissolve the Sb in 6 N HCl and Br and filter off the paper pulp, washing with 6 N HCl. Det. the Sb by the KBrO<sub>3</sub> method of Gyory (*Z. anal. Chem.* 32, 415(1893)). *To det. small quantities of Bi in Sn-Zn alloys*.—Dissolve 5 g. of alloy in 50 cc. of 7 N HCl, adding 5 cc. of HNO<sub>3</sub> after the first violent action is over. Then add 15 g. of tartaric acid and 5 cc. of 0.1 N arsenite soln. (to get a filterable ppt.). Make the soln. alk. with NH<sub>4</sub>OH, add 5 g. of NH<sub>4</sub>Cl and 40 cc. of satd. KCN soln. which has been treated with Br to remove sulfide. Next add 7 g. of Na<sub>2</sub>S<sub>2</sub>O<sub>4</sub> and treat as above to ppt. the Sb. Reheating of the filtrate will in this case always produce further pptn. which will, however, be As in this case. Filter and wash the Bi ppt. as prescribed

for Sb. Dissolve the Bi in Br-HCl, dil., fume with  $\text{H}_2\text{SO}_4$ , clear with  $\text{HNO}_3$ , fume again and det. the Bi colorimetrically by the iodide method. *To det. small quantities of Sb in Pb alloys.*—Dissolve 20 g. of metal in 100 cc. of 6 N  $\text{HNO}_3$  and 5-g. tartaric acid. Dissolve the  $\text{Pb}(\text{NO}_3)_2$  that crystallizes out in hot water, add 80 cc. of 9 N  $\text{H}_2\text{SO}_4$ , filter off the  $\text{PbSO}_4$  ppt. and wash with 2%  $\text{H}_2\text{SO}_4$ . Make the filtrate ammoniacal and continue as in the detn. of Sb in Cu alloys. *To sep. Cd from Bi and Pb.*—Dissolve the sample in  $\text{HNO}_3$  and remove the greater part of Pb as  $\text{PbSO}_4$  as just described, add 10 cc. of 50% citric acid, make alk. with  $\text{NH}_4\text{OH}$ , add about 1 g. of KCN in a soln. freed from sulfide and 7 g. of  $\text{Na}_2\text{S}_2\text{O}_4$ . Heat on the steam bath to  $60^\circ$ , remove and let stand 15–30 min. and then filter to ppt. Sb and Bi. Sat. the filtrate with  $\text{H}_2\text{S}$  and weigh the ppt. as  $\text{CdSO}_4$  after treatment with  $\text{H}_2\text{SO}_4$  and  $\text{HNO}_3$ . *To sep. Cd from Sb.*—The above treatment serves to ppt. enough Sb provided sufficient Bi and Pb are present, so that the residual Sb will not ppt. with  $\text{CdS}$ . *For the detn. of Cd in Pb-base alloys.*—It is well to avoid the  $\text{PbSO}_4$  pptn. Excellent results were obtained by a procedure like that given above using the following quantities of reagents: 5 g. alloy, 50 cc. of 50% citric acid, 50 cc. 6 N  $\text{HNO}_3$ ,  $\text{NH}_4\text{OH}$  till neutral and then 20 cc. of 7.5 N  $\text{NH}_4\text{OH}$ , 10 cc. of satd. KCN soln., 10 g.  $\text{Na}_2\text{S}_2\text{O}_4$ , heating at  $60^\circ$ , 10 cc. of 7.5 N  $\text{NH}_4\text{OH}$  satd. with  $\text{H}_2\text{S}$ . W T H.

A dilution method for the colorimetric determination of  $p_{\text{H}}$  in colored solutions. F. C. THOMPSON AND W. R. ATKIN. *J. Intern. Soc. Leather Trades' Chem* 13, 297, 9 (1929).—Prep. a series of dilns. proceeding in powers of 2. Det.  $p_{\text{H}}$  value of all dilns. that are not too highly colored, using the usual colorimetric method with comparator. Plot the  $p_{\text{H}}$  values found against log to any base of the diln. The points lie on a straight line. Extrapolate to zero diln. The correctness of this method is demonstrated theoretically and by data obtained with dild. tan liquors, for which the  $p_{\text{H}}$  values obtained by extrapolation checked those obtained electrometrically within about 0.05  $p_{\text{H}}$  unit. H. B. MERRILL.

A sensitive reaction of cuprous ion. OTOZO FUNAKOSHI. *Mem. Coll. Sci. Kyoto Imp. Univ. A* 12, 155–7 (1929).—Feigl has shown that *p*-dimethylaminobenzylidene rhodanine is a sensitive precipitant for Ag, giving a reddish violet ppt. with 1 part Ag in 5 million of water. If, instead of the acetone soln. used by F., a 0.03% soln. in alc. is used as reagent, the rhodanine compd. will give a reddish violet ppt. with  $\text{Cu}^+$  at about the same diln. in neutral or slightly acid solns. Colors are obtained with concd. solns. of  $\text{Cu}^{++}$  but the products are much more sol. in water. W T H.

A rapid method of qualitative analysis. 1. Some specific and special tests for common cations and anions. GREGOIRE GUTZEIT. *Helv. Chim. Acta* 12, 713, 40 (1929).—Characteristic tests are given for: *Silver* with  $\text{K}_2\text{CrO}_4$ ,  $\text{Na}_2\text{HAsO}_4$ ,  $\text{NH}_4$  dithiocarbamate and dihydroxynaphthalene disulfonic acid (chromotropic acid). *Lead*— $\text{NH}_4\text{SAC}$ , tetramethyl-*p*-diamino-*p*-diphenylmethane, benzidine, diphenylthiocarbazon and  $\text{SnCl}_2$  with KI. *Mercury*—diphenylcarbazine, tincture of nutgalls,  $\text{SnCl}_2$  and aniline, Zn purpurate,  $\text{K}_2\text{Co}(\text{CNS})_4$  and Cu-Zn. *Bismuth*—cinchonine nitrate and KI, quinine sulfate, dil.  $\text{H}_2\text{SO}_4$  and KI, pyrogallol,  $\text{Na}_2\text{SnO}_2$ ,  $\text{NH}_4$  tetracetvl. *Copper*—Denigès' HBr reagent, formaldoxime, *n*-aminocaproic acid, benzidine-HCl, benzidine acetate, tincture of guaiac and KCN, 1,2-diaminoanthraquinone-3 sulfonic acid, xanthogen amide, NaOH, amyl alc. and  $\text{CS}_2$ , benzoine oxime in alc. soln. in the presence of tartaric acid, pyrimidine thiocyanate. *Cadmium*—thiosinamine and NaOH, bromobrucine reagent, pyridine iodide, diphenylcarbazidethiocyanate, diphenylthiocarbazon. *Arsenic*— $\text{AgNO}_3$ , 8-hydroxyquinoline,  $\text{NH}_4\text{VO}_3$  followed by strychnine sulfate, diazobenzene chloride in acid soln. *Antimony*— $\text{Na}_2\text{S}_2\text{O}_3$ , phosphomolybdic acid, pyrogallol, pyrocatechol, tetraethylrhodamine, indene and anthracene. *Tin*—cacotheline, sulfomolybdic acid,  $\text{AuCl}_3$ . *Iron*— $\text{K}_4\text{Fe}(\text{CN})_6$ , KCNS, tannin, tincture of nutgalls, pyrocatecholic acid, 2,4-dinitroresorcinol, alloxanic reagent, chromotropic acid, 1,2,5-thiosalicilic acid. *Chromium*—chromic salts are oxidized by  $\text{NaBrO}$ ,  $\text{KMnO}_4$  and  $\text{Na}_2\text{CO}_3$ ,  $\text{KClO}_3$ ,  $\text{H}_2\text{O}_2$  in alk. soln., perborates in alk. soln. Chromates give characteristic reactions with yellow alizarin acid G, diphenylcarbazine, orcein,  $\alpha$ -naphthylamine, dinitrate of 1,8-dihydroxynaphthalene-3,6-disulfonic acid, chrome-red-acidol, alizarine VI B. A. S. F. Bayer. *Manganese*— $\text{NaBrO}$ ,  $\text{KIO}_4$ , tetramethyldiaminodiphenylmethane, benzidine acetate, tetralline. *Nickel*—diacetyl-di-oxime, 1,2-diaminoanthraquinone-3-sulfonic acid, dicyandiamidine sulfate, ovalene, diuraminoxime, benzildioxime. *Cobalt*— $\alpha$ -nitroso- $\beta$ -naphthol,  $\beta$ -nitroso- $\alpha$ -naphthol, nitroso- $\beta$ -naphthol-3,6-disulfonate of Na, diaminoanthraquinonesulfonic acid, naphtheneic acid, resorcinol, KCNS,  $\text{Na}_2\text{S}_2\text{O}_4$ , phenylthiohydantoic acid, pyrimidone thio-cyanate in concd. HCl. *Zinc*—pyridine bisulfite, urobilin,  $\text{KHg}(\text{SCN})_3$ , K pyridine iodide, antipyrine thiocyanate, pyrimidone thiocyanate. *Aluminum*—alizarin, tinc-

ture of orcanette, aurine tricarboxylic acid. *Barium*—Na rhodizonate, triquinol, tetrahydroxyquinone, lokaonic acid. *Strontium*—Na rhodizonate, tetrahydroxyquinone. *Calcium*—aniline, phenol and  $\text{NH}_4\text{OH}$ , thiodiphenylcarbazide. *Magnesium*— $\text{NaIO}$ , 1,2,5,8-tetrahydroxyanthraquinone, dihydrothio-*p*-toluidinesulfonic acid, diphenyl carbazide. *Potassium*— $\text{K}_2\text{PtCl}_6$ , Na Bi thiosulfate, lokaonic acid. *Sodium*—dihydroxytartaric acid, K Bi Cs nitrite,  $\text{Mg UO}_2$  acetate. *Ammonium*— $\text{HCHO}$ , hematoxylin, *p*-nitrodiazobenzene, Nessler's reagent. Besides the foregoing tests for cations, the behavior of tincture of campeche, antipyrine thiocyanate, pyrimidone thiocyanate, thiodiphenylcarbazide, diphenylthiocarbazon, diphenylcarbazide,  $\text{NH}_4$  dithiocarbamate, quinalizarin in alk. soln. are described with the various cations. The following tests for the following anions are described. *Fluorine*—pernambuco paper, methemoglobin. *Chlorine*—phenolaniline, aniline, toluidine and  $\text{AcOH}$ , urotropine acetate, diphenylamine sulfate, tetramethyl-*p*-diaminodiphenylamine,  $\text{Cu}(\text{NO}_3)_2$  paper,  $\text{CuSO}_4$ . *Bromine*—acetate of fluorescein, reduced fuchsin,  $\text{CuSO}_4$ . *Iodine*—starch paste,  $\text{PdCl}_2$ ,  $\text{TiNO}_3$ . *Hydrogen sulfide*—tartar emetic paper,  $\text{Na}_2\text{NOFe}(\text{CN})_5$ , dimethyl-*p*-phenylenediamine sulfate, nitrobenzene. *Thiosulfate*— $\text{SbCl}_5$ ,  $\text{FeCl}_3$  paper.  $\text{H}_2\text{SO}_4$ —aniline- $\text{Cd}(\text{NO}_3)_2$  reagent,  $\text{ZnNOFe}(\text{CN})_5$ , oxazine dyes.  $\text{H}_2\text{SO}_4$ —Ba rhodizonate,  $\text{Hg}(\text{NO}_3)_2$  in 1%  $\text{HNO}_3$ .  $\text{HNO}_2$ —metaphenylene diamine, antipyrine,  $\text{ZnCl}_2$  starch and  $\text{ZnI}_2$  sulfanilic-naphthylamine, diamino-2,4-hydroxy-6-pyrimidine hydrochloride, benzidine- $\beta$ -naphthol, safranin T.  $\text{HNO}_3$ —salts of cinchonamine, quinetol, acetate of diphenylendanioldihydrotriazole, nitron and  $\text{HCH}_2\text{O}$ , dimonohydroxyphenanthrylamine, brucine, 1,5-dihydroxyanthraquinone,  $\alpha$ -dinaphthodimethylamine.  $\text{H}_3\text{PO}_4$ —stannous thiomolybdate,  $\text{UO}_2(\text{OAc})_2$ , benzidine molybdate.  $\text{H}_3\text{BO}_3$ —turmeric paper, turmeric-oxalic acid paper.  $\text{H}_2\text{SiO}_4$ —stannous molybdate, alanine tincture,  $\text{NH}_4$  salt of aurintricarboxylic acid,  $\text{NH}_4$  molybdate- $\text{KNO}_3$ . *HCN*—Na pierate paper, guaiacol- $\text{CuSO}_4$ , hydroceruligone. *Complex cyanides*— $\text{FeCl}_3$ ,  $\text{MoO}_3$ ,  $\text{FeSO}_4$ . *Oxalic and tartaric acids*—resorcinol,  $\text{NH}_4\text{VO}_3$ . W. T. H.

**Simple methods of potentiometric titration of acids and bases.** LOUIS KAHLLENBERG AND ALBERT C. KRUEGER. *Trans. Am. Electrochem. Soc.* 56 (preprint) 10 pp. (1929).—Expts. in potentiometric titrations are recorded, demonstrating that the calomel electrode may be dispensed with. The potential between 2 suitable electrodes, dipped into a dil. acid soln., was measured by means of a potentiometer as the titration proceeded. By simple trial a pair of electrodes, which was most suitable for the purpose in hand, was selected. When tungsten was used as one of the electrodes a large no. of other metals served very well as the other electrode. Equil. is reached most rapidly with the couples W-Cu; W-Ni; W-Si; and W-Co. With these, and a no. of other couples, an actual change in polarity was observed at the neutral point. C. G. F.

**New test for boric acid and borates.** A. SCOTT DODD. *Analyst* 54, 282-5 (1929).—The test with methyl red or Sofnol Indicator No. 1 and mannitol is very satisfactory.  $\text{NaOH}$  is added until the soln. is barely alk. to the above indicator and 0.5 g. of mannitol is added. On shaking a reddish pink coloration is obtained. W. T. H.

**Quantitative analysis of phosphoric acid. IV. Gravimetric and volumetric determination as ammonium phosphomolybdate.** MASAYOSHI ISHIBASHI. *Mem. Coll. Sci. Kyoto Imp. Univ.* A 12, 135-53 (1929).—The conclusions drawn are based on some 150 expts. of which the results are given. The solns. used in these expts. were: 0.1% soln. of pure  $(\text{NH}_4)_2\text{HPO}_4$ , 3.5% soln. of pure  $(\text{NH}_4)_6\text{Mo}_7\text{O}_{21}\cdot 4\text{H}_2\text{O}$ , 5 *N*  $\text{NH}_4\text{NO}_3$ , 5 *N*  $\text{HNO}_3$  and 0.4 *N*  $\text{HNO}_3$ . The best gravimetric results were obtained as follows: To a neutral soln. of 6-70 mg.  $\text{P}_2\text{O}_5$  add about twice the theoretical requirement of  $(\text{NH}_4)_6\text{Mo}_7\text{O}_{21}$  soln., making the total vol. about 60 cc. Add 20 cc. of 5 *N*  $\text{NH}_4\text{NO}_3$  and 20 cc. of 5 *N*  $\text{HNO}_3$ . Heat for 5 min. at 50-60° in a water bath with occasional stirring. Filter through a quartz filtering crucible and wash promptly with 0.4 *N*  $\text{HNO}_3$  until the washings give no test for Mo. Place the filtering crucible on glass wool in a larger porcelain crucible, heat gradually for 10 min. and then at 250-300° to const. wt. Cool in a desiccator over  $\text{P}_2\text{O}_5$  or  $\text{CaCl}_2$ . 0.5  $\text{H}_2\text{O}$  and weigh quickly. The ppt. contains 3.78%  $\text{P}_2\text{O}_5$  and corresponds to the formula  $(\text{NH}_4)_3\text{Mo}_{12}\text{PO}_4$ . In this form it is very hygroscopic. If the ppt. is washed with  $\text{HNO}_3$  as above and dried over  $\text{CaCl}_2$  2 $\text{H}_2\text{O}$  it contains 3.60% of  $\text{P}_2\text{O}_5$  and has the compn.  $(\text{NH}_4)_3\text{Mo}_{12}\text{PO}_4\cdot\text{HNO}_3\cdot 2\text{H}_2\text{O}$ . The alkalimetric titration method, after washing with 1%  $\text{KNO}_3$  instead of 0.4 *N*  $\text{HNO}_3$ , gave results which agreed with those obtained gravimetrically. W. T. H.

**The determination of sulfate in chromic acid and in chromium plating baths.** H. H. WILLARD AND RICHARD SCHNEIDEWIND. *Trans. Am. Electrochem. Soc.* 56 (preprint) 13 pp. (1929).—To make an accurate sulfate detn in chromic acid, the latter must be reduced to a chromic salt. In this soln. the Cr is present as a complex ion,

contg. some sulfate which is not pptd. by Ba except on standing for a long time, and sometimes not at all. By heating with AcOH a more stable complex is formed, contg. acetate, and the sulfate being now in the ionic form is rapidly pptd. As a rapid control method for plating baths, a measurement of the turbidity produced by the  $\text{BaSO}_4$  is satisfactory. Instead of measuring the depth of liquid required to extinguish the light, as in the Parr Sulfur Photometer, it has been found more accurate to maintain a fixed depth of liquid and vary the strength of the light, measuring the voltage across its terminals or the resistance in series with it. C. G. F.

A turbidimetric method for the determination of the sulfate content of chromium plating baths. LAWRENCE E. STOUT AND A. W. PETCHAFT. *Trans. Am. Electrochem. Soc.* 56 (preprint) 10 pp.(1929).—A new and rapid method for the detn. of sulfates in Cr plating baths is presented. The Parr Sulfur Photometer can be used if  $\text{SrCl}_2$  be substituted for  $\text{BaCl}_2$ , and if the funnel of the instrument be made of glass throughout, so that no rubber comes in contact with the solns. of  $\text{CrO}_3$ . The accuracy of the method described is at least comparable to any heretofore used, and is much more rapid and convenient, requiring neither chem. balance nor complicated gravimetric procedure. C. G. F.

The analysis of organic mixtures. ERWIN BENESCH. *Chem.-Ztg.* 53, 566 7 (1929).—If the nature of the substances present is known and it is only necessary to det. the quantities present, all that is necessary is to make as many analyses as there are substances present, or one less analysis if the weight of the original material is known. Thus with a mixt. of 2 org. substances, the amt. of each can be calcd. from the wts of  $\text{H}_2\text{O}$  and of  $\text{CO}_2$  obtained by combustion and if 3 substances are present in the mixt. the original wt., the  $\text{CO}_2$  and  $\text{H}_2\text{O}$  values are sufficient. The simple algebraic computation is outlined. W. T. H.

Note on the destruction of organic matter for the analysis of the constituents of the ash. EMILE CHERBULIEZ. *Helv. Chim. Acta* 12, 818-9(1929).—It is recommended to heat with  $\text{H}_2\text{SO}_4$ ,  $\text{HClO}_4$  and finally some fuming  $\text{HNO}_3$ . W. T. H.

Iodine determination in organic compounds which readily split off iodine. E. I. VAN ITALLIE. *Pharm. Weekblad* 66, 629-32(1929).—Antiseptics and pharmaceuticals which contain I, like  $\text{CHI}_3$ , iodoic, yatren, euphoren, aristol, etc., are readily decomposed by mineral acids with liberation of  $\text{I}_2$ . The  $\text{I}_2$  may be distd. from the sample (10-200 mg.) with 8-10 cc.  $\text{H}_2\text{SO}_4$  in a retort, the neck of which dips into a soln. of NaOH. The NaOH is then dild. to 100 cc., a 25-cc. aliquot acidified with dil.  $\text{H}_2\text{SO}_4$ , boiled with NaOCl, cooled, treated with KI and the liberated  $\text{I}_2$  titrated with 0.1 N  $\text{Na}_2\text{S}_2\text{O}_3$ . Or, the  $\text{I}_2$  in the distillate may be detd. gravimetrically as AgI. The method gave satisfactory values with a no. of I-contg. compds. A. W. DOX.

A specific color test for isobutyl alcohol. ARTUR KUTZLNIGG. *Z. anal. Chem.* 77, 349-52(1929).—To a 1% soln. of  $\text{Na}_3\text{Fe}(\text{CN})_6$  add the liquid to be tested and heat to boiling. If isobutyl alc. is present the aq. layer will be light brown to orange in color. The test is given also, and somewhat more conveniently, with  $\text{Na}_3\text{Fe}(\text{CN})_6 \cdot \text{H}_2\text{O}$  or  $\text{Na}_3\text{Fe}(\text{CN})_6 \cdot 2\text{NH}_3$ ; the latter is easily prepd. from  $\text{Na}_2\text{NOFe}(\text{CN})_6$  by treating with twice its wt. of  $\text{NH}_3$  and allowing to stand 48 hrs. W. T. H.

Determination of glycerol and ethylene glycol in radiator compounds. ALFRED KUNDERT. *Chemist Analyst* 18, 5(1929).—A mixt. of water, glycerol and ethylene glycol can be sepd. by a single distn., as there are nearly  $100^\circ$  difference between the b. ps. W. T. H.

Determination and separation of formaldehyde and acetaldehyde by means of methone. D. VORLÄNDER WITH CURT IHLE AND HANS VOLKHOIZ. *Z. anal. Chem.* 77, 321-7(1929).—The behavior of these aldehydes toward methone,  $\text{C}_5\text{H}_{12}\text{O}_2$ , can be utilized for their detection and detn. Each gives cryst. compds. which can be dried in a vacuum and weighed; the methylene compd. can be dried at  $90-95^\circ$  to const. wt. The  $\text{HCHO}$  compd. is monobasic toward NaOH but the ethylidene compd. is dibasic. Several analytical methods have been devised and tested. (I) Heat the aldehydes and an excess of methone for 12 hrs. at  $50^\circ$  and allow to stand 12-16 hrs. at room temp. Filter, wash with cold water and weigh or dissolve the unweighed, washed ppt. in EtOH and titrate at  $65-70^\circ$  with NaOH using phenolphthalein as indicator. (II) Use a carefully measured quantity of methone, ppt. as in (I) and titrate the excess methone in the filtrate. (III) With  $\text{HCHO}$  alone, the analysis can be effected without filtering off the ppt., by dissolving it in warm EtOH and titrating with NaOH at room temp. By combining with  $\text{HCHO}$ , methone loses  $1/2$  of its acid property so that the  $\text{HCHO}$  is known from the loss in acidity. A titrated methone soln. or weighed, powd. methone can be used. Four methods are given for the sepn. of the 2 aldehydes. (1) Treat the vacuum-dried methone compds. with 4-5 times as much glacial AcOH and heat

6-7 hrs. in boiling water. Filter after standing 12 hrs. in the cold. Rinse the ppt. into a small flask and treat with cold, dil.  $\text{Na}_2\text{CO}_3$  soln., d. 1.095. The  $\text{HCHO}$  compd. dissolves in the soda soln. and can be reprecipitated by adding  $\text{AcOH}$  or  $\text{HCl}$  till acid to methyl orange; the  $\text{AcH}$  compd., on the other hand, is changed to its anhydride by treatment with  $\text{AcOH}$  and is then insol. in  $\text{Na}_2\text{CO}_3$  soln. (2) Treat the mixt. of aldehydes in aq. soln. with a weighed or titrated amt. of methone; after 15 hrs. dissolve the ppt. with  $\text{EtOH}$  and titrate at  $65-70^\circ$  with  $\text{NaOH}$ . This method gives the  $\text{HCHO}$  alone. (3) Weigh the mixt. of the 2 condensation products and titrate the excess of methone. (4) Ppt. both aldehydes with methone as in (1) and shake the soln. and ppt. in a machine after adding  $1/15$  of the solns. vol. of 50%  $\text{H}_2\text{SO}_4$ . Filter, wash with cold water and treat with cold soda soln. This dissolves the  $\text{HCHO}$  compd. alone and the  $\text{AcH}$ -methone compd. remains as undissolved anhydride. From the soda soln., ppt. the  $\text{HCHO}$ -methone compd. by careful neutralization, and weigh both of the insol. products. This procedure gives excellent results if allowance is made for a loss of 1 mg. of the  $\text{HCHO}$  compd. and of 8 mg. of the  $\text{AcH}$  compd. for each 100 cc. of soln. or wash water.

W. T. H.

The preparation of alcoholic caustic potash solution and the reaction with caustic potash for aldehydes present in chloroform. N. VALYASHKO. *Farm. Zhur.* 1928, 34 5; *Chem. Zentr.* 1929, I, 457.—Malfatti's method is recommended (*C. A.* 6, 200) for making the alc.  $\text{KOH}$  soln. used for the detn. of the acid no. and of the sapon. no., because with this method the soln. does not become yellow or brown. The required amt. of  $\text{KOH}$  is ground with an equal or slightly larger amt. of  $\text{CaO}$ , with addn. of a little  $\text{EtOH}$ . With the aid of  $\text{EtOH}$  the paste obtained is transferred into a flask and the rest of the  $\text{EtOH}$  required is added. The mixt. is shaken until all the  $\text{KOH}$  is dissolved. The soln. is carefully decanted or filtered. The soln. thus obtained remains perfectly colorless for 1 year even in presence of air and does not change its titer. According to Malfatti the oxidation and the turning brown of the alc.  $\text{KOH}$  soln. is caused by colloidal or finely suspended particles of metals, especially of  $\text{Fe}$  or  $\text{Cu}$ , originating from containers used in the manuf. On account of Malfatti's expts. V. and other Russian authors doubt the value of the  $\text{KOH}$  test for aldehydes in  $\text{CHCl}_3$ . V. believes that the turning yellow of the  $\text{KOH}$  pieces in  $\text{CHCl}_3$  is caused by the oxidation of the  $\text{EtOH}$  absorbed by  $\text{KOH}$ , with min. traces of metals as catalysts. Thus the reaction is not specific for aldehydes but is also given by alcs. According to Rosenfeld and other Russian authors samples of  $\text{CHCl}_3$  contg.  $\text{EtOH}$  gave a yellow color with the purest  $\text{KOH}$  even in cases where no aldehyde could be detected with Nessler's reagent.

G. SCHWOCH

Refractometric determination of formic acid in the presence of acetic acid. J. BULIR. *Chem. Listy* 23, 25-6(1929); cf. *C. A.* 15, 353.—Objections raised against this method by Štiastny are shown to be unfounded, fairly accurate results (0.2 g. of formic acid per 100 cc.) being attained provided that no substances other than the above acids and water are present in the soln.

B. C. A.

The titration end point in the determination of tartaric acid by the Goldenberg method. D. ALFRED UHL. *Z. anal. Chem.* 77, 328-34(1929).—In the Goldenberg method, the end point is usually a spot test on litmus paper. Better results will be obtained if an electrometric end point is obtained with quinhydrone or if the litmus paper is standardized so that the end point will be obtained at  $p_{\text{H}}$  7-8.

W. T. H.

The titration of acetic anhydride in mixtures of ethyl alcohol or methanol and water. J. F. M. CAUDRI. *Rec. trav. chim.* 48, 778-92(1929).—Lumière and Barbier (*Bull. soc. chim.* 35, 625(1906)) found that  $\text{Ac}_2\text{O}$  cannot be titrated with alkali in aq. alc., the exptl. figures being always too low and approaching the theoretical value more and more, the more  $\text{EtOH}$  is added before the titration. It is now found that in this titration  $\text{AcOEt}$  is formed which may be distd. off after the titration; the amt. of alkali used up for the titration and the amt. necessary for the sapon. of the  $\text{AcOEt}$  together correspond to the quantity of  $\text{Ac}_2\text{O}$ . Thus the reaction between  $\text{Ac}_2\text{O}$  and dil. aq. alc. alkali is most simply represented as 2 simultaneous reactions, viz., the action of  $\text{Ac}_2\text{O}$  with  $\text{NaOH}$  and with  $\text{NaOEt}$ . In analogy with the theory of Wegscheider (*C. A.* 13, 2474) on aq. alc.  $\text{Na}$  alkylate solns., developed by C. previously (*C. A.* 23, 3393), it follows that  $x/y = k_{\text{H}}(1-\beta)/k_{\text{A}}\beta$ , when  $x$  and  $y$  are the quantity of  $\text{Ac}_2\text{O}$  reacting with  $\text{NaOH}$  and  $\text{NaOEt}$ ,  $\beta$  is the proportion of the total quantity of  $\text{Na}$  present as alcoholate, and  $k_{\text{H}}$  and  $k_{\text{A}}$  are the consts. for alk. hydrolysis and alcoholysis. The ratio  $x/y$  is dependent on the initial concn. of the base but independent on the concn. of the  $\text{Ac}_2\text{O}$ , given a definite temp. and a given concn. of the  $\text{EtOH}$  and this was confirmed experimentally. The lower the temp., the greater the amt. of  $\text{Ac}_2\text{O}$  that had reacted with the formation of  $\text{AcOEt}$ ; e. g., under comparable conditions at  $0^\circ$ , 57%;

at 7°, 53%; and at 25°, 41.8%. With increasing concn. of the EtOH in the EtOH-water mixt. the % of  $\text{Ac}_2\text{O}$  that reacts with the ethylate increases: in 10% EtOH, 26%; in 20% EtOH, 41.8%; in 30% EtOH, 54%; in 50% EtOH, 68%; and in 75% EtOH, 81%; whereas the theoretical value was obtained when an abs. alc. soln. of  $\text{Ac}_2\text{O}$  reacts with an abs. alc. soln. of  $\text{NaOEt}$ . In mixts. of MeOH and water the following % of the  $\text{Ac}_2\text{O}$  had been converted into  $\text{AcOMe}$  at 25°: in 2 1/2% MeOH, 44%; in 5% MeOH, 60%; in 10% MeOH, 76%; in 15% MeOH, 82%; in 20% MeOH, 85%; in 50% MeOH, 92%; and in 75% MeOH, 97%. From these figures it follows that  $\text{NaOMe}$  and  $\text{NaOEt}$  are much more reactive toward  $\text{Ac}_2\text{O}$  than  $\text{NaOH}$ . It was to be expected now that acid chlorides would behave like acid anhydrides on neutralization with alkali in mixts. of alcohols and water. This was confirmed experimentally for  $\text{BzCl}$ , and the same holds for the neutralization in acetone where an ester-like compd. is formed by means of the enolic form of the acetone. On treating  $\text{BzCl}$  in acetone with half the theoretical amt. of  $\text{NaOH}$ ,  $\text{Bz}_2\text{O}$  was obtained by the von Pechmann reaction in homogeneous soln. (cf. Wedekind, *Ber.* 34, 2070(1901)). Finally it was shown that  $\text{Ac}_2\text{O}$  may be titrated potentiometrically with standardized  $\text{NH}_3$ , in water-EtOH mixts.

Colorimetric method for determining small quantities of aniline. V. I. MINAEV, K. O. SVETLYAKOV AND S. S. FROLOV. *Kunstseide* 11, 241-3(1929).—See C 4 22, 3602.

The alkaloid test for tannins. CHRISTINA MARY FEAR. *Analyst* 54, 316-20 (1929).—Expts. described indicate that the only alkaloids giving appreciable ppts. with tannin solns. are brucine, caffeine, cinchonine, cinchonides, quinine and strychnine. It, moreover, seems probable that the phenomenon described as pptn. is one of interaction, either phys. or chem., of alkaloid and tannin and is not caused by pptn. of unchanged alkaloid hydrochlorides through supersatn. The assumption, so frequently made, that alkaloids are general reagents for the tannins is evidently not entirely true.

Microchemical method for determining semicarbazones and its application to the analysis of ketones. RALPH P. HOBSON. *J. Chem. Soc.* 1929, 1384-5.—The semicarbazone was hydrolyzed with a soln. contg. 15%  $\text{HCl}$  and 5%  $\text{HgCl}_2$  by boiling under reflux for 7-8 hrs., and the  $\text{NH}_3$  detd. by Pregl's modified micro-Kjeldahl method:  $\text{H}_2\text{NCONHNH}_2 + \text{H}_2\text{O} = \text{NH}_3 + \text{CO}_2 + \text{N}_2\text{H}_4$ ;  $\text{N}_2\text{H}_4 + 2\text{HgCl}_2 = \text{N}_2 + 2\text{H}_2 + 4\text{HCl}$ ; the  $\text{N}_2\text{H}_4$  must be destroyed, as the ketone released or org. impurities, if present, may cause a partial reduction to  $\text{NH}_3$ . One of the 3 N atoms appears as  $\text{NH}_3$ . This method affords a means for the detn. of ketones, provided they can be converted quantitatively into their semicarbazones when present only in small amts.; the semicarbazones do not need to be purified but the excess  $\text{H}_2\text{NCONHNH}_2$  must be removed by pptn. of the semicarbazone with  $\text{H}_2\text{O}$  or by evapn. to dryness and extg. the  $\text{H}_2\text{NCONHNH}_2$  with  $\text{H}_2\text{O}$  or by extg. with  $\text{Et}_2\text{O}$  and then shaking out the  $\text{H}_2\text{NCONHNH}_2$  with  $\text{H}_2\text{O}$ .

Determination of indices of refraction of becquerelite, curite, kasolite, fourmarierite, parsonsite, dumontite and ianthinite. VALÉRIE BILLIET. *Bull. soc. franç. minéral.* 49, 136-40(1926).—Eleven new U minerals have been discovered in the Kasolo, (Ka-

tanga) mine. These have high  $n_s$  so that a series of mixts. of piperine-iodides and of S-Se was used, at 100°. Tables of the  $n_s$  of these mixts. are given. B. E. TIFFANY

Some covellite-chalcocite relationships. ALAN M. BATEMAN. *Econ. Geol.* 24, 424-39(1929); cf. C. A. 11, 3202.—From a study of the behavior of intergrowths of covellite and chalcocite on heating, B. concludes that covellite enters into solid soln. in chalcocite to the extent of 30-40% at 75-150°, but that chalcocite does not dissolve in covellite to any appreciable extent. ELLIOTT J. ROBERTS

Marcasite in the contact metamorphic ore deposits of the Twin Buttes district, Pima County, Ariz. BENJ. N. WEBBER. *Econ. Geol.* 24, 301-10(1929).—Marcasite occurs as a concentric structure around pyrite in a deposit of intensely metamorphic character. The deposit shows no action of supergene solns. ELLIOTT J. ROBERTS

Blue rock-salt. CORNELIO DOELTER. *Monatsh.* 52, 241-52(1929).—A review of the occurrence of blue rock-salt in minerals and a discussion of the possible causes of the color, e. g., mineral pigments, radiations and org. matter. G. B. TAYLOR

The existence of agate and of Iceland spar in the archipelago of Kerguelen. EDGAR AUBERT DE LA RÜE. *Compt. rend.* 188, 1421-2(1929).—A great part of the archipelago consists of basaltic coulées. All of the agates are found with the basalts. The interiors of some are occupied by geodes of quartz, or rarely of amethyst. Large deposits of Iceland spar of perfect clearness occur on the Kerguelen islands, in veins in the decomposed basalt. While other eruptive rocks are represented, only the basalts enclose mineral deposits of practical interest. The numerous beds of lignite in the north of the islands are also found among the basalt coulées. A. J. MONACK

The identity and genesis of lodestone magnetite. W. H. NEWHOUSE. *Econ. Geol.* 24, 62-7(1929).—From the study of a large no. of specimens of lodestone, N. concludes that lodestone is generally formed from oxidized magnetite (ferromagnetic ferric oxide). ELLIOTT J. ROBERTS

Spinel of the type  $M_2^{++} M_2^{+++}O_4$ . G. NATTA AND L. PASSERINI. *Atti accad. Lincei* 9, 557-63(1929).— $Mg_2SnO_4$  and  $Co_2SnO_4$ , prepd. by pptg. with alkali from a soln. contg. 1 mol.  $SnCl_4$  to 2  $MgCl_2$  and  $CoCl_2$ , resp., and calcining the dried ppt at 900°, were studied with the aid of x-rays.  $Co_2SnO_4$  crystallizes in the cubic system, the unit contg. 8 mols. with  $a = 8.605 \pm 0.005$  A. U. The  $d_{calc.} = 6.307$ ,  $d_{obs.} = 6.108$ .  $Mg_2SnO_4$  is isomorphous with the above;  $a = 8.580 \pm 0.007$  A. U.,  $d_{calc.} = 4.864$ ,  $d_{obs.} = 4.738$ . Both are, therefore, true spinels. A. W. CONTIERI

The isomorphous mixtures in the calcite group. G. BILBIN. *Mem. soc. Russe Mineralogie* [2], 56, 3-36; *Chem. Zentr.* 1928, II, 975.—With their content of  $CaCO_3$ ,  $MgCO_3$ ,  $FeCO_3$  and  $MnCO_3$ , as the basis, 397 analyses of minerals of the calcite group are arranged into a tetrahedron. G. SCHWOCH

X-ray study of symmetry and twins of dolomite. L. GARRABOS. *Bull. soc. franç. minéral.* 49, 110-27(1926).—A study of dolomite twins by etching in dil. HCl and by x-rays. Diagrams are given of probable arrangement of the atoms in the space lattice. B. E. TIFFANY

Phosgenite of Monteponi. F. RODOLICO. *Atti accad. Lincei* [5], 8, 171-4(1928).—Twinned crystals of phosgenite,  $d = 6.05$ , are described, in one of which numerous regular pits occurred. These pits were square in shape with edges parallel to the angles between the planes (001) and (111), and were formed by the facets of a very obtuse bipyramid sometimes truncated and terminating in a square. Analysis gave: PbO 81.73, Cl 13.06,  $CO_2$  7.91, Ag 0.01, less O for Cl 2.99%. B. C. A.

The optical properties of synthetic anorthite and the results compared with those given by different methods of determining the plagioclases. L. DUPARC AND M. GYSIN. *Bull. soc. franç. minéral.* 49, 63-76(1926).—A petrographic study of sections of 2 melts of the theoretical compn. of anorthite. B. E. TIFFANY

Mangan-titan-pyroxene from Shisaka-jima. HOKOTO SATO. *Proc. 3rd Pan-Pacific Sci. Congr.* 1926, I, 803-4(1928).—This mineral is probably a product of contact action of schistose granite. It is brownish black, fine-granular, with sp. gr. = 3.495, closely assoc. with hercynite and apatite. The pure compd. is pink, with cleavage prismatic, also slight on (010) and (100); optical plane (010), biaxial,  $+2E = 29^\circ$ . The variable extinction suggests the monoclinic system; max. extinction angle is  $43^\circ$ . Pleochroism is distinct,  $a$  pink,  $b$  colorless,  $c$  pink.  $\alpha_D = 1.694$ ,  $\gamma_D = 1.710$ . Analyses were doubtful because of hercynite contamination. E. M. SYMMES

Gen vite, a new mineral. L. DUPARC AND M. GYSIN. *Bull. soc. franç. minéral.* 50, 41-6(1927).—A mineral from Morocco is described and the name genevite is proposed. It is tetragonal, with  $a$  = 10.0,  $c$  = 10.0,  $d = 3.16$ ,  $\rho = 4.0$ . Analysis gave:  $SiO_2$  37.11,  $Al_2O_3$  16.19,  $Fe_2O_3$  3.05,  $FeO$

2.53, MnO tr., CaO 33.67, MgO 2.17, K<sub>2</sub>O 0.66, Na<sub>2</sub>O 0.46, H<sub>2</sub>O 2.70, loss on ignition 1.01%. The mineral is optically —,  $n_g = 1.707$ ,  $n_p = 1.698$ . B. E. TIFFANY

Phenacite from San Miguel di Piracicaba, Minas Geraes, Brazil. V. ROSICKY. *Bull. soc. franç. minéral.* 50, 47-55(1927).—A crystallographic study. B. E. T.

The datolite of Toggiano. EMANUELE GRILL. *Mem. accad. Lincei* [6], 3, 84-105 (1928); *Chem. Zentr.* 1929, I, 373.—The forms of the datolite of Toggiano are described in detail. It has the compn.: SiO<sub>2</sub> 37.48, CaO 34.40, MgO 0.38, Fe<sub>2</sub>O<sub>3</sub> + Al<sub>2</sub>O<sub>3</sub> 0.68, B<sub>2</sub>O<sub>3</sub> 21.81, H<sub>2</sub>O 5.25%; d. = 2.994; F was not found. A large part of the B<sub>2</sub>O<sub>3</sub> is lost with the ordinary method of detg. the H<sub>2</sub>O by drying, the loss being 7.6% in 32.5 hrs. at 700° and 7.56 in 40 hrs. at 900°. With the temp. sufficiently high (in the muffle furnace) all B<sub>2</sub>O<sub>3</sub> volatilizes in 132 hrs. G. SCHWACH

Sorption of gas by minerals. I. Heulandite and chabazite. JITSUSABURO SAMESHIMA. *Bull. Chem. Soc. Japan* 4, No. 4, 96-103(1929).—The sorptive capacities of the minerals, dehydrated at 350° for CO<sub>2</sub>, C<sub>2</sub>H<sub>4</sub> and NH<sub>3</sub> were detd. at 25° and approx. one atm. Heulandite sorbed only NH<sub>3</sub> appreciably, 137.6 cc. (N. T. P.) in 1340 min., and after expulsion of the NH<sub>3</sub> at 300°, 138.3 cc. in 60 min. On exposure to NH<sub>3</sub>, the dehydrated crystals expanded, became chalky and, when heated, were reduced to a powder. The mol. ratio of NH<sub>3</sub> taken up to H<sub>2</sub>O lost was nearly unity. In 30 min. chabazite sorbed 117.4 and 209.3 cc. of CO<sub>2</sub> and NH<sub>3</sub>, resp., and in 90 min. 50.3 cc. of C<sub>2</sub>H<sub>4</sub>. These values increased slowly with time. W. L. HILL

Heulandite from Monastir. GIULIA MARTINEZ. *Atti accad. Lincei* 9, 128-33 (1929).—Both the natural heulandite as well as a recrystd. product have been exam'd, the compns. being: natural, SiO<sub>2</sub> 47.77, TiO<sub>2</sub> 0.57, Al<sub>2</sub>O<sub>3</sub> 19.01, Fe<sub>2</sub>O<sub>3</sub> 8.88, FeO 2.00, MnO 0.01, MgO 4.23, CaO 8.70, Na<sub>2</sub>O 3.00, K<sub>2</sub>O 1.59, H<sub>2</sub>O 3.97, sum 99.72%; recrystd., SiO<sub>2</sub> 57.40, Al<sub>2</sub>O<sub>3</sub> 17.10, CaO 7.80, H<sub>2</sub>O 17.67, sum 99.77%. Crystallographic measurements are also given. A. W. CONTIERI

Laumontite of Toggiano. P. GALLITELLI. *Atti accad. Lincei* [6], 8, 82-7(1928).—Two types of laumontite occur assocd. with the datolite of Toggiano, the one of a rather fibrous structure, with a pearly luster, the other granular and whitish. Goniometric analyses have been made of these 2 varieties, which contain, resp.: SiO<sub>2</sub> 50.78, 51.43, Al<sub>2</sub>O<sub>3</sub> 21.09, 22.30; BeO 0.47, 0.40; CaO 12.13, 12.47; H<sub>2</sub>O 15.34, 13.74%. When heated, laumontite loses water continuously, but there is some evidence of an arrest point between 250° and 300°, leading to the conclusion that there is probably some difference in the nature of the water lost below 300° and that given up at higher temps. B. C. A.

Investigations on the chemical composition of chlorites. J. ORCEL. *Bull. soc. franç. minéral.* 50, 75-456(1927).—A comprehensive treatise including a review of previous work, methods of analysis, analyses of sheridanite, leuchtenbergite, ripidolite, aphrosiderite, bavalite, thuringite, clinocllore, kotschubeite, etc. The chlorites are classified into 9 groups on the basis of these analyses. A bibliography is given. B. E. TIFFANY

Sepiolite deposit in Salinelles, Gard. H. LONGCHAMON AND F. MOURGUES. *Bull. soc. franç. minéral.* 50, 66-74(1927).—L. and M. describe the deposit and suggest that it may have been formed by pptn. from a colloidal suspension of the mineral in fresh water, upon the entrance of salt water. The present contamination by lime and silica is due to water circulating in from the limestone above. The excess silica found now may be due to CO<sub>2</sub> in the water attacking the mineral. B. E. TIFFANY

Some minerals containing the rarer elements. D. SATO. *Proc. 3rd Pan Pacific Sci. Congr.* 1926, I, 865-6(1928); cf. C. A. 20, 3409.—The occurrence of allanite, monazite, xenotime, fergusonite, samarskite, columbite, hagatalite, naegite and oymalite is shown. E. M. SYMMES

Japanese minerals containing the rarer elements. MASAOKI HOSHINA. *Proc. 3rd Pan-Pacific Sci. Congr.* 1926, I, 867-8(1928). E. M. SYMMES

Chemical investigation of Japanese minerals containing the rare elements. Y. SHIBATA. *Proc. 3rd Pan-Pacific Sci. Congr.* 1926, I, 852-65(1928). E. M. SYMMES

Anglesite from Tsumeb, Otavi (S. W. Africa). V. ROSICKY. *Bull. soc. franç. minéral.* 49, 160-3(1926).—Measurements of the angles of a series of crystals are given. B. E. TIFFANY

Notes on the meteorite from the Pampa del Infierno. ENRIQUE HERRERO DUCLOUX. *Anales soc. cient. Argentina* 107, 491-7(1929).—The specimen weighed 896 g.; sp. gr. = 3.407. The stone belongs to the type *franchfortosa*, not heretofore found in Argentina. Analysis gave: SiO<sub>2</sub> 38.860, P<sub>2</sub>O<sub>5</sub> 0.327, Fe<sub>2</sub>O<sub>3</sub> 0.102, FeO 19.765, MnO 0.620, SnO<sub>2</sub> 0.031, Al<sub>2</sub>O<sub>3</sub> 11.947, CaO 2.700, MgO 20.051, K<sub>2</sub>O 0.071, Na<sub>2</sub>O 0.572,

S 3.034,  $\text{Cr}_2\text{O}_3$  0.601, Fe 2.916, Ni 0.387, Co 0.085,  $\text{Cr}_2\text{O}_3\cdot\text{FeO}$  0.045; P 0.015%;  $\text{TiO}_2$ , NiO, CoO traces.

**Notes on the mineralogy of Brazil.** JORGE PALMIRO DE ARAUJO FERRAZ. *Bull. soc. franç. minéral.* 50, 6-41 (1927).—An annotated list of minerals of Brazil, edited by A. ROCCATI from papers left by Ferraz. Analyses are included of: acgirite, albertite, albite, andalusite, anthosiderite, apatite, asbestos, atopite, azurite, baddeleyite, barite, bauxite, Bi, chalcopyrite, chalmersite, chromite, columbite, derbylite, euxenite, ferrazite, garnets, comprising almandite, andradite, grossularite and pyrope, gorceixite, goyazite, graphite and gypsum.

**Solvent effects of certain organic acids upon oxides of iron.** NORMAN J. HARRAR. *Econ. Geol.* 24, 50-61 (1929).—Samples of  $\text{FeO}$ ,  $\text{Fe}_2\text{O}_3$  and limonite were shaken with 500 cc. portions of 0.1 N solns. of formic, acetic, propionic, oxalic, malonic, succinic, lactic, tartaric, citric, benzoic, salicylic and sulfuric acids and portions of the solns. analyzed after 40 and 60 day periods.  $\text{FeO}$  dissolved most readily, limonite a little less so, and the  $\text{Fe}_2\text{O}_3$  much more difficultly. A definite relation existed between the ionization constants of the acids and the amts. of Fe dissolved. The hydroxy acids dissolved abnormal quantities of Fe and underwent striking color changes.

**Solution, transportation and precipitation of iron and silica.** E. S. MOORE AND J. E. MAYNARD. *Econ. Geol.* 24, 272-303, 365-402, 506-27 (1929).—M. and M. made a very detailed lab. study of the following points: the amt. of  $\text{Fe}_2\text{O}_3$  and  $\text{SiO}_2$  in natural waters; the agents by which these substances were taken into soln.; the final chem. state of the  $\text{Fe}_2\text{O}_3$  and  $\text{SiO}_2$  in the soln. permitting transportation; the manner of pptn. of the  $\text{SiO}_2$  and  $\text{Fe}_2\text{O}_3$  to form the characteristically banded ppts., and the agents which brought about this pptn.

**The origin of some iron ores and serpentine in the Dutch East Indies.** W. F. GISOLF. *Proc. 3rd Pan-Pacific Sci. Congr.* 1926, II, 1729-32 (1928).  
**Formation of Japanese gold ores.** CHOZO IWASAKI. *Proc. 3rd Pan-Pacific Sci. Congr.* 1926, II, 1737-8 (1928).

**Zoning in Michigan copper deposits and its significance.** I. T. M. BRODERICK. *Econ. Geol.* 24, 149-62 (1929).—In most of the mines the As-Cu ratio increases with depth; in general, the lower the lode stratigraphically in the series, the higher the As-Cu ratio at the outcrop. In the lowest member, the As-Cu ratio increases with depth to approx. 0.56% and then rapidly declines with greater depth. The total variation of the ratio in the different beds is 0.0003-0.56%. The As is probably present chiefly as Cu arsenides, perhaps somewhat in solid soln. in the Cu. II. *Ibid* 311-26.—The deeper zones contain Cu arsenides and chalcocite, and the  $\text{Fe}_2\text{O}_3$  of the original rock has been reduced to  $\text{FeO}$ , now present in the form of silicates. The intermediate zones contain smaller quantities of arsenides and sulfides and the  $\text{Fe}_2\text{O}_3$  has been reduced and removed. The shallow zones contain practically no arsenides or sulfides and there has been little reduction or removal of  $\text{Fe}_2\text{O}_3$ .

**The copper deposits of Michigan.** B. S. BUTLER AND W. S. BURBANK WITH T. M. BRODERICK, L. C. GRATON, C. D. HOHL, CHAS. PALACHE, M. J. SCHOLZ, ALFRED WANDKE AND R. C. WELLS. U. S. Geol. Survey, *Professional Paper* 144, 233 pp. (1929).—This paper is a detailed description of the geology of the Mich. Cu region. Statistics on Cu production and dividends by companies, lodes and mines from 1845 to 1925 are given. The genesis of the deposits is discussed. Conclusion: Ascending ore solns. were pptd. by oxidation. The underlying Duluth gabbro is probably the source of the Cu. Geophys. methods are discussed in their application to the exploration of these deposits. Detailed descriptions of the lodes and fissures are given and an extensive bibliography is included.

**Ore deposits of the Kune copper mine.** KOZABURO MAKINO. *Proc. 3rd Pan-Pacific Sci. Congr.* 1926, II, 1738 (1928).

**Ore deposits of the Iimori copper mine.** KOZABURO MAKINO. *Proc. 3rd Pan-Pacific Sci. Congr.* 1926, II, 1738-9 (1928).

**Ore deposits of the Ashio copper mine.** TOSHIO KISHI. *Proc. 3rd Pan-Pacific Sci. Congr.* 1926, II, 1739 (1928).

**The geologic age of the ore deposit of the Tsuchikura mine, with special reference to the late Palaeozoic mineralization in Japan.** KAMEKI KINOSHITA. *Proc. 3rd Pan-Pacific Sci. Congr.* 1926, II, 1732-4 (1928).

**Geology of Hyder and vicinity, southeastern Alaska—with a reconnaissance of Chickamin River.** A. F. BUDDINGTON. U. S. Geol. Survey *Bull.* 807, 121 pp. (1929).—The minerals found are: (1) native elements (Au and Ag), (2) sulfides (galena, pyrite, pyrrhotite, sphalerite, chalcopyrite, molybdenite, chalmersite, covellite, marcasite),

(3) sulfo-salts (tetrahedrite, freibergite, arsenopyrite, proustite), (4) sulfates (barite, anglesite), (5) oxides (quartz, magnetite, specularite, limonite), (6) carbonates (calcite, ankerite, malachite, azurite), (7) tungstate (scheelite). A. J. MONACK

**Platinum and black sand in Washington.** J. T. PARDEE. U. S. Geol. Survey *Bull.* 805-A, 1-15(1929).—A total of about  $7\frac{1}{2}$  oz. of Pt has been reported from the state of Wash. Most of this came from the beach south of Cape Flattery; the remainder from a short course along the south fork of Lewis River near Moulton. At both places the Pt was obtained as a by-product of placer mining of Au. A discussion of black sands is given, including a list of minerals other than quartz, and a table showing mineral compns. of 50 samples of black sand. A. J. MONACK

**The chromite-bearing ultrabasic deposits of Singhbhum.** C. MAHADEVAN. *Econ. Geol.* 24, 195-205(1929).—The deposits contain ore analyzing 44-53%  $\text{Cr}_2\text{O}_3$ . Production in 1926 amounted to 1623 tons. ELLIOTT J. ROBERTS

**Chromite deposits in the Philippines.** V. ELICANO. *Proc. 3rd Pan-Pacific Sci. Congr.* 1926, II, 1753-4(1928). E. M. SYMMES

**Mineral resources of the Russian Far East.** P. I. POLEVOI. *Proc. 3rd Pan-Pacific Sci. Congr.* 1926, II, 1754-7(1928); cf. C. A. 19, 2010. E. M. SYMMES

**Mineral resources of South Manchuria.** HANZO MURAKAMI. *Proc. 3rd Pan-Pacific Sci. Congr.* 1926, II, 1763-4(1928). E. M. SYMMES

**Mineral resources of the Japanese Empire.** NOBUYASU KANEHARA. *Proc. 3rd Pan-Pacific Sci. Congr.* 1926, II, 1765(1928). E. M. SYMMES

**Geologic age of gypsum deposits in Japan.** KAMEKI KINOSHITA. *Proc. 3rd Pan-Pacific Sci. Congr.* 1926, II, 1734-6(1928). E. M. SYMMES

**Strontium from a domestic standpoint.** R. M. SANTMYERS. *Bur. Mines Econ. Paper* 4, 19 pp.(1929).—S. discusses the U. S. Sr industry, including domestic and foreign deposits, imports, uses, methods of manuf. and tests. ALDEN H. EMERY

**Barite in the jurassic and cretaceous deposits of the Tschuvaschki Republic.** L. M. MIROPOLSKI. *Bull. acad. sci. union rep. soviet. social.* 1928, 425-41.—The different forms of barite, which appear in these deposits both as concretion and as sep. crystals of varying habit, are described. B. C. A.

**The pyrophyllite deposits of North Carolina (with a more detailed account of the geology of the Deep River region).** JASPER L. STUCKEY. North Carolina Dept. of Conservation and Development, *Bull.* 37, 62 pp(1928).—The pyrophyllite bodies occur in acid rocks in oval or lenticular deposits formed along lines of shearing due to folding. The chief minerals are pyrophyllite, quartz, pyrite, chloritoid and sericite, the minor minerals include feldspar, Fe oxides, epidote, zircon, titanite, rutile, zeolites and apatite. The deposits are formed by metasomatic replacement in the order: (1) silicification of tuffs and breccias, (2) development of (a) pyrite, (b) chloritoid in those bodies near the Fe breccia, (c) pyrophyllite by replacement of silicified tuff and (d) sericite. The pyrophyllite is closely assoc. with some of the old Au mines, formation of both being probably due to hot solns. The material is used in making roofing paper, cotton cordage, textiles, rubber, soap, pipe covering, pottery and porcelain, asbestos, paint, toilet preps., bleaching compds., crayons and pencils and sheet asphalt. Waste in production has been huge because only ore pure enough to use without treatment has been used. ALDEN H. EMERY

**Deposits of vermiculite and other minerals in the Rainy Creek District near Libby, Montana.** J. T. PARDEE and E. S. LARSEN. U. S. Geol. Survey *Bull.* 805-B, 1-28(1929).—The deposits occur in an easily accessible area about 7 mi. N.E. of Libby, Mont. About  $\frac{2}{3}$  of the stock consists of a coarse-grained pyroxenite that ranges from nearly unmixt pyroxene to nearly unmixt biotite or vermiculite (alteration product) and usually contains 7-10% of F-rich apatite. About 0.12%  $\text{V}_2\text{O}_5$  is also present. The remainder of the stock is coarse-grained syenite and altered nepheline syenite. The vermiculite is being developed commercially. A fibrous amphibole also occurs as a spur north of Kearney Creek and a small quantity has been mined for expl. purposes. Quartz, chalcopyrite, galena, sphalerite, fluorite, strontianite, celestite, aegirite and aegirite-diopside occur in veins in the pyroxenite mass. Some of the aegirites contain 3-4% of  $\text{V}_2\text{O}_5$ . A. J. MONACK

**A unique feldspar deposit near DeKalb Junction, N. Y.** B. M. SHAUB. *Econ. Geol.* 24, 68-89(1929).—The feldspar-quartz deposit, contg. tremolite, phlogopite, titanite, diopside, serpentine and talc, was probably formed by the hydrothermal replacement of the quartz-diopside and dolomite country rocks. E. J. R.

**The diamond deposits on the coast of Little Namaqualand.** PERCY A. WAGNER and HANS MERENSKY. *Trans. Geol. Soc. S. Africa* 31, 1-41(1928).—A description of the diamond deposits on the southwest coast of Africa with a discussion of the possible

origins of the diamonds (cf. *Proc. Geol. Soc. S. Africa* 31, 25(1928)). This region is compared with the diamond deposits of Brazil.

**Upland diamond deposits, Diamantina district, Minas Geraes, Brazil.** DJALMA GUIMARAES. *Econ. Geol.* 24, 444-7(1929).—G. corrects some statements of Thomson (*C. A.* 23, 4425) regarding the geology of the region and points out that the breccia was not originally a basic intrusion but either neutral or acidic since the contained minerals (quartz, rutile, etc.) are more characteristic of a neutral or acid rock.

**Northward extension of the Sheridan coal field—Big Horn and Rosebud counties, Montana.** A. A. BAKER. U. S. Geol. Survey *Bull.* 806-B, 15-67(1929).—The following are treated: geography (land features, drainage and water supply, timber, settlement, routes of travel); geology (stratigraphy, structure, physiography); coal (distribution and correlation of the coal beds, phys. properties, chem. properties, burning of the coal beds, fossil wood, mining, details by townships). It is possible that more complete exploration will show that the present est. of 38,500,000,000 short tons of coal in the field is too low.

**Igneous metamorphism of coal beds.** GEO. C. MCFARLANE. *Econ. Geol.* 24, 1-14(1929).—The change from low-rank bituminous to anthracite is accomplished at temps. ranging from 160° to 350°. Sp. gr., fixed C, volatile matter and H<sub>2</sub>O absorbed detns. for coals heated at different temps. are given. A Colo. coal within 1 ft. of a basalt sill had been heated to approx. 1000° by the intrusive mass.

**New theories regarding the formation of petroleum.** A. WEINFELD. *Intern. Z. Bohrtech. Erdölbergbau u. Geol.* 37, 83-9, 93-6(1929).—Discussion of genetic connection between salt deposits and petroleum in porous sands. W. is entirely opposed to the idea of migration of oil from its mother rock and therefore assumes that the greater part of oil found in porous beds is primary in character.

**Oil-bearing rocks of the Waiapu Subdivision (New Zealand).** M. ONGLEY AND E. O. MACPHERSON. *Proc. 3rd Pan-Pacific Sci. Congr.* 1926, II, 1594(1928).

**Petroleum in Taranaki (New Zealand).** I. I. GRANGE. *Proc. 3rd Pan-Pacific Sci. Congr.* 1926, II, 1595(1928).

**The Echigo oil fields (Japan).** TSUNENAKA IKI. *Proc. 3rd Pan-Pacific Sci. Congr.* 1926, II, 1596-7(1928).

**The diatom theory of the origin of petroleum in California.** JUN-ICHI TAKAHASHI. *Proc. 3rd Pan-Pacific Sci. Congr.* 1926, II, 1613-4(1928); cf. *C. A.* 22, 2727.

**Further studies of volcano gases.** A. L. DAY. *Proc. 3rd Pan-Pacific Sci. Congr.* 1926, I, 710(1928).—Gas reactions can contribute heat and reduce viscosities of lava and the flow temp. The mechanism of gas explosions and reasons for periodicity are shown. Water is the most important volatile ingredient in magmas and the most important factor in lava movement and explosions.

**Extrusives and ejectamenta of some Philippine volcanoes.** A. D. ALVIR. *Proc. 3rd Pan-Pacific Sci. Congr.* 1926, I, 758-60(1928).

**Steam as immediate cause of the last eruptions of Taal and Bulusan volcanoes.** MIGUEL SADERRA MASÓ. *Proc. 3rd Pan-Pacific Sci. Congr.* 1926, I, 761-7(1928).

**Distribution of volcanic rocks in Japan, with subordinate notes on the Korean rocks.** S. KÔZU AND M. WATANABE. *Proc. 3rd Pan-Pacific Sci. Congr.* 1926, I, 770-80(1928).

**Some alkali rocks occurring in Korea.** S. KÔZU AND K. SETO. *Proc. 3rd Pan-Pacific Sci. Congr.* 1926, I, 781(1928).

**Concretions in water-laid tuff in the Philippine Islands.** JOSÉ M. FELICIANO. *Proc. 3rd Pan-Pacific Sci. Congr.* 1926, II, 1863-6(1928).

**Water-laid volcanic rocks of early upper Cretaceous age in southwestern Arkansas, southeastern Oklahoma and northeastern Texas.** CLARENCE S. ROSS, HUGH D. MISER AND LLOYD W. STEPHENSON. U. S. Geol. Survey, *Professional Paper* 154F, 175-202(1929).—Tuffaceous material of Cretaceous age occurs in an east-west belt about 150 miles long lying near the northern margin of the Gulf Coastal Plain in Texas, Okla. and Ark. It was deposited for the most part in shallow H<sub>2</sub>O under the influence of strong currents and is mixed in various proportions with detrital material derived from the Paleozoic rocks on the north. Intense alteration has formed many clay beds, chiefly bentonite. The commonest rock is in the form of rounded lithic grains about 0.5-1.0 mm. in diam. The volcanic vents are probably located in Howard, Pike and Sevier Cos., Ark.

ALDEN H. EMERY

**Contact metamorphism of the Ellsworth schist near Blue Hill, Me.** J. L. GILLSON AND R. M. WILLIAMS. *Econ. Geol.* **24**, 182-94(1929).—Analyses of unmetamorphosed and contact-metamorphosed Ellsworth schist are given. The pyrite-chalcopyrite deposits were formed from solns. migrating from a nearby granite. E. J. R.

**Chemical and mineralogical composition of red and green eocene schistous clay of the Eastern Carpathians.** A. GAWEL. *Bull. acad. polonaise* **1928A**, 523-37.—Chem analyses are recorded of the portion of slate clay sol. in HCl and these are expressed by the general formula  $4\text{SiO}_2(\text{Al}_2\text{O}_3 + \text{Fe}_2\text{O}_3)(\text{FeO}, \text{MgO}, \text{CaO}, \text{K}_2\text{O}, \text{Na}_2\text{O})$ . The red clay is characterized by the absence of combined  $\text{Fe}_2\text{O}_3$  but contains free  $\text{Fe}_2\text{O}_3$ , to which the color is due, while in the green clay the Fe oxide is combined with silica. B. C. A.

**The characteristics of "terra rossa" from the vicinity of Rome.** B. FILOSOFOV. *K. D. Glinka Memorial vol.* (Leningrad Agr. Inst.) 191-207(1928).—F. presents data on the chem. and mineralogical compn. of 3 samples of native rock and the corresponding weathered materials, which give rise to "terra rossa" in the vicinity of Rome. The analyses of one specimen of native rock and weathered material are: hygroscopic moisture 1.17, 8.7;  $\text{SiO}_2$  47.53, 43.2;  $\text{Al}_2\text{O}_3$  14.85, 19.46; FeO 5.32, 7.21; MnO 0.27, 0.13; MgO 8.18, 9.08; CaO 12.66, 11.74;  $\text{K}_2\text{O}$  5.59, 0.51;  $\text{Na}_2\text{O}$  2.15, 1.41;  $\text{CO}_2$  0.00, 0.01;  $\text{H}_2\text{O}$  1.28, 4.42; org. substance 0.0, 0.55%. From the analyses presented F. concludes that the weathering in the region of the Mediterranean is similar to that of laterization in the tropics. The presence of free Al hydroxides is another indication of the similarity. According to F., the intensity of the red color is detd. by the presence of Ca, but its presence is not a necessary attribute of the formation of "terra rossa" J. S. JOFFE

**A study of thermal springs in the Philippines.** JOSÉ M. FELICIANO. *Proc. 3rd Pan-Pacific Sci. Congr.* **1926**, I, 804-11(1928).—Very few thermal springs are radioactive, but the cold springs are slightly so, an anomaly which may be due to the fact that heat is derived mostly from volcanic rock. Underground waters absorb emanations from radioactive rock irrespective of temp.; magmatic diluted with vadose waters probably represent most of those in volcanic regions. Recent intrusions and extrusions are less radioactive than older ones. E. M. SYMMES

**The distribution of radioactive mineral springs in Japan.** SAEMON TARO NAKA MURA. *Proc. 3rd Pan-Pacific Sci. Congr.* **1926**, I, 814-7(1928). E. M. SYMMES

**The distribution of rare chemical elements in the Japanese Islands.** S. KÖZU AND M. WATANABE. *Proc. 3rd Pan-Pacific Sci. Congr.* **1926**, I, 839-52(1928).—Rare earths and rare acid earths are found mostly in the outer zone of northeast Japan and the inner zone of southwest Japan, with Li, Be, W, Mo, Th and U. Radioactive minerals are found in the inner zone of northeast Japan, but in them no radioactive element has been detected chemically. Pt, Ir and Os are most abundant in Hokkaido. Gases contg. He are widely distributed, the max. He content being 0.2%. E. M. SYMMES

**Helium contents and ages of Japanese radioactive minerals from Ishikawa district.** Y. KANO AND B. YAMAGUCHI. *Bull. Chem. Soc. Japan* **3**, 244-52(1928). The minerals xenotime, samarskite, monazite and ishikawaite (cf. *C. A.* **17**, 252) have been examd. for their He content with the following results: 1 g. of the minerals heated to 1000° yields, resp., 0.025, 1.42, 0.246 and 1.77 cc. of He. The U, Th and Pb contents of ishikawaite were detd. Calcs. based on the He and Pb contents give values, resp., for the age of this mineral as 72.3 and 127 million years. The ages of the samarskite and the monazite are calcd. as 81.2 and 73.9 million years. These 3 minerals from Ishikawa belong to the same geological age, either Jurassic or Cretaceous. B. C. A.

**Determination of the helium content of some Japanese minerals.** II. JIRO SASAKI. *Bull. Chem. Soc. Japan* **4**, No. 5, 111-2(1929); cf. *C. A.* **21**, 1610.—The He content in cc. per g. of the minerals studied was: conglomerate of samarskite and columbite 0.20, naegite 0.028, 2 samples each of ilmenite and sphene 0.00044, none and 0.0054, none, resp., rutile 0.0000053. One specimen of sphene was feebly radioactive, the rutile and ilmenite were not. W. L. HILL

## 9—METALLURGY AND METALLOGRAPHY

D. J. DEMOREST, R. H. ABORN

**A method for the sizing of ore by elutriation.** JOHN GROSS, S. R. ZIMMERLEY AND ALAN PROBERT. *Bur. Mines, Repts. of Investigations* No. 2951, 8 pp.(1929).—Elutriation was adopted as probably giving better results than sedimentation for sizing materials finer than 200 mesh. Illustrations of an elutriator are shown and its operation is discussed. The method may be used for the sepn. of sized minerals to det. metallurgical recovery, as well as for the detn. of surface in the calcn. of grinding efficiencies. H. C. PARISH

**The relation of table feed preparation to table efficiency.** A. W. FAHRENWALD AND W. F. MECKEL. *Bur. Mines, Repts. of Investigations* No. 2949, 15 pp.(1929).—In general, the work of the table of the reciprocating type of gravity concentrator grows better as the difference in size between concn and tailing material becomes greater. A difference in sp. gr. between concn. and tailing material has the greatest effect on table concn. Conditions are most favorable to concn. when the concn. grains are smaller, heavier and more nearly spherical than the tailing grains. H. C. P.

**Reducing and oxidizing agents and lime consumption in flotation pulp.** LEONARD KLEIN, C. R. KING, T. F. MITCHELL, O. E. YOUNG, F. H. MILLER, L. M. BARKER AND OLIVER C. RALSTON. *Am. Inst. Mining Met. Eng., Tech. Publication* No. 224, 17 pp.(1929).—O is always dissolved in pyritic flotation pulps made alk. with CaO in the presence of air, in amts. depending on the extent of aëration. Sol. sulfides and thiosulfates are present as a result of the action of CaO and air on powd. sulfide minerals. CaO is consumed by interaction with sulfide and gang minerals, probably by adsorption on all surfaces, by reaction with oxidation products, by CO<sub>2</sub> from the air and by reaction with constituents of the water used. H. C. PARISH

**High-zinc slags in Australia.** PHILIP S. MORSE. *Am. Inst. Min. Met. Eng., Tech. Publication* No. 222, 14 pp.(1929).—Australian Pb blast-furnaces make slags high in ZnO, often 20% or more. This is possible when roasting is carried to the point where no mat is made; S on the charge must be below 4% or Zn mush will form. The Zn remains in the slag probably in the form of spinels, such as ZnO.Fe<sub>2</sub>O<sub>3</sub> and ZnO.Al<sub>2</sub>O<sub>3</sub>, together with some dissolved sulfide. A. BUTTS

**Diffusion of iron oxide from slag to metal in the open-hearth process.** C. H. HERTY, JR. *Am. Inst. Mining Met. Eng., Tech. Publication* No. 229, 18 pp.(1929).—The fundamental principles governing the diffusion of FeO from slag to metal in the open-hearth steel process are discussed and different diffusion coeffs. are calcd. from furnace data. DOWNS SCHAAP

**The value of pyritic ores as sources of iron ore.** ARTHUR J. CADDICK. *Mining Mag.* 41, 22-4(1929).—Results are given of a study of compns. of com. Fe ores in comparison with residues from pyritic ore after a treatment of roasting, chloridization and leaching. It is indicated that pyritic ore contg. 39% S, 37% Fe and 14% SiO<sub>2</sub> will yield a residue profitable for Fe smelting; but if the SiO<sub>2</sub> exceeds 14%, preliminary concn. will be necessary. A. BUTTS

**Iron-ore sinter.** G. M. SCHWARTZ. *Am. Inst. Mining Met. Eng., Tech. Publication* No. 227, 30 pp.(1929).—The fundamental reactions that take place in the sintering of Fe ores were studied by detg. the nature of the resulting minerals. Microscopic studies were made of the polished surfaces of 9 com. Fe ore sinters and 18 exptl. sinters produced under varying conditions. DOWNS SCHAAP

**Leaching manganese from the siliceous iron ores of Minnesota.** CARL ZAPFFE. *Eng. Mining J.* 127, 1039-40; 128, 14-9(1929).—The ore is crushed to pass 65 mesh, and roasted in a reducing atm. of producer or blast-furnace gas at 400°, reducing MnO<sub>2</sub> to MnO and Fe<sub>2</sub>O<sub>3</sub> to Fe<sub>3</sub>O<sub>4</sub> with a little FeO. It is then leached with (NH<sub>4</sub>)<sub>2</sub>SO<sub>4</sub>, in which MnO and FeO are sol and Fe<sub>3</sub>O<sub>4</sub> is insol. NH<sub>3</sub> gas is liberated, and on bringing this in contact with the soln. of MnSO<sub>4</sub> in a standard NH<sub>3</sub> tower, Mn(OH)<sub>2</sub> is pptd. This is converted to stable MnO.OH by treatment with air. The ppt. is washed, dried and sintered. A pilot mill gave 92% recovery of the Mn in the ore. In leaching there must be a large excess of (NH<sub>4</sub>)<sub>2</sub>SO<sub>4</sub>. The residue contg. Fe<sub>3</sub>O<sub>4</sub> is treated by magnetic concn., and a recovery of 70% of the original Fe is made. The exptl. development of this process, called the Bradley process, together with details of app. and essential controlling conditions, are outlined and a flow-sheet is given. A sinter contg. 64% Mn, 7% Fe, 2% SiO<sub>2</sub>, and practically free from P and S, is made. This is ideal for ferro-Mn. The process is applicable to all low-grade Mn ores and is especially valuable in sepg. high SiO<sub>2</sub>. A. BUTTS

The development of the "chlorine process" of extraction of platinum metals from ores. R. A. COOPER AND F. W. WATSON. *J. Chem. Met. Min. Soc. S. Africa* 29, 220-30(1929).—Various methods of concn. and leaching with various solvents were tried on ore from the Waterberg district, Transvaal. Only cyanide and Cl gas gave encouragement. Application of Cl was tried in various ways, and finally 80% extn. was obtained by heating the ore to 550° in a glass combustion tube and passing moist Cl through, then leaching with acidified H<sub>2</sub>O. Addn. of 1% NaCl increased extn. to 90%. A revolving steel tube of large capacity gave good results on original ore and tailings, but the costs were too high for low-grade material, and on concentrates results were poor. Similar treatment using a stationary rectangular muffle, however, was successful unless coarse Pt was present. In this case, electrolytic amalgamation (cf. C. A. 23, 3194) was used, followed by chlorination of the tailings, yielding 90% extn. On norite, ore flotation was the only successful method of concn. By this 87% of the Pt was obtained in 5% of the ore, but the previous method could not ext. the Pt from this conc. because of the Pt existing as a solid soln. or submicroscopic dispersion within base-metal sulfides in the ore. A slight modification in roasting, with elimination of the NaCl, then resulted in successful chlorination and leaching without amalgamation. From the soln. obtained Pt is pptd. with Zn dust. Cu must be pptd. before pptn. of the Pt, slow pptn. with pulverized limestone being found best. Ni remains after the Pt is pptd. and is then pptd. separately. Thus, 80% of the Cu and Ni in the ore is recovered besides the Pt. The final product carries 52% Pt and 15 Pd. A com. plant has been built and is treating flotation concentrates from sulfide norite carrying 25-30 dwt. Pt per ton. A BUTTS

The new Sulman-Picard process for tin extraction. A. S. FITZPATRICK. *Chem. Eng. Mining Rev.* 21, 331-2(1929).—The Sn is 1st converted to sulfide by one of two methods. In the one the finely ground ore or concentrate is briquetted with pyrite and sometimes charcoal, or reduction may be accomplished by passing coal gas or producer gas over the dried porous briquet. In the other method pyrite is heated in a furnace compartment separately from the mixt. of finely ground ore and a reducing agent. S from the pyrite combines with the Sn to form the sulfide. The Sn concentrate mixt. is next allowed to cool away from air. The mass is leached with a soln. of NH<sub>4</sub> polysulfide, then distd. and calcined with charcoal to SnO<sub>2</sub>. A sulfide of the required soly. is formed at 750-850°. Temp. control is very important. It is considered possible to collect sulfides of As and Sb separately. No details of the furnace to be used in this process are yet available. H. C. PARISH

Developing an efficient and economical gold-ore treatment process. ALGERNON DELMAR. *Eng. Mining J.* 128, 208-10(1929).—Three slightly siliceous limestone ores were treated: (A) a low-grade ore contg. native Hg, the  $-1/4$ -mesh portion contg. 80% of the Au; (B) the  $+1/2$ -mesh portion contg. 81% of the Au; and (C) ore wherein the Au was evenly distributed. The ore A could not be treated by amalgamation as the native Hg did not coalesce with the Hg in the traps. Wet grinding and cyaniding did not give good recovery. Screening and cyaniding the  $-1/4$ -mesh material gave a satisfactory recovery. Ore B was wet screened and the  $+1/2$ -mesh material was ground to  $-1/4$  mesh, amalgamated and cyanided. Ore C was ground to  $-30$  mesh, amalgamated and cyanided. C. L. READ

The extraction of gold from sea waters. A. GLAZUNOV. *Chem. Listy* 23, 188-93, 215-22(1929); cf. C. A. 23, 3847.—Solns. contg. 5-50 mg. Au per ton (metric) were concd. to 260 mg./ton by passing through containers filled with pyrites or Cu<sub>2</sub>S. Grains of pyrites 1-1.5 cm. av. diam. were most useful and a water flow of 5-10 mm. per sec. (2-4 l. per hr. per sq. cm.) through a layer of pyrites 20 cm. deep was used. From 25 to 40% of the Au in soln. was recovered. With sea water the concn. of Au deposited was not proportional to the water passed through the filters. The action of sea water constituents (grasses and weeds) dissolved the pyrites to form a spongy layer. By changing the filter mass so that the pyrites remained unattacked, the process was successful. The waters at Ile d'Ouessant contain 1 mg. Au per metric ton; by adsorption 0.20-0.25 mg. per ton was recovered. FRANK MARESH

Gold and silver in 1927. J. P. DUNLOP. *Bur. Mines, Mineral Resources of U. S. 1927*, Pt. I, 599-636(preprint No. 23, published Aug. 1, 1929). E. H.

Gold, silver, copper, lead and zinc in Colorado in 1927. CHAS. W. HENDERSON. *Bur. Mines, Mineral Resources of U. S. 1927*, Pt. I, 527-72(preprint No. 21, published July 17, 1929). E. H.

Gold, silver, copper, lead and zinc in Nevada in 1927. C. N. GERRY. *Bur. Mines, Mineral Resources of U. S. 1927*, Pt. I, 509-24(preprint No. 20, published July 18, 1929). E. H.

**Lead in 1927.** LEWIS A. SMITH. *Bur. Mines, Mineral Resources of U. S. 1927*, Pt. I, 341-72 (preprint No. 15, published April 8, 1929). E. H.

**Present-day smelting practice at Rio Tinto.** H. R. PORRS. *Bull. Inst. Mining Met.* 1929, No. 299, 1-10; *Metal Ind.* (London) 35, 200-3 (1929).—Copper metallurgy is described. E. H.

**Distribution of copper in the slag and mat from pyritic smelting.** B. PENTEGOV. *Proc. 3rd Pan-Pacific Sci. Congr.* 1926, II, 1760-2 (Publ. 1928). E. M. SYMMES

**Physico-chemical air investigations in the manufacturing rooms of the copper foundry "Krassny Fakel."** S. BRUJEVIC. *Zentr. ges. Hyg.* 18, 702 (1928); *Wasser u. Abwasser* 25, 287.—Results showed the presence of 39.3 mg. of metals per cc. of air in the founding or casting room and 2.3-9.0 mg. per cc. in the molding and forming rooms. The elec. condition of the air points to a very high ionization. ZnO is negatively charged. C. R. F.

**A note on making steel in a basic-lined converter from Indian pig iron at Mysore Iron & Steel Works.** PREM N. MATHUR. *J. Indian Chem. Soc.* 6, 353-5 (1929).—Molten Indian Fe contg. 0.12-0.40% P is blown in a basic-lined converter by a process differing from the standard method mainly in that no afterblow is required.

**Heat economy in the steel industry.** SABURO UNNO. *J. Fuel Soc. Japan* 8, 760-73 (1929); English Abstract, *Ibid* 79-81.—U. measured the thermal efficiency of 6 heating furnaces in the Yawata Steel Works. The furnace temp. was measured by Holbarn-Kurlbaum photometric pyrometer where the temp. was highest and by a thermocouple of basic metal and by a Hg thermometer where the temps. were medium and low. The heat lost through the furnace walls and the amt. carried away with the discharge were calcd. The thermal efficiency can be increased by means of heat insulation and by the utilization of waste heat. The results of the expts. are illustrated by curves and drawings. F. I. NAKAMURA

**A new development in wrought iron manufacture.** JAMES ASTON. *Am. Inst. Mining Met. Eng., Tech. Publication No. 228*, 12 pp. (1929).—The inventor of a process for making wrought Fe without hand puddling describes the operations in a pilot plant producing 200 tons daily. He also explains the physicochem. principles involved.

**Byers new process for wrought iron.** JAMES ASTON. *Iron Age* 124, 341-4 (1929).—See preceding abstr. DOWNS SCHAAP

**Experimental data on the equilibrium of the system: iron oxide-carbon in molten iron.** A. B. KINZEL AND J. J. EGAN. *Am. Inst. Mining Met. Eng., Tech. Publication No. 230*, 9 pp. (1929).—An exptl. method is described for obtaining the FeO-C equil. const. at steel-melting temps. A figure for the FeO-C product of  $5 \times 10^{-4}$  is given as the wt.-concn. equil const. at 1550° and 1 atm. DOWNS SCHAAP

**Some cupola troubles.** W. H. BLEEKE. *Foundry Trade J.* 41, 115-6 (1929). E. H.

**The viscosity (of metals).** J. COURNOT. *Rev. métal.* 26, 326-8 (1929); cf. C. A. 20, 568; 21, 1090, 2454; 22, 375, 2543.—Results of measurements on Al and on duralumin show that the practical viscosity limit increases with the diam. of the wire.

**A new hardness tester.** J. POMEY AND P. VOULET. *Rev. métal.* 26, 238-47 (1929).—With this instrument, as with the Brinell, hardness is defined as the ratio of the load to the area of mark, which is made by a very small diamond cone, the angle of which has been selected to give a hardness value identical with the Brinell hardness. A. PAFINEAU-COUTURE

**Chemical action in relation to fatigue in metals.** B. P. HAIGH. *Inst. Chem. Eng.*, March 20, 1929, 15 pp.—Endurance and fatigue limits are affected by chem. action on the surface, even by water or air, and even if no visible corrosion occurs. Practical illustrations are given, and these conclusions were confirmed by lab. tests on specimens moistened with various reagents. It was proved that this "conjoint action" accelerated fatigue, irrespective of corrosion. Expts. carried out in America on the reduction of the fatigue limit of alloy steels by fresh or salt water are described. Results were found not to vary with the size of the specimen. Solns. were not more active than was water in affecting the fatigue limit; some, e. g., Na dichromate, are beneficial. Tests at higher temps. suggest that air in soln. in water may be of importance. The coating with grease, etc., of a specimen tested in air greatly increases the fatigue limit. B. C. A.

**Tensile strength and hardness of metals.** O. SCHWARZ. *Z. Ver. deut. Ing.* 73, 792-7 (1929).—Although for nonferrous metals (Al and its alloys excluded) a linear

relation between Brinell hardness and tensile strength does not exist, the expression  $K_z = 0.36 H_B$  for practical purposes is sufficiently accurate for all metals (where  $K_z$  = tensile strength, and  $H_B$  = Brinell hardness).

E. H.

A new macroscopical metallographic reagent. GEORGES D'HUART. *Rev. métal.* 26, 300-6 (1929).—The compn. of the new reagent is: distd.  $H_2O$  100 cc., concd.  $HCl$  100 cc., crystd. chromic acid 40 g., anhyd.  $NiCl_2$  16 g.; dissolve the  $NiCl_2$  in the  $HCl$  soln., with slight heating, cool and add the chromic acid. The time required for etching varies from a few sec. to a max. of 1 min. With less than the indicated amt. of  $CrO_3$ , there is an intense evolution of  $H_2$ , while a greater proportion causes surface oxidation with deposition of a brownish yellow film of oxide. The reagent does not keep because of oxidation of  $HCl$ , and the  $HCl-NiCl_2$  and  $CrO_3-H_2O$  solns. may be stored separately and mixed just before using. The etched piece is most conveniently photographed under a thin layer of  $H_2O$ , and all oxidation can be prevented by using a dil., slightly acid  $ZnCl_2$  soln. instead of  $H_2O$ . If the etched piece is to be dried, wash with  $H_2O$ , immediately immerse in  $ZnCl_2$  soln., let stand for some time (not specified), rinse in alc., dry in a current of warm air, and apply a soln. of dammar gum in benzine. When they are exceptionally strongly pronounced, lines of slippage in mild steel, which has been strained beyond the elastic limit, are revealed by the reagent; but with the following modified formula lines of medium, or even slight, intensity, can be readily revealed.  $H_2O$  100 cc.,  $HCl$  140 cc.,  $CrO_3$  40 g.,  $NiCl_2$  16 g., crystd.  $CuCl_2$  8 g. Formation of a deposit of  $Cu$  can be prevented by washing with a 120%  $HCl$  soln. (probably a misprint for 12%) until all the  $Cu$  has been removed, before washing with  $H_2O$ . If the lines do not stand out sufficiently, because the background is too dark, the latter may be cleared by treating for some time with concd.  $NH_4OH$ . Photomicrographs are given and discussed, showing the practical applications of the reagent and its advantages over the Heyn, LeChatelier and Oberhoffer reagents.

A. PAPINEAU-COUTURE

On the road to pure iron and some of its indicated properties. T. D. YLSEN. *Trans. Am. Electrochem. Soc.* 56 (preprint) 8 pp. (1929).—The purity of  $Fe$  has been gradually increased, until now one can readily produce it with an  $Fe$  content greater than 99.95%. The remaining 0.05% consists partly of interstitial elements, such as  $C$ ,  $P$ , etc., and partly of substitution elements, such as  $Al$ ,  $Si$ , etc. Of these 2 classes of impurities the interstitial elements have by far the greater effect on the phys. properties, and are very difficult to remove simultaneously. By careful prepn., using electrolytic  $Fe$  with a small quantity of  $C$  as deoxidizer, and vacuum furnaces, samples have been obtained with greatly improved magnetic properties, indicating that pure  $Fe$  may have a hysteresis loss approaching zero, and an exceedingly high permeability.

A year's progress in steel treating. H. F. MOORE. *Iron Age* 124, 517-8 (1929).

E. H.

Hardening steel with nitrogen. V. O. HOMERBERG. *Iron Age* 123, 1562-5, 1759-61 (1929).—Steels contg. varying amts. of  $C$  with approx. 1 to 1.25%  $Al$ , 1 to 5%  $Cr$  and 0.20%  $Mo$  show max. surface hardness when exposed to  $NH_3$  gas at  $510^\circ$  under definite conditions. The process (Fry process) of case-hardening steels is called "nitriding." Equipment required for nitriding is discussed. If decarburization takes place before nitriding, the case will lend itself to chipping and flaking.  $Ni$  plating to a depth of 0.0005 in. or coating with  $Sn$  or solder protects the surfaces not to be hardened. The surface hardness is retained at high temps. and is equiv. to 1000 Brinell. Nitrided steels are resistant to atm.,  $H_2O$ , and salt  $H_2O$  corrosion.

C. H. LORIG

X-ray investigation of the structure of tempered carbon steel. G. KURDJUMOV. *Z. Physik* 55, 187-98 (1929).—A steel sample contg. 1.44%  $C$  was studied by the Debye-Scherrer powder method. The changes in property of hardened steel on annealing in the temp. range of  $100-150^\circ$  depend upon the destruction of the tetragonal form, which tends to go into the cubical lattice. The second change is due to the decomposition of austenite and the third change is connected with the formation of the mixt. of  $\alpha$  iron and cementite. These three changes have been found previously by a study of thermal expansion and elec. cond. Cf. G. Kurdjumov and E. Kaminskii, *C. A.* 23, 3198.

GEORGE GLOCKLER

Continuous bending experiments on steels. E. HOUDREMONT AND R. MAILANDER

**Krupp. Monatsh.** 10, 39-49(1929).—The results of 170 exptl. series of steels of varying compn. confirm the known relations between the fatigue strength, elastic limit and tensile strength. The fatigue strength increases more slowly than the tensile strength and much more slowly than the elastic limit with increased cold deformation.

**Response of steels at elevated temperatures.** W. H. HATFIELD. *J. West Scot. Iron Steel Inst.* 36, 60-71(1929).—Time-yield tests at elevated temps. indicate that for a mild steel contg. C 0.25%, Mn 0.53%, Si 0.11% and Ni 0.13%, the max. safe load for a continued period is 7.7 tons per sq. in. at 400°, and about 4 tons per sq. in. at 500°. For 3% Ni steel these values are about 10.5 and 5 tons per sq. in. respectively.

**Resistance to oxidation at elevated temps.** is studied with a few steels, the following gain in wt., expressed as mg. per sq. cm. of surface, being obtained by exposing the samples for 6 hrs. at 540° to steam formed from H<sub>2</sub>O contg. 5 cc. of O<sub>2</sub> per l. The results follow: 0.25% C, steel 0.62; high tensile alloy steel 0.73; 14% Cr stainless steel 0.24; 18% Cr, 8% Ni, rustless steel 0.01. Tensile tests at 800° show that Ni-Cr-W heat-resisting steels give values 20-25 tons per sq. in.

**Heat-resistant steels.** E. HOUDREMONT AND V. EHMCKE. *Krupp. Monatsh.* 10, 79-94(1929).—A review.

**The influence of size of section on the strength of gray cast iron.** J. G. PEARCE. *Foundry Trade J.* 41, 101-2, 104, 106(1929).

**Tensile strength and fracture of rolled strips of molybdenum.** TAKEO FUJIWARA. *Mem. Coll. Sci. Kyoto Imp. Univ. A* 12, 165-78(1929).—The tensile strengths of rolled strips of Mo, especially in reference to the direction of rolling, were detd. with a tensile testing machine, and their fractures examined by means of photomicrographs and x-rays.

**The effect of mixing small quantities of cobalt with brass.** DAIDZI IITSUKA. *Mem. Coll. Sci. Kyoto Imp. Univ. A* 12, 179-98(1929).—Cu and Co are not completely sol in the molten state; instead, they form 2 liquid layers, the soly. limits at a temp. a little higher than 1110° being 3.5% Co on the Cu side, and probably 8% Cu on the Co side. By using this modified diagram of the Cu-Co system, the author's diagram of the Cu-Zn system and Lewkonja's diagram of the Zn-Co system together with data on thermal analyses and microstructures of ternary compns., a corner of the ternary equil. diagram where Cu varies from 50-100%, Zn varies from 0-50% and Co varies from 0-10% was established.  $\beta$  brass is improved in all its mech. properties by addn. of Co, while  $\alpha$  brass is improved in strength but not in elongation. 60-40 brass with 3.4% Co is more resistant to sea water than simple brass.

**Resistance of zinc to indentation.** J. N. FRIEND AND W. E. THORNECROFT. *J. Inst. Metals*, Advance copy, March, 1929, 6 pp.—A machine by which the effect of varying load, duration of application and temp. on the deformation of soft metals can be detd., consists essentially of a steel bar supported on a fulcrum at one end and carrying a collar on the underside of which is affixed a hard steel cone (45°). The cone rests on a small block of the metal to be tested, which is contained in a marble trough with two glass sides, filled with liquid paraffin and heated electrically. With rolled 99.9% Zn under const. load  $L$ , at const. temp., the depth of indentation,  $D$ , varied with the time  $t$  according to the equation  $D = Kt^m$ , where  $K$  represents the depth of indentation when  $L$  acts for unit time.  $K$  varied with temp. and load,  $m$  with temp. only. A break in a smooth curve was indicated at about 160°, interesting in view of the supposed allotropic change of Zn at 160-180°.

**The electrical conductivity, corrosion and age-hardening of cadmium-zinc alloys.** G. GRUBE AND ARTHUR BURKHARDT. *Z. Metallkunde* 21, 231-4(1929).—The elec. cond. of Cd-Zn alloys at various temps. shows that Zn dissolves Cd in solid soln. to the extent of 3.7% at 263°, 3.08% at 226°, 2.06% at 212° and 0.92% at 142°, and that Cd dissolves Zn in solid soln. to the extent of 4.3% at 263°, 2.97% at 180° and 2.08% at 150°. The corrosion of these alloys for 24 hrs. in  $N$  NaOH at 25°, 2  $N$  NaOH at 35° and 3  $N$  NaOH at 30° was investigated. The loss of Zn was least and nearly zero between 0% Zn and 17.4% Zn (the eutectic compn.) but took a sudden jump at this compn., then falling off in intermediate compns. but rising to a second max. at about 82% Zn, then gradually falling off to that of pure Zn. The effect of time on corrosion by 2.9  $N$  NaOH at 45° was studied. For 3- and 6-hr. periods the corrosion curve was similar to the preceding except the second max. occurred at 77% Zn. Test pieces

were made up of 98% Zn and 2% Cd, rolled, quenched in water from 300°, and measured for tensile strength, elongation and Brinell hardness after aging. At 20° and at 70° pure Zn showed no change with this treatment. In 15 days the tensile strength rose from 14.3 kg./sq. mm. to 19.2 kg./sq. mm. and up to 8 weeks appeared to remain const. at this temp.; the elongation in 15 days increased from 5.7 to 11.4%; the Brinell hardness number (2.5/187.5/60) increased from 57.2 to 65.4 in 4 days and then fell slightly to 64.4 at the end of 15 days.

**Crystal faces developed by etching metallic crystals of aluminum and zinc.** BUN-TARO FUJITA. *Mem. Coll. Sci. Kyoto Imp. Univ. A* 12, 159-63(1929).—When the surface of a single crystal of a metal is etched by some reagent, its surface shines brightly in several directions. This seems to be caused by the reflection of light at many small and regularly arranged facets of the crystal, which are developed by etching. The crystallographic indices of Al and Zn crystals were detd. by means of an optical goniometer and x-ray analysis.

**Thermoelectric tests for aluminum-manganese and other alloys.** CYRIL S. TAYLOR AND JUNIUS D. EDWARDS. *Trans. Am. Electrochem. Soc.* 56, (preprint) 4 pp. (1929).—One % of Mn added to Al has a marked effect upon the thermoelec. properties of the metal. The high thermoelec. potential of the couple: alloy (Al + 1% Mn) vs. pure Al, forms the basis of a new sensitive instrument for distinguishing between pure Al and the Al-Mn alloy. The instrument is also applicable for testing Mg base alloys, contg. Al, against pure Mg; the galvanometer deflection is roughly proportional to the percentage of Al present.

**Preparation of aluminum alloys for microscopic examination.** HEINZ CHOLANT. *Z. Metallkunde* 21, 197-9(1929).—The use of  $\text{NH}_4$  alum during the polishing of Al alloys prevents the formation of a hazy surface. An alc. soln. of iron nitrate, acid with  $\text{HNO}_3$ , is recommended for the etching of  $\text{CuAl}_2$ , which it colors brown, leaving  $\text{NiAl}_3$  and  $\text{FeAl}_3$  uncolored. The technic of polishing and etching used by other workers is discussed. It is recommended that Al alloys be ground with emery paper with a layer of paraffin, polished with alc. and "Geolin" with the addn. of  $\text{NH}_4$  alum, etched for  $\text{CuAl}_2$  with alc. iron nitrate soln. and etched for iron compds. with  $\text{H}_2\text{SO}_4$ .

**The age-hardening of an aluminum alloy as revealed by x-ray diffraction.** FRHR. VON GÖLER AND G. SACHS. *Metallwirtschaft* 8, 671-80(1929).—Alloy pieces contg. Cu 5.05, Si 0.26, Fe 0.27 and Mg 0.03% were quenched from 525°. The tensile strength, elongation and reduction in area were detd. on pieces which had been aged at room temp. up to 80 hrs. and on others which had been "artificially aged" in steps of 50° up to 400° for 24-hr. periods and for 1/2-hr. periods. X-ray diffraction methods were applied to the change in Al lattice size resulting from the exclusion of Cu from supersatd. soln. (C. A. 19, 1213). The cube edge length  $a_0$  changed from 4.040 Å U. for pure Al to 4.030 Å U. for the quenched 5% Cu alloy. Single crystals of the 5% Cu alloy were prepd. and after given the heat treatments described above were photographed by the rotating crystal method. With aging temps. up to 220° for 1/2 hr. anneal  $a_0$  remains const., but above this temp.  $a_0$  increases suddenly, indicating pptn. of  $\text{CuAl}_2$ . The interference spots remain sharp up to 200° (1/2 hr. anneal) but are diffuse above this temp., again becoming sharp at 300°, indicating an inhomogeneous pptn. of  $\text{CuAl}_2$  and perhaps some lattice distortion. Pptn. is complete at 350° as indicated by the sharpness of the interference spots. New interference rings, originating in pptd.  $\text{CuAl}_2$ , appear at 300° (1/2 hr.). The mech. properties of similarly heat-treated single crystals were studied. The data indicate a distortion accompanying the second discontinuity in mech. properties originating in the pptn. of  $\text{CuAl}_2$  but indicate neither the pptn. of  $\text{CuAl}_2$  nor distortion of the lattice for the first discontinuity. Conclusion: The chief agent in age-hardening of this 5% Cu alloy is not the pptn. of  $\text{CuAl}_2$  but a change which proceeds within the Cu-Al solid soln. prior to but distinct from the pptn. itself, and may be pictured as a preparative process, probably an agglomeration of mols. of the compd.  $\text{CuAl}_2$  still, however, held in solid soln.

**Silver contents of specimens of ancient and medieval lead.** J. N. FRIEND AND W. E. THORNEYCROFT. *J. Inst. Metals*, Advance copy, March, 1929, 12 pp.—Detns. of the Ag content of 20 specimens of ancient, Roman and medieval Pb showed that pre-Roman Pb was not desilverized, although considerable variation occurred in their Ag content, a variation which occurred in medieval samples, some of which, however, were really of Roman origin. Spartan votive figurines (700-500 B. C.) contained 0.0568% Ag.

**Cadmium coating.** GIULIANO MONTELUCCI. *Rev. métal.* 26, 340(1929); cf.

de Lattre, C. A. 23, 806.—M. claims priority for the use of the Cd-Zn eutectic for Cd coating.

**The corrosion rate of ferro-nickel alloys.** COLIN G. FINK AND CLAUDE M. DE-CROLY. *Trans. Am. Electrochem. Soc.* 56 (preprint) 34 pp.(1929).—In the chem. engineering industry there has been an increasing demand for special alloys resistant to various chem. reagents. The authors record tests made on com. alloys of the Fe-Ni series, using the intermittent corrosion test, as this more nearly approaches actual service conditions. Specifications laid down by the Am. Soc. for Testing Materials were followed as closely as possible. Results in general indicate that the rate of corrosion in  $H_2SO_4$  increases at first very rapidly with the concn. of the acid, reaches a max., then decreases again, reaching a min., and usually increases again to reach a second max. The addn. of small percentages of Cr to the alloy, e. g., up to about 4%, does not materially alter the general trend of the Ni-Fe curves. However, higher percentages, such as one finds in nichrome, with 12.5% Cr, tend to eliminate the first sharp rise in the corrosion rate. Nor is there in these high Cr alloys a distinct min. to be detected. On the other hand, other alloys quite distinct in compn. from the ferro-Ni alloys, such as the com. Cu alloy Barberite, composed of Cu with a little Ni, Sn and Si, give the same type of corrosion rate curve as the Fe-Ni alloys. The addn. of  $CrO_3$  to the  $H_2SO_4$  does not render the surface of the Ni-Fe alloys passive, but, on the contrary, accelerates the corrosion. Contact potential measurements, made with the different samples of Fe-Ni alloys, show a relation between voltage and acid concn. somewhat similar to the corrosion rate relation, but in other respects are more or less distinct, indicating that the rate of corrosion is primarily dependent upon the rate of oxidation by the O dissolved in the  $H_2SO_4$ , and not by the rate of ionization of the metal.

C. G. F.

**Accelerated corrosion tests for coatings of the iron phosphate type.** E. M. BAKER, A. J. HERZIG AND R. M. PARKE. *Trans. Am. Electrochem. Soc.* 56 (preprint) 9 pp. (1929).—Coatings of the Fe phosphate type, often used in place of certain electroplated coatings, were produced on mild steel from solns. contg. various concns. of Fe phosphate and phosphoric acid. The salt spray test and intermittent immersion tests in distd. water and 0.01 N  $H_2SO_4$  were suitable for evaluating the quality of the coatings. Intermittent immersion tests in 5 and 20% NaCl solns. were unsuitable. Substantially all the Fe in the soln. is in the Fe state after the bath has been in operation. Some observations are presented on the effect of bath compn. on the quality of coating, and on the optimum bath compn. for best quality.

C. G. F.

**Corrosiveness of soils with respect to iron and steel.** Preliminary studies. H. D. HOLLER. *Ind. Eng. Chem.* 21, 750-5(1929).—A method of estg. soil corrosion based on the relation of salt content, acidity and corrosiveness of soil to rainfall is suggested. The corrosiveness of soils as indicated by the initial losses of buried specimens in humid areas of the U. S. has been correlated with their acidity. A relation exists between the ability of a soil to react on Fe with liberation of  $H_2$  and its total acidity as indicated by titration. The corrosiveness of a soil in humid regions may possibly be indicated by its total acidity or by its action on Fe with evaluation of  $H_2$ .

E. F. SNYDER

**Some aspects of corrosion in cast iron main pipes.** J. R. BRADSHAW. *Gas J.* 186, 593-6(1929).—Eight samples of cast iron pipes of varying sizes, ages and surroundings, some gas pipes and some water pipes, were studied for corrosion effects. The outside corrosion consisted essentially of  $FeO$ , etc., typical of electrolytic soil action. With the exception of a gas main over 75 years old, the internal deposits were essentially brown hydrated ferric oxide with various amts. of  $FeO$ , the former pipe showing much org. matter. Pipe buried in firm clay stands up much longer than in a mixt. of clay and ashes or wet clay. A standard and unvarying quality of Fe of high d. should last almost indefinitely.

J. B. CARPENTER, JR.

**The corrosion of light and ultra-light metals and alloys.** R. CAZAUD. *Rev. métal.* 26, 209-20, 259-86, 307-25, 367-77(1929).—A summary of the work carried out and results obtained to date under the direction of the sub-comm. on light and ultra-light alloys of the permanent comm. on aeronautical investigations, with bibliography of 60 references. **Methods for testing the corrosion of light alloys and metals in wet media.** X. WACHÉ AND G. CHAUDRON. *Ibid* 209-13.—Corrosion of Al and duralumin by  $H_2O_2$  soln., both in presence and absence of NaCl, was studied, the technic adopted being as follows: clean with 000 glass paper, weigh, after treatment with the corroding soln. collect the easily detachable  $Al_2O_3$  on a tared filter, and dry 36 hrs. at  $50^\circ$  side by side with the test sample to which adheres the remainder of the  $Al_2O_3$ . Within limits of 1.5-4%, the concn. of  $H_2O_2$  (without addn. of NaCl) has no appreciable effect on the rate of oxidation of Al as cast. Addn. of NaCl facilitates oxidation of Al, and

the rate of attack does not remain as const. over the  $H_2O_2$  concn. range of 1.5-4%, which is attributed to the fact that NaCl reduces the adhesion of the  $Al(OH)_3$  film to the metal, thus affording the O easier access to the metal. A 1%  $H_2O_2$  soln. has very little effect on duralumin, even at the end of 3 weeks, but corrodes Al to a considerable extent; on addn. of 1% NaCl the rate of attack of duralumin becomes greater than that of Al, but the reaction on duralumin is practically complete at the end of 2 hrs. The following explanation is put forward: the addn. of other metals (principally Cu) to Al in duralumin increases its resistance to oxidation by the non-conducting  $H_2O_2$ , but on addn. of NaCl, which is an electrolyte, electrochem. phenomena come into play, because of phys. and chem. differences in the surface of the metal, and facilitate oxidation. After heating 3 hrs. at  $480^\circ$  and quenching in cold water, there was no appreciable change in the rate of oxidation of either Al or duralumin; subsequent annealing for 88 hrs. at  $220^\circ$  did not cause any appreciable change in the rate of corrosion of Al, and slightly increased that of duralumin. Addn. of Mg reduces the corrodibility of Al by  $H_2O_2 + NaCl$ , while Si and Cu increase it. It was previously shown (C. A. 22, 3616) that the electrochem. theory applies in the case of the soln. of Al and its alloys in acids, and the mechanism of oxidation by  $NaCl + H_2O_2$  appears to be similar. The parallelism between the two, however, holds only as regards the rate of soln. per unit area, detd. after the end of the induction period (in the case of soln. in acids), and the loss of metal caused by attack of  $H_2O_2 + NaCl$ . Application of solution electromotive forces to the study of light alloys. AUBERT AND PROT. *Ibid* 214-7.—The purposes of the investigation were to find what coated metals would corrode least in case the coating were damaged, and to devise a method for differentiating alloys and detg. their resistance to corrosion by sea water. The results, which are given very briefly, indicate that the only metal suitable for protecting Al against sea water is Zn, while for duralumin Cd might also possibly be used. The detn. of soln. potential does not appear to furnish a convenient or satisfactory method of differentiating between different Al alloys, at least by the method used by A. and P. The corrosion of aluminum alloys. QUILLARD AND BASCOM. *Ibid* 217-20.—The results obtained so far would indicate that the corrodibility of an Al alloy can be detd. rapidly as a function of its chem. activity toward  $HgCl_2$  and of its soln. potential before and after chem. treatment; but the conditions of such a test have not yet been definitely ascertained. Study of the corrodibility of magnesium and ultra-light alloys. A. PORTEVIN AND E. PRETET. *Ibid* 259-72; cf. C. A. 21, 3338.—A more detailed account of the investigation. Value of radiometallographic methods for detecting fissures and internal defects in the metal of light alloys. JEAN COURNOT AND ALBERT ROUX. *Ibid* 272-4. Micrographic study of the corrosion of a few light alloys by sea water. R. CAZAUD. *Ibid* 274-81.—The resistance of light alloys to corrosion by sea water can easily be estd. by photographing before treatment and after immersion for 6, 24 and 72 hrs. in sea water; and it is considered that the classification which is thus obtained quite rapidly cannot differ appreciably from that obtained from tests of longer duration. As regards the effects of addn. of other elements to Al, Si and Mn have a distinctly beneficial effect and Mg has a harmful effect on the resistance to corrosion. Annealed duralumin is appreciably more corrodible than heat-treated duralumin, and the constituent elements seem to be attacked to a less extent than the solid soln. of Al. Effect of occluded gases on the solution of aluminum-copper alloys in hydrochloric acid. R. CAZAUD AND A. PETIT. *Ibid* 281-5.—The rate of evolution of  $H_2$  per unit area, at given temp. and concn., was used to characterize the soly. of the metal. Different alloys differ especially during the 1st stage of attack which Chaudron and Waché call the "induction period"; but 2 alloys having different rates of attack at the start may have the same rate at a subsequent stage, and C and P. define the attackability by the curve of vol. of  $H_2$  as a function of time. The rate of soln. increases with the fineness of the structure of the alloy. Dil HCl dissolves only the Al leaving the Cu in the form of a spongy mass having the same dimensions as the original metal. After a fusion in high vacuum, which eliminates the occluded gases, the corrodibility of the metal is always lowered. pH measurements applied to the study of corrosion of light alloys by sea water. ABEL PETIT. *Ibid* 285-6.—The investigation was carried out to det. the variation produced in the pH value of sea water by immersion of light alloys, with a view to classifying the alloys, if possible. The area of the test pieces had but little effect on the pH of the soln. The order of classification of a no. of alloys varies with the time of immersion. The expts. did not give any indication as to which of the constituent elements of the alloys increases or decreases their corrodibility. The method would seem to permit of differentiating between the samples; but under the limits of accuracy of the technic followed the

natural heterogeneity of the samples and the formation of a thin film of cold-hardened metal during polishing apparently produce greater variations than the constituents of the alloys. Method for rapidly estimating the permeability and adherence of varnishes used for the protection of light alloys. AUBERT AND G. DIXMIER. *Ibid* 307-8.—See Dixmier, C. A. 22, 4842. Protection of aluminum by coating in salt solutions. AUBERT AND G. DIXMIER. *Ibid* 309-10.—Each test piece was cleaned by washing successively with benzine, alc. and  $\text{H}_2\text{O}$ , dried on soft paper, and finally immersed in the reagent. They were then subjected to corrosion tests in sea water, and the degree of corrosion was judged from the appearance of the sample. Conclusions: (1) Salts, particularly  $\text{NH}_3$  salts, afford no protection, only  $\text{Na}_2\text{SO}_3$  possibly giving some protection, and only at  $100^\circ$ . (2) Water under pressure affords but poor protection. (3)  $\text{KHCrO}_4$ ,  $\text{Na}_2\text{CrO}_4$ ,  $\text{K}_2\text{Cr}_2\text{O}_7$ ,  $(\text{NH}_4)_2\text{Cr}_2\text{O}_7$ ,  $\text{KMnO}_4$ , Na vanadate, Na tungstate and Na molybdate in alk. ( $\text{Na}_2\text{CO}_3$  or  $(\text{NH}_4)_2\text{CO}_3$ ) soln. all give adherent coatings affording good protection, which could be greatly improved by the concurrent use of an oil or varnish. (4) No difference was observed due to differences in the degree of polishing. Protection of light alloys by tars. AUBERT AND A. PIGNOT. *Ibid* 310-2.—The properties required of a satisfactory varnish for light alloys are enumerated. The following gave satisfactory results: pitch (volatile 52-7%, m. p. (Kraemer) 68-75°) 65, PhOH 5, crude benzine (distd. 100-80°) 30; pitch 65,  $\text{C}_6\text{H}_5\text{N}$  5, crude benzine 30; pitch 65, light anthracene oil 10, crude benzine 25% by wt. A no. of varnishes with coumarone resin base were also studied, but were found unsatisfactory. Protection of light and ultra-light metals and alloys against corrosion by sea water by electroplating. JEAN COURNOT AND JEAN BARY. *Ibid* 312-8; cf. C. A. 21, 708; 22, 753.—The previously published report is reproduced in somewhat more detailed form. Cementation of light and ultra-light alloys in order to protect them against corrosion by sea water. JEAN COURNOT AND EUGÈNE PEROT. *Ibid* 318-25, 367-74; cf. C. A. 21, 1246, 2651, 2867.—A more detailed account of the investigation. Protection of aluminum and light alloys against corrosion by sea water by means of electrolytic cadmium plating. J. COURNOT. *Ibid* 374-6; cf. C. A. 22, 753.—Satisfactory coating could not be obtained with  $\text{CdSO}_4$  in  $\text{H}_2\text{SO}_4$ . Best results for coating Al and duralumin were obtained with a bath contg:  $\text{CdCO}_3$  11.6 g., KCN 35 g., Na phosphate 5 g.,  $\text{K}_4\text{Fe}(\text{CN})_6$  7.5 g., gelatin 2.5 g. per l., 0.5-0.7 amp. per sq. dm. and 3-5 v. The coatings obtained under these conditions did not fail in bending and stamping tests until the supporting metal cracked, and corrosion tests in sea water gave entirely satisfactory results. Excellent results were also obtained by applying a light Cd coating, followed by Cr-plating at 13-17 amp. per sq. dm., under 4-5 v., at exactly  $50^\circ$ , in a bath contg: chromic acid (free from  $\text{H}_2\text{SO}_4$ ) 250 g.,  $\text{Cr}_2(\text{SO}_4)_3$  5 g., crystd.  $\text{Na}_2\text{CO}_3$  14 g., boric acid 3 g. per l.

478,643, Jan. 13, 1927. A lattice for Cowper's app. or regenerative chambers is described.

**Treatment of ores.** PETER TROTZIG. Ger. 477,950, Feb. 20, 1927. Slime from heavy ores is subjected to an elec. current to produce a foamy mass.

**Device for sorting and grading ores, coal and coke.** WM. ROSS. Ger. 478,721, Jan. 27, 1927.

**Separating ore constituents by passage through an alternating magnetic field.** J. A. SEEDÉ (to British Thomson-Houston Co., Ltd.). Brit. 305,102, Jan. 30, 1928.

**Apparatus for sorting mineral pulps hydraulically.** THOMAS G. MARTYN. U. S. 1,724,100, Aug. 13. Structural features.

**Rotary cylindrical apparatus for wet concentration of ore constituents.** A. R. BROWN and J. I. YEATS. Brit. 304,508, March 12, 1928. Structural features.

**Vertical retort apparatus (and mode of working) for reducing iron, copper or nickel ores.** F. L. DUFFIELD. Brit. 304,174, Oct. 10, 1927. Structural features.

**Treating tin-bearing ores, etc.** W. WITTER, M. LISSAUER, H. LISSAUER and B. GRIESMANN (trading as M. Lissauer et Cie). Brit. 304,829, Oct. 27, 1927. Sn ores and other Sn-bearing materials are mixed with a reducing material such as C and heated in stages from 200° to 800° to remove As, Sb, Pb and Bi successively by volatilization without affecting the Sn. Zn also may be partly removed in a similar manner. Cu and Ag may be sepd. by use of NaCl in a subsequent treatment. A rotary furnace may be used, and various details are given.

**Recovering or purifying light metals.** I. G. FARBENIND. A.-G. (Adolf Beck, inventor). Ger. 479,481, Jan. 16, 1926. See U. S. 1,661,526 (C. A. 22, 1322).

**Tin recovery from scrap.** LES PETITS FILS DE F. DE WENDEL ET CIE. Brit. 304,639, Jan. 25, 1928. Residues, sweepings, etc., from the manuf. of tin-plate are treated with hot alk. solns. such as NaOH and Na<sub>2</sub>CO<sub>3</sub> together. An app. is described.

**Apparatus for sooting molds.** HERMANN MÜLLER. Ger. 477,988, May 15, 1928. A radial nozzle device for sooting molds is described.

**Molds for casting plated ingots.** S. H. CARBIS (to Aluminium, Ltd.). Brit. 304,752, Jan. 27, 1928. Structural features.

**Ingot molds.** M. BLAGÉ and SOC. ANON. DES FORGES DE VIREAUX-MOLHAIN. Brit. 304,302, Jan. 20, 1928. Structural features.

**Aluminum castings.** EUGEN STRASSER (to Max Dietiker). U. S. 1,724,624, Aug. 13. Molds are formed of a mixt. of molding sand and finely divided Cu ore.

**Alloy-surface castings.** ROGER WILLIAMS (to Electro Metallurgical Co.). U. S. 1,725,039, Aug. 20. Alloys are formed on the surface of castings formed mainly from iron or steel by casting the metal in molds which are coated with metal particles contg. Cr such as ferro-Cr together with woven org. material and a material such as NaF, which is capable of inhibiting the formation of oxides and of promoting the uniformity of the coating.

**Castings with a chromium alloyed surface.** WALTER M. MITCHELL (to Electro Metallurgical Co.). U. S. 1,724,299, Aug. 13. Base metal castings contg. Cr 5-15% throughout and which may be otherwise composed mainly of Fe and Ni are provided with a Cr alloy surface contg. over 25% Cr, which avoids cracking and warping. Cf. C. A. 22, 3387.

**Die-casting apparatus.** WALTER O. WILL and ERIC CARLSON (to Stewart Die Casting Corp.). U. S. 1,724,331, Aug. 13. Structural features.

**Die-casting apparatus.** DAVID J. CONANT (to Westinghouse Elec. & Mfg. Co.) U. S. 1,724,395, Aug. 13. Structural features.

**Die-casting machine.** INTERNATIONAL DE LAVAUD MFG. CORP. Ger. 478,887, Oct. 25, 1927.

**Die-casting mold.** CONRAD VAUGHAN and F. H. ADAMS (1926), LTD. Ger. 477,992, Oct. 21, 1927. Details are given.

**Nitrogenized steel dies for stamping metals.** P. F. M. AUBERT, A. J. P. DUVAL and H. A. M. DUVAL (trading as Aubert et Duval Frères). Brit. 305,539, Feb. 6, 1928. Various details of prepreg. nitrogenized dies are given.

**Rolling strip metal.** BELL TELEPHONE LABORATORIES, INC. Brit. 304,849, Oct. 31, 1927. Strips of metal such as the Fe-Ni alloy "Permalloy" for continuous inductive loading of a. c. conductors are made by preforming wire to strip form and then accurately sizing the strip by cold-rolling. An app. is described.

**Blast-furnace operation.** VULCAN-FEUERUNG A.-G. Brit. 304,887, Dec. 16, 1927. Water is supplied to the smelting zone of blast or cupola furnaces by spraying it so close to the furnace tuyères that the water enters in liquid form. A nozzle construction is described. Cf. C. A. 23, 811.

**Blast-furnace charging apparatus.** A. E. HANDY (to Waygood-Otis, Ltd.). Brit. 304,772, Jan. 28, 1928. Structural features.

**Cupola furnace.** MAX FELDER. Ger. 478,849, May 23, 1926. The furnace has an adjacent hot hearth for the refining and superheating of the molten metal.

**Smelting furnace.** CLEMENT H. MACE. U. S. 1,724,490, Aug. 13. Various details of blast furnace tuyère construction, etc., are described.

**Reverberatory smelting furnace.** HENRY L. CHARLES. U. S. 1,724,340, Aug. 13. Structural features.

**Construction and operation of regenerative open-hearth furnaces used in steel making.** GEORGE H. ISLEY (to Morgan Construction Co.). U. S. 1,724,656, Aug. 13.

**Continuous furnace for annealing and heat-treating metals.** ARTHUR T. KATHNER. U. S. reissue 17,413, Aug. 20. See original pat. No. 1,669,902 (C. A. 22, 2351).

**Continuous open-ended furnace for annealing and heat treating metals.** ARTHUR T. KATHNER. U. S. 1,725,398, Aug. 20. Structural features.

**Spongy iron.** HÖGANÄS-BILLESOLMS AKTIEBOLAG. Ger. 478,563, Dec. 3, 1927. Spongy Fe is prep'd. from pressed ore mixed with C and Ca compds. contg. S by heating without admitting air or gas. Cf. C. A. 23, 1863.

**Cementing iron and steel.** CARL LUTZ. Ger. 479,402, Oct. 29, 1926. Finely divided tobacco waste or tobacco dust is used as the source of C. It may be mixed with small amts. of carbonaceous substances such as wood charcoal.

**Rust-proofing iron and steel.** W. H. COLE. Brit. 305,386, Feb. 28, 1928. In a process such as is described in Brit. 289,906 (C. A. 23, 811), a soln. is used which is prep'd from Fe oxide 25, ZnO 15, Cr oxide 1 and Al 1 part, separately dissolved in  $H_3PO_4$ , the solns. being then mixed and further treated with  $K_2Cr_2O_7$ ,  $K_2CrO_4$ ,  $NH_4$  phosphate or naphthalene. Cf. C. A. 23, 3894.

**Heat-treating steel.** H. HANEMANN. Brit. 304,196, Jan. 16, 1928. Steel pieces are first heated for a long time to 20–50° below the crit. points and then heated quickly and uniformly throughout (suitably by direct resistance heating or by eddy currents) beyond the crit. points, and allowed to cool.

**"High-speed" steels.** STAHLWERK BECKER A.-G. Brit. 305,105, Dec. 30, 1926. In high-speed steels contg. Co, the C content is increased, above 0.6%, by 0.04% for each 1% of Co. Cf. C. A. 22, 3877.

**Refining nickel and its alloys.** BELL TELEPHONE LABORATORIES, INC. Brit. 304,371, Oct. 20, 1927. Ni or alloys formed mainly of Ni, while molten, are treated with V, Ta or Nb in small proportions and V may be followed by a small quantity of Mg. Various details are given.

**Bearing alloy containing copper and lead, etc.** ALBERT H. ACKERMAN (to Ackermite Co.). U. S. 1,724,896, Aug. 20. A bearing metal is formed from Cu and Pb combined while molten with S, Sb sulfide, As sulfides and As oxide.

**Bearing metals containing lead and other metals.** E. ABEL. Brit. 304,548, May 18, 1928. Pb is used with less than 1% Rb or Cs or both and also Na; other elements also may be present such as alkali metals, alk. earth metals, Al, Be, Cd, Co, Cu, Ni, Bi, Zn, Sn, Sb, As, P, S, Se and Si.

**Brazing alloy.** ANDREW E. AVERRETT (to General Elec. Co.). U. S. 1,724,818, Aug. 13. An alloy suitable for use as a substitute for ordinary silver solder comprises Cu about 54, Zn about 36 and Ag about 10%. Cf. C. A. 23, 2146.

**Aluminum-silicon alloys.** A. PHILLIPS, E. BARON and METROPOLITAN-VICKERS ELECTRICAL CO., LTD. Brit. 305,311, Nov. 24, 1927. Al-Si alloys contg. 5–15% Si are obtained in the modified condition by heating the molten alloy with anhyd.  $Na_2CO_3$  or other alkali metal carbonate or bicarbonate.

**Aluminum-silicon alloys.** SOC. D'ÉLECTROCHIMIE D'ÉLECTROMÉTALLURGIE ET DES ACIERIES ÉLECTRIQUES D'UGINE. Brit. 305,640, Feb. 8, 1928. Crude Al-Si alloys, which may be elec. furnace products contg. over 67% Al and contg. also impurities such as Fe, C and Ti, are submitted to liquation (suitably at about 575°) for producing a more refined alloy contg. a higher proportion of Al and a solid residue contg. a greater proportion of Si together with most of the impurities. The material may be preliminarily heat-treated to increase the size of the Si crystals. Cf. C. A. 23, 4183.

**Copper-aluminum alloys plated with gold alloys.** VICTOR D. DAVIGNON (to General Plate Co.). U. S. 1,725,445, Aug. 20. Various details are given of the manuf. of plated products.

**Iron-chromium-nickel alloys.** F. KRUPP A.-G. Brit. 305,654, Feb. 9, 1928. In alloys such as those which contain Cr 18–25 and Ni 7–12%, together with Fe, the quantity of other constituents such as C is so det'd. that the alloys retain an austenitic

structure when heated to 600–900°. The C may be less than 0.07%, and other elements such as Mo and Cu may be present.

**Iron alloys.** T. D. KELLY. Brit. 304,893, Dec. 23, 1927. A base alloy of Fe contg. Si or Mn (with or without C and which may also contain 0.2–2.0% of V, Mo or W) is mixed in a non-oxidizing atm. with alloys contg. Cr, Ni and Cu (or Cr and Ni or Cr and Cu) 5–20 parts each together with C-free Fe 60–80 parts, to form finished alloys contg. 2–20% Si or Mn or both. Melting may be effected in an elec. furnace or by use of powdered fuel substantially free from S and burnt by hot air or gases under pressure. Al, Mg, powdered C, ferro-Si or ferro-Mn may be used as deoxidants.

**Magnesium and its alloys.** I. G. FARBENIND. A.-G. Brit. 305,197, Feb. 2, 1928. The resistance to corrosion of Mg and its alloys is improved by treating them for an hr. or more with a boiling aq. soln. of a bichromate (suitably after a preliminary treatment with dil. HNO<sub>3</sub>).

**Protecting magnesium or its alloys from corrosion.** METALLGES. A.-G. (formerly Metallbank und Metallurgische Ges. A.-G.). Brit. 305,544, Feb. 6, 1928. Pure Al or an Al alloy such as an Al-Si alloy is used for coating Mg or Mg alloys.

**Steel alloys.** H. J. SCHIFFLER. Brit. 304,303, Jan. 19, 1928. Steels resistant to scaling up to 800° contain Al 1–4% with or without addn. of other metals such as Mn, Cr, W, Mo, Ti and V. They may be annealed at 750–950° and quenched, with or without reheating to 500–750°. Steel alloys contg. Cr or both Cr and Ni and higher proportions of Al also are mentioned.

**Heat-resistant steel alloy.** OESTERREICHISCHE SCHMIDTSTAHLWERKE A.-G. Brit. 305,047, Jan. 28, 1928. Steel alloys are formed contg. up to 25% Al, about 0.8–2.0% C and up to 6% Si, with or without up to 10% Cu and up to 25% Cr. Ni may be used instead of part or all of the Cu.

**Zinc alloys.** W. M. PEIRCE and E. A. ANDERSON (to New Jersey Zinc Co.). Brit. 305,651, Feb. 9, 1928. See U. S. 1,716,599 (C. A. 23, 3657).

**Heat-treatment of steel bars.** GEORGE LANGFORD (to McKenna Process Co. of Ill.). U. S. 1,724,031, Aug. 13. After heating to approx. its hardening temp., the temp. of the bar is slowly lowered to the crit. point for the steel, and the bar is afterward slowly cooled in order to effect oil tempering.

**Salt bath for heat-treating metals.** ARTHUR E. BELLIS. U. S. 1,724,551, Aug. 13. A salt bath comprising KCl 79 and anhyd. Na borate 20 parts is used. U. S. 1,724,552 specifies the use of B<sub>2</sub>O<sub>3</sub> as an oxide solvent in salt baths for heat-treating metals.

**Hardening metal articles by nitrogenization.** P. F. M. AUBERT, A. J. P. DUVAL and H. A. M. DUVAL (trading as Aubert et Duval Frères). Brit. 304,783, Jan. 26, 1928. Articles of steel or cast iron and which contain one or more of the elements Al, Si, Mn, Ni, Cr, Mo, W, V, Ti and Zr are nitrogenized in their marginal layers sufficiently to impart resistance to the action of corroding agents, and only for such a time that the condition of the nitrogenizing agents is not altered. Cf. C. A. 23, 800.

**Case-hardening.** DEUTSCHE GOLD-UND SILBER-SCHNEIDANSTALT VORM ROESSLER. Brit. 304,209, Jan. 16, 1928. Articles of iron or steel are hardened in a molten bath of salts such as chlorides admixed with finely divided C such as charcoal, with or without caustic alkalis, carbonates, cyanides, cyanamides, etc., preferably at 900–950°.

**Protecting metal surfaces.** VEREINIGTE STAHLWERKE A.-G. (Arthur Boeddeker, inventor). Ger. 478,902, May 8, 1927. App. for coating metal objects with a protective film of condensed oil vapor is described.

**Carbonizing the surface of metals.** H. M. ELSEY (to Westinghouse Elec. & Mfg. Co.). Brit. 305,465, Feb. 4, 1928. Metals such as Ni, W and Ni alloys, which may be used in electron tubes, are first superficially oxidized and then heated to 700–1000° in a hydrocarbon gas (which may be dild. with N, A or He) to effect reduction and carbonization.

**Carbonizing the surface of metals.** C. B. ÜPP and L. SUTHERLIN (to Westinghouse Elec. & Mfg. Co.). Brit. 305,467, Feb. 4, 1928. Metal such as Ni, Mo, W or a Ni alloy, which may be used in electron tubes, is passed through a tube through which is passed also a hydrocarbon gas such as C<sub>2</sub>H<sub>2</sub>, CH<sub>4</sub>, C<sub>2</sub>H<sub>4</sub>, petroleum ether or natural gas, and heated electrically or by gas burners.

**Treating aluminum surfaces to prevent corrosion.** B. JIROTKA. Brit. 305,149, Oct. 28, 1927. Al or Al alloys are treated with HNO<sub>3</sub> of a strength of at least 25% for 15–60 min. Different colored effects may be obtained by adding to the acid small quantities of salts of Cr, Cu, Co, Ni, Zn or other suitable metals, and an alkali chromate may be added to increase the oxidizing action. In some cases, the Al article while immersed in the acid is connected with a C electrode so as to form a closed circuit. After the treatment the metal may be coated, e. g., with a varnish, paint, celluloid or resin.

**Coating surfaces with osmium.** N.-V. PHILIPS' GLOEILAMPENFABRIEKEN. Brit. 304,580, Oct. 31, 1927. A wire or rod of W, Mo, Ni or C, or other article to be coated with Os is heated in an atm. contg. one or more volatile carbonyl halogen compds. of Os, preferably the chloride.

**Coating surfaces with rhodium, iridium and ruthenium.** N. V. PHILIPS' GLOEILAMPENFABRIEKEN. Brit. 304,396, Oct. 31, 1927. The articles to be coated (which may be metallic or non-metallic) are heated in an atm. contg. one or more volatile compds. of the coating metal such as the carbonyl chlorides.

**Apparatus for cleaning and degreasing metal objects.** ALEXANDER WACKER GES. FÜR ELECTROCHEMISCHE INDUSTRIE G. M. B. H. (Georg Wolff, inventor). Ger. 479,389, Sept. 21, 1927.

**Welding.** TH. GOLDSCHMIDT A.-G. (Fritz Wust, inventor) Ger. 478,544, Sept. 3, 1925. Iron cuttings are made into bundles, heated to welding temp. electrically, and subjected to pressing, hammering or rolling.

**Welding aluminum-plated sheet iron ware.** F. JORDAN Brit. 304,170, Oct. 15, 1927. Al-plated sheet iron parts are welded together autogenously by elec resistance pressure electrodes so as to convert the Al into oxide, which melts together with the iron to complete the weld.

**Rosin-core solder.** PERRY C. RIPLEY (to Kester Solder Co.). U. S. 1,724,680, Aug. 13. A permanently plastic rosin-contg. material fills and seals a solder tube.

## 10—ORGANIC CHEMISTRY

CHAS. A. ROUILLER AND CLARENCE J. WEST

**Waxes and boghead coals as mother substances of petroleum.** IV. N. D. ZELINSKII AND K. P. LAVROVSKI. *Ber.* 62B, 1264-6 (1929); cf. *C. A.* 22, 2920.—Beeswax heated with 30% of  $\text{AlCl}_3$  began to decomp. at  $120^\circ$  and yielded 80% of liquid and solid products from which was isolated a substance volatile with steam, b.  $70\text{--}300^\circ$ , consisting chiefly of paraffin hydrocarbons; the portion non-volatile with steam yielded on extn with  $\text{Et}_2\text{O}$  liquid paraffins, b.  $90\text{--}250^\circ$ , and solid paraffins, m.  $59^\circ$ , mol. wt (Rast) 317, and m.  $70\text{--}1^\circ$ , mol. wt. 426. From 300 g of a boghead coal heated under 10 mm. with 30%  $\text{AlCl}_3$  was obtained 107 g. condensate, most of which solidified. The hydrocarbons volatile with steam b.  $90\text{--}210^\circ$  and reacted with  $\text{KMnO}_4$ ; on hydrogenation with Pt-charcoal they gave a light naphtha oil in which cycloparaffin hydrocarbons predominated. The portion of the condensate not volatile with steam consisted chiefly of a paraffin m.  $63\text{--}4^\circ$ , mol. wt. 380. There is no doubt that the tar, so rich in unsatd. compds., obtained by the dry distn. of Siberian boghead coals differs materially in its chem. nature from that obtained by decomp. such a boghead coal with  $\text{AlCl}_3$ . C. A. R.

**The gradual combustion of hydrocarbons.** STANISLAS LANDA. *Paliva a topeni* 11, 1-4 (1929); cf. *C. A.* 22, 1948.—I. The oxidation of paraffin yielded propionic, formic, acetic, capric and caproic aldehydes, MeOH and EtOH,  $\text{Et}_2\text{CO}$  and  $\text{MeCOEt}$ . The yield of low alcs and ketones was large; higher alcs could not be found. This suggests that paraffin contains branched C chains besides the *n*-chain. II. Triacontane  $\text{Me}(\text{CH}_2)_{28}\text{Me}$  was prepd. by the electrolysis of alc. K palmitate and from a Japanese wax. The reaction proceeds thus:  $2\text{C}_{15}\text{H}_{31}\text{COO} \longrightarrow \text{C}_{30}\text{H}_{62} + 2\text{CO}_2$ . The product settles out on the surface as an oil. It was washed with alc. KOH,  $\text{H}_2\text{O}$ , and rectified *in vacuo*. After redistn., it had the appearance of paraffin; it crvstl. from  $\text{C}_6\text{H}_6$  in large plates, m.  $66^\circ$ . The gradual combustion occurred from  $290\text{--}310^\circ$ . At  $330^\circ$  the triacontane burned with a flame. At  $300^\circ$  very little cracking occurs without catalysts. The evolved gases were collected and showed  $\text{CO}_2$  0.49%, unsatd. hydrocarbons 0.47%,  $\text{O}_2$  16.63%, H 0.00%, CO 1.65%,  $\text{CH}_4$  and homologs 0.00%, N 80.76%. The sol. products contained no fraction b. below  $100^\circ$ . The soln. had an aldehyde odor, colored Schiff's reagent, reduced  $\text{NH}_3\text{-AgNO}_3$ , and did not give the  $\text{CHI}_3$  reaction. AcH was not present, EtOH was absent (even the test was negative); MeOH could not be detected either as MeI or by its reaction with salicylic or  $\text{H}_2\text{SO}_4$ . HCHO was demonstrated by Hehners', Marquis', etc., reactions. After burning 200 g. triacontane, 73 cc. 1 *N* NaOH was necessary to neutralize the acids present. The acid which was identified was  $\text{HCO}_2\text{H}$ ; neither AcOH nor  $\text{EtCO}_2\text{H}$  could be demonstrated. The oil residue constituted 50–60% of the original triacontane; it was redistd. at 14 mm. Hg into 5 fractions: 1, b.  $0\text{--}100^\circ$ ,  $d_{10}$  0.879, 9% of total; 2, b.  $100\text{--}150^\circ$ ,  $d$  0.881, 14% of total; 3, b.  $150\text{--}200^\circ$ , 7%; 4, b.  $200\text{--}250^\circ$ , 14%; 5, residue b. above  $250^\circ$ , 56% of the

total. The acids in fractions 3 and 4 formed soap with alkalis. Fraction 1 was satd. with  $\text{Na}_2\text{SO}_4$  and filtered off; all of the soln. combined with the  $\text{Na}_2\text{SO}_4$ . The freed aldehydes were identified as caproic and heptylic. The semicarbazone of caproic aldehyde m.  $104-6^\circ$ . The acids in the residue were shown to be butyric and valeric. The main products of oxidation were aldehydes, and from them acids were formed. Ketones and alcs. do not form unless side chains are present. The splitting of the triacontane mol. occurs in several places for aldehydes of odd and even nos of C atoms result. The gradual combustion of petroleum oils may be used analytically; those oils lacking paraffin, after a gradual oxidation, fail to give an aldehyde test (Schiff reagent); those oils contg. paraffin give a positive test.

Correction. The nitration of methane- and ethanesulfonyl-*p*-phenetidines. FREDERIC REVERDIN. *Helv. Chim. Acta* 12, 786(1929).—A few detailed corrections to R.'s paper are given (cf. *C. A.* 23, 2704).

Polymerization of ethylene by electric discharge. Synthesis of butene and hexene. GEORGES MIGNONAC and RENÉ VANIER DE SAINT-AUNAY. *Compt. rend.* 189, 1068 (1929); cf. *C. A.* 23, 3437.— $\text{C}_2\text{H}_4$  was continuously circulated through a high-frequency discharge at  $0-10^\circ$  and then through a condenser at  $-60^\circ$ , collecting 90-5% of the  $\text{C}_2\text{H}_4$  as polymers. The product was fractionated and identified by  $\text{O}_3$  oxidation as 1-butene (I) and 1-hexene (II). Lowering the temp. of the condenser to  $-80^\circ$  and circulating the gas more rapidly gave a product which was essentially I; at higher condenser temps., the yield of II was increased, showing that 2 consecutive reactions were taking place, i. e.,  $2\text{C}_2\text{H}_4 \rightarrow \text{C}_4\text{H}_8$  and  $\text{C}_4\text{H}_8 + \text{C}_2\text{H}_4 \rightarrow \text{C}_6\text{H}_{12}$ .

The action of a zinc-copper couple on methylene iodide. GUV EMSCHWILLER. *Compt. rend.* 188, 1555-7(1929); cf. *C. A.* 21, 563.— $\text{CH}_2\text{I}_2$  (I) in anhyd.  $\text{Et}_2\text{O}$  is attacked by Zn-Cu, giving  $\text{C}_2\text{H}_4$  and  $\text{ICH}_2\text{ZnI}$  (40% yield) which with  $\text{I}_2$  yields I and  $\text{ZnI}_2$ , with  $\text{H}_2\text{O}$ ,  $\text{MeI}$ ; with  $\text{O}_3$ ,  $\text{CH}_2\text{O}$  and  $\text{ZnI}_2$ ; with heat,  $\text{C}_2\text{H}_4$ . Some  $\text{CH}_2(\text{ZnI})_2$  is also obtained which with  $\text{H}_2\text{O}$  yields  $\text{C}_2\text{H}_4$  and  $\text{Zn}(\text{OH})_2$ .

Synthetic alcohols. Manufacture of synthetic ethyl and methyl alcohol by the mining company of Béthune. PAUL DAMM. *Mon. prod. chim.* 11, No. 114, 15; *Chem. Zentr.* 1928, II, 2208.—A report on the synthetic manuf. of EtOH and MeOH from coke-oven gases. The gases consist chiefly of H,  $\text{CH}_4$ ,  $\text{C}_2\text{H}_4$ , CO and N. H is sep'd. by liquefaction of the rest of the gases.  $\text{C}_2\text{H}_4$ ,  $\text{CH}_4$  and CO can be sep'd. by the same method.  $\text{C}_2\text{H}_4$  is converted into EtOH by means of  $\text{H}_2\text{SO}_4$ . A suitable mixt. of H, CO and N serves for the synthesis of MeOH according to the equation:  $\text{CO} + 2\text{H}_2 = \text{CH}_3\text{O}$ . For this reaction a catalyst is used whose compn. is kept secret.  $\text{NH}_3$  is synthesized from the remaining mixt. of H and N. It is still more advantageous to make MeOH from water gas. MeOH should have a promising future because it is an excellent motor fuel.

Preparation of *dl*-citronellol. JEAN DOEUVRE. *Bull. soc. chim.* 45, 403 12(1929), cf. *C. A.* 23, 4187.—Treatment of 2-methyl-2,6-heptenol with  $\text{PBr}_3$  gave a mixt. (I) contg. 22% of 2-methyl-6-bromo-1-heptene and 76% of 2-methyl-6-bromo-2-heptene. Treating 41 g. of I with 5.2 g. of Mg and a trace of  $\text{I}_2$  in 60 cc. of  $\text{Et}_2\text{O}$  gave an organo-magnesium compd. which was added to an equiv. quantity of  $\text{ClCH}_2\text{CH}_2\text{OMgBr}$  (obtained from  $\text{ClCH}_2\text{CH}_2\text{OH}$  (II) and  $\text{EtMgBr}$ );  $\text{Et}_2\text{O}$  was evap'd. from this product, which was then heated for 30 min. in a  $\text{H}_2\text{O}$  bath, hydrolyzed with ice  $\text{H}_2\text{O}$  and  $\text{HOAc}$  and finally fractionated giving: (a) b.  $115-20^\circ$ , 2-methyl-2-heptene (III) and 2-methyl-1-heptene (IV) which gave 2-methyldibromoheptane,  $b_{15}$   $108-10^\circ$ , with  $\text{Br}_2$  in  $\text{CCl}_4$ , (b) b.  $120-30^\circ$  contg. II; (c)  $b_{15}$   $115-7^\circ$ , 5 g. of *dl*-citronellol (V),  $d_4^{20}$  0.863,  $n_D^{20}$  1.4588 (allophanate, m.  $105-6^\circ$ ); and (d)  $b_1$  over  $117^\circ$ , 8-10 g. of polymers. Treatment with  $\text{O}_3$  indicated that V was 25% of the  $\alpha$ -form (2,6-dimethyl-1,8-octenol) and 76% of the  $\beta$ -form (the 2,8-octenol), the isomer ratio being the same as in the starting material I. Treating the Mg deriv. obtained from 38 g. of I with an excess of ethylene oxide in the cold, adding 100 cc. of PhH, evap'd. off the  $\text{Et}_2\text{O}$  and refluxing at the b. p. of PhH for 40 min. gave 4 g. of V after hydrolyzing and fractionating. Treatment of the Mg

deriv. of neopentene and 40% of a mixt.,  $b_{15}$   $100-0^\circ$  (cor.),  $d_4^{20}$  0.809,  $n_D^{20}$  1.4021,  $n_D^{25}$  1.384, contg. 2,6-dimethyl-2,7-heptenol and 2,6-dimethyl-1,7-heptenol.  $b_{15}$   $99-100^\circ$ , in  $\text{CCl}_4$ , this latter mixt. gave 45% of the corresponding 7-bromoheptene,  $b_{15}$   $108-10^\circ$ ,  $d_4^{15}$  1.123,  $n_D^{15}$  1.4749, which was allowed to react with Mg and then with VI under  $\text{H}_2$ , producing a mixt. which was fractionated to give 2,6-dimethyl-2-heptene and 2,6-dimethyl-1-heptene, b.  $142-3^\circ$ ,  $d_4^{14}$  0.768,  $n_D^{14}$  1.4321, and V. In the course of this and

previous work (*loc. cit.*) V and *d*-citronellol have been prepd. by a no. of methods, in each case the product apparently being identical with the 1-*rhodinol* of Barbier and Rouveault (see Grignard and D., *C. A.* 22, 3879, 4104). The conclusion is drawn that the product of B. and B. is a mixt. of the  $\alpha$ - and  $\beta$ -isomers of citronellol. A. S. C.

**Diisopropyl sulfate and dipropyl sulfate.** R. LEVAILLANT. *Compt. rend.* 188, 261-3 (1929).—Contrary to previous reports, the neutral iso-Pr sulfate (I) can easily be prepd. in 30% yields by the reaction between  $\text{Me}_3\text{CHOH}$  and  $\text{SO}_2\text{Cl}_2$  in half its wt. of  $\text{CCl}_4$ , the reaction being kept very well cooled. Purification is accomplished by distn. under 3-4 mm. at less than  $90^\circ$  and the resulting ester is quite stable at ordinary temps.,  $b_p$  78- $80^\circ$ ,  $n_D^{17}$  1.409,  $d_4^{20}$  1.118,  $d_4^{17}$  1.101, mol. refraction 40.91 (theory, 40.98). Both I and normal  $\text{Pr}_2\text{SO}_4$  react with  $\text{PhONa}$  to give the appropriate ethers in yields of 47 and 66%, resp.  $\text{Me}_3\text{CHOPh}$ ,  $n_D^{17}$  1.4983,  $d_4^{20}$  0.959,  $d_4^{17}$  0.943, mol. refraction 42.32 (theory 42.24).  $\text{ProPh}$ ,  $b_p$  81°,  $n_D^{14}$  1.503,  $d_4^{20}$  0.969,  $d_4^{14}$  0.955, mol. refraction 42.13 (theory 42.24). Normal  $\text{Pr}_2\text{SO}_4$  ( $b_p$  82°,  $d_4^{20}$  1.042,  $d_4^{16}$  1.026,  $n_D^{16}$  1.426) is oxidized by  $\text{KMnO}_4$  to the sulfate,  $b_{\text{about } 2.5}$  87- $9^\circ$ ,  $n_D^{18}$  1.414,  $d_4^{17}$  1.12. C. H. PRET

**Preparation of free halogenated aliphatic amines.** M. DE MONTMOLLIN AND J. ZOLLIKER. *Helv. Chim. Acta* 12, 610-6 (1929).—The following general method yields the salts of  $\beta$ -haloalkylamines: (1)  $\text{EtOCHClCH}_2\text{Cl}$

(2)  $\text{EtOCHRCH}_2\text{Cl} + \text{satd. alc. NH}_3 \xrightarrow{160-80^\circ} \text{EtOCHRCH}_2\text{NH}_2$  (plus secondary and tertiary amines). (3)  $\text{EtOCHRCH}_2\text{NH}_2 + \text{satd. aq. HCl} \xrightarrow{150^\circ} \text{RCHClCH}_2\text{NH}_2 \cdot \text{HCl}$ .  $\gamma$ -Haloalkylamines are prepd. as follows: (4)  $\text{RCH(ORCH}_2\text{CN} \xrightarrow{\text{reduce}} \text{RCH(ORCH}_2\text{CH}_2\text{CH}_2\text{NH}_2$ . (5) Hydrolyze as in (3). The following new

compds. are described:  $\beta$ -chlorobutylamine picrate, yellow, m.  $124^\circ$ ; *N*-[ $\beta$ -chlorobutyl]-benzamide, m.  $69^\circ$ ; di-[ $\beta$ -bromobutyl]amine-HBr;  $\gamma$ -ethoxybutylamine, b.  $142-3^\circ$ ;  $\gamma$ -methoxybutylamine, b.  $128-30^\circ$  (picrate, yellow, m.  $110-2^\circ$ ; phenylthiourea, m.  $84^\circ$ );  $\gamma$ -propoxybutylamine, b.  $160^\circ$  (picrate, yellow, m.  $101^\circ$ ; phenylthiourea, m.  $67^\circ$ );  $\gamma$ -bromobutylamine picrate, yellow or orange, m.  $152^\circ$ . All previous work described in the literature indicates that the free halogenated amines immediately condense to ring compds. By the following procedure, de M. and Z. obtained the free amines pure enough to analyze. The salt was dissolved in water and treated with the theoretical amt of  $\text{Na}_2\text{CO}_3$ . The pptd. oil was distd. *in vacuo* and immediately analyzed. In a few hrs. at room temp. or very quickly at  $120-30^\circ$ , condensation to ring compds. resulted. The  $\beta$ -compds. are more stable than the  $\gamma$ -, and the Cl derivs. more stable than Br compds. They prepd.  $\beta$ -chlorobutylamine,  $b_p$   $50^\circ$ ; di-[ $\beta$ -chlorobutyl]amine,  $b_p$   $91^\circ$ ;  $\gamma$ -bromobutylamine,  $b_p$   $57^\circ$ . M. A. DAHLEN

**Decomposition of quaternary ammonium and sulfonium hydroxides.** IV. JULIUS v BRAUN, WILHELM TRUFFERT AND KARL WEISSBACH. *Ann.* 472, 121-42 (1929); *et C. A.* 18, 1835.—The work of Hanhart and Ingold (*C. A.* 21, 2660) is discussed. The influence of  $\text{CO}_2$  taken up from the air during the evapn. of the aq. soln. on the decompn. of quaternary  $\text{NH}_4$  bases is shown by the following figures (the 1st figures are the % of unsatd. compd. without and with  $\text{CO}_2$ ; the last 2 figures the % of satd. tert. base under the same conditions):  $\text{BuNMe}_3\text{OH}$ , 77, 23, 10, 50;  $\text{C}_{10}\text{H}_{21}\text{NMe}_3\text{OH}$ , 62, 25, 30, 72;  $\text{C}_{12}\text{H}_{25}\text{NMe}_3\text{OH}$ , 82, 15.5, 18, 84.5;  $\text{C}_8\text{H}_{19}\text{NMe}_3\text{OH}$ , 82, 65, —, about 20. *Docosyl bromide*,  $b_p$   $225^\circ$ , m.  $44^\circ$ ;  $\text{Me}_3\text{N}$  gives nearly quant. *docosyltrimethylammonium bromide*. The decompn. products are  $\Delta^1$ -docosylene,  $b_p$   $174-8^\circ$ , m.  $41^\circ$  and *docosyldimethylamine*,  $b_p$   $190^\circ$ , m.  $41^\circ$ ; HCl salt, m.  $180^\circ$ ; picrate, m.  $84^\circ$ . The influence of adding 3-4 vols. of  $\text{C}_2\text{H}_5(\text{OH})_2$  on the decompn. is shown in the following figures (again the figures refer to the unsatd. compd. when the base is heated alone and with  $\text{C}_2\text{H}_5(\text{OH})_2$  and the satd. tert. base under the same conditions):  $\text{C}_7\text{H}_{19}\text{NMe}_3\text{OH}$ , 77, 16.5, 10, 69;  $\text{C}_{10}\text{H}_{21}\text{NMe}_3\text{OH}$ , 62, 14, 30, 76;  $\text{C}_8\text{H}_{19}\text{NMe}_3\text{OH}$ , 82, 32, —, 49. The ratio of hydrocarbon to base upon dry distn. of  $\text{C}_7\text{H}_{19}\text{NMe}_3\text{OH}$  (77:12) is practically the same as when the base is distd. with KOH (81:12); the corresponding figures for  $\text{C}_{10}\text{H}_{21}\text{NMe}_3\text{OH}$  are 62:30 and 79:13. In dil. alkali, the % of base split increases with increasing concn. of the alkali but the ratio of hydrocarbon to base is unchanged, 10:17. *Hexyldithiourethan*, m.  $50^\circ$ ; with KOH this gives  $\text{C}_6\text{H}_{13}\text{SH}$ , transformed by MeI and MeONa into *hexyl Me sulfide* (I),  $b_p$   $61-2^\circ$ , and with more MeI into *hexyldimethylsulfonium iodide*, m.  $68^\circ$ . The hydroxide, distd. with  $\text{C}_2\text{H}_5(\text{OH})_2$ , gives 7.2%  $\text{C}_6\text{H}_{12}$  and 85.5% I; distd. with 50% KOH at the ordinary pressure, there results 19%  $\text{C}_6\text{H}_{12}$  and 77.5% I. *Decyldithiourethan*, m.  $76^\circ$  (80% yield); the mercaptan  $b_p$   $114-5^\circ$ ;

*decyl Me sulfide* (II),  $b_{13}$  125°; *decyldimethylsulfonium iodide*, very hygroscopic. The base, on distn., yields 21.5%  $C_{10}H_{20}$  and 68.5% II; distd. with  $C_2H_5(OH)_2$ , there results 3%  $C_{10}H_{20}$  and 94% II; with 50% KOH, 27%  $C_{10}H_{20}$  and 64% II. *Phenylethyl methyl sulfide*,  $b_{13}$  111°; *phenylethyldimethylsulfonium iodide*, m. 130° (decompn.); decompn. of the base gives styrene. *Decylselenomercaptan*,  $b_{13}$  128-9°; *decyl Me selenide*,  $b_{14}$  137-8°; with MeI there results only  $Me_2SeI$ . C. J. WEST

**Methyltin derivatives.** I. Introduction. II. Action of zinc on trimethyltin bromide. III. Trimethyltin phenolate. IV. Decamethylstannobutane. CHARLES A. KRAUS AND ARTHUR M. NEAL. *J. Am. Chem. Soc.* 51, 2403-7(1929); cf. C. A. 19, 2928, 3250.—The action of Zn on  $Me_3SnBr$  in  $H_2O$  was studied. The chief product of reduction was  $Me_3Sn$ , some  $Me_3SnOH$  and metallic Sn also being formed. *Trimethylstannyl phenolate*,  $PhOSnMe_3$ , was prepd. by the action of  $Me_3SnBr$  (1 mol.) on  $PhONa$  (1 mol.),  $b_8$  109°,  $b$  223-4° (uncor.) with slight decompn. *Decamethylstannobutane*,  $Me_{10}Sn_4$ , was prepd. from  $(NaMe_3Sn)_2$  (1 mol.) and  $Me_3SnBr$  (2 mols.); mol. wt. found, 610, 627 (calcd. 625). H. W. LEAHY

**Lead tetramethyl and the use of alkyl magnesium chlorides for the preparation of organometallic compounds.** ERICH KRAUSE. *Ber.* 62B, 1877-8(1929).—K. recommends alkylmagnesium bromide and chloride instead of iodide. The Mg must be very finely distributed.  $PbMe_4$  is prepd. very pure with  $MeMgCl$  and is very explosive. A. E. BEITLICH

**Isomeric trithioacetaldehydes.** ERNEST V. BELL, GEORGE MACDONALD BENNETT AND FREDERICK G. MANN. *J. Chem. Soc.* 1929, 1462-5.—The  $\gamma$ -isomer (I) of  $MeHC(SCHMe)_2S$  (cf. Mann and Pope, C. A. 17, 2558), in spite of the fact that it has a definite m. p. when crystd. from various solvents or sublimed, is a mixt. of the  $\alpha$ - (II) and  $\beta$ -isomers(III), contg. 40% of the latter. The m. p. of  $PhOH$  already satd. with I is no further depressed by the addn. of II and III successively. The m. ps. of series of mixts. of I with II and III are all consistent with I being a mixt. of the compn. stated. The m.-p. curve of II and III is given, and is similar to that of Suyver (*Rec. trav. chim.* 24, 377(1905)) but the m. ps. are 4° higher. II, monoclinic,  $a:b:c = 0.6907:1:0.8009$ ,  $\beta$  114° 44'. III, orthorhombic prisms,  $a:b:c = 0.9217:1:1$ . Crystn. of I from  $EtOH$  gives mixt. of II and III; slow crystn. from  $Me_2CO$  gives crystals of II, while from  $C_6H_6$  crystals of III could be isolated. Since II and III differ only slightly in their solubilities in 8 solvents examd. by S. and as the joint soly. curves of 2 substances in a solvent are closely related to the m.-p. curve of their mixts., it is intelligible that the proportions of these 2 stereoisomers dissolved at the invariant point should be the same as that in their eutectic mixt. The position of the invariant point on the soly. curve must be practically independent of the individual solvent and of the temp. (over the range involved). C. J. WEST

**$\alpha$ -Bromo- and hydroxyaldehydes.** IV.  $\alpha$ -Hydroxybutyraldehyde,  $\alpha$ -hydroxyisobutyraldehyde, glycolaldehyde. RUDOLF DWORZAK AND JENNY PIERRI. *Monatsh.* 52, 141-50(1929); cf. C. A. 23, 2151.—Bromination of parabutyraldehyde at 10 to -5° and addn. of  $EtOH$  give about 35% crude  $EtCHBrCH(OEt)_2$ ,  $b_{12}$  76-81°, which, boiled with 3 parts  $H_2O$  for 3 hrs., gives  $\alpha$ -hydroxybutyraldehyde,  $b_{14}$  70-80°, solidifies after about 2 weeks; 1 g.  $CuO$  corresponds to 0.5851 g. aldehyde; the osazone could not be crystd.; *p*-nitrophenylhydrazones, orange-yellow, m. 135°; *p*-nitrophenyl-osazone, dark red, m. 227°. Paraisobutyraldehyde, on bromination and alcoholysis, gives about 25% of the acetal,  $b_{11}$  79-81°, and also a compd.  $C_{12}H_{18}OBr_2$ ,  $b_{11}$  140-50°, m. 85.5° (mol. wt. too low for this formula: found, 400; calcd., 658). Hydrolysis gives  $\alpha$ -hydroxyisobutyraldehyde, whose *p*-nitrophenylhydrazones is orange. Details are given of the prepn of  $HOCH_2CHO$  from  $BrCH_2CH(OEt)_2$ , which possesses no advantage over other methods. C. J. WEST

**Ketonic transformation of aldehydes at high temperatures.** S. DAN LOV. *J. Russ. Phys.-Chem. Soc.* 61, 723-5(1929); *Ibid.* 51, 109(1919); 57, 347(1925); 59, 196, 210(1927); C. A. 21, 571.—D. undertook studies of the pyrogenous isomerization of aldehydes to ketones under the influence of catalysts with a view to interpreting similar reactions in the destructive distn. of wood, two products of which are here treated.  $CMe_3CHO$  was quant. converted to  $Me_2CHCOMe$ ,  $b$  93-4°, at 350° with  $Al_2(SO_4)_3$  as a catalyst.  $CPh_3CHO$  was converted to triphenylethanone, m. 136°, by heating at 25 mm. to 320-40° with  $Al_2(SO_4)_3$ . C. B.

**Cyclic acetals.** II. RUDOLF DWORZAK AND KARL HERRMANN. *Monatsh.* 52, 83-106(1929); cf. C. A. 23, 1615.—Four methods were employed in the prepn. of the acetals: I, satn. of a cooled mixt. of mol. amts. of the components; II, shaking at room temp., the ketone, contg. 1% by wt. of  $HCl$ , being in excess, with  $Na_2SO_4$  to take up the  $H_2O$ ; III, with 0.25-0.5%  $H_2SO_4$  as catalyst; IV, heating mol. amts. of the compo-

nents with 40%  $\text{H}_2\text{SO}_4$  at  $100^\circ$ ; the yields were approx. the same with each method.  $\text{C}_2\text{H}_4(\text{OH})_2$  (V) does not react with  $m\text{-MeC}_6\text{H}_4\text{CHO}$  or  $p\text{-MeOC}_6\text{H}_4\text{CHO}$ ;  $\text{CH}_2(\text{CH}_2\text{OH})_2$  (VI) does not react with  $\text{Me}_2\text{CO}$  or  $\text{MeEtCO}$ . V and  $\text{Me}_2\text{CO}$  give 7.6% (II) or 8% (IV) of  $(\text{CH}_3\text{O})_2\text{CMe}_2$ ,  $b_{760}$   $91.5\text{--}2^\circ$ .  $\text{C}_2\text{H}_5(\text{OH})_2$  (VII) and  $\text{Me}_2\text{CO}$  give 77% (II) or 74% (III) of acetoneglycerol,  $b_{11}$   $82.5^\circ$ . V and  $\text{MeEtCO}$  give 15% (II) of methyl ethylketone ethyleneglycol,  $b_{11}$   $113.5^\circ$ . VII and  $\text{MeEtCO}$  give 60% of methyl ethylketone glycerol,  $b_{11}$   $89^\circ$ . V and  $\text{Pr}_2\text{CO}$  give 30% (III) of dipropylketone ethyleneglycol,  $b_{760}$   $172.5\text{--}4^\circ$ . VI and  $\text{Pr}_2\text{CO}$  give 0% (III), 1.2–2.7% (IV) of dipropylketone ethyleneglycol,  $b_{760}$   $187^\circ$ . VII and  $\text{Pr}_2\text{CO}$  give 10% (III) of dipropylketone glycerol,  $b_{11}$   $160^\circ$ . V and  $\text{BzH}$  give 28% (IV) of  $(\text{CH}_3\text{O})_2\text{CHPh}$ ,  $b_{11}$   $223\text{--}5^\circ$ ; VI and  $\text{BzH}$  give 32% (I), 38.5% (IV) of  $\text{CH}_2(\text{CH}_3\text{O})_2\text{CHPh}$ ,  $b_{11}$   $124\text{--}5^\circ$ ; VII and  $\text{BzH}$  give 52% (I or IV) of benzaldehyde glycerol,  $b_{11}$   $157^\circ$ ,  $m.$   $10\text{--}5^\circ$ , which may be a mixt. of the 2 possible isomers.  $m\text{-MeC}_6\text{H}_4\text{CHO}$  and VI give 24.7% (IV) of  $m\text{-tolylaldehydetrimethyleneglycol}$ ,  $b_{12}$   $140^\circ$ ; VII gives 6.1% of  $m\text{-tolylaldehydeglycerol}$ ,  $b_{11}$   $158^\circ$ . Anisaldehydetrimethyleneglycol, 29.9% yield (IV),  $b_{11}$   $164\text{--}5^\circ$ ; the glycerol deriv.,  $b_{10}$   $164^\circ$ , 13% yield (IV). C. J. WEST

Action of columbium and tantalum pentachlorides on organic compounds. III. H. FUNK AND K. NIEDERLÄNDER. *Ber.* 62B, 1688–91 (1929).—Studies of the reaction of  $\text{CbCl}_5$  and  $\text{TaCl}_5$  with glacial  $\text{AcOH}$ ,  $\text{MeOH}$  and  $\text{EtOH}$  were carried out. A soln. of  $\text{TaCl}_5$  in  $\text{AcOH}$  evapd. *in vacuo* yields  $\text{TaCl}(\text{AcO})_4$  (I) and sometimes  $\text{TaCl}(\text{AcO})_4 \cdot 4\text{AcOH}$  (very unstable). Two mols. of I give when heated for 2 hrs. *in vacuo* at  $80\text{--}90^\circ$   $(\text{AcO})_2\text{Ta}(\text{O})\text{OTa}(\text{O})(\text{AcO})\text{Cl}$  (II).  $\text{CbCl}_5$  yields when boiled with  $\text{AcOH}$  a white ppt. corresponding in compn. to II.  $\text{TaCl}_5$  gives with  $\text{MeOH}$   $(\text{MeO})_3\text{TaCl}_2$  and with  $\text{EtOH}$   $\text{Et}_3\text{TaCl}_2$ . A. E. BEITZCH

Catalytic transfer of hydrogen between organic compounds. SHIRO AKABORI AND TAZO SUZUKI. *Proc. Imp. Acad. (Japan)* 5, 255–6 (1929).—Tetralin and Pd black reduce cinnamic acid, oleic acid, eugenol and coumarin to hydrocinnamic acid, stearic acid, hydroeugenol and hydrocoumarin in satisfactory yields, the 1st 3 at  $115\text{--}20^\circ$ , the last in boiling PhMe.  $\text{BzCl}$  is only slightly attacked, giving a small quantity of  $\text{BzH}$ . Tetrahydroquinoline and maleic acid in boiling  $\text{H}_2\text{O}$  with Pd black give quant.  $(\text{CH}_2\text{CO}_2\text{H})_2$ ; no reaction occurs with  $\text{CH}_2(\text{CO}_2\text{H})_2$ , showing that for the dehydrogenation of tetrahydroquinoline at  $100^\circ$  there must be both the H activator and H acceptor. Piperidine is not dehydrogenated by maleic acid and Pd in boiling  $\text{H}_2\text{O}$ , but safrrole and Pd at  $175^\circ$  give 88% of pyridine. Tetrahydroisoquinoline gives a good yield of isoquinoline at  $149^\circ$  with anethole and Pd but tetrahydropapaverine is not dehydrogenated under these conditions. Nicotine (4.9 g.) and anethole with Pd black at  $150\text{--}2^\circ$  give 0.4 g. nicotine. C. J. WEST

Constitution of linolic acid. ROBERT D. HAWORTH. *J. Chem. Soc.* 1929, 1456–61.—According to the literature, at least 2 linolic acids (I) are known, one from poppy seed oil, assumed by Goldsobel (*C. A.* 5, 1281) to be octadeca- $\Delta^9,10,12,13$ -dienoic acid (II) and a second from soy-bean oil and rice-bran oil, assumed by Takahashi (*C. A.* 15, 2273) to be the 9:10,14:15-isomer. The structures of these 2 acids have been reinvestigated. The tetra-Br acids obtained from poppy seed oil was identical with that obtained from soy-bean oil and the identity of the 2 specimens was confirmed by comparing the Me esters of the tetra-Br acids. The Me linolates, obtained by reducing the Br acids were identical in b. p., and hexoic, azelaic and  $(\text{CO}_2\text{H})_2$  were isolated, in yields approx. 80% of those calcd. from II, after the ester derived from either oil had been oxidized with  $\text{KMnO}_4$  in cold  $\text{Me}_2\text{CO}$ . In a few expts. the presence of  $\text{CH}_2(\text{CO}_2\text{H})_2$  was detected but the majority of this acid was converted into  $(\text{CO}_2\text{H})_2$  and a control expt. showed that  $\text{CH}_2(\text{CO}_2\text{H})_2$  was slowly oxidized to  $(\text{CO}_2\text{H})_2$  under the conditions employed in the oxidation of Me linolate. These oxidation expts. indicate that I from poppy seed oil or soy-bean oil has the formula II and this has been confirmed by oxidation with  $\text{KMnO}_4$  in dil. alk. soln. The sativic acid, from either source, was the same, and on oxidation with ice-cold  $\text{KMnO}_4$  in alk. soln. gave suberic, valeric and oxalic acids, together with smaller quantities of azelaic and hexoic acid. When the oxidation was carried out in hot alk. soln., the products were hexoic and azelaic acids and a smaller quantity of suberic acid. The yield of oxidation products would suggest that I is almost entirely composed of II although the presence of geometrical isomers is not excluded. Details are given in the exptl. section. C. J. WEST

Chemical constitution of clupanodonic acid. MITSUMARU TSUJIMOTO. *Bull. Chem. Soc. Japan* 3, 299–307 (1928).—The isolation of nearly pure clupanodonic acid is reported. The fatty acids of a Japanese sardine oil were treated by the Li salt-acetone method and the highly unsatd. acids so obtained were changed to Me esters and fractionated under 5-mm. pressure. The fraction b.  $217\text{--}26^\circ$  was taken as the Me ester of

clupanodonic acid. It was saponified and the accompanying small quantity of unsaponifiable matter removed. The finally oxidized acids were sep'd. by means of petroleum ether. The acid thus obtained had the following properties:  $d_4^{16}$  0.9410, neutralization value 170.7; I no. 3388.8,  $n_D^{16}$  1.5057; calcd. for  $C_{22}H_{34}O_8$ ; neutralization value 169.8, I no. 384.3. A study of the constitution of this acid follows. The ozonide prepd. from the acid was decompd. with water and the volatile and nonvolatile decompn. products were exam'd. The results of several expts. show that no conjugated double bonds and no triple bonds are present. Evidence is given showing that the mol. consists of the following at. groups: (1)  $MeCH_2CH=$ , (2)  $=CHCH_2CH=$ , (3)  $=CH(CH_2)_2CH=$ , (4)  $=CH(CH_2)_2CO_2H$ . As to the arrangement of these groups no definite data have yet been obtained. Indications point to 2 possible formulas which are given. These formulas have been proposed provisionally. The decompn. of the Am ester ozonide of this acid was studied to confirm the position of the ethylenic linkage nearest to the  $CO_2H$  group. Evidence is given which indicates that the ethylenic linkage nearest the  $CO_2H$  in the mol. is situated between the 4,5-C atoms counting from the  $CO_2H$  group.

E. S. WALLIS

Interpretation of the rearrangements of pinacols and tertiary amino alcohols from the electron theory of valency. MASAO MIGITA. *Bull. Chem. Soc. Japan* 3, 308 16 (1928).—A theoretical paper. Exptl. evidence taken from the chem. literature is cited to show that the theory of "affinity requirement" of Meerwein and others cannot foretell the products of semipinacolin deamination of tertiary amino alcs. except those of the type  $R_2C(OH)CHR'NH_2$ . An interpretation of all rearrangements similar to the pinacolin transformation is given in terms of the modern electron theory developed by Lapworth and Kermack. This interpretation has the following advantages. (1) The products of rearrangements of pinacols and tertiary amino alcs. are reliably predicted by one and the same reasoning. (2) It can also be explained why tertiary amino alcs. generally behave abnormally toward  $HNO_3$ , whereas in certain cases normal displacement of the amino group takes place. The theory as outlined has certain fundamental contradictory facts: (1) The problem of steric hindrance is unsolved. (2) The rearrangements of alkyltrimethylpinacols offer a strong objection to this interpretation, for they give ketones,  $MeCOCRMe_2$  by the migration of the more positive group. (3) When  $H_2NCHPhCET_2OH$  is treated with  $HNO_3$ , the main product is the corresponding glycol, while according to the above theory in the case of  $H_2NCHPhC(CH_2Ph)_2OH$  the normal displacement of the amino group should take place at least as easily as in the former case, since benzyl is more positive than Et, it should migrate more difficultly to the positively polarized  $\beta$ -C atom. But the actual products disprove this prediction, for it gives the glycol only as a by-product.

E. S. WALLIS

Configuration of pentaerythritol. III. J. BÖESEKEN AND B. B. C. FELIX. *Ber* 62B, 1310-6 (1929); cf. *C. A.* 23, 99.—In spite of the fact pointed out by Kenner (*C. A.* 23, 1616) and by Sementsov (*C. A.* 23, 4445) that in a pyramidal arrangement an asym configuration is possible, B. and F. hold fast to the opinion that as long as no *cis trans*-isomeric acetals of pentaerythritol (I) have been isolated, resolution into optical antipodes is decisive evidence of the tetrahedral configuration. In continuation of their investigation they have resolved the basic acetal, bis[aminoacetaldehyde]pentaerythritol (II), studied the camphor acetals of I and resolved [pyruvic acid dimethylol]-*p*-methylcyclohexane (III),  $MeCH \begin{array}{c} \diagup CH_2CH_2 \diagdown \\ \diagdown CH_2CH_2 \diagup \end{array} C \begin{array}{c} \diagup CH_2O \diagdown \\ \diagdown CH_2O \diagup \end{array} CMeCO_2H$ .  $H_2NCH_2CH(OEt)_2$

g. from 200 g.  $BrCH_2CH(OEt)_2$  and liquid  $NH_3$  at  $105^\circ$  (80 atm.),  $b_{760}$   $163.4^\circ$ ; refluxed with I and HCl in abs. alc. it yields II, m.  $124^\circ$ , resolved by means of malic acid into the *l*-base,  $[\alpha]_D^{20} -2.04^\circ$  (9.3 g. in 100 cc.  $CHCl_3$ ), m.  $60-70^\circ$ , and the *d*-base,  $[\alpha]_D^{20} 4.03^\circ$  (8.3 g. in 100 cc.  $CHCl_3$ ). The *l*-base in  $H_2O$  (5.9 g. in 100 cc.) showed  $[\alpha]_D^{20} -0.43^\circ$ , changing to  $[\alpha]_D 0.01^\circ$  on neutralization with AcOH; the *d*-base (4.64 g. in 100 cc.)  $[\alpha]_D^{20} 0.95^\circ$ , changing to  $[\alpha]_D -0.05^\circ$  on neutralization; no racemization occurred, for liberation of the bases gave products showing the original rotations in  $CHCl_3$ . Di-camphor acetal of I, from camphor acetal and I refluxed in abs. alc. with HCl, m.  $156^\circ$ ,  $[\alpha]_D^{20} -29.3^\circ$  (1 g. in 20 cc.  $CHCl_3$ ); monocamphor acetal, obtained along with the preceding compd., m.  $135^\circ$ ,  $[\alpha]_D^{20} -18.6^\circ$  ( $CHCl_3$ ); no isomers of these acetals were obtained. 4,4-Dimethylol-1-methylcyclohexane,  $b_D 105^\circ$ , m.  $45^\circ$ , was obtained in 35% yield by reducing 200 g. *p*-cresol with Ni and H (100-50 atm.) at  $150-60^\circ$ , treating the resulting 4-methylcyclohexanol (275 g.) with 0.5 mol.  $PBr_3$  below  $10^\circ$ , converting

the bromide (330 g.) into the Mg compd., condensing this with  $\text{HC}(\text{OEt})_3$  to *p*-methyl-hexahydrobenzaldehyde di-Et acetal (34% yield), hydrolyzing the acetal with 5 N HCl and treating the bisulfite compd. of the aldehyde with HCHO and KOH in cold aq. alc. *Ei* ester of III, from  $\text{AcCO}_2\text{H}$  refluxed in abs. alc. with HCl, then treated with  $\text{C}_6\text{H}_6$ , freed of the  $\text{H}_2\text{O}$ -EtOH- $\text{C}_6\text{H}_6$  by slow distn. and refluxed in abs. alc. with the dimethylol and HCl, *b*<sub>10</sub> 82-9°, *d*<sub>20</sub> 1.049, *n*<sub>D</sub><sup>20</sup> 1.4638. Free III, viscous liquid, resolved through the gelatinous quinine salt into an acid with  $[\alpha]_D^{20}$  4.85° (8.1 g. in 100 cc.  $\text{CHCl}_3$ ) and an acid with  $[\alpha]_D^{20}$  -2.84° ( $\text{CHCl}_3$ , 12.5%). After some weeks the *dl* and the active acids partially crystd.; all the crystals, however, were inactive and m. 111°; resolution of the cryst. acids gave fractions with  $[\alpha]_D^{20}$  10.5° ( $\text{CHCl}_3$ , *c* 5.87) and -8.5° (*c* 6.65).

C. A. R.

**Preparation of tertiary  $\alpha$ -hydroxy acids.** R. HEILMANN. *Bull. soc. chim* **45**, 412 (1929).—A general method has been suggested for the prepn. of  $\alpha$ -HO acids of the type  $\text{RC}(\text{OH})\text{R}'\text{CO}_2\text{H}$  by the oxidation of  $\alpha$ -HO ketones,  $\text{RC}(\text{OH})\text{R}'\text{COMe}$  (obtained by the hydrolysis of  $\text{RC}(\text{OH})\text{R}'\text{C}(\text{CH}_3)_2$  with alk. hypochlorites or hypobromites with the elimination of  $\text{CHCl}_3$  or  $\text{CHBr}_3$ ). In this manner 4-heptanone was converted into 3-propyl- $\Delta^1$ -3-hexinol, then to 3-propyl-3-hydroxy-2-hexanone and finally oxidized to dipropylhydroxyacetic acid, m. 80°, *Me* ester, *b*<sub>10</sub> 83-4°. 1,1,1-Trimethyl-2-propanone was converted to  $\alpha$ -tert-butyl-lactic acid, m. 141°, sublimes 130° at 14 mm., through the intermediates 3-tert-butyl- $\Delta^1$ -3-butanol and 3-tert-butyl-3-hydroxy-2-butanone; and also 2-pentanone gave 3-methyl- $\Delta^1$ -3-hexinol, 3-methyl-3-hydroxy-2-hexanone and finally 70% of  $\alpha$ -propyl-lactic acid, *b*<sub>10</sub> 127-8°, *Me* ester, *b*<sub>15</sub> 65-6°; *Ei* ester, *b*<sub>9</sub> 68°.

A. S. CARTER

**Preparation of glycerides of amino fatty acids.** WEIZMANN AND L. HASKELBERG. *Compt. rend.* **189**, 104-6 (1929).—3-Chloro-1,2-propanediol was heated for 1 hr. in a  $\text{H}_2\text{O}$  bath with the Na salt of glycine (I); the product was dissolved in MeOH (cold), filtered and pptd. with  $\text{Et}_2\text{O}$  giving 20-30% of  $\alpha$ -monoglycyl glyceride, m. 160-70°, decomp. at 250°. In the same manner, alanine (II) gave  $\alpha$ -monolanyl glyceride, m. 219°. I or II with  $\alpha,\beta$ -distearyl or -dipalmityl glyceride gave the following mixed glycerides:  $\alpha'$ -glycyl- $\alpha,\beta$ -istearyl, m. 170°;  $\alpha'$ -glycyl- $\alpha,\beta$ -dipalmityl, m. 215°;  $\alpha'$ -alanyl- $\alpha,\beta$ -distearyl, m. 233°;  $\beta'$ -alanyl- $\alpha,\beta$ -dipalmityl, m. 216°; also  $\alpha'$ -dl-leucyl- $\alpha,\beta$ -distearyl (m. 150°) and  $\alpha'$ -dl-leucyl- $\alpha,\beta$ -dipalmityl glyceride (m. 219°) were prepd by the same method.

A. S. CARTER

**$\gamma,\gamma$ -Dimethylpimelic acid.** GUST. KOMPFA *Ber* **62B**, 1371-2 (1929).— $\gamma,\gamma$ -Dimethylpiperidine-HCl shaken with  $\text{BzCl}$  and a slight excess of alkali yields *N*-benzoyl- $\gamma,\gamma$ -dimethylpiperidine, *b*<sub>10</sub> 174-7°, *d*<sub>4</sub><sup>16</sup> 1.0511, *n*<sub>D</sub><sup>16</sup> 1.54534, converted by heating with  $\text{PCl}_5$  into PhCN and  $\gamma,\gamma$ -dimethylpentamethylene dichloride (yield, 30%). *b*<sub>8</sub> 58-9°, *d*<sub>4</sub><sup>15</sup> 1.0917, *n*<sub>D</sub><sup>15</sup> 1.48990. The crude mixt. of the dichloride and PhCN boiled in aq. alc. with KCN gives 80% of the dicyanide, m. 123°, which is hydrolyzed by HCl (d. 1.19) at 120° to  $\gamma,\gamma$ -dimethylpimelic acid (85% yield), m. 83°; dianilide, m. 165°; diimide, m. 176°.

C. A. R.

**Stereochemistry of the glutacnic acids.** I. R. MALACHOWSKI. *Ber* **62B**, 1323-6 (1929).—The failure, up to the present, to isolate more than 1 form (m. 138°) (I) of glutacnic acid has given rise to theoretical speculations involving anomalous bonds in this group of acids, but M. has now found that a 2nd form (II) of I does exist and can be prepd. in essentially the same way as *cis*-aconitic acid (*C. A.* **23**, 1878); glutacnic anhydride is decompd. with cold  $\text{H}_2\text{O}$  but the II must be removed as quickly as possible from the solvent as it is exceedingly unstable in  $\text{H}_2\text{O}$ . In solid form and in  $\text{Et}_2\text{O}$  it can be kept for weeks but when fused and in  $\text{H}_2\text{O}$  it rapidly rearranges into I. Unlike I, II, which from its method of formation may be assumed to be the *cis*-form, is readily converted back into the anhydride with  $\text{Ac}_2\text{O}$  (almost quantitatively at 40°). At 0° the dissocn. consts. of I and II are  $1.74 \times 10^{-4}$  and  $1.43 \times 10^{-4}$ , resp. In  $\text{M}/64$  soln. at 0° the mol. cond. of I remains const. at 23.79  $\pm$  0.02, while that of II increases from 21.85 at a rate corresponding to 15, 36, 59 and 74% rearrangement in 1, 3, 5 and 7 days, resp.; at 15-20° there is 40% rearrangement in 16 hrs. II m. 136-6.5° (cor.); an equimol. mixt. with I m. 111-4°. II gives no color with  $\text{FeCl}_3$  and immediately decolorizes  $\text{KMnO}_4$ .

C. A. R.

**Dehydration of malic acid.** II. AMANDUS HAHN, W. HAARMANN AND F. FISCH-BACH. *Z. Biol.* **88**, 586-93 (1929); cf. *C. A.* **22**, 3420.—The phenylhydrazone of pyro-racemic acid is obtained from muscle in much greater quantity when neutralized malic acid is present together with methylene blue and semicarbazide than when it is absent. Oxalacetic acid is the first product in the dehydration of malic acid. F. K.

**Substituted, optically active asparagines. I.** O. LUTZ. *Ber.* 62B, 1879-84 (1929).— $\text{I-NH}_2\text{COCH}_2\text{CHBrCO}_2\text{H}$  (I) and aromatic amines yield substituted *d*-asparagines. Thus, 10 g. of I in 150 cc.  $\text{H}_2\text{O}$  and 15 g. *p*- $\text{MeC}_6\text{H}_4\text{NH}_2$  in 50 cc. MeOH on standing, deposit cryst. *l-p*-toluidinosuccinic acid monoamide m.  $100-1^\circ$ , in 60-70% yield. Similarly were prepd., with poorer yields, the following succinic acid monoamides: *d-o*-toluidino, m.  $164-6^\circ$ ; *d-o*-anisidino, m.  $153-4^\circ$ ; *d-m*-phenetidino, m.  $149-51^\circ$ ; *d-p*-phenetidino, m.  $139-40^\circ$ ; *d-1,2,4*-xylydino, m.  $145-6^\circ$ ; and *d-1,2,5*-xylydino, m.  $138-9^\circ$ . These compds. showed *d*-rotation in NaOH soln., which gradually changed sign with increasing addns. of HCl. K. H. ENGEL

**Photochemical and oxidative degradation of carbonyls.** HANS REIHLEN, A. GRUHL AND G. V. HESSLING. *Ann.* 472, 268-87 (1929).— $\text{Fe}(\text{CO})_5$  (5 cc.) and 25 cc EtSH at  $38^\circ$  in the light of a Hg lamp react according to the equation  $2\text{Fe}(\text{CO})_5 + 2\text{EtSH} = [\text{Fe}(\text{C}_2\text{O}_3)\text{SEt}]_2 + 4\text{CO} + \text{H}_2$ ; the mercaptocarbonyl m.  $75.5^\circ$ . The principal difficulty of the reaction is overheating; by working at  $3-5^\circ$ , the same products are formed, but the ratio of CO:H is 9.2:1 instead of 4:1, and the mercaptocarbonyl is not pure.  $\text{Fe}(\text{CO})_5$  and  $\text{Ac}_2\text{CH}_2$ , similarly treated at  $130^\circ$  for 6-8 hrs., give 45% ferric acetylacetonate, a small amt. of an  $\text{Me}_2\text{CO}$ -insol. product,  $\text{Fe}_3\text{C}_{20}\text{H}_{24}\text{O}_{12}$ , yellow, and a 2nd product,  $\text{FeC}_{14}\text{H}_{14}\text{O}_6$ , colorless but quickly turning black in the air; the gases consisted of CO and  $\text{H}_2$ .  $\text{Ni}(\text{CO})_4$  and  $\text{AcCl}$  in petroleum ether (b.  $40-50^\circ$ ), heated at  $50-5^\circ$  for 13 hrs. in the Hg light, react according to the equation  $\text{Ni}(\text{CO})_4 + 2\text{AcCl} = 4\text{CO} + \text{NiCl}_2 + \text{Ac}_2$ , the  $\text{NiCl}_2$  reacting with  $\text{Ac}_2$  to give  $\text{NiCl}_2\text{Ac}_2$ ; in the presence of  $\text{O}_2$  at about  $10^\circ$  there results  $\text{AcOH}$  and  $\text{Ac}_2\text{O}$ ,  $\text{NiCl}_2$ , CO and  $\text{CO}_2$ . Unsuccessful attempts to reduce  $\text{Fe}(\text{CO})_5$  and  $\text{Ni}(\text{CO})_4$  are reported. C. J. WEST

**A characteristic reaction of primary *aci*-nitro compounds.** HEINRICH WIELAND AND ZENJIRO KITASATO. *Ber.* 62B, 1250-3 (1929).—In investigations on the polymeric fulminic acids, in attempting to benzoylate in  $\text{C}_6\text{H}_5\text{N}$  metacyanilic acid (I), which contains a primary  $\text{NO}_2$  group, the product was unexpectedly found to contain Cl. Methazonic acid,  $\text{HC}(\text{:NOH})\text{CH:N}(\text{:O})\text{OH}$  (II), and  $\text{PhCH:N}(\text{:O})\text{OH}$  (III) behaved in the same way, while secondary *aci*-nitro compds. are apparently benzoylated normally. The compds. obtained from II and III were *dibenzoylchloroglyoxime*,  $\text{HC}(\text{:NOBz})\text{C}(\text{:NOBz})\text{Cl}$  (IV), and *benzoylbenzohydroxamyl chloride*,  $\text{PhC}(\text{:NOBz})\text{Cl}$  (V), resp., probably formed by addn. of  $\text{BzCl}$  to the  $\text{RCH:N}(\text{:O})\text{OH}$  and subsequent cleavage of  $\text{H}_2\text{O}$  from the resulting  $\text{RCH[N(Obz)OH]Cl}$ . Without  $\text{C}_6\text{H}_5\text{N}$ , III does not react with  $\text{BzCl}$ . IV and V are also formed from the acid-stable form of  $\text{HC}(\text{:NOH})\text{CCl:NOH}$  (VI) and from  $\text{PhCCl:NOH}$ , resp., with  $\text{BzCl}$  in  $\text{C}_6\text{H}_5\text{N}$ ; the alkali-stable isomer of VI yields an isomer (VII) of IV. IV, from II and  $\text{BzCl}$  in  $\text{C}_6\text{H}_5\text{N}$  at  $15^\circ$ , m.  $165^\circ$ , loses both its Cl and Bz to cold alc. KOH. VII, m.  $165^\circ$  but depresses the m p of IV to  $140^\circ$ . V, m.  $109^\circ$ . C. A. R

**The hydrazide of the 9,10-dihydroxystearic acid and the symmetric bisdihydroxyheptadecylurea.** C. BERNSTEIN AND F. ULLER. *Wissenschaftl. Mitt. Österreich. Heilmittelstelle* 1928, XI-XIV; *Chem. Zentr.* 1928, II, 1317. *Dihydroxystearic acid hydrazide*,  $\text{Me}(\text{CH}_2)_7\text{CH}(\text{OH})\text{CH}(\text{OH})(\text{CH}_2)_7\text{CONHNH}_2$  (I) (from dihydroxystearic acid ester and  $\text{H}_2\text{NNH}_2 \cdot \text{H}_2\text{O}$ ), m.  $164^\circ$ , insol. in  $\text{H}_2\text{O}$  and petroleum ether, almost insol. in EtOH; *HCl salt*,  $\text{C}_{18}\text{H}_{35}\text{O}_3\text{N}_2\text{Cl}$  (II), m.  $194-5^\circ$  (decompn.), slightly sol. in EtOH, insol. in  $\text{H}_2\text{O}$  and  $\text{Et}_2\text{O}$ . *Benzaldihydroxystearic acid hydrazide*,  $\text{Me}(\text{CH}_2)_7\text{CH}(\text{OH})\text{CH}(\text{OH})(\text{CH}_2)_7\text{CONHN:CHPh}$  (from I and  $\text{BzH}$ ), m.  $143-4^\circ$ , sparingly sol. in EtOH, insol. in  $\text{H}_2\text{O}$ . *Piperonaldihydroxystearic acid hydrazide* (from I and piperonal), m.  $153.5-4.5^\circ$ . *sym-sec-Dihydroxystearic acid dihydrazide*,  $\text{Me}(\text{CH}_2)_7\text{CH}(\text{OH})\text{CH}(\text{OH})(\text{CH}_2)_7\text{CONHNHCO}(\text{CH}_2)_7\text{CH}(\text{OH})\text{CH}(\text{OH})(\text{CH}_2)_7\text{Me}$  (from I with I in alc.), m.  $202-4^\circ$ , almost insol. in all org. solvents. *Dihydroxystearic acid azide*  $\text{Me}(\text{CH}_2)_7\text{CH}(\text{OH})\text{CH}(\text{OH})(\text{CH}_2)_7\text{CON}_3$  (III) (from II and  $\text{N}_2\text{O}_5$ ), m.  $168-73^\circ$ . *sym Bis[dihydroxyheptadecyl]urea*,  $\text{OC[NH}(\text{CH}_2)_7\text{CHOHCHOH}(\text{CH}_2)_7\text{Me}]_2$  (from III by boiling with  $\text{H}_2\text{O}$ , m.  $187^\circ$ , slightly sol. in EtOH, AcOH and  $\text{Et}_2\text{O}$ , insol. in petroleum ether. G. S

**The optical properties of some amino acids. II. Arginine and histidine.** GEORGE L. KEENAN. *J. Biol. Chem.* 83, 137-8 (1929); cf. C. A. 19, 1128.—Optical data on cryst. arginine and histidine are presented to supplement data already published on other cryst. amino acids. Arginine, crystd. from  $\text{H}_2\text{O}$ , dihydrate,  $n_D^{25} 1.528$ ,  $n_D^{20} 1.549$ ,  $n_D^{15} 1.579$ ; crystd. from 66% alc.,  $n_D^{25} 1.548$ ,  $n_D^{20} 1.562$ ,  $n_D^{15} 1.610$ . Histidine, crystd. from  $\text{H}_2\text{O}$ ,  $n_D^{25} 1.520$ ,  $n_D$  indeterminate,  $n_D^{15} 1.610$ . A. P. LOTHROP

**Rearrangement reactions in the carbohydrate group. I. New derivatives of monoacetoneglucose.** KARL JOSEPHSON. *Ann.* 472, 217-29 (1929).—3-Acetyldiacetone glucose (5 g.) in 10 cc. AcOH, to which 3 cc.  $\text{H}_2\text{O}$  is added after soln., allowed to stand 3-4 days and then concd. at  $30-5^\circ$  in vacuo, gives 62% 3-acetyl-1,2-isopropylidene-glucose  $< 1,4 >$  (I), m.  $125-6^\circ$ ,  $[\alpha]_D^{20}$  (yellow)  $-20.1^\circ$  (0.1593 g made up to 5 cc. in  $\text{H}_2\text{O}$ );

the structure is shown by transforming it into the diacetone deriv. with  $\text{Me}_2\text{CO}$  and  $\text{CuSO}_4$ ; very dil. alkali causes rearrangement into the 6-Ac deriv., m. 144–6° (Fischer and Noth, *C. A.* 12, 2558). I is rather stable at  $p_{\text{H}}$  about 4; in 1%  $\text{Na}_2\text{HPO}_4$  ( $p_{\text{H}}$  about 9) the rearrangement is practically complete in 5 min.; data are given for the rate of rearrangement at  $p_{\text{H}}$  5.81, 6.75 and 7.10,  $k$  being 1.1, 9.6 and  $19.5 \times 10^{-3}$  and the ratio  $k/\text{OH}$  being 2.0, 2.0 and  $1.8 \times 10^5$ . I and  $\text{Ph}_3\text{CCl}$  in  $\text{C}_6\text{H}_5\text{N}$  give the 6-trityl deriv., sinters 55°,  $[\alpha]_{\text{D}}^{20} -16^\circ$  (0.1573 g. made up to 5 cc. in  $\text{CHCl}_3$ );  $\text{Ac}_2\text{O}$  gives the 3,5-di-Ac deriv., sinters about 64° and then melts gradually,  $[\alpha]_{\text{D}}^{20} 5^\circ$  (0.1071 g. made up to 5 cc. in  $\text{CHCl}_3$ ).

C. J. WEST

**Triphenylmethyl ethers of several di- and trisaccharides. Constitution of maltose, saccharose and raffinose.** KARL JOSEPHSON. *Ann.* 472, 230–40 (1929).—Helferich and Koester (*C. A.* 18, 2873) have shown that the primary HO groups in poly-HO compds. are much more easily etherified with  $\text{Ph}_3\text{CCl}$  than the sec. groups. It is now shown that the no. of trityl groups introduced into maltose (I), saccharose (II) and raffinose (III) in  $\text{C}_6\text{H}_5\text{N}$  corresponds to the no. of primary HO groups to be expected according to Haworth's formulation. I (3.5 g.) in 60 cc.  $\text{C}_6\text{H}_5\text{N}$  and 8.4 g.  $\text{Ph}_3\text{CCl}$ , allowed to stand 40 hrs. at room temp., give 6-tritylglucoside  $< 1,5 >$  -6-tritylglucose  $< 1,5 >$  (ditritylmaltose), m. 137–9° (all m. ps. cor.),  $[\alpha]_{\text{D}}^{23} 78^\circ$  (0.0627 g. made up to 5 cc.  $\text{EtOH}$ ), shows no mutarotation, reduces Fehling soln. and yields a hexa-Ac deriv., m. 116–9°,  $[\alpha]_{\text{D}}^{20} 91^\circ$  (0.0823 g. made up to 5 cc. in  $\text{CHCl}_3$ ), and gives with  $\text{HBr}$   $\text{Ph}_3\text{CBr}$ . 6-Tritylglucoside-  $< 1,5 >$  -1,6-ditritylfructoside  $< 2,5 >$  (tritritylsaccharose), from 3.4 g. II and 8.4 g.  $\text{Ph}_3\text{CCl}$  in 50 cc.  $\text{C}_6\text{H}_5\text{N}$  in 10 g. yield, m. 127–9°,  $[\alpha]_{\text{D}}^{23} 44.3^\circ$  (0.0790 g. made up to 5 cc. in  $\text{EtOH}$ ); penta-Ac deriv., m. 125–6°,  $[\alpha]_{\text{D}}^{23} 57^\circ$  (0.0716 g. made up to 5 cc. in  $\text{CHCl}_3$ ). 6-Tritylgalactoside-  $< 1,5 >$  -glucoside-  $< 1,5 >$  -1,6-ditritylfructoside  $< 2,5 >$  (tritylraffinose), m. about 130° (1.3 g. from 0.7 g. III and 1.6 g.  $\text{Ph}_3\text{CCl}$ ),  $[\alpha]_{\text{D}}^{23} 79^\circ$  (0.0254 g. made up to 5 cc. in  $\text{EtOH}$ ); octa-Ac deriv., m. 123–5° (not cor.),  $[\alpha]_{\text{D}}^{20} 66^\circ$  (0.0757 g. made up to 5 cc. in  $\text{CHCl}_3$ ).

**Chemistry of starch.** H. PRINGSHEIM AND COLLABORATORS. XXII. Amylose and amylopectin. ARNOLD STEINGROEVER. *Ber.* 62B, 1352–9 (1929); cf. *C. A.* 23, 376.—An amylose completely sol. in cold  $\text{H}_2\text{O}$  and molecularly dispersed in this solvent can be obtained by subjecting the triacetate to a previous disaggregating treatment, either by heating in a bomb tube with 10 parts  $\text{C}_{10}\text{H}_8$  for 0.5 hr. at 260–70° or by refluxing it 24 hrs. in  $\text{CHCl}_3$  in the presence of 0.2% of  $\text{PhSO}_3\text{H}$ . If the product is hydrolyzed in the usual way with alc. KOH and very cautiously dehydrated with alc. and ether there is obtained an amyloosan showing the same sp. rotation as the original amylose, having no reducing power and giving the blue color with I. It is readily sol. in  $\text{H}_2\text{O}$  at room temp. and the soln. seems to be stable on standing although on freezing the solute gradually seps. out. In f.-p. detns. the f. p. of the soln. rises continuously after each detn. so that the lowest value (about 600) found can only be considered as the upper limit of the real mol. wt. The ash content of these preps. is always less than 0.5% and cannot account for the lowering of the f. p., which thus indicates a dispersion of the solute into particles of a mol. order of magnitude (corresponding to about 4- $(\text{C}_6\text{H}_{10}\text{O}_5)$  at the beginning); in 0.001 *M*  $\text{NaSCN}$ , which is a specially good disperser, no further diminution in particle size was observed. The 2 preps. do not raise the b. p. of pure water; in fact, they lower it several hundredths of a degree. Difficulties are also encountered with the Barger-Rast method. Measurements at high temps. were abandoned because the blanks even were not sufficiently reproducible. At room temp. a long time must be taken and yet it cannot be unlimited because of re-assocn. and for the same reason the concn. must be kept low. The values obtained correspond to about 2- $(\text{C}_6\text{H}_{10}\text{O}_5)$ . Longer refluxing with  $\text{PhSO}_3\text{H}$  does not improve the soly. of the product and seems to bring about a rearrangement similar to that with cellulose acetate. Amylopectin, prepd. according to Ling and Nanji, was acetylated, while still moist with  $\text{Et}_2\text{O}$ , with  $\text{Ac}_2\text{O}$  and  $\text{C}_6\text{H}_5\text{N}$  by shaking 3–4 days in the incubator; the resulting stiff jelly was decompd. with much ice, the ppt. ground to a powder with  $\text{H}_2\text{O}$ , dehydrated with alc., extd. with boiling  $\text{AcOEt}$  (which removes a substance with the soly. properties of an amylose acetate), taken up in  $\text{CHCl}_3$ , centrifuged and pptd. with  $\text{Et}_2\text{O}$ ; the amylopectin triacetate so obtained slowly dissolves in  $\text{CHCl}_3$  and  $\text{AcOH}$  in the course of several days at room temp., but even 1% solns. are so viscous and turbid that polarimetric measurements cannot be made;  $\text{H}_3\text{PO}_4$  can be detected qualitatively after decompn. of the org. matter. It has hitherto not been possible to break down the acetate with  $\text{PhSO}_3\text{H}$  without extensive rearrangement and decrease in the rotation; after refluxing 3–4 days and sapong. the product which seps. from the

$\text{CHCl}_3$ , there was obtained a substance with a rotation of  $165^\circ$ , having no reducing power, forming a red color with I and giving in freezing water values intermediate between those corresponding to  $2(\text{C}_6\text{H}_{10}\text{O}_5)$  and  $3(\text{C}_6\text{H}_{10}\text{O}_5)$ . If the boiling with  $\text{Ph}\cdot\text{SO}_3\text{H}$  in  $\text{CHCl}_3$  is done in the presence of much  $\text{Ac}_2\text{O}$ , no  $\text{AcOH}$  is split off; the product remains in soln. after boiling 4 days and alc. ppts. a substance having all the properties of amylose acetate. Starch pptd. from starch paste with alc. and dehydrated with alc. and ether can likewise be acetylated in  $\text{C}_6\text{H}_5\text{N}$  at incubator temp., yielding an acetate contg.  $\text{H}_3\text{PO}_4$ , swelling in  $\text{CHCl}_3$ ,  $\text{AcOH}$  and  $\text{Me}_2\text{CO}$  and dispersing in the last 2 solvents after several days to homogeneous but highly viscous and turbid solns. even at 1-2% concns. C. A. R.

A new series of depolymerization products of starch. AMÉ PICTET AND HANS VOGEL. *Helv. Chim. Acta* 12, 700-13(1929).—Previously reported degradation products of starch are not true structural units of starch, as they show neither a color with I nor a tendency to polymerize. *Isotrihexosan* (I) shows both of these properties. Dry potato starch, heated with 3 parts dry glycerol in an oil bath at  $220^\circ$ , dissolves gradually, and after 3 hrs. begins to show a violet color with  $\text{I}_2$ . After 2 hrs. more, the mixt. is cooled, 10 parts abs. alc. added, and the ppt. washed again with alc. and purified by soln. in  $\text{H}_2\text{O}$  and repptn. with alc.; 72% of I results, a white cryst. powder,  $(\text{C}_6\text{H}_{10}\text{O}_5)_3$ , mol. wt. in  $\text{H}_2\text{O}$ , 472 (calcd. 486), turns yellow toward  $235^\circ$ ,  $[\alpha]_D^{20} 2^\circ$  (decompn.),  $[\alpha]_D^{166.4-6.7^\circ}$  in  $\text{H}_2\text{O}$ , does not reduce Fehling soln., or neutral  $\text{KMnO}_4$ , is not attacked by emulsin. Malt diastase changes I to *dextrinose* (II) (synonym for *isomaltose* from starch, to avoid confusion with Fischer's isomaltose from glucose), and hot dil.  $\text{HCl}$  gives glucose. Heated with 6 parts  $\text{Ac}_2\text{O}$  and 3 parts  $\text{C}_6\text{H}_5\text{N}$ , I gives a *nonacetate*, m.  $156^\circ$ , decomps. about  $200^\circ$ , mol. wt. in  $\text{AcOH}$ , 878 (calcd. 864),  $[\alpha]_D^{154.8^\circ}$  in  $\text{CHCl}_3$ ; cold  $\text{NaOMe}$  in alc. regenerates I. When I is dissolved in cold concd.  $\text{HCl}$  and the latter allowed to evap. *in vacuo*, a new *trisaccharide*, *isotrihexose*, results, decomps.  $155-60^\circ$ , mol. wt. in  $\text{H}_2\text{O}$ , 543 (calcd. 504),  $[\alpha]_D^{102.1^\circ}$  in  $\text{H}_2\text{O}$ , reduces hot Fehling soln. and gives no color with  $\text{I}_2$ ; the very sol. osazone m.  $169-71^\circ$ . Dil.  $\text{HCl}$  hydrolyzes I to II, crystals with  $1\text{H}_2\text{O}$  from 80% alc., m.  $67-8^\circ$  (dry; *hydrate*, m.  $91-6^\circ$ ), mol. wt. in  $\text{H}_2\text{O}$ , 338 (calcd., 360),  $[\alpha]_D^{141.6^\circ}$  in  $\text{H}_2\text{O}$ ; osazone, m.  $167^\circ$  (the osazone from II contg. 17% maltose, m.  $154^\circ$ ; previous preps. of II probably contained maltose). Acetylation of II gives maltose octaacetate. When I is heated more severely ( $240^\circ$ ) with glycerol, it is further depolymerized to *dextrinosan* (III), which can also be obtained from starch directly, best with the addn. of a little  $\text{H}_2\text{C}_2\text{O}_4$ ; III,  $(\text{C}_6\text{H}_8\text{O}_5)_3$ , m.  $185-6^\circ$  (decompn.), mol. wt. in  $\text{H}_2\text{O}$ , 305-41 (calcd. 324),  $[\alpha]_D^{150.3^\circ}$  in  $\text{H}_2\text{O}$ ; best purified by regeneration from its *hexaacetate*, m.  $140-3^\circ$ , mol. wt. in  $\text{C}_6\text{H}_5\text{N}$ , 559 (calcd. 576),  $[\alpha]_D^{145.5^\circ}$  in  $\text{CHCl}_3$ . Hydration of III with cold concd.  $\text{HCl}$  gives II; but dehydration of II by heating 1 hr. at  $175^\circ$  and 12 mm. gives an *anhydride* isomeric with III, amorphous, m.  $130-40^\circ$ , and assumed to contain an ethylene oxide group, since it regenerates II on boiling in  $\text{H}_2\text{O}$ . In concd. soln. in  $\text{H}_2\text{O}$ , I forms (in 12-24 hrs.) a ppt. of a *polymer*, *isopolyhexosan* (IV); light does not affect the change, which is inhibited by various salts. IV forms rather starch-like grains which show birefringence, softens  $235^\circ$  and decomps.  $245^\circ$ ; boiling with  $\text{H}_2\text{O}$  reforms I, and hydrolysis with  $\text{HCl}$  gives only glucose. Acetylation of IV gives  $(\text{C}_6\text{H}_7\text{O}_5\text{Ac})_{12}$ ,  $[\alpha]_D^{177.4^\circ}$  in  $\text{CHCl}_3$ , mol. wt. in  $\text{C}_6\text{H}_5\text{N}$ , 3325, 3411 (calcd. 3456). B. H. NICOLET

Glycerides of chaulmoogra oil. A. RÖMER AND H. ENGEL. *Z. Untersuch. Lebensm.* 57, 113-47(1929).—The oil was hardened at  $170-200^\circ$  in the presence of a 0.1% mixt. of Pd and kieselguhr (1%). It was optically inactive and m.  $28^\circ$ . With the results of many fractional crystns. from acetone and  $\text{Et}_2\text{O}$  at  $0^\circ$ , graphs showing m. p. and wt. of the fractions were constructed. *Dihydrochaulmoogrodihydrohynocarpin*, m.  $307^\circ$ , made up 79% of the hardened oil. There was 13% of *dihydrohynocarpodihydrochaulmoogrin*, m.  $42.2^\circ$ , and also traces of a slightly sol. glyceride, possibly *tripalmitin*. Sapon., acid and I values as well as fractional pptn. of the fatty acids with  $\text{Mg}(\text{OAc})_2$  checked the above findings. Natural chaulmoogra oil contains the corresponding unsatd. glycerides *chaulmoogrodihydrohynocarpin* and *hynocarpodichaulmoogrin* in corresponding proportions while the fatty acids of the hardened oil have the compn. 40% dihydrochaulmoogric acid and 59% dihydrohynocarpic acid (*C. A.* 15, 728). Dihydrochaulmoogric and dihydrohynocarpic acids are 3-4 times more sol. in  $\text{EtOH}$  than stearic and palmitic acids. Tridihydrochaulmoogrin, m.  $51^\circ$ , was synthesized by the action of the Pb salt of dihydrochaulmoogric acid on tribromohydrin in the presence of xylene at  $170-80^\circ$  for 10 hrs. Analogously tridihydrohynocarpin, m.  $39.2^\circ$ , didihydrochaulmoogrin, m.  $60.7^\circ$ , trilaurin and trimyristin were prepd. C. R. F.

Some esters of 1,3- and 1,4-cyclohexanediol (resorcitol and quinitol). L. PAL-

FRAY AND B. ROTHSTEIN. *Compt. rend.* 189, 188-9 (1929); cf. C. A. 22, 2370, 4462, 4482.—*trans*-1,4-Cyclohexanediol (I) with EtCOCl and C<sub>6</sub>H<sub>5</sub>N in CHCl<sub>3</sub> gave the *trans*-dipropionate (II), m. 75.5-6.0°. From com. 1,4-cyclohexanediol (III), the product was essentially II but also some *cis*-form, m. 39.5-40°, was found. I reacted with iso-BuCOCl giving the *divaleryl*, but in this case as with III, the product was a mixt. of the 2 isomers,  $d_4^{22}$  0.9867,  $n_D^{22}$  1.4477, which could not be sepd. The *cis*-form of I reacted with PhCH:CHCOCl to give both the *trans*- and *cis*-dibenzoylates, m. 189° and 122°, resp. A phthalate could not be prepd. 1,3-Cyclohexanediol gave the following esters: *diacetate*,  $b_p$  130.5-1.5°,  $d_4^{25}$  1.0790,  $n_D^{25}$  1.4494; *dipropionate*,  $b_p$  154°,  $d_4^{26}$  1.0355,  $n_D^{26}$  1.4478; *diisovalerate*,  $b_p$  159-60,  $d_4^{27}$  0.9806,  $n_D^{27}$  1.4458; *diphenylacetate*,  $b_p$  215-7°,  $d_4^{24}$  1.1235,  $n_D^{24}$  1.5390; *dibenzoate*, *trans*, m. 122.5°, *cis*, m. 65.5°; *di-p-nitrobenzoate*, *trans*, m. 176.5°, *cis*, m. 154-4.5°; and the mixed Et oxalate ester, C<sub>12</sub>H<sub>10</sub>(OCO.CO<sub>2</sub>Et)<sub>2</sub>,  $b_p$  187°,  $d_4^{23}$  1.1988,  $n_D^{23}$  1.4604. The *cis*- and *trans*-forms of the diol were successfully isolated through the dibenzoate. Reaction of 1,3-di[chloromethoxy]cyclohexane with RMgX gave the following bis-ethers: 1,3-di[propoxycyclohexane],  $b_p$  113°,  $d_4^{22}$  0.9006,  $n_D^{22}$  1.4430; 1,3-di[phenylmethoxycyclohexane],  $b_p$  205-7°,  $d_4^{26}$  1.0739,  $n_D^{25}$  1.5440; and 1,3-di[2-methoxypropoxycyclohexane], 1,3-C<sub>6</sub>H<sub>10</sub>[OCH<sub>2</sub>CH<sub>2</sub>(OMe)Me]<sub>2</sub>,  $b_p$  160-2°,  $d_4^{23}$  0.9006,  $n_D^{23}$  1.4489.

A. S. CARTER

The action of sodium alcoholate on diethyl 2,3-cyclohexanedione-1,4-dicarboxylate. LUDIA S. DEBUSENKO. *Acta Univ. Asiae Med* 1928, Ser. 6, No. 1, 3-16.—These investigations, dealing with the action of NaOEt on di-Et 2,3-cyclohexanedione-1,4-dicarboxylate (I), were concerned with explaining the mechanism of the formation of tri-Et cyclopentenetricarboxylate (II) in the condensation of adipic acid esters with (CO<sub>2</sub>Et)<sub>2</sub> under the influence of metallic Na. The presence of the diketone group —CO—CO— in I leaves open the possibility that it is first transformed into alc. under —C(OH)(CO<sub>2</sub>Et), in the same way as with benzil, whereby tri-Et cyclopentanoltetricarboxylate (III) is formed, from which II is further formed under the existing reaction conditions with loss of water. A fundamental study of these reactions was carried out. With an excess of alc., I is converted into tri-Et 2-hydroxycyclopentane-1,2,3-tricarboxylate (III) under the influence of NaOEt. III reverts to I in the absence of alc. under the influence of NaOEt and metallic Na. In the condensation of adipic acid esters with oxalic acid esters, besides I, II and III, previously identified, only Et oxaladipate (IV) can be found. These compds., thus obtained, leave the original question unanswered, i. e., as to whether II is to be considered as a product of the ring closure of IV or a transformation product of I. From best evidence it seems that III is formed as a primary transformation product of IV, which, under the reaction conditions (presence of excess of metallic Na and dry NaOEt), either splits off water and thus forms II or, in case alc. is split off, yields I. The mechanism of the conversion of III to I and the reversion of the latter can be represented by the following scheme:

V and VI are mono-enolic and di-enolic tautomers, resp. The conversion of I to III in an alc.-contg. medium under the influence of NaOEt and the reverse process under the influence of metallic Na and NaOEt in the complete absence of alc., makes probable the hypothesis that the conversions —CO.CO— + HOC<sub>2</sub>H<sub>5</sub>  $\rightleftharpoons$  >C(OH)CO<sub>2</sub>Et constitutes a reversible process.

R. P. WALTON

**Chaulmoogrylamino phenols and chaulmoogrylbenzylamine.** IRÈNE DE SANTOS AND AUGUSTUS P. WEST. *Phillipine J. Sci.* **38**, 445-9(1929); cf. *C. A.* **23**, 3540.—Four new derivs. of chaulmoogric acid were prep'd. by heating the amide with the appropriate Cl deriv. in the presence of NaOAc and Cu powder: *o*-hydroxyanilide, m. 104.9-5.9°; *m*-hydroxyanilide, m. 105.9-8.0°; *p*-hydroxyanilide, m. 97.8-101.9°; benzylamide, m. 92.7-5.8°. The yields were 5-22%. BEN H. NICOLET

**Diethyl 1-cyclohexanone-2,6-dicarboxylate.** The mechanism of the reducing action of zinc upon halogen derivatives. M. I. USHAKOV. *J. Russ. Phys.-Chem. Soc.* **61**, 795-802(1929).—*Di-Et 1-cyclohexanone-2,6-dicarboxylate* (I) was prep'd. by condensation of  $\text{CH}_2[\text{CH}_2\text{CH}(\text{CO}_2\text{Et})_2]_2$  (II) (Meerwein and Schürmann, *C. A.* **7**, 3475):  $\text{I} \rightarrow \text{II} + \text{CO}(\text{OEt})_2$ , when 1 mol. each of II and metallic Na in 650 cc. abs. alc. were heated 3 hrs. on a water bath, the alc. and  $\text{CO}(\text{OEt})_2$  distd. off, the residue fractionated *in vacuo*, cooled with ice and decomp'd. with 20%  $\text{H}_2\text{SO}_4$ ; the 2nd fraction contg. most of the I,  $b_D^{20}$  165-5.5°; yield 36%. *1-Phenylpyrazolone* of I, was obtained in 90% yield on heating 1 hr. in a water bath an equimol. amt. of I and  $\text{PhNHNH}_2$ , the product crystd. from  $\text{Et}_2\text{O}$  and recrystd. from a mixt. of alc. and  $\text{Et}_2\text{O}$ , m. 151-2°, white powder, insol. in  $\text{H}_2\text{O}$ . The cyclohexanone,  $\text{CH}_2 \cdot (\text{CH}_2)_4 \cdot \text{CH}_2 \cdot \text{CO}$ , from I was prep'd. on heating

at 230-40° for 1 hr. equal vols. of I and  $\text{H}_2\text{O}$  (Meerwein and Schürmann, *loc. cit.*); the semicarbazone m. 166°. The bromination of I gives  $\text{EtO}_2\text{CCBr} \cdot (\text{CH}_2)_4 \cdot \text{CBr}(\text{CO}_2\text{Et}) \cdot \text{CO}$

(III) when 21 g. I in 100 cc.  $\text{Et}_2\text{O}$  with powd. marble is cooled with ice and slowly mixed with 28 g. Br, the product washed with  $\text{H}_2\text{O}$ , then with 2 *N* NaOH and 10%  $\text{H}_2\text{SO}_4$ ; on drying it forms a heavy yellow liquid easily decomp'd. on distn. The action of Zn dust on III. Twenty-nine g. of III in 30 cc. PhMe are mixed with 14 g. Zn dust and heated on a water bath; after the turbulent reaction has subsided, the heating is continued for 2 hrs., forming two layers over some Zn; the mixt. is treated with  $\text{H}_2\text{O}$ , the ZnO formed is dissolved with 10%  $\text{H}_2\text{SO}_4$ , the PhMe layer removed, dried with calcined  $\text{MnSO}_4$ , filtered and distd. *in vacuo*, giving 8.5 g. of a liquid  $b_D^{20}$  140-75°, which gives violet color with  $\text{FeCl}_3$ , the Cu salt, the *N*-phenylpyrazolone, m. 150-2°, show that this fraction contains 70% of I. CHAS. BLANC

**Chemistry of the three-carbon system. XXI. Some cycloheptane compounds.** WILFRED E. HUGH, GEO. A. R. KON AND THOMAS MITCHELL. *J. Chem. Soc.* **1929**, 1435-40.—Cycloheptylideneacetic acid on treatment with alkali passes into an equimixt. from which about 25% of the unchanged acid could be recovered (Kon and May, *C. A.* **21**, 3187); with I, instead of May's extrapolation method (*C. A.* **22**, 370) this value is confirmed (26%  $\alpha, \beta$ -isomer) but subsequent expts. with the pure  $\beta, \gamma$ -acid suggest that this value may be 2-3% low.  $\Delta^1$ -Cycloheptenylacetic acid,  $b_D^{20}$  153°,  $b_D^{25}$  107,  $d_4^{25}$  1.01155,  $n_D^{20}$  1.48820; Et ester,  $b_D^{20}$  104-7°,  $d_4^{25}$  0.97172,  $n_D^{20}$  1.44680; chloride,  $b_D^{20}$  100-4°; anilide, m. 79-80°. Cycloheptylideneacetone, from the  $\alpha, \beta$ -acid,  $b_D^{20}$  96°,  $d_4^{25}$  0.94852,  $n_D^{20}$  1.49518; semicarbazone, m. 172-3°; cycloheptenylacetone,  $b_D^{20}$  95°,  $d_4^{25}$  0.93558,  $n_D^{20}$  1.47595; semicarbazone, m. 128-9°. The equilibration of the 2 ketones is difficult because equil. is reached after 5 min. treatment with  $\text{EtONa}$ , the av. figure is 65% of the  $\alpha, \beta$ -ketone. The mobility of the acid system,  $(k_1 + k_2) \times 10^4$ , is 0.66; for the ketone system,  $(k_1 + k_2) \times 10^4$ , is greater than 3500. The work shows that the mobility and the point of equil. of ketones cannot be simply correlated with those of the corresponding acids. C. J. WEST

**The action of hydrohalic acids upon acetylene glycols.** YU. ZALKIND AND A. KRUGLOV. *J. Russ. Phys.-Chem. Soc.* **61**, 803-14(1929).—The action of HBr on acetylene glycols may produce 2 derivs., a dibromide,  $\text{R}_2\text{C}:\text{CBrCBr}:\text{CR}_2$  and an oxybromide,  $\text{RR}'\text{C}:\text{CBr}:\text{CH}:\text{CRR}'\text{O}$  (*J. Russ. Phys.-Chem. Soc.* **58**, 1039, 1052; **56**,

283). The glycols with aromatic radicals react either with HBr or HI in both directions. Tetraphenylbutenediol (I), however, reacts with HI differently (Salkind and Krugov, *Ber.* **61**, 2306), giving the oxyiodide, but instead of the expected diiodides, which seem to be unstable, there are formed hydrocarbons:  $\text{C}_{22}\text{H}_{20}$ , m. 235° and 204-5°, and  $\text{C}_{24}\text{H}_{22}$ , m. 201-2°. The oxyiodide, 2,2,5,5-tetraphenyl-3-iododihydrofuran,  $(\text{C}_6\text{H}_5)_2\text{C}:\text{CH}:\text{CI}:\text{C}(\text{C}_6\text{H}_5)_2\text{O}$  (II), could only be obtained when using very dil. HI and heating

on a boiling water bath, whereby the hydrocarbon,  $\text{C}_{22}\text{H}_{20}$ , m. 235°, is also formed; the mixt. is poured in cold  $\text{H}_2\text{O}$  the solid is filtered off, washed, dried, extd. with ligroin, filtered hot, from which is crystd. II contg. some hydrocarbon; this is dissolved again in a mixt. of acetone and ligroin, whereby on cooling the hydrocarbon is pptd., filtered,

and after partial evapn. of the solvent is pptd. The pure **II** m. 139–40° (yield 60–70%), colorless prisms, readily sol. in org. solvents. *1,1,4,4-Tetraphenyl-1,2,3-butatriene*,  $(C_6H_5)_2C:C:C(C_6H_5)_2$  (**III**), m. 235°, is obtained in 80–85% yield, when **I** is treated with a more concd. soln. in AcOH at 0°; when working at 5–15° the **III** is contaminated with the hydrocarbon, m. 204–5°. **III** was also prepd. with a satd. soln. of HI in AcOH and **II**. In all the cases the reaction product was poured in cold H<sub>2</sub>O, the solid filtered off and crystd. from a mixt. of C<sub>6</sub>H<sub>6</sub> and C<sub>6</sub>H<sub>5</sub>CH<sub>3</sub>, and then from AcOEt, yellow prisms, sol. in PhMe, CHCl<sub>3</sub>, poorly sol. in petroleum ether and Et<sub>2</sub>O (Rast, *Ber.* **55**, 1051 (1922); Brand, *Ber.* **54**, 1987, 2020; *J. Chem. Soc.* **57**, 1537; *Ann.* **279**, 379). *1,10,10-Triphenylbenzofulvene* is obtained in 60–80% yield when 1 g. **I** with 5–10 cc. dil. HI and 0.5 g. **I** is heated in a boiling water bath for 1–2 hrs., the product poured into cold H<sub>2</sub>O, filtered and crystd. from AcOEt, orange crystals, m. 205–6°, easily sol. in C<sub>6</sub>H<sub>6</sub>, C<sub>6</sub>H<sub>5</sub>CH<sub>3</sub>, CHCl<sub>3</sub>, less sol. in AcOH, ligroin, acetone and alc. *1,1,4,4-Tetraphenyl-1,3-butadiene*,  $(C_6H_5)_2C:CHCH:C(C_6H_5)_2$ , is prepd. when 1 g. **III** is heated in a water bath for 3 hrs. with 8 cc. HI and 1 g. P; on diln. with H<sub>2</sub>O the solid product is filtered off and crystd., first from C<sub>6</sub>H<sub>6</sub> and then from a mixt. of acetone and alc., colorless needles, m. 192–3°.

CHAS. BLANC

**Relation between quinone hydrazones and *p*-hydroxyazo compounds.** VI. *p*-Quinone dihydrazones from *p*-hydroxyazo compounds. W. BORSCHKE, W. MÜLLER AND C. A. BODENSTEIN. *Ann.* **472**, 201–16 (1929); cf. *C. A.* **21**, 68. In the following it is shown that true hydroxyazo compds. of the type 4-hydroxyazobenzene react under definite conditions with primary hydrazines to form *p*-quinone dihydrazones, thus giving chem. proof, previously lacking, that 4-hydroxyazo compds. are capable of quinone tautomerism. *p*-Anisylsemicarbazide, m. 184°, from  $p\text{-MeOC}_6\text{H}_4\text{NHNH}_2$  and KCNO, is oxidized in AcOH by CrO<sub>3</sub> to 4-methoxyphenylazoformamide (**I**), orange-red, m. 157° (decompn.) (90% yield); with H<sub>2</sub>NNHCONH<sub>2</sub>·HCl in MeOH the latter gives quinone disemicarbazone, yellow, m. 251° (decompn.); similarly, 2,4-(O<sub>2</sub>N)<sub>2</sub>C<sub>6</sub>H<sub>3</sub>NHNH<sub>2</sub> (**II**) gives the semicarbazone 2,4-dinitrophenylhydrazine (**III**), dark brown, m. 242° (decompn.), and 4,2-NC(O<sub>2</sub>N)<sub>2</sub>C<sub>6</sub>H<sub>3</sub>NHNH<sub>2</sub>, the semicarbazone 4-cyano-2-nitrophenylhydrazine, black-brown, decomp. 240° (70% yield). **I** and *p*-O<sub>2</sub>NC<sub>6</sub>H<sub>4</sub>NHNH<sub>2</sub> give 4-methoxyphenylhydrazoformamide; i. e., the hydrazine acts as a reducing rather than as a substituting agent. 4-Phenoxyphenylsemicarbazide, m. 159°; 4-phenoxyphenylazoformamide, orange-red, m. 165°; neither this nor the 4-Br deriv. reacts with 4-O<sub>2</sub>NC<sub>6</sub>H<sub>4</sub>NHNH<sub>2</sub>, except to be reduced. Thus, the ethers of the oxyazo compds. do not condense with primary hydrazines in the presence of HCl to form quinone dihydrazones. 2,4,6-(O<sub>2</sub>N)<sub>3</sub>C<sub>6</sub>H<sub>2</sub>N·NC<sub>6</sub>H<sub>4</sub>OH and **II** give *p*-quinone 2,4,6-trinitrophenylhydrazine 2,4-dinitrophenylhydrazine, dark brownish red, m. 204–6°. *p*-Quinone bis[2,4-dinitrophenylhydrazine], dark red, m. 267–8° (decompn.), results in 1.1 g. yield from 1.44 g. 2,4-(O<sub>2</sub>N)<sub>2</sub>C<sub>6</sub>H<sub>3</sub>N·NC<sub>6</sub>H<sub>4</sub>OH (**IV**), and **II**, in 0.7 g. yield from 0.54 g. O·C<sub>6</sub>H<sub>4</sub>O and **II**, by heating **IV** with 2 N HCl for 2 hrs., from 2,4-dinitrophenylazoanisole, m. 177–8°, and **II** by heating 0.5 day, and from *O*-Bz deriv. of **IV**, red-brown, m. 164°, and **II** with MeOH·HCl. **IV** and H<sub>2</sub>NNHCONH<sub>2</sub>·HCl give **III**. 4-Hydroxyphenylazoformanilide and **II** in MeOH·HCl or **IV** and PhNHNHCONH<sub>2</sub>·HCl give quinone phenyl-1-semicarbazone 2,4-dinitrophenylhydrazine, dark red, decomp. 248–50°. **IV** and 2-O<sub>2</sub>NC<sub>6</sub>H<sub>4</sub>NHNH<sub>2</sub> or 2-O<sub>2</sub>NC<sub>6</sub>H<sub>4</sub>N·NC<sub>6</sub>H<sub>4</sub>OH-4 and **II** give quinone 2-nitrophenylhydrazine 2,4-dinitrophenylhydrazine, black-brown, m. 236–8° (decompn.). 2,4-(O<sub>2</sub>N)<sub>2</sub>C<sub>6</sub>H<sub>3</sub>N·NC<sub>6</sub>H<sub>4</sub>(OH)Me-4,2 and **II** give toluquinone bis[2,4-dinitrophenylhydrazine], grayish black, m. 269°, while 2-O<sub>2</sub>NC<sub>6</sub>H<sub>4</sub>NHNH<sub>2</sub> gives toluquinone 2-[2-dinitrophenylhydrazine] 5-[2,4-dinitrophenylhydrazine], dark brown, m. 246–7° (decompn.). Thymoquinone 6-[2-nitrophenylhydrazine] 3-[2,4-dinitrophenylhydrazine], black, m. 258–60°. Quinone 2,4-dinitrophenylhydrazine 3-nitrophenylhydrazine, brown, m. 223–5°, from 3-nitrobenzenesulphonic acid, light yellow, m. 146–7°. The 4-nitrophenylhydrazine deriv., black, m. 215° (decompn.). 4-Hydroxyazobenzene-2'-carboxylic acid, brown, m. 206–7°; *Me* ether, yellow, m. 170–2° (*Me* ester, red, m. 105–6°); either acid and **II** give quinone 2-carboxyphenylhydrazine 2,4-dinitrophenylhydrazine, deep violet, m. 226–8°. **IV** does not react with BzNHNH<sub>2</sub>, PhNHNH<sub>2</sub>, or NH<sub>2</sub>OH. C. J. W.

**Derivatives of 2,4-dichlorophenylhydrazine, 2,4,6-trichlorophenylhydrazine and 2-chloro-4-nitrophenylhydrazine with aldehydes and ketones, especially the sugars.** E. VOTOČEK AND L. RYS. *Collection Czechoslov. Chem. Comm.* **1**, 346–51 (1929); cf. *C. A.* **18**, 50; **19**, 44; **20**, 1794. The hydrazones of the above 3 compds. (**I**, **II** and **III**, resp.) with COMe<sub>2</sub>, BzH, salicyl aldehyde, arabinose, rhamnose, glucose, galactose and fructose, also the osazones of the sugars have been prepd. The **II** and **III** hydrazones of COMe<sub>2</sub> sep. easily from dil. solns., and m. 58° and 121.5°, resp. So do the **I** and **II** hydrazones of fructose, m. 120° and 155°, resp. **I** was prepd. (cf. *C. A.* **23**, 1400).

For II 60 g. of 2,4,6-Cl<sub>3</sub>C<sub>6</sub>H<sub>3</sub>NH<sub>2</sub> in concd. H<sub>2</sub>SO<sub>4</sub> was added to 500 g. concd. HCl, cooled, 24 g. concd. NaNO<sub>2</sub> soln. added and the excess destroyed with urea, the mixt. added to 150 g. of SnCl<sub>2</sub> in HCl, the double salt recrystd. from hot H<sub>2</sub>O, dried, decompd. with Na<sub>2</sub>CO<sub>3</sub>, recrystd. from C<sub>6</sub>H<sub>6</sub> and EtOH. Yield 55%, white crystals, m. 143°. For III 100 g. of 2,4-Cl(O<sub>2</sub>N)C<sub>6</sub>H<sub>3</sub>NH<sub>2</sub> in concd. H<sub>2</sub>SO<sub>4</sub> was added to 500 g. concd. HCl, cooled, 50 g. NaNO<sub>2</sub> in H<sub>2</sub>O added and the mixt. added to 260 g. SnCl<sub>2</sub> in concd. HCl. Recrystallize as before. Sn was remove by H<sub>2</sub>S. An equal vol. of HCl was added and satd. with HCl gas, filtered, decompd. with NaOAc and recrystallized from EtOH; yellow, m. 144°.

V. F. HARRINGTON

**Aromatic sulfonamides.** J. AND P. KOETSCHET. *Helv. Chim. Acta*, 12, 669 (1929).—Sulfonamides contg. the groups —CH<sub>2</sub>OH or —CHO cannot be made from the acids by the usual methods. Dakin (C. A. 11, 3276) obtained *p*-OHCC<sub>6</sub>H<sub>4</sub>SO<sub>2</sub>NH<sub>2</sub> (I) by the action of chloramine-T and glucose. It is now found that in the presence of acid (and hence of dichloroamine) I is formed without glucose, and may be sepd either as the phenylimide or phenylhydrazone. The *p*-nitrophenylhydrazone of I, yellow needles, m. 256–7°; the *α*-naphthylhydrazone, m. 254–5°. Methylation of I with Me<sub>2</sub>SO<sub>4</sub> (gradual addn. of alkali) formed *p*-sulfonmethylamidobenzaldehyde, m. 119–9.5°; phenylhydrazone, m. 163–4°; and *p*-sulfondimethylamidobenzaldehyde, m. 134–7°; phenylhydrazone, m. 170–1°. By the Cannizzaro reaction, I gave *p*-sulfonamidobenzyl alc., m. 119–20°, and H<sub>2</sub>NSO<sub>2</sub>C<sub>6</sub>H<sub>4</sub>CO<sub>2</sub>H. "Chloramine-TO" (prepn from *o*-MeC<sub>6</sub>H<sub>4</sub>SO<sub>2</sub>NH<sub>2</sub> described in detail) boiled and agitated by steam in 10 parts of 2.5% AcOH, gave the anhydrobenzylalcohol-*o*-sulfimide of *o*-sulfamidopseudobenzaldehyde (II), m. 141–2° and some saccharin (III). With hydrazines, II gave the phenylhydrazone (IV) (authors' name; see formula), red-brown, m. 110°, the *p*-nitrophenylhydrazone, yellow needles, m. about 250°, and the *α*-naphthylhydrazone, m. 206–8°, of *o*-sulfamidopseudobenzaldehyde (V). A new nomenclature is proposed in which these compds are

H derivs. of *S*-dioxo-*α,β*-benzisothiazole (VI). IV would then become *S*-dioxo-2,3-dihydro-3-phenylhydrazino-*α,β*-benzisothiazole. Boiling dil. HCl does not affect II, but SO<sub>2</sub> gives 1 mol. of anhydro-*o*-sulfamidobenzyl alc. (VII), m. 112.5–3°, and the soln. seems to contain V, although the isolated product is apparently a polymer of V, amorphous, m. above 250°. Methylation of II with Me<sub>2</sub>SO<sub>4</sub> gives 3 products: *N*-Me deriv. of II, m. 262–3°; *N*-Me deriv. of VII, m. 122–3°; and an aldehyde, *N*-Me deriv. of V, which with PhN<sub>2</sub>H<sub>2</sub> gives the *N*-Me deriv. of IV, m. 153–4°. In the prepn. of II, there is also formed a small quantity of the "bitter substance," *o*-toluenesulfonyl deriv. of *S*-dioxo-3-amino-*α,β*-benzisothiazole, m. 255° (Herzog, C. A. 20, 3450; Klages, C. A. 21, 2888) which accompanies III in its technical manuf. By modifying the conditions for the action of Cl<sub>2</sub> on *o*-MeC<sub>6</sub>H<sub>4</sub>SO<sub>2</sub>NH<sub>2</sub> this can be obtained in double the yield previously possible. When III is boiled 1.5 hrs. with 6 parts of PhNH<sub>2</sub> and the excess PhNH<sub>2</sub> distd. off up to 250°, pseudosaccharin anilide (*S*-dioxo-3-anilino-*α,β*-benzisothiazole), m. 313–5°, is obtained in much improved yield. A table gives the "system nos." (cf. Beilstein, 4th ed.) of the compds. described.

B. H. NICOLET

***o*-Aminobenzenesulfonic acid (orthanilic acid).** HANS EDUARD PIERZ DAVID WITH EMIL SCHLITTLER AND HANS WALDMANN. *Helv. Chim. Acta* 12, 663 (1929).—A no. of methods for the prepn. of *o*-H<sub>2</sub>NC<sub>6</sub>H<sub>4</sub>SO<sub>2</sub>H (I) were studied. Directions are given for the nitration of PhSO<sub>3</sub>H and sepn. of the isomers as Fe<sup>+</sup> salts; after reduction, 23% of I was obtained. Sulfonation of PhNH<sub>2</sub> with ClSO<sub>3</sub>H in C<sub>2</sub>H<sub>5</sub>Cl (cf. D. R. P. 392,460) was not satisfactory. *o*-ClC<sub>6</sub>H<sub>4</sub>NO<sub>2</sub> boiled 8 hrs. with Na<sub>2</sub>S<sub>2</sub> in alc. gave 72–75% (*o*-NO<sub>2</sub>C<sub>6</sub>H<sub>4</sub>S<sub>2</sub>), 100 g. of which in 600 cc. concd. HCl and 50 cc. concd. HNO<sub>3</sub> gave with Cl<sub>2</sub> *o*-NO<sub>2</sub>C<sub>6</sub>H<sub>4</sub>SO<sub>2</sub>Cl (II), m. 67°, in 80% yield. Hydrolysis with Na<sub>2</sub>CO<sub>3</sub> and reduction with Fe gave 92% I (microphotographs are given of crystal forms of the isomers of I, and of the stable and unstable forms of I). With NH<sub>4</sub>OH II gave the amide (90%), reduced by Fe to *o*-H<sub>2</sub>NC<sub>6</sub>H<sub>4</sub>SO<sub>2</sub>NH<sub>2</sub> (III) (70%). With HCl and C<sub>6</sub>H<sub>5</sub>ONO in alc., III gave C<sub>6</sub>H<sub>5</sub>— NH (IV), white needles pptd. by Et<sub>2</sub>O, be-

H<sub>2</sub>ONO in alc., III gave C<sub>6</sub>H<sub>5</sub>— NH (IV), white needles pptd. by Et<sub>2</sub>O, be-

haves on heating like gun-cotton, and has a very sweet taste, recalling saccharin, to which it is closely related. Various azo dyes from IV were very similar to corresponding dyes from  $p\text{-H}_2\text{NC}_6\text{H}_4\text{NHAc}$ .

**The reaction between phenol and lead subacetate (Goulard's extract).** E. A. LUM. *Pharm. J.* 122, 149–50, 251, 321 (1929); G. S. GIBSON, *Ibid* 192–3; J. E. DRIVER, *Ibid* 251; E. MATTHEWS, *Ibid* 297.—With Medley (*C. A.* 20, 3777), L. considers the ppt. to be  $\text{Pb}(\text{OPh})_2$ ; a large portion of ionized Pb is in neutral soln. G. and M. previously (*C. A.* 22, 1965) found for the ppt. the compn.  $\text{Pb}(\text{OPh})_2 \cdot \text{Pb}(\text{OH})(\text{OAc})$  (I). This formula L. accepts, also the following equation given by M.:  $3\text{Pb}(\text{OH})(\text{OAc}) + 2\text{PhOH} = \text{I} + \text{Pb}(\text{OAc})_2 + 2\text{H}_2\text{O}$ .

**The preparation of aromatic ethers by the catalytic action of alkali bisulfates.** JEAN B. SENDERENS. *Compt. rend.* 188, 1073–6 (1929).—Heating  $\text{PhCH}_2\text{OH}$  to 145–50° in the presence of  $\text{KHSO}_4$  or  $\text{NaHSO}_4$  gives  $(\text{PhCH}_2)_2\text{O}$ . Similarly,  $(\text{PhCH}_2\text{CH}_2)_2\text{O}$  was prepd. from  $\text{PhCH}_2\text{CH}_2\text{OH}$ . Mixts. of alcs. under the foregoing conditions give corresponding mixed ethers.

**Some substances derived from the anhydrocatechol tetramethyl ether.** WILSON BAKER. *J. Chem. Soc.* 1929, 1593–1604.—Anhydrocatechol tetra-Me ether (I) contains the same C skeleton as the natural isoflavones and from the point of view of genetic relationships it was of importance to attempt to oxidize the  $\text{CH}_2$  group in this compd. to a CO group with the object of producing 5,7,3',4'-tetramethoxyisoflavone. It was considered doubtful whether such a relationship between the catechols and the isoflavones really exists in nature, since the isoflavone corresponding to the catechols is unknown and no catechols are known to occur which correspond to any of the known isoflavones. I, m. 133–4°, gives a bright orange soln. in concd.  $\text{H}_2\text{SO}_4$ ; in AcOH and a few drops of concd.  $\text{HNO}_3$  the orange-yellow color rapidly develops a greenish tint and then more slowly becomes a dull slate-blue. I yields no recognizable products either by fusion with KOH, toward which it is remarkably stable, or by oxidation with  $\text{CrO}_3$  in AcOH. It does not react with aromatic aldehydes or NO compds. Definite results were obtained only on oxidizing with  $\text{KMnO}_4$  and  $\text{CrO}_3$ .  $\text{KMnO}_4$  in  $\text{Me}_2\text{CO}$  at 12–22° gives about 12% of 5,7,3',4'-tetramethoxy-3-phenylcoumarin (II), very pale yellow, m. 177°, and about 8% of a basic substance converted by HCl into 5,7,3',4'-tetramethoxyisoflavylum chloride (III). The solns. of II are all very pale yellow; that in EtOH exhibits a bluish green, in  $\text{C}_6\text{H}_6$  and  $\text{Me}_2\text{CO}$  a fine blue and in  $\text{CHCl}_3$  a strong greenish blue fluorescence. II does not give an oxonium salt on warming with concd. HCl. Demethylation gives the corresponding tetra-HO deriv., yellow, m. 337° (decompn.); the concd.  $\text{H}_2\text{SO}_4$  soln. is yellow and exhibits a very weak green fluorescence. A suspension in air-free  $\text{H}_2\text{O}$ , treated with a drop of 1% NaOH, yields a bright yellow soln. which, when shaken rapidly, darkens and becomes dull reddish brown.  $\text{FeCl}_3$  in EtOH gives a greenish yellow color, changing with excess through dull yellowish brown to red-brown. Phloroglucinaldehyde and Na homoveratrate, boiled with  $\text{Ac}_2\text{O}$  for 24 hrs., give the di-Ac deriv., pale yellow, m. 151°, of 5,7-dihydroxy-3',4'-dimethoxy-3-phenylcoumarin, yellow, m. 327° (decompn.); methylation gives II, thus establishing its constitution. III, bright red, m. 128–9° (decompn.); the same product was obtained from the bromide (Pratt and Robinson, *C. A.* 19, 2341). The oxidation of I with  $\text{KMnO}_4$  in  $\text{C}_6\text{H}_5\text{N}$  gives about 25% of II and only a trace of III. Oxidation of I with  $\text{CrO}_3$  in  $\text{C}_6\text{H}_5\text{N}$  gives about 4% of the 2 products. Oxidation of the pseudo-base of III gives only a trace of II and a minute amt. of an acid, probably 2,4,6-HO(MeO)- $\text{C}_6\text{H}_2\text{CO}_2\text{H}$ ; the stability of this base towards oxidation excludes the possibility of its being regarded as an intermediate in the oxidation of I to II. This leads B. to the opinion that the isoflavones are not derived from catechol-like substances. Freudenberg, Carrara and Cohn (*C. A.* 20, 405) have described a reddish violet HCl salt of I, which, however, is identical with III. The analogous HCl salt of anhydroepicatechol tetra Me ether (F., Fikentscher and Wenner, *C. A.* 19, 2041) is shown to be identical with tetramethyluteolinidin chloride (Pratt, Robinson and Williams, *C. A.* 18, 986). This crystals from hot 8% HCl on cooling and satg. with HCl as the compd.  $\text{C}_{19}\text{H}_{16}\text{O}_8 \cdot \text{Cl} \cdot \text{HCl} \cdot 2\text{H}_2\text{O}$ , orange-red needles with greenish yellow reflex.

**Substitution in resorcinol derivatives.** II. Bromo derivatives of  $\beta$ -resorcyraldehyde and their orientation. MYSORE GURU SRINIVASA RAO, COLLURAYANA SRIKANTIA AND MYSORE SESHA IVENGAR. *J. Chem. Soc.* 1929, 1578–81; cf. *C. A.* 19, 1701.—2,4-HO(MeO) $\text{C}_6\text{H}_2\text{CHO}$  (I) (3 g.) in 15 cc.  $\text{HCO}_2\text{H}$  and 15 g. AcONa, treated with 1 cc. Br in 15 cc.  $\text{HCO}_2\text{H}$ , gives quant. the 5-Br deriv., m. 120–1° (larger amts. give 75% yields);  $\text{FeCl}_3$  gives a dark violet color; oxime, m. 148–9°; phenylhydrazone, m. 177–8°. The same compd. results by reduction of the 5- $\text{NO}_2$  deriv. and applying the Sandmeyer reaction. Excess Br or the action of the calcd. amt. of Br upon I in AcOH and AcONa

gives the *3,5-di-Br deriv.*, m. 97–8°; FeCl<sub>3</sub> gives a violet color; *oxime*, m. 215°; *phenylhydrazine*, m. 131–2°. Nitration gives 2,6,4,3-Br<sub>2</sub>(O<sub>2</sub>N)(HO)C<sub>6</sub>HOMe, m. 127–8° whose Me ether, m. 81°, was prepd. by Jackson and Fiske (*Am. Chem. J.* 30, 53 (1903)). Bromination of other derivs. of 2,4-(HO)<sub>2</sub>C<sub>6</sub>H<sub>3</sub>CHO gives 5-Br derivs., showing that the MeO and EtO groups are powerfully *p*-directive.

C. J. WEST

An easy conversion of hydroxyhydroquinone trimethyl ether derivatives into quinone compds. TIBOR SZÉKI. *Ber.* 62B, 1373–8 (1929).—A no. of trimethoxyphenylphthalides in AcOH with a little concd. HNO<sub>3</sub> yield quinones with extraordinary ease, even in the cold, the two MeO groups in the *p*-position to each other being oxidized. 3-[2',4',5'-Trimethoxyphenyl]meconin (I) (6.7–7 g. from 4.5 g. opianic acid, 1,2,4-C<sub>6</sub>H<sub>3</sub>(OMe)<sub>3</sub> and H<sub>2</sub>SO<sub>4</sub>), m. 115–9°, sol. in concd. H<sub>2</sub>SO<sub>4</sub> with deep cherry-red color. *Me-4,5,8',4',5',2',4',5'-octamethoxytriiphenylmethane-6-carboxylate*, similarly obtained from Me opianate, m. 143°, sol. in H<sub>2</sub>SO<sub>4</sub> with dark red color. 4-Nitro deriv. (II) of I, from nitroopianic acid (65% yield), lemon-yellow, m. 184°, sol. in H<sub>2</sub>SO<sub>4</sub> with reddish yellow color changing on heating to green and then violet. 2-Methoxy-5-meconylbenzoquinone (III), from 2 g. I in 8 cc. cold AcOH slowly treated with 1 cc. of a mixt. of equal vols. of AcOH and HNO<sub>3</sub> (d. 1.48), shrinks 202–4°, m. around 220°. I slowly added to HNO<sub>3</sub> (d. 1.48) at –60° gives 2-methoxy-5-[4'-nitromeconyl]benzoquinone, lemon-yellow, m. 199–200° (decompn.), sol. in concd. H<sub>2</sub>SO<sub>4</sub> with yellowish red color changing to green and then deep blue on heating, also obtained by oxidizing II in the same way. 2-Methoxy-5-phthalidylbenzoquinone, prepd. like III, brick-red, m. 152–4°, also obtained with fuming HNO<sub>3</sub> but as lemon-yellow crystals which begin to reddens 160° and m. 170–80° to a semi-fluid mass. 2-Methoxy-5-[diphenylbenzoylmethyl]benzoquinone, orange-yellow, m. 181°. 2-Methoxy-5-[α,α-diphenylethyl]benzoquinone, cinnabar-red, m. 198°. 2-Methoxy-5-[α,β-diphenylisopropyl]benzoquinone, crimson, m. 183–4°. 2-Methoxy-5-meconylhydroquinone, from III in AcOH with SO<sub>2</sub>, m. 210° sol. in alkalis with yellowish red color; diacetate, m. 153°. 2-Methoxy-5-phthalidylhydroquinone, m. 204°; diacetate, m. 178°.

C. A. R.

Nitrosation of phenols. VI. Further study of the nitrosation of *m*-chlorophenol. HERBERT HODGSON AND ARNOLD KERSHAW. *J. Chem. Soc.* 1929, 1553–7; cf. C. A. 22, 1966.—The 2 alleged forms of 3-chlorobenzoquinone 4-oxime (I), stable towards acid and alkali, resp. (C. A. 18, 235) are impure specimens of 1 form, the reddish color of the acid stable specimen being due to traces of decompn. products formed during the drastic acid treatment. The conversion of 3,4-Cl(ON)C<sub>6</sub>H<sub>3</sub>OH (II) into I by acid and alkali is readily explained by current electronic theories (formulas given). II, m. 133°, exposure in EtOH to ultra-violet light transforms it into resinous products. 3-Chloro-4-nitrosoanisole, from the 4-NH<sub>2</sub> deriv., bright green, m. 60°. I, very pale greenish yellow, m. 184° (decompn.), gives in dil. aq. NaOH and Na<sub>2</sub>CO<sub>3</sub> red solns. which become green on diln. I or II with BzCl in Na<sub>2</sub>CO<sub>3</sub> gives the benzoate, golden brown, m. 189.5°; Me<sub>2</sub>SO<sub>4</sub> gives the Me ether, pale yellow, m. 113°. *p*-Benzoquinone dioxime 4-Me ether, m. 115°.

C. J. WEST

Reaction between magnesium phenyl bromide and phenyl glycidate. D. R. BOYD AND G. J. C. VINEALL. *J. Chem. Soc.* 1929, 1622.—Ph glycidate and PhMgBr give 75% of *γ*-phenoxy-*α*-phenylisopropyl alc. (I), m. 92.5°; if the reaction product is not heated before decompn. with H<sub>2</sub>O, an oil, b<sub>p</sub> 165°, probably *α*-bromo-*γ*-phenoxyisopropyl alc., is obtained. I reacts with PCl<sub>5</sub> to give an ester of H<sub>3</sub>PO<sub>4</sub> sol. in NH<sub>4</sub>OH.

C. J. WEST

Conjugated double bonds. VIII. RICHARD KUHN AND ALFRED WINTERSTEIN. *Helv. Chim. Acta* 12, 493–8 (1929); cf. C. A. 23, 2698.—BzH and MeCH:CHCHO give PhCH:CHCH:CHCHO, b<sub>p</sub> 160–2°, in 10% yield. Diphenylhexatriene and alkali metal give a bluish black addn. compd. which is decompd. by water giving PhCH<sub>2</sub>CH:CHCH:CHCH<sub>2</sub>Ph. Diphenyloctatetraene and Li give a similar addn. compd., but several days is required for the reaction.

FREDERICK C. HAHN

2,4-Dinitrobenzaldehyde as a reagent. GEORGE MACDONALD BENNETT AND WALTER L. C. PRATT. *J. Chem. Soc.* 1929, 1465–8; cf. C. A. 22, 3663.—An improved method for the prepn. of 2,4-(O<sub>2</sub>N)<sub>2</sub>C<sub>6</sub>H<sub>3</sub>CHO is given. The following 2,4-dinitrobenzylidene derivs were prepd.: *m*-chloroaniline, orange, m. 137°; 3,5-dibromoaniline, Cu-red, m. 181°; *p*-iodoaniline, yellow, m. 163°; *p*-aminophenol, yellow, m. 158°; *p*-aminoacetanilide, yellow, m. 199°; 6-aminoquinoline, pale yellow, m. 206°; bis derivs.; *o*-phenylenediamine, red brown, m. 158°; 3,4-lolylenediamine, brown, m. 153.5°; 4,4'-diaminodiphenylamine, purple with green reflex, m. 263° (decompn.). *α*-Picoline yields *α*-dinitrostyrylpyridine, yellow, m. 159°. 2,6-Dimethylquinoline (I) gives 2-[2,4-dinitrostyryl]-6-methylquinoline (II), yellow, m. 163.5°; heating in Ac<sub>2</sub>O with excess of the reagent gives tetranitro-2,4-distyrylquinoline, deep yellow, m. 270° (decompn.).

The di- and tri-Cl derivs. of I react rapidly to give the 5,8-di-Cl and the 5,6,8-tri-Cl derivs. of II, orange, m. 198.5°, and bright yellow, m. 225.5°, resp. 2,4,6-Trimethylquinoline yields 2-[2,4-dinitrostyryl]-4,6-dimethylquinoline, yellow, m. 195°. 2-Methylbenzimidazole yields 2-dinitrostyrylbenzimidazole, orange-yellow, m. 215°.  $p\text{-O}_2\text{NC}_6\text{H}_4\text{CH}_2\text{CN}$  gives 2,4,4'-trinitro- $\alpha$ -cyanostilbene, pale brown, m. 149° C. J. WEST

Systematic investigation of polymorphism of organic compounds. C. WEYGAND. *Ann.* 472, 143-79 (1929); cf. C. A. 23, 3683, 3685.—A discussion under the headings: specific seeding action with polymorphic forms in the chalcone series; relation between structural isomerism (tautomerism) and polymorphism; systematic relation between the polymorphic forms of chalcones,  $\beta$ -hydroxychalcones  $\alpha$ -bromochalcones and  $\beta$ -ethoxychalcones. The original should be consulted for the details of the various polymorphic forms observed. C. J. WEST

Action of diazomethane on piperonal. II. ERICH MOSETTIG. *Ber.* 62B, 1271-8 (1929); cf. C. A. 22, 4512.—It was shown in the earlier paper that piperonal (I) with  $\text{CH}_2\text{N}_2$  under certain conditions gives only to a very minor extent the expected aceto-piperone (II), the chief products being piperonylacetone (III) and a substance (IV) which has now been identified as isosafrole oxide (V). Chlorohydrin of V, from IV in cold petroleum ether with dry HCl, m. 47-8.5° 2-Piperidino-1-[3',4'-methylenedioxyphenyl]-3-propanol or 3,1,2-isomer, from V, piperidine and  $\text{H}_2\text{O}$  in sealed tubes at 100°, m. 42-4°, isolated as the HCl salt, m. 165-7°; *picrate*, light yellow, m. 178-80°; *chloroplatinate*, has no sharp m. p. 2-Dimethylamino-1-[3',4'-methylenedioxyphenyl]-3-propanol or 3,1,2-isomer, similarly obtained with aq.  $\text{NHMe}_3$ , oil; *picrate*, dark yellow, m. 164-5°; HCl salt, quickly deliquesces in the air. By using larger amts. than before in the reaction between I and  $\text{CH}_2\text{N}_2$ , there were obtained from a IV which had been purified by fractionation and steam distn. the above derivs. of V. C. A. R.

Spectrochemistry of  $\alpha$ -diketones and ethylene oxides. K. V. AUWERS (WITH F. BERGMANN). *Ber.* 62B, 1317-9 (1929).—Moureu has shown that diketones of the type of benzylmethylglyoxal (I) and benzylphenylglyoxal (II) exist in 2 forms mutually interconvertible under the influence of alkalis. To the lower-melting, yellow isomers he assigned the true diketone structure and to the higher-melting, colorless isomers the keto-enol structure,  $\text{PhCH:C(OH)COR}$ . Although the chem. evidence he gives is convincing it did not seem superfluous to amplify and confirm it spectrochemically; the true diketones should show only moderate, the keto-enols very high exaltations. II did not prove well adapted to spectrochem. investigation because the enol form, on account of its high m. p., had to be measured at 90-100° and at this temp. in contact with the glass of the cup and prism it changed so rapidly into its isomer that the lines being measured traveled across the field of vision with relatively high velocity. A few rough measurements showed, however, that its exaltations are high. The diketonic I,  $d_4^{16}$  1.0919,  $n$  1.52767, 1.53404 for  $\alpha$  and He at 15.8°,  $n_{\text{He}}^{20}$  1.4322,  $E\Sigma$  0.74, 0.83 for  $\alpha$  and D. Keto-enol form,  $d_4^{78.4}$  1.0756,  $n$  1.58698, 1.59953 for  $\alpha$  and He at 78.4°,  $E\Sigma$  3.17, 3.50. Benzalacetone oxide,  $d_4^{66}$  1.0733,  $n$  1.51529, 1.52016, 1.53196 for  $\alpha$ , He and  $\beta$  at 66.0°,  $E\Sigma$  1.00, 1.04, 28% for  $\alpha$ , D and  $\beta$ - $\alpha$ . The diketone and keto-enol forms can therefore be sharply differentiated from each other but not the diketone from the oxide. Arndt and Eistert have recently shown by chem. means that Schlotterbeck's "trichloroacetone" is really the oxide  $\text{CCl}_3\text{CH}_2\text{CH}_2\text{O}$ . Its optical consts.

are:  $d_4^{19}$  1.4962,  $d_4^{20}$  1.495,  $n$  1.47310, 1.47729, 1.48235, 1.48786 for  $\alpha$ , He,  $\beta$  and  $\gamma$  at 19.0°,  $n_{\text{He}}^{20}$  1.4768,  $E\Sigma$  (calcd. for the ketone) -0.15, -0.12, -4%, -5% (calcd. for the oxide) 0.19, 0.23, 4%; 3% for  $\alpha$ , D,  $\beta$ - $\alpha$  and  $\gamma$ - $\alpha$ . To decide as between the ketone and oxide forms it was necessary to det. whether accumulation of Cl atoms on a C increases or lowers the optical consts. For this purpose was chosen chloral, for which the oxide form is excluded. Its consts. are:  $d_4^{21.4}$  1.5059,  $d_4^{20}$  1.508,  $n$  1.44988, 1.45412, 1.45964, 1.46544 at 21.4°,  $E\Sigma$  0.26, 0.31, 9, 8%. This leaves no doubt that the Schlotterbeck compd. is the oxide. C. A. R.

The velocity of oxidation of the acids of the benzene series with potassium permanganate in alkaline medium. B. V. TRONOV AND A. A. GRIGOR'YEV. *J. Russ. Phys.-Chem. Soc.* 61, 653-65 (1929).—T. and G. carried out the oxidation of the Na salts of mono- and di- $\text{CO}_2\text{H}$  and  $\text{SO}_3\text{H}$  acids of  $\text{C}_6\text{H}_6$ ,  $\text{C}_{10}\text{H}_8$  and furfuran, with and without a substitution group, or the  $\text{CO}_2\text{H}$  group in the side chain, using 0.1 N or 1 N soln. of the acids and an equimol. amt. of NaOH, to which was added 5.5%  $\text{KMnO}_4$  in the proportion of 1 mol. of  $\text{KMnO}_4$  to 10 mols. of the acid. The results are shown in tables,

to which are appended tentative conclusions: all substituents, whether in the *p*-, *o*- or *m*-position, accelerate the oxidation of  $\text{BzOH}$ ; even the  $\text{NO}_2$ , which retards further nitration, acts favorably; the substituents  $\text{Cl}$ ,  $\text{Br}$ ,  $\text{NO}_2$ ,  $\text{CO}_2\text{H}$  and  $\text{OMe}$  accelerate the oxidation from 2 to 100 times, while  $\text{OH}$  and  $\text{NH}_2$  hundreds of thousand times. Nothing definite can be said regarding the isomeric position of the substituents. In the  $\text{HO}$  and  $\text{NH}_2$  acids the *m*-isomer seems to oxidize more readily. The  $\text{NO}_2$  acts more rapidly in the *p*-position to the  $\text{CO}_2\text{H}$  group, while in the di- $\text{CO}_2\text{H}$  acids the *p*-acid is oxidized 10 times slower than the other isomers.  $\text{PhSO}_3\text{H}$  is oxidized 10 times faster than  $\text{BzOH}$ . The satd. side chains are oxidized much more rapidly than the ring. The position of the  $\text{CO}_2\text{H}$  group, either in the ring ( $\text{MeC}_6\text{H}_4\text{CO}_2\text{H}$ ) or in the side chain ( $\text{PhCH}_2\text{CO}_2\text{H}$  and  $\text{PhCH}_2\text{CH}_2\text{CO}_2\text{H}$ ) have very little influence on the speed of oxidation. Unsatd. chains (cinnamic acid and its derivs.) are oxidized a thousand times more easily. The furfuran ring (in pyromucic acid) is less resistant to oxidation than the  $\text{C}_6\text{H}_5$  ring.

CHAS. BLANC

**Influence of ethyl ether and of dimethylpyrone on the availability of hydrogen chloride in alcoholic solution.** VIVIAN E. S. MITCHELL and JAMES R. PARTINGTON. *J. Chem. Soc.* 1929, 1562-8.—The rate of esterification of  $\text{PhCH}_2\text{CO}_2\text{H}$  in dry  $\text{EtOH}$ , under the influence of  $\text{HCl}$ , is accelerated by the addn. of small quantities of dry  $\text{Et}_2\text{O}$  and retarded by the addn. of small quantities of  $\text{H}_2\text{O}$  or dimethylpyrone (I). The effect with I is analogous to that with  $\text{H}_2\text{O}$  if the former is regarded as dibasic. Thus, on the assumption that the catalytic acceleration is due to hydron, and retardation to combination with such ion, a mol. of  $\text{H}_2\text{O}$  unites with 1 mol. of hydron and a mol. of I with 2. The slight accelerating influence of dry  $\text{Et}_2\text{O}$  is possibly due to a solvent effect, and it is probable that  $\text{Et}_2\text{O}$  does not, under these conditions, behave as a base. Other possibly basic substances, such as  $\text{Me}_2\text{O}$  and  $\text{Me}_2\text{CO}$  and in  $\text{MeOH}$  solns., will be studied.

C. J. WEST

**Isomeric monohydroxyphenylalanines. I. New synthesis of the *o*- and *m*-isomers and a comparison of their properties with those of tyrosine.** WM. P. DICKINSON and PHILIP G. MARSHALL. *J. Chem. Soc.* 1929, 1495-8.—Condensation of glycine anhydride (I) and *o*- $\text{HOC}_6\text{H}_4\text{CHO}$  with  $\text{AcONa}$  and  $\text{Ac}_2\text{O}$  by heating 9 hrs. at  $125^\circ$  and 2 hrs. at  $135^\circ$  gives 15.8% of 2,5-diketo-3,6-di-*o*-acetoxybenzylidenepiperazine, m.  $272^\circ$ , gives an orange-yellow color with concd.  $\text{H}_2\text{SO}_4$ ; the poor yield is due to the formation of coumarin as a by-product. Condensation of I and *o*- $\text{MeC}_6\text{H}_4\text{CHO}$  by heating with  $\text{AcONa}$  and  $\text{Ac}_2\text{O}$  12-15 hrs. at  $140^\circ$  gives 46.6% of the corresponding *o*- $\text{MeO}$  deriv., m.  $268^\circ$ , which also gives an orange-yellow color in concd.  $\text{H}_2\text{SO}_4$ . Reduction with  $\text{HI}$  and red P gives *o*-hydroxyphenylalanine (II), m.  $249-50^\circ$  as reported by Blum (C. A. 3, 204). The *m*-acetoxy deriv., pale yellow, m.  $272^\circ$  (90% yield), is similarly reduced to *m*-hydroxyphenylalanine (III), m.  $275^\circ$  (B. gives  $279-80^\circ$ ). Folin and Ciocalteu's modified Millon test (C. A. 21, 3210) gives with II a much less orange shade than with tyrosine (IV), the intensity being approx. 35% of that produced by IV; III gives a shade identical with that given by IV, the intensity being 60% that of IV. With Folin's  $\text{PhOH}$  reagent, the results were: IV, 100%; II, 126.5%; III, 123.5%; tryptophan, 84.7%; cystine, glycine, phenylalanine or alanine gave no color with reagent.

C. J. WEST

**Phenylserines.** OESTERLIN. *Metallborse* 19, 1237-8(1929).—Prolonged (2-3 weeks) action of  $\text{NH}_3$  on  $\text{PhCH(OH)CHBrCO}_2\text{H}$  gave phenylisoserine (I), m.  $230-2^\circ$ , wrongly described by Forster and Rao (C. A. 20, 3450) as *cis*-phenylserine; *p*-toluenesulfonyl deriv., m.  $189^\circ$ . Similarly,  $\text{MeNH}_2$  and  $\text{Me}_2\text{NH}$  (in dil. alc., or even in dry  $\text{C}_6\text{H}_6$ ) gave resp. the *N*-*Me*, m.  $272^\circ$  (decompn.), and *N*-di-*Me* derivs. m.  $143^\circ$ , of I. Phenylglycidic acid (II) and  $\text{NH}_3$  also gave I; the Et ester of II yielded phenylisoserine amide, hexagonal prisms, m.  $200^\circ$ ; and with  $\text{MeNH}_2$ , *N*-methylphenylisoserine methylamide, m.  $153^\circ$ . Hydrolysis of III with 2.5%  $\text{Ba(OH)}_2$  gave I and a less sol. isomeric phenylisoserine (IV), m.  $270-80^\circ$ . The structures of I and IV were proved by oxidation of each with  $\text{KMnO}_4$  in 0.5 *N*  $\text{H}_2\text{SO}_4$ , with isolation of  $\text{PhCH(NH}_2\text{)CO}_2\text{H}$  (as the *p*- $\text{MeC}_6\text{H}_4\text{SO}_3$  deriv.). The 2 phenylserines, on the other hand, gave by this method  $\text{PhCHO}$  and  $\text{NH}_3$ .

BEN H. NICOLET

**Intranuclear migration of the mercuric group in benzene derivatives. I. Mercuric derivatives of sulfosalicylic acid and the reaction mechanism.** I. K. ISHIIHARA. *J. Pharm. Soc. Japan* 49, 579-608(1929).—A historical review on the synthesis of org.  $\text{Hg}^+$  derivs. is given. Aq. sulfosalicylic acid (I) and  $\text{HgO}$  at  $15^\circ$  gave  $\text{HOHgSO}_3\text{C}_6\text{H}_4\text{(OH)CO}_2\text{H}$  (II) which on heating at  $150-60^\circ$  loses 1 mol. of  $\text{H}_2\text{O}$ . II (226 g.) in  $\text{H}_2\text{O}$  (1250 cc.) and I (375 g.) treated on the water bath for 2 hrs. gave  $(\text{HO})\text{C}_6\text{H}_4(\text{CO}_2\text{H})\text{SO}_3\text{HgSO}_3(\text{CO}_2\text{H})\text{C}_6\text{H}_4\text{OH}$  (III) (yield, 196 g.) which on heating gave 4,3-HO(HO<sub>2</sub>C)- $\text{C}_6\text{H}_4\text{SO}_3\text{R}$  (IV) ( $\text{R} = 2,3,5\text{-HO(HO}_2\text{C)(HO}_2\text{S)C}_6\text{H}_3\text{Hg-}$ ). II is sol. in  $\text{HCl}$  and  $\text{KOH}$ ,

but insol. in org. solvents. Aq. IV changes to I and 3-hydroxymercuric-5-sulfo-2-hydroxybenzoic acid (V) which loses  $H_2O$  and forms  $HOHgC_6H_3(CO_2H).SO_3.O$  (VI). V

forms Na, Ba and aniline salts. Aq. V treated with HCl and evapd. to dryness *in vacuo* gave 3-chloromercuric-5-sulfo-2-hydroxybenzoic acid (VII) which on heating decomps. into V,  $HgCl_2$  and I. VII and  $PhNH_2$ . HCl gave the aniline salt. V in alc. and  $H_2S$  dried with  $CaCl_2$  gave  $[2,3,5-HO(HO_2C)(RO_2S)C_6H_2Hg]_2S$  (VIII), which on heating at  $120-30^\circ$  loses  $EtOH + 5 H_2O$ . Aq. V at  $5-10^\circ$  treated with KI gave 3,3'-mercuri-bis[5-sulfo-2-hydroxybenzoic acid mono-K salt] (IX), which on heating with KI decomps. into  $HOC_6H_3(SO_3K)CO_2K$  and  $HgI_2$ . IX on heating with  $H_2S$  at  $150-60^\circ$  changes into  $HOC_6H_3(SO_3K)CO_2H.2H_2O$ . Two mols. of V and 1 mol. of  $BaI_2$  on heating gave the Ba salt.

F. I. NAKAMURA

Mixed glycerides of salicylic acid. III. W. HUMNICKI AND (MLLE.) J. LUNKIEWICZ. *Bull. soc. chim.* 45, 422-8(1929); cf. C. A. 23, 3913.—Na salts of fatty acids were prepd. by adding a calcd. quantity of NaOEt to the acid in alc., heating for 30 min., filtering and drying the pptd. salt. Ag salts were prepd. by adding an equiv. quantity of  $NH_4OH$  and  $AgNO_3$  to the acids in alc., filtering and drying at  $50^\circ$  *in vacuo*. Heating 1,3-dichloro-2-propanol salicylate at  $138-40^\circ$  for 8 hrs. with the suitable Ag salt gave the following mixed esters of  $\beta$ -glycerol salicylate which were purified by vacuum distn.:  $\alpha,\alpha'$ -diisovalerate,  $b_{12}$   $237-8^\circ$ ;  $\alpha,\alpha'$ -dicaproate,  $b_{12}$   $256-7^\circ$ ;  $\alpha,\alpha'$ -dilaurate, m.  $52-3^\circ$  (purified by crystn.);  $\alpha,\alpha'$ -dimyristate, m.  $55-7^\circ$  (purified by crystn.);  $\alpha,\alpha'$ -dioleate, oily liquid. Heating 1 mol. of 1,3-dichloro-2-propanol acetate with 24 g. of  $HOC_6H_4CO_2Na$  for 6 hrs. at  $127-30^\circ$  gave glycerol  $\alpha,\alpha'$ -disalicylate  $\beta$ -acetate, m.  $96-7^\circ$ . In the same manner, the suitable esters of dichloropropanol gave the following mixed esters of glycerol  $\alpha,\alpha'$ -disalicylate:  $\beta$ -isovalerate, m.  $52-3^\circ$ ;  $\beta$ -caproate,  $b_{12}$   $268-70^\circ$ ;  $\beta$ -laurate, oil,  $d_{20}$  1.118,  $n_D^{20}$  1.507;  $\beta$ -myristate, m.  $34-5^\circ$ ;  $\beta$ -stearate, m.  $42-4^\circ$ . Heating 3-chloro-1,2-propanediol with  $HOC_6H_4COCl$ , extg. with  $Et_2O$  and recrystg. from EtOH gave 3-chloro-1,2-propanediol disalicylate, m.  $82-3^\circ$ .

A. S. CARTER

Previously undescribed form of tyrosine crystals. JAMES C. ANDREWS. *J. Biol. Chem.* 83, 353-5(1929).—By neutralization of a soln. of the HCl salt, tyrosine was obtained in the form of blunt prisms, resembling aspartic acid.

A. G.

Reduction of semicarbazones of  $\alpha$ -ketonic acids. Semicarbazides substituted in the 1-position by acids. J. BOUGAULT AND (MLLE.) L. POPOVICI. *Compt. rend.* 189, 186-8(1929).—Reduction of phenylglyoxylic acid semicarbazone (I) with Na-Hg gave  $\alpha$ -semicarbazidophenylacetic acid (II),  $PhCH(CO_2H)NHNHCONH_2$ , m.  $208^\circ$ ; phenylpyruvic acid semicarbazone (III) gave  $\alpha$ -semicarbazido- $\beta$ -phenylpropionic acid (IV),  $PhCH_2CH(CO_2H)NHNHCONH_2$ , m.  $164^\circ$ , by the same treatment. II and IV were insol. in  $H_2O$  and EtOH, slightly sol. in  $Et_2O$ , MeAc and PhH; they are amphoteric, but essentially acid;  $K_2HgI_4$  (Nessler's soln.) had no effect on I or III but oxidized II and IV; similarly a soln. of II or IV in excess  $Na_2CO_3$  was oxidized by  $I_2$  to the semicarbazone of  $BzH$  or  $PhCH_2CO$ , resp., decarboxylation taking place.

A. S. C.

Synthesis of the esters of  $\beta$ -benzyl- $\alpha,\gamma$ -dicyanoglutaconic acid. YOSHIYUKI URUSHIBARA. *Bull. Chem. Soc. (Japan)* 3, 316-20(1928).—Di-Et  $\beta$ -benzyl- $\alpha,\gamma$ -dicyanoglutaconate (I),  $EtO_2C(CN)C:C(CH_2Ph)CH(CN)CO_2Et$  was prepd. by the condensation of ethyl  $\alpha$ -cyano- $\beta$ -ethoxy- $\gamma$ -phenylcrotonate,  $EtOC(CH_2Ph):C(CN)CO_2Et$  and Na Etcyanoacetate. The method of condensation and of prepn. of the compds. used is completely described. A cryst. substance, m.  $131^\circ$ , was proved to be di-Et  $\beta$ -benzylcyanocarbamylglutaconate,  $NH_2COC(CO_2Et):C(CH_2Ph)CH(CN)(CO_2Et)$  and not I. An oily substance which afterwards changed into a cryst. monohydrate was thought to be the ester desired. In a similar manner the Me Et esters were prepd. The final product was the monohydrate of Me Et  $\beta$ -benzyl- $\alpha,\gamma$ -dicyanoglutaconate,  $H_2NCO(EtO_2C)C:C(CH_2Ph)CH(CN)CO_2Me$ , m.  $115^\circ$ . By starting from Me  $\alpha$ -cyano- $\beta$ -ethoxy- $\gamma$ -phenylcrotonate a specimen of Me Et  $\beta$ -benzylcyanocarbamylglutaconate,  $MeO_2CC(CN):C(CH_2Ph)CH(CONH_2)CO_2Et$  was obtained, m. about  $115^\circ$ . Expts. indicate that the 2 specimens may be identical. However U. makes the suggestion only with reserve.

E. S. W.

Some outstanding advances in the chemistry of the terpenes during the last decade.

THOMAS H. DURRANS. *Perfumery Essential Oil Record* 20, Special No., 278-9(1929).

E. H.

Configuration determinations in the terpene series. III. JULIUS V. BRAUN, HUGO KRÖPER AND WILHELM REINHARDT. *Ber.* 62B, 1301-7(1929); cf. C. A. 23, 420G.—In the transformations into each other of individual members of the terpene series, both open and cyclic, the replacement of the  $NH_2$  group by HO plays an important role. The usual method of effecting such a replacement (treatment of the primary

base with  $\text{HNO}_3$ ) is quite unreliable in establishing relationships in structure and configuration, as the reaction may often be accompanied by intramol. rearrangements or yield mixts. of products. More reliable, from the structural point of view, is the treatment of the Bz deriv.,  $\text{RNHBz}$ , of the amine with  $\text{PCl}_5$  (or  $\text{PBr}_5$ ), which gives a mixt. of PhCN and a halide,  $\text{RCl}$  or  $\text{RBr}$ , easily converted into the alc. ROH. Only in the case of active  $\text{H}_2\text{NCH}_2\text{C}^*\text{HMeCH}_2\text{CH}_2\text{NH}_2$ , however, had it been proven that the reaction is effected without any configurational change about the asym.  $\text{C}^*$  atom, and it has accordingly been tried out with 2 more bases, the open *dihydromenthonylamine* (I) and the cyclic *dihydrocamphylamine* (II). Both bases are readily decompd. by  $\text{PCl}_5$  after benzylation and that the asym. C atom is not affected was shown by converting the resulting chlorides (III and IV) into the iodides (V and VI) and condensing these with  $\text{NMe}_3$  to the quaternary salts (VII and VIII), which proved to be identical with compds. obtained directly by exhaustive methylation of I and II. I,  $b_{15}$   $85^\circ$ , eagerly absorbs  $\text{CO}_2$  from the air, was obtained with H and Pd-charcoal in water from menthonylamine-HCl as the HCl salt, m.  $123-4^\circ$ ,  $[\alpha]_D^{16}$   $5.74^\circ$  ( $\text{H}_2\text{O}$ , 19.83%); Bz deriv.,  $b_{0.3}$   $201-2^\circ$ . *Dihydromenthonyl chloride* (III) (yield, about 40%),  $b_{10}$   $85-7^\circ$ ,  $d_4^{12}$   $0.8752$ ,  $[\alpha]_D^{12}$   $-2.56^\circ$ . *Iodide* (V),  $b_{10}$   $108-12^\circ$ ,  $d_4^{14}$   $1.1533$ ,  $[\alpha]_D^{14}$   $-9.69^\circ$ . *Trimethylammonium iodide* (VII), m.  $236^\circ$ ,  $[\alpha]_D^{18}$   $4.35^\circ$  (alc., 14.33%). II, from dihydro- $\alpha$ -campholenic nitrile with Na and alc. or with Ni and H under 25 atm. in decalin at  $150^\circ$ ,  $b_{13}$   $88^\circ$ ; HCl salt, m.  $255^\circ$  (decompn.); picrate, m.  $197^\circ$ ; phenyllithiurea, m.  $116^\circ$ ; Bz deriv.,  $b_{0.2}$   $190^\circ$ ,  $[\alpha]_D^{22}$   $26.37^\circ$  (alc., 12.45%). *Dihydrocamphyl chloride* (IV) (yield, somewhat more than 50%),  $b_{13}$   $88^\circ$ ,  $d_4^{25}$   $0.9983$ ,  $[\alpha]_D^{25}$   $46.65^\circ$ . *Iodide* (VI),  $b_{13}$   $115-20^\circ$ ,  $d_4^{20}$   $1.0051$ ,  $[\alpha]_D^{20}$   $44.72^\circ$ . *Trimethylammonium iodide* (VIII), m.  $277-8^\circ$ ,  $[\alpha]_D^{20}$   $23.74^\circ$  ( $\text{H}_2\text{O}$ , 1.93%). C. A. R.

**Norpinic acid.** C. W. SHOPPEE AND J. L. SIMONSEN. *Chemistry and Industry* 48, 730-1 (1929).—The constitution of norpinic acid was confirmed synthetically as follows. The *trans*-norpinic acid prepd. by Kerr (C. A. 23, 1398) was converted into the *cis*-norpinic anhydride (I) by treatment with  $\text{Ac}_2\text{O}$  at  $220^\circ$ , and was found to be identical in all respects (m. p.  $135^\circ$ ) with that described by Perkin and Simonsen. Digestion of I with water gives *cis*-norpinic acid, m.  $173-5^\circ$  both alone and in admixt. with some of the acid prepd. from  $\alpha$ -pinene. FREDERICK C. HAHN

**Tricyclene series.** GUST. KOMPPA. *Ber.* 62B, 1366-70 (1929).—The correctness of the tricyclic (I, R =  $\text{CO}_2\text{H}$ ) rather than Bredt and May's tetracyclic formulation for tricyclenic acid (II) (Jagelki's "dehydrocamphenylic acid") has been established by reducing II to the corresponding hydrocarbon, tricyclene (III). The Et ester of II was reduced with Na and alc. to *tricyclenol* (IV) (I, R =  $\text{CH}_2\text{OH}$ ), converted by cautious treatment with  $\text{PCl}_5$  into *tricyclenyl chloride* (V) and again reduced with Na and alc. to III. The results of this work also show that while I and teresantalic acid and their derivs. have very nearly the same m. ps. the 2 acids are not identical. IV with HCl gives a dichloride,  $\beta,\omega$ -*dichlorocamphane* (VI), which with Na and alc. yields III; boiled in aq. alc. with  $\text{Ag}_2\text{O}$ , VI is partially converted into the *glycol* (VII) but forms chiefly an oil volatile with steam which reacts with neither  $\text{NH}_2\text{CONHNH}_2$  nor  $\text{PhNCO}$  and is probably the inner ether (VIII) of VII. IV (70-80% yield), m.  $110-1^\circ$ ; urethan, m.  $86^\circ$ . V (86% yield),  $b_8$   $75-6^\circ$ ,  $d_4^{20}$   $1.0348$ ,  $n_D^{20}$   $1.49336$ . III,  $b_8$   $40^\circ$ ,  $b_{15}$   $152-3^\circ$ , m.  $62-4^\circ$ ; along with it is formed some *Et tricyclenyl ether*,  $b_8$   $74-5^\circ$ ,  $b_{15}$   $174-5^\circ$ . VI (89% from IV in cold abs.  $\text{Et}_2\text{O}$  satd. with HCl), m.  $53-5^\circ$ .  $\beta,\omega$ -*Dihydroxycamphane* (VII), thick oil. VIII,  $b_8$   $80-3^\circ$ . C. A. R.

**Fenchene series. II. A homologous isofenchene.** GUST. KOMPPA. *Ann.* 472, 179-84 (1929); cf. C. A. 23, 3693.—Isofenchone and  $\text{MeMgI}$  give about 50% of *methylisofenchol*,  $b_{10}$   $82^\circ$ , m.  $47^\circ$ ; dehydration of this with  $\text{K}_2\text{SO}_4$  at  $155-60^\circ$  gives *methylfenchene*,  $b_{10}$   $160-2^\circ$ ,  $d_4^{20}$   $0.85205$ ,  $n_D^{20}$   $1.46261$ . The action of  $\text{O}_3$  gives an aldehyde and a ketone acid, further oxidized by  $\text{NaBrO}$  to *dl-cis*-fenchocamphoric acid. In other words, no Wagner rearrangement has taken place. C. J. WEST

Some new pairs of stereoisomeric trisubstituted glycols. ALEX. MCKENZIE, E. M. LUIS, M. TIEFFENAU AND P. WEILL. *Bull. soc. chim.* **45**, 414-22(1929); cf. *C. A.* **22**, 585.—It has been found that the C:O in RCH(OH)COR' is unsym. and upon reaction with R''MgX the product, RCH(OH)C(OH)R'R'', possesses 2 forms depending upon whether R' or R'' is the radical last introduced. To distinguish, the form in which the radical last introduced possesses the higher mol. wt. is called the  $\alpha$ -form and the  $\beta$ -form is that isomer in which the R of lower mol. wt. is the last to be introduced.  $\alpha$ -*p*-Methoxyphenylglycolamide (I) was treated with 8 mols. of EtMgBr in 8 l. of Et<sub>2</sub>O with warming and agitation for 3 hrs. The Et<sub>2</sub>O soln. after hydrolysis with H<sub>2</sub>O was fractionated, giving 48% of 1-*p*-methoxyphenyl-1-hydroxy-3-butanone (II), *b*<sub>D</sub> 175°, *d*. 1.11, *n*<sub>D</sub> 1.531; semicarbazone, m. 220-2°; oxime in 2 forms, one crystd. from a mixt. of PhH and ligroin, m. 128°, the other from Et<sub>2</sub>O and ligroin and then from EtOH and ligroin, m. 88-9°. One mol. of II was treated with 5 mols. of PhMgBr and heated for 2 hrs., giving after hydrolysis with dil. H<sub>2</sub>SO<sub>4</sub> and steam distn. to remove Ph<sub>2</sub>, a product which was crystd. from PhH and ligroin followed by EtOH and ligroin to yield 30% of the  $\alpha$ -form of 1-*p*-methoxyphenyl-2-phenyl-1,2-butanediol (III), m. 90°. As before, 1 mol. of I and 5 mols. of PhMgBr gave 25% of *p*-methoxyphenylbenzoylcarbinol (IV), m. 100-1°; semicarbazone, m. 206°; oxime, m. 132°, which was not distd. but purified by crystn. from EtOH and Et<sub>2</sub>O followed by a CHCl<sub>3</sub>-ligroin mixt. Treating IV with EtMgBr gave 25% of the  $\beta$ -isomer of III, m. 112-3°. Similarly II gave the  $\alpha$ -form of 1-*p*-methoxyphenyl-2-ethyl-1,2-hexanediol (V), m. 74°, when treated with BuMgBr; with 4 mols. of BuMgBr, I gave 1-*p*-methoxyphenyl-1-hydroxy-2-hexanone, *b*<sub>D</sub> 204-8°, which was treated with EtMgBr giving the  $\beta$ -form of V, m. 65.5-65°. *dl*-Benzoin with *p*-MeOC<sub>6</sub>H<sub>4</sub>MgBr gave the  $\alpha$ -form of 2-*p*-methoxyphenyl-1,2-diphenyl-1,2-ethanediol (VI), m. 203-4°, which was dehydrated at 50° with H<sub>2</sub>SO<sub>4</sub>, giving a 1-*p*-methoxyphenyl-1,2-diphenylethanone (VII), m. 85-6°. KCN (24 g.) was dissolved in 184 cc. of H<sub>2</sub>O and 232 cc. of EtOH, to which was added 80 g. of BzH and 104 g. of *p*-MeOC<sub>6</sub>H<sub>4</sub>CHO. After heating for 80 min. the mixt. was cooled, the oil was sepd. and slowly crystd. (cold), giving after recrystn. from EtOH, 76 g. of phenyl-*p*-methoxybenzoylcarbinol (VIII), m. 105.5-6.5, semicarbazone, m. 185-6°; phenylhydrazone, m. 149-50.5; oxime, m. 136-8°. Oxidation of VIII with CuSO<sub>4</sub> in C<sub>6</sub>H<sub>5</sub>N and H<sub>2</sub>O for 10 hrs. gave 4.5 g. of 4-methoxybenzil, m. 62-3°. With PhMgBr, 1 mol. of VIII gave 8 g. of the  $\beta$ -isomer of VI, m. 155-6°. Dehydration of this isomer with H<sub>2</sub>SO<sub>4</sub> gave a product identical with VII, m. 85-6°.

A. S. CARTER

The nitration of 4-methylbenzophenone and 2,4-dimethylbenzophenone. LOUIS CHARDONNENS. *Helv. Chim. Acta* **12**, 649-62(1929).—The conditions for nitration of 4-methyl- and 2,4-dimethylbenzophenone are described in detail, methods being given for introducing 1 to 4 nitro groups. The following benzophenone derivs. are described: 3-nitro-4-methyl, m. 129-130°; 3-amino-4-methyl, yellow, m. 107.5°; 3,3'-dinitro-4-methyl, m. 133.5-134°; 3,3'-diamino-4-methyl, yellow, m. 130°; 3,5-dinitro-4-methyl, m. 108.5-109°; 3,5,3'-trinitro-4-methyl, yellow, m. 171°; 3,5-dinitro, yellow, m. 131°; 3,5,3'-dinitro-4-methyl, yellow, m. 135.5-136°; 3,5,3',5'-tetranitro-4-methyl, yellow, m. 196-198°; 2,4-dimethyl-5-nitro, yellow, m. 62-3°; 5-amino-2,4-dimethyl, yellow, m. 103.5-4°; 2,4-dimethyl-3-nitro, m. 79.5-80°; 3-amino-2,4-dimethyl, yellow, m. 84°; 2,4-dimethyl-5,3'-dinitro, m. 144.5°; 2,4-dimethyl-3,5-dinitro, m. 111-2°; 2,4-dimethyl-3,5,3'-trinitro, m. 139-140°; 2,4-dimethyl-3',5'-dinitro, yellow, m. 110°; 2,4-dimethyl-3,5,3',5'-tetranitro, yellow prisms, m. 187-8°.

M. A. DAHLEN

Thermal and hydrolytic decomposition of basic and phenolic diphenylmethane derivatives and synthesis of optically active aromatic compounds. JULIUS V. BRAUN, ERNST ANTON, WERNER HAENSEL AND GEORG WERNER. *Ann.* **472**, 1-89(1929).—Cyclohexanone (50 g.), 95 g. PhNH<sub>2</sub>, 88 cc. concd. HCl and 13 cc. EtOH, warmed 4 days on the H<sub>2</sub>O bath, give 53 g. PhNH<sub>2</sub>, 1.5 g. cyclohexenylaniline (I) and 70 g. diaminodiphenylcyclohexane (II); if the condensation is continued for 12 days, there result 35 g. PhNH<sub>2</sub>, 2.3 g. I and 99 g. II, pale yellow, *b*<sub>D</sub> 175°; HCl salt, m. 228°; picrate, m. 170°; Ac compd., m. 152°; Bz compd., m. 177°; phenylthiourea, m. 144°; benzal compd., m. 82°. Reduction gives *p*-cyclohexenylaniline, m. 45°; warming I with PhNH<sub>2</sub> in HCl or better with PhNH<sub>2</sub>.HCl gives II. II, *b*<sub>D</sub> 248°, m. 114°; HCl salt, m. 235°; Ac compd., m. 266°; diphenylthiourea, m. 163°. Warming 114 g. II, 78 cc. concd. HCl and 11 cc. EtOH 12 days at 100° gives 5 g. PhNH<sub>2</sub>, 8 g. I and 96 g. II. A slight decompn. of II takes place upon heating at 305°; a little HCl, H<sub>2</sub>SO<sub>4</sub>, HBr or ZnCl<sub>2</sub> causes a more marked decompn.; H<sub>3</sub>PO<sub>4</sub> or Cl<sub>3</sub>CCO<sub>2</sub>H has no action. PhNHMe (107 g.) and cyclohexanone (50 g.), heated 12 days as above, give 123 g. 1,1-di[methylamino]diphenylcyclohexane, *b*<sub>D</sub> 250-2°, m. 124° (HCl salt, m. 220°; picrate, m. 105°; di-Ac deriv., m. 185°; diphenylthiourea, m. 165°) and 3.5 g. *N*-methylcyclohexenylaniline,

$b_{14}$  184° (*HCl* salt, m. 212°; *picrate*, m. 114°; *Ac* deriv., m. 85°; *N-NO* compd., m. 89°)  $\text{PhNMe}_2$  (123 g.) and 50 g. cyclohexanone give 125 g. *di*[*dimethylamino*]diphenylcyclohexane,  $b_{12}$  282–3°, m. 164° (*HCl* salt, m. 180°; *picrate*, m. 148°; *dimethiodide*, m. 178°) and 4.5 g. cyclohexenyldimethylaniline (III),  $b_{14}$  190°, m. 56° (*HCl* salt, m. 195°; *picrate*, m. 162°; *methiodide*, m. 190°). 1,1-Amino[*dimethylamino*]diphenylcyclohexane, light yellow,  $b_{0,1}$  250–5°, m. 101° (*HCl* salt, m. 195°; *Ac* deriv., m. 115°); distn with a couple drops of dil. *HCl* gives  $\text{PhNMe}_2$  and I. 1,1-Dimethylaminophenyl[*diethylaminophenyl*]cyclohexane,  $b_{0,1}$  260–5°, m. 108° (*HCl* salt, m. 141–2°, strongly hygroscopic). Condensation with  $\alpha\text{-C}_{10}\text{H}_7\text{NH}_2$  is slow, the yield being only 13% after 90 hrs.; the compd.,  $\text{C}_{24}\text{H}_{28}\text{N}_2$ ,  $b_{0,1}$  270–80°, m. 152°. III in fuming *HBr* gives the compd.  $\text{C}_{14}\text{H}_{20}\text{NBr}$ , m. 95° (20% yield) (*picrate*, m. 152°). Cyclohexanone (20 g.) and 50 g. tetrahydroquinoline give 5 g. 6-cyclohexenyldimethylaminocyclohexane,  $b_{0,1}$  163–5° (*HCl* salt, m. 120°; *picrate*, m. 90°) and 30 g. 1,1-di[tetrahydroquinolyl]cyclohexane,  $b_{0,1}$  265–7°, m. 114° (*di-NO* compd., m. 85°; *di-Bz* deriv., m. 154°; *diphenylthiourea*, m. 92°). *m*- $\text{MeC}_6\text{H}_4\text{NH}_2$  gives only a few % of 3-methyl-4,6-dicyclohexenyldimethylaniline, yellow oil,  $b_{12}$  230–5° (*picrate*, m. 176–7°); *p*- $\text{MeC}_6\text{H}_4\text{NH}_2$  (110 g.) gives 9 g. of 4-methyl-2,6-dicyclohexenyldimethylaniline,  $b_{12}$  228°, m. 60° (*picrate*, m. 192°; *Bz* compd., m. 69°). *p*-Cyclohexylaniline (30 g.) gives about 1 g. of the compd.  $\text{C}_{24}\text{H}_{28}\text{N}$ ,  $b_{12}$  260–5°. 3-Methylcyclohexanone (IV) (50 g.) and 83 g.  $\text{PhNH}_2$  after 12 days at 100° give 42 g.  $\text{PhNH}_2$ , 24 g. methylcyclohexenyldimethylaniline (V),  $b_{14}$  187–90° (*Ac* deriv., m. 127°; *Bz* deriv., m. 178°; *phenylthiourea*, m. 143°), and 38 g. 1,1-diaminodiphenyl-3-methylcyclohexane (VI),  $b_{14}$  285–90° (*HCl* salt, m. 214°; *diphenylthiourea*, m. 127°); 40 g.  $\text{PhNH}_2$  and 80 g. IV, 12 days at 100°, give 14 g.  $\text{PhNH}_2$ , 27 g. V and 74 g. VI.  $\text{PhNMe}_2$  (100 g.) and 100 g. IV give 28 g. methylcyclohexenyldimethylaniline,  $b_{14}$  194–6°, m. 38° (*picrate*, m. 162°; *methiodide*, m. 159°), and 11 g. 1,1-tetramethyldiaminodiphenyl-3-methylcyclohexane,  $b_{12}$  295°, m. 109° (*picrate*, orange, m. 164°; *dimethiodide*, m. 186°). *o*-Methylcyclohexanone condenses more slowly than IV and yields probably 2-methylcyclohexenyldimethylaniline,  $b_{14}$  160° (*chloroplatinate*, m. 211–2°). Cyclopentanone (20 g.) and 86 g.  $\text{PhNMe}_2$  heated with concd. *HCl* 10 hrs. at 150° give 20 g. cyclopentenylidimethylaniline (VII),  $b_{12}$  160°, m. 10° (*HCl* salt, m. 170°; *picrate*, m. 129°; *methiodide*, decomps. 180°), and 12 g. 1,1-tetramethyldiaminodiphenylcyclopentane, m. 128° (*HCl* salt, m. 213°; *picrate*, m. 181; *dimethiodide*, decomps. 195°). VII is reduced by Na and *EtOH* to *p*-cyclopentenylidimethylaniline,  $b_{12}$  156° (*HCl* salt, m. 175°; *picrate*, m. 134°; *methiodide*, m. 179°). In the reaction product of  $\text{PhNH}_2$  and  $\text{Me}_2\text{CO}$  (Homolka, Ger. Pat. 399,141), in addn. to  $\text{Me}_2\text{C}(\text{C}_6\text{H}_4\text{NH}_2)_2$ , there may be observed a small fraction (about 1%) consisting of isopropenyldimethylaniline (VIII), b. 125–30° (pressure not given), which may be obtained in better yields by heating  $\text{Me}_2\text{C}(\text{C}_6\text{H}_4\text{NH}_2)_2$  with a few drops of dil. *HCl* and  $\text{H}_2\text{SO}_4$  *in vacuo*; the distillate consists of  $\text{PhNH}_2$  and VIII in the ratio of about 2:1. VIII yields a *HCl* salt, m. 230–5°; a *picrate*, m. 180°; the *Ac* deriv., m. 110–1°, the *phenylthiourea*, m. 137°. VIII, freshly prepd., has  $d_4^{20}$  1.0320 and is a mobile liquid, on standing 40 hrs. there results a dimer or bisisopropenyldimethylaniline (IX), m. 173° (*HCl* salt, m. 228°; *picrate*, m. 172°; *di-Ac* deriv., m. 205°; *phenylthiourea*, m. 117°; these compds. could not be obtained from the corresponding derivs. of VIII). IX is unsatd towards  $\text{KMnO}_4$  and the *Ac* deriv. is catalytically reduced; the dihydro deriv., m. 121°, sapon. gives the bisisopropenyldimethylaniline (X),  $b_{0,1}$  205–10°, m. 50–2° (*diphenylthiourea*, m. 178°; *picrate*, m. 213°; *HCl* salt, m. 275°). X, through the diazo reaction, yields the phenol,  $\text{C}_{18}\text{H}_{22}\text{O}$ , m. 106–7° (*Bz* deriv., m. 117°; *Ac* deriv.,  $b_{1,1}$  192°).  $\text{Me}_2\text{CO}$  and  $\text{PhNHMe}$ , heated 10 hrs. at 150° with *HCl*, give 50% of 2,2-dimethylaminodiphenylpropane,  $b_{12}$  190°, m. 138° (*HCl* salt, m. 218°; *Ac* deriv., m. 139°; *diphenylthiourea*, m. 170°); distn with a little acid gives equal parts of  $\text{PhNHMe}$  and *N*-methyl-*p*-isopropenyldimethylaniline,  $b_{14}$  123–5° (*HCl* salt, oily; *picrate*, m. 147°); d. 0.9675, changes only to 1.0067 after heating 20 hrs. on the  $\text{H}_2\text{O}$  bath, indicating only slight polymerization.  $\text{Me}_2\text{C}(\text{C}_6\text{H}_4\text{NMe}_2)_2$  gives *N*-dimethylisopropenyldimethylaniline,  $b_{14}$  120–2°, m. 74° (*HCl* salt, m. 122°; *picrate*, m. 96°); this also shows little tendency to polymerization.  $\text{Me}_2\text{CO}$  and *m*- $\text{MeC}_6\text{H}_4\text{NH}_2$  give about 9% of 3-methyl-4-isopropenyldimethylaniline (XI),  $b_{12}$  150–5° (*HCl* salt, m. 217°; *picrate*, m. 224°; *Ac* compd., oily), reduced to 3-methyl-4-isopropenyldimethylaniline,  $b_{12}$  141–5° (*HCl* salt, m. 211°) and 3% of 3-methyl-4,6-diisopropenyldimethylaniline,  $b_{12}$  225–30° (*HCl* salt, m. 218°; *picrate*, m. 205°). XI, warmed 16 hrs. at 100°, shows about 10% polymerization. 2,2-Diaminodiphenylbutane,  $b_{12}$  210° (20% yield); distd. with a little *HCl* or  $\text{H}_2\text{SO}_4$ , there results about 40% of *p*-isobutenyldimethylaniline,  $b_{14}$  140–5°,  $d_4^{19}$  0.9899 (*HCl* salt, m. 238°; *picrate*, m. 196°; *phenylthiourea*, m. 131°; *Ac* deriv., m. 121°); after standing 4 days and warming 24 hrs. at 100° 75% is recovered unchanged while the rest is obtained as a dark red hard glass. 2,2-Dimethylaminodiphenylbutane,  $b_{14}$

240°, m. 98° (*diphenyllithiurea*, m. 142°; *di-Ac deriv.*, m. 121°); *p-isobutenylmethyl-aniline*,  $b_{14}$  145–50°. 2,2-Tetramethyldiaminodiphenylbutane,  $b_{0.8}$  210–2° (*HCl salt*, m. 125°; *picrate*, m. 80–90°; *methiodide*, m. 202°); *p-isobutenyldimethylaniline*,  $b_{14}$  138–42°,  $d_4^{20}$  0.9561; (*picrate*, m. 125°; *dimethiodide*, m. 175°); polymerization is scarcely noticeable. MeBuCO and PhNMe<sub>2</sub> give 5% *p-isohexenyldimethylaniline*,  $b_{12}$  160–2° (*methiodide*, m. 175°), and 15% 2,2-tetramethyldiaminodiphenylhexane,  $b_4$  230–4° (*dimethiodide*, m. 196°). PhAc and PhNMe<sub>2</sub> give 20% of tetramethyldiaminotriphenylethane, m. 134° (*dimethiodide*, m. 188°), and 7–8% of *p-α-phenylvinyl*dimethylaniline,  $b_{18}$  208–11°,  $d_{20}$  1.0409 (*HCl salt*, m. 144°; *methiodide*, m. 170°). Condensation of PhNH<sub>2</sub> and PrCHO gives only 2-propyl-3-ethylquinoline; PrCHO and PhNMe<sub>2</sub> with 20% HCl and a little EtOH show about 30% condensation after 5 days at 100°; the principal product is 1,1-tetramethyldiaminodiphenylbutane,  $b_{0.8}$  225–7°; distd. with a little H<sub>2</sub>SO<sub>4</sub> *in vacuo* there results 30% of a mixt. of PhNMe<sub>2</sub> and *p-butenyldimethylaniline*, the latter,  $b_{12}$  140–2°,  $d_4^{15}$  0.9395 (*picrate*, reddish yellow, m. 99–100°); it shows little tendency to polymerize, even on heating at 100° for 24 hrs.; warming with PhNH<sub>2</sub>·HCl for 30 hrs. gives about 50% of 1,1-aminophenyl[methylaminophenyl]butane,  $b_{0.2}$  205–10°. In comparison with PrCHO, BzH and PhNMe<sub>2</sub> are almost completely condensed in 24 hrs.; *p*-Me<sub>2</sub>NC<sub>6</sub>H<sub>4</sub>CHO is completely condensed in 24 hrs. and *p*-NO<sub>2</sub>C<sub>6</sub>H<sub>4</sub>CHO in about 18 hrs. In acid soln. 1 mol. of an aromatic aldehyde and 1 mol. of an aromatic aniline first condense to a very active product closely related but not identical with the basic hydrol. Condensation of 2 mols PhOH and 1 mol. cyclohexanone, using  $\frac{1}{2}$  of the wt. of the latter of concd. HCl, at 36° gives, after 60 hrs., a 65% yield, consisting of 1,1-dihydroxydiphenylcyclohexane (XII) (*di-Me ether*,  $b_{16}$  260–3°, m. 82°; *di-Ac deriv.*, m. 122°) (cf. Schmidlin and Lang, *C. A.* 5, 487), and a small amt. of *o*-cyclohexyldicyclohexanone. Distn. of XII at the ordinary pressure gives PhOH, cyclohexenylphenol (XIII), m. 123° (*Me ether*,  $b_{14}$  155°, m. 35°; *Ac deriv.*, m. 52°), and *p*-cyclohexylphenol (XIV), m. 131° (*Me ether*, m. 58°; *Ac deriv.*,  $b_{18}$  170°, m. 35°). XIII adds Br to the double bond before substitution occurs and this reaction may be used to det. the amt. of XIII present in the mixt. with XIV. Warming XIII with concd. HCl gives about 50% of XIV, while the other half is a resinous mass, similar to that obtained by the distn. of XII. Heating XII with Ni and H at 230–50° gives cyclohexanol, *p*-cyclohexylcyclohexanol (Schrauth and Görg, *C. A.* 18, 388) (*Ac deriv.*,  $b_{18}$  158–60°), and a partial reduction product of XII, C<sub>18</sub>H<sub>26</sub>O<sub>2</sub>,  $b_{13}$  260–70°. Cyclohexanone and *m*-MeC<sub>6</sub>H<sub>4</sub>OH, after 14 days, condense to the extent of 40%; cyclohexenylcresol,  $b_{12}$  175°; *p*-cyclohexyl-*m*-cresol, thick oil. *o*-Methylcyclohexanone and PhOH give methylcyclohexenylphenol,  $b_{12}$  173–5°, and the diphenylmethane compd., C<sub>19</sub>H<sub>22</sub>O<sub>2</sub>,  $b_{12}$  280°, m. 135–7°. Cyclopentanone and PhOH give 1,1-dihydroxydiphenylcyclopentane,  $b_{12}$  270°, m. 155–6° (*Me ether*,  $b_{12}$  240–5°, m. 115°; *Ac deriv.*, m. 79°); heating with 3 parts concd. HCl 3 hrs. at 100° gives PhOH and *p*-cyclopentylphenol,  $b_{12}$  155°, m. 63–5° (*Me ether*,  $b_{12}$  143°; *Ac deriv.*,  $b_{12}$  150–2°); distn. of the diphenol at the ordinary pressure gives cyclopentenylphenol, m. 148–50° (*Me ether*, m. 90°; *Ac deriv.*, m. 72°). 4-Cyclopentylcyclohexanol,  $b_{12}$  135°, m. 43–50° (*phenylurethan*, m. 115–45°); this is a mixt. of 2 stereoisomers. Oxidation gives 4-cyclopentylcyclohexanone,  $b_{12}$  125°,  $n_D^{18}$  1.4860,  $d_4^{18}$  0.9714 (*semicarbazone*, m. 195–7°). Me<sub>2</sub>CO and PhOH give after 60 hrs. practically quant. Me<sub>2</sub>C(C<sub>6</sub>H<sub>4</sub>OH)<sub>2</sub>,  $b_{13}$  250–2°; distn. at the ordinary pressure gives a small amt. of *p*-isopropylphenol,  $b_{12}$  112–5°, m. 61°; the action of 3 parts of concd. HCl for 20 hrs. at 100° gives a dimer, C<sub>18</sub>H<sub>20</sub>O<sub>2</sub>,  $b_{14}$  255–6°, m. 181°, which is stable towards HCl at 125°; the *di-Me ether*, m. 115°, is stable towards catalytic reduction or Na and EtOH; *di-Ac deriv.*, m. 165°. Catalytic reduction (Ni) gives a mixt. of cyclohexanol, *p*-isopropylcyclohexanol, *di-4-hydroxycyclohexyldimethylmethane*,  $b_{14}$  230–4° (*diketone*, m. 158–60°; *semicarbazone*, m. 222°), and *p*-hydroxyphenyl-4-hydroxycyclohexyldimethylmethane (XV),  $b_{12}$  244–8° (*di-Ac deriv.*,  $b_{18}$  234–7°; *mono-Me ether*,  $b_1$  170–5°). The last 2 compds. are probably mixts. of stereoisomers. Oxidation of XV with CrO<sub>3</sub> gives the ketone,  $b_{15}$  205–10° (*semicarbazone*, m. 184°). Oxidation of XV with KMnO<sub>4</sub> gives the substituted adipic acid, MeOC<sub>6</sub>H<sub>4</sub>Me<sub>2</sub>CCH(CH<sub>2</sub>CO<sub>2</sub>H)CH<sub>2</sub>CH<sub>2</sub>CO<sub>2</sub>H, m. 116° (45% yield). Me<sub>2</sub>CO and *m*-MeC<sub>6</sub>H<sub>4</sub>OH give the diphenol,  $b_{12}$  230–5°. MeEtCO and PhOH give a diphenol,  $b_{12}$  250–3°, which, on distn. at ordinary pressures, gives, as 1 product, *p*-isobutenylphenol, m. 86° (*Ac deriv.*,  $b_{18}$  148°). Catalytic reduction with Ni at 200° gives the compd., C<sub>10</sub>H<sub>20</sub>O, an isomer of menthol,  $b_{10}$  128°, oxidized to the ketone, C<sub>10</sub>H<sub>18</sub>O,  $b_{12}$  104–6° (*semicarbazone*, m. 190°). EtCHO and PhOH give EtCH(C<sub>6</sub>H<sub>4</sub>OH)<sub>2</sub>,  $b_{18}$  250°, which, distd. at atm. pressure, gives *p*-propenylphenol, m. 89–91°; heating the latter 1 hr. at its b. p. gives a reddish oil, about half of which is *p*-PrC<sub>6</sub>H<sub>4</sub>OH. PrCHO gives 1,1-dihydroxydiphenyl-

butane (XVI),  $b_{12}$  270°, which on distn. gives *p*-butylphenol,  $b_{12}$  138–41° (*Ac deriv.*,  $b_{12}$  138–41°). Catalytic reduction of XVI at 220° gives the compd.  $C_{14}H_{24}O_2$ ,  $b_{12}$  235–40° (*di-Ac deriv.*,  $b_{12}$  230–4°), and 4-butylcyclohexanol,  $b_{12}$  120–2°,  $d_4^{20}$  0.9106,  $n_D^{15}$  1.4691, which yields 2 phenylurethans, m. 124° and 42°, sepd. by crystn. from MeOH; oxidation ( $CrO_3$ ) gives *p*-butylcyclohexanone, m. 101–2° (*semicarbazone*, m. 175°).  $PrCHO$  and *m*- $MeC_6H_4OH$  give butenylcresol,  $b_{12}$  150° (*Me ether*,  $b_{12}$  130–3°; *Ac deriv.*,  $b_{12}$  140°) and 1,1-dihydroxydi-*m*-tolylbutane,  $b_{12}$  250° (*di-Ac deriv.*,  $b_{12}$  230–5°); heating 8 hrs. with 3 parts concd. HCl at 120–5° gives 3-methyl-4-butylphenol,  $b_{14}$  140–5°. Catalytic reduction of  $MeCH(C_6H_5)_2$  gives a mixt. of the compd.  $C_{14}H_{26}O_2$ ,  $b_{12}$  240° (*mono-Me ether*,  $b_{0.2}$  175–8°), and the compd.  $C_{14}H_{26}O_2$ , m. 140–6° (a mixt. of isomers) (*mono-Me ether*,  $b_{0.2}$  175–8°), oxidized to the ketone,  $C_{14}H_{22}O_2$ ,  $b_{12}$  225–30°, m. 55–6° (*semicarbazone*, m. 215–7°). Camphor (100 g.), 120 g.  $PhNH_2$  and 150 cc. 20% HCl, heated 14 days at 100°, give about 1 g. of the compd.  $C_{16}H_{21}N$ ,  $b_{0.2}$  140°,  $[\alpha]_D^{14}$  9.49° (0.2090 g. in 2.2990 g. EtOH). Similarly 43 g. menthone, 88 g.  $PhNMe_2$  and 80 cc. concd. HCl, heated 10 hrs. at 180°, give 2.5 g. of the compd.  $C_{18}H_{27}N$ ,  $b_{12}$  195–205°,  $[\alpha]_D^{15}$  13° (10% in  $CHCl_3$ ). *d*-3-Methylcyclopentanone and  $PhNMe_2$ , heated several days at 100° in HCl soln., give about 4% of 3-methylpentenyldimethylaniline, m. 64°, which shows scarcely any optical activity, and about the same yield of tetramethyldiaminodiphenyl-3-methylcyclopentane, m. 95°,  $[\alpha]_D^{21}$  22.50° ( $CHCl_3$ ). *d*-3-Methylcyclohexanone (XVII) and  $PhOH$ , condensed in the usual manner, give 56% of the diphenol,  $C_{18}H_{22}O_2$ ,  $b_2$  235–6°, m. 153–5°,  $[\alpha]_D^{20}$  –18.74° (EtOH); heating 4 hrs. at 100° with concd. HCl gives *p*-methylcyclohexylphenol,  $b_{14}$  170°, m. 60–75°,  $[\alpha]_D^{20}$  –6.94° ( $C_6H_6$ ), identical with that obtained by fractional distn. of the product obtained by heating 3 hrs. at 100°. XVII and  $PhNH_2$  give the same products as the inactive compd. except that they are optically active; the diamine has  $[\alpha]_D^{23}$  –11.78° ( $CHCl_3$ ), the unsatd. amine  $[\alpha]_D^{20}$  54.21° (EtOH), 57.02° ( $CHCl_3$ ); a carefully prepd. sample of the diamine,  $b_{0.1}$  240–3°, has  $[\alpha]_D^{18}$  –16.21° ( $CHCl_3$ ). Methylcyclohexylaniline, m. 146°,  $[\alpha]_D^{17}$  –4.78° (EtOH); methylcyclohexylphenol, m. 60°,  $[\alpha]_D^{20}$  –6.9° ( $C_6H_6$ ). Methylcyclohexenylmethylylaniline,  $b_{12}$  192–5°, m. 33°,  $[\alpha]_D^{18}$  47.63° ( $CHCl_3$ ) (*HCl salt*, m. 180°); 1,1-dimethylaminophenyl-3-methylcyclohexane,  $b_{12}$  260–5°,  $[\alpha]_D^{23}$  –15.26° ( $CHCl_3$ ) (*HCl salt*, m. 185°); bisphenylthiourea, m. 105°. The corresponding dimethylaniline derivs. have  $[\alpha]_D^{23}$  46.69° and –20.94° 3-Methylcyclohexylbenzene (XVIII),  $b_{14}$  123–4°,  $[\alpha]_D^{20}$  –5.26° (cf. Kursanov, *C. A.* 1, 2093). *p*-Methylcyclohexylbromobenzene, in 60% yield from the diazo compd. and  $CuBr$ ,  $b_{14}$  165–7°,  $d_4^{18}$  1.2100,  $[\alpha]_D^{18}$  –2.23°; the diazo compd. and  $CuCN$  give the nitrile,  $b_{14}$  166–8°,  $d_4^{13}$  1.0058,  $[\alpha]_D^{28}$  –1.62°. Reduction of the diazo compd. with  $SnCl_2$  gives 50% of *p*-3-methylcyclohexylphenylhydrazine, m. 84–5°,  $[\alpha]_D^{20}$  –4.99° (EtOH), relatively unstable (*HCl salt*, m. 210°; *semicarbazide*, m. 217–8°; *thiosemicarbazide*, m. 175°). XVIII and  $AcCl$  with  $AlCl_3$  give 85% of *p*-methylcyclohexylacetophenone,  $b_{14}$  182–5°,  $d_4^{21}$  0.9986,  $[\alpha]_D^{21}$  –3° (*semicarbazone*, m. 211°). Methylcyclohexenylmethylylaniline, m. 33°, yields a yellow *NO compd.*, m. 50°, reduced to the hydrazine, m. 34°  $[\alpha]_D^{16}$  39.12° (EtOH) (*thiosemicarbazide*, m. 181°);  $HCHO$  gives a *hydrazine*, m. 121°, and  $BzH$  a *hydrazone*, m. 108°.

C. J. WEST

Isomerism in 9-fluorene derivatives? A. KIEGL. *Ber.* 62B, 1327–35 (1929). All of the 7 cases of supposed stereoisomerism of 9-fluorene derivs. which had been reported up to 1925 were later shown to be incorrect. K. in his work on fluorene derivs. nevertheless kept the possibility of such an isomerism in view and with E. Thoma carefully investigated the reduction of fluorenone with Zn dust and  $AcOH$ . Along with fluorene alc., m. 156°, were obtained not inconsiderable amts. of fluorenopinalcol and a little 9-acetoxyfluorene, difluorenyl ether and diphenylenepheneanthrone but no traces of an isomeric fluorene alc. A careful repetition of the work of Schlenk and Bergmann on the prepn. of stereoisomeric fluorene derivs. (*C. A.* 22, 4495) gave entirely neg. results. Na fluorene and  $CO_2$  gave only technical ( $\alpha$ )-fluorene-9-carboxylic acid, m. 221–3° (slight gas evolution), and none of S. and B.'s ( $\beta$ )-acid, m. 232°; the Na fluorene was prepd. both by their method from  $Ph_3CNa$  and fluorene and from 9-methoxyfluorene, m. 43.5° (made from carefully purified 9-chlorofluorene), and Na powder. Again, the acid obtained from fluorenone di-Me acetal with Na and  $CO_2$  decompd. 184° (S. and B. state it m. 172–3°) and proved to be identical with the 9-methoxyfluorene-9-carboxylic acid obtained by Klinger from the 9-Cl acid. The supposed new benzohydrylfluorene, m. 187°, obtained by S. and B. from 9-chlorofluorene and  $Ph_3CHNa$ .

was sepd. by fractional crystn. into the known benzohydrylfluorene, m. 217°, ( $\text{CHPh}$ )<sub>2</sub>, m. 209°, and a little difluorenyl, m. 240°. Finally, S. and B. claim to have obtained from 9,9-dichlorofluorene and  $\text{Ph}_2\text{CNa}$ , diphenylenediphenylethylene oxide (I), m. 228°, diphenylenediphenylethylene (II), m. 225°, and an isomer (III), m. 213°, of II. III, however, is an isomorphous mixt. of I and II; an equal amt. of II lowers its m. p. only a few degrees, I raises its m. p.; fractionation from  $\text{C}_6\text{H}_6$  gives I or II, depending on which component is present in excess; with  $\text{AcCl}$  it gives II and phenylbenzoylfluorene, a product which can have been formed only from I; a hot  $\text{C}_6\text{H}_6$  soln. of approx. equal amts. of I and II gives on cooling crystals which differ from the supposed III only in being colorless.

C. A. R.

**New derivatives of 2-hydroxyfluorene.** CELESTINO RUÍZ. *Anales asocn. quim. Argentina* 16, 170-86(1928).—From fluorene 2-nitrofluorene was prepd., reduced by Sn to 2-aminofluorene, and diazotized and decomd. into 2-hydroxyfluorene with 20-60% yields, with resin formation. By modifying the Diels and Schlenk method (*Ber.* 34, 1759) fluorenol was prepd. in 80% yield. Mononitration of hydroxyfluorene by the Raiford and Colber method (*C. A.* 19, 1858) gave 1- or 3-nitro-2-hydroxyfluorene, which was reduced by  $\text{NaHSO}_3$  to 1- or 3-amino-2-hydroxyfluorene. The latter was oxidized to phthalic acid, showing that both  $\text{NH}_2$  and  $\text{NO}_2$  were originally in the same nucleus as the OH. By the action of  $p\text{-MeC}_6\text{H}_4\text{SO}_2\text{Cl}$  2- $p$ -toluenesulfonylhydroxyfluorene was obtained, whose main nitration product is 7-nitro-2-hydroxyfluorene, which can also be prepd. by diazotization of 2-amino-7-nitrofluorene, showing the constitution. By reduction with  $\text{Al-Hg}$  7-amino-2-hydroxyfluorene is obtained. Denitration by the Banús and Thomas method (*C. A.* 17, 2574) does not give 1,3-dinitrohydroxyfluorene, but phthalic acid. 1,3,7-Trinitro-2-hydroxyfluorene was not identified. Combining 2-hydroxyfluorene with  $\text{PhN}_2\text{Cl}$  gives benzene-1- or 3-hydroxyfluorene, showing that coupling is in the  $o$ -position. No nitroso deriv. of 2-hydroxyfluorene was obtained, only small quantities of 1- or 3-nitro-2-hydroxyfluorene. These derivs. all resemble those of  $\text{Ph}_2$ , sustaining previous hypotheses that fluorene acts like ( $o\text{-MeC}_6\text{H}_4$ )<sub>2</sub> and not like dibenzocyclopentadiene.

E. M. SYMMES

**The effects of orientation in the diphenyl and fluorene series.** CELESTINO RUÍZ. *Anales asocn. quim. Argentina* 16, 187-96(1928).— $\text{Ph}_2$  and fluorene follow the laws of orientation observed in the  $\text{C}_6\text{H}_5$  nucleus, but are always found in a nucleus which is little stable, depending upon the nature of the substituent. By energetic action there is possible the formation of a double conjugate system between equiv. positions 4 and 4' for  $\text{Ph}_2$  and 2 and 7 for fluorene.

E. M. SYMMES

**Synthesis of phenol ketones according to Hoesch.** W. BORSCHIE. II. Condensation of arylglyoxylic nitriles with phthloroglucinol. W. BORSCHIE, C. WALTER AND J. NIEMANN. *Ber.* 62B, 1360-6(1929); cf. *C. A.* 20, 2323.—It had been shown that the substances obtained by Marsh and Stephen by treating arylglyoxylic nitriles with resorcinol according to Hoesch and hydrolyzing the product are not "superoxide forms of dihydroxydibenzils,"  $\text{ArC}_6\text{H}_3\text{O}_4$ , but compds. of the compn.  $\text{ArC}_6\text{H}_3\text{O}_5$  (formed from 1 mol. of the nitrile and 2 of  $\text{C}_6\text{H}_3(\text{OH})_2$ ) for which the structure I was tentatively proposed. As, however, all three HO groups are methylated in the same way by  $\text{CH}_3\text{N}_2$ , preference is now given to the structure II. Repetition of M. and S.'s work with phthloroglucinol (III) showed that the reaction proceeds in the same way, as shown

by analysis not only of the final products of hydrolysis but also of the intermediate imino lactones,  $(\text{HO})_3\text{C}_6\text{H}_3\text{C}(\text{C}(\text{NH})\text{O.C}_6\text{H}_3(\text{OH})_2) \quad (\text{IV})$ . 1,4,6,2',4',6'-Hexa-

hydroxytriphenylacetic iminolactone,  $\text{C}_{26}\text{H}_{18}\text{O}_8\text{N}$  (IV,  $\text{Ar} = \text{Ph}$ ), crystals with  $\text{H}_2\text{O}$  from 20%  $\text{MeOH}$ , m. 286-7°, from  $\text{BzCN}$  and III in  $\text{Et}_2\text{O}$  satd. with  $\text{HCl}$ ;  $\text{HCl}$  salt, m. 215-2° (decompn.); penta-Ac deriv., from the IV and  $\text{Ac}_2\text{O}$  on the  $\text{H}_2\text{O}$  bath, prisms with 2 mols.  $\text{H}_2\text{O}$  drying with porcelain-like turbidity and m. 178-81°. 4''-MeO analog, from  $p\text{-MeOC}_6\text{H}_4\text{COCN}$  and III, m. 259-60°, contains 1 mol.  $\text{H}_2\text{O}$  after drying over  $\text{CaCl}_2$ , is easily sol. in hot dil. mineral acids.  $p\text{-ClC}_6\text{H}_4\text{COCN}$ , b.p. 117-8°, m. 40-1°, was obtained in 4.5-g. yield by digesting with 5 N  $\text{HCl}$  the 4-dimethylaminoanil, red, m. 146-7°, which is in turn obtained in 8-g. yield from 5 g.  $\text{ClC}_6\text{H}_4\text{CH}_2\text{CN}$  and  $p\text{-ONC}_6\text{H}_4\text{NMe}_2$  in boiling  $\text{MeOH}$  cautiously treated with  $\text{NaOH}$ . 4''-Cl iminolactone (IV,  $\text{Ar} =$

convert the aldoximes,  $\text{XC}_6\text{H}_4\text{COCH:NHOH}$ , of 4-chloro- or 4-bromophenylglyoxal into the corresponding benzoyl cyanides with  $\text{Ac}_2\text{O}$  or  $\text{SOCl}_2$ , they undergo a "Beckmann rearrangement of the 2nd kind," as they do also on heating alone, and decompn. into  $\text{HCN}$  and 4- $\text{XC}_6\text{H}_4\text{CO}_2\text{H}$ . C. A. R.

**Bivalency of carbon. II.** The displacement of chlorine from desyl chloride, Benzoin diethyl acetal. ALLAN M. WARD. *J. Chem. Soc.* 1929, 1541-53; cf. *C. A.* 22, 70.—In EtOH or dil. EtOH at 25°,  $\text{BzPhCHCl}$  (I) is stable but the addn. of NaOH or NaOEt to the soln. brings about a very rapid displacement of Cl, the reaction being complete for 0.1 *N* alkali in less than 1 hr. The velocity coeffs. calcd. on the basis of a bimol. reaction are in good agreement when the concns. of the reactants are approx. 0.1 *M* but for 0.2 *N* NaOH or NaOEt they are less regular and often show a considerable drift; these variations may be due to side reactions or to inaccuracy in measurements owing to the rapidity of the reaction. The magnitude of *k* also diminishes with increasing concns. of alkali. The difference in the mechanism of the reaction in this case from those previously studied finds further support on the basis of the products obtained from I and alkali. When the final reaction mixt. was added to dil. HCl the product was benzoin (II); no evidence was obtained for the formation of the Et ether. The formation of II only would appear to indicate that the Cl of I was displaced entirely by the HO group in EtOH by the agency of EtONa. The intermediate product is the *di-Et acetal* (III) of II, rapidly decompd. by dil. HCl to II. Quant. detns. (Ziesel) showed that 78% of III is formed at 15° in EtOH-EtOH, 74% in EtOH-NaOH and 54% in 10% aq. EtOH-NaOH. III, m. 68°, monoclinic, *a*:*b*:*c* = 1.099:1:1.010,  $\beta$  94°7' (other crystallographic data are given). C. J. WEST.

**The specific action of the oxime group on metal salts. III.** The complex chemical behavior of stereoisomeric oximes. W. HIEBER AND F. LEUTERT. *Ber.* 62B, 1830-46(1929); cf. *C. A.* 22, 3104, 3105.—The structures of both metal salts and oximes (especially their steric configuration) play a role in their combination. Halides of Co, Ni and Cu display the greatest tendency to combine with oximes. Coordination of the metal is always on the oxime N, regularly lying in a position opposite to that previously occupied by the hydroxyl (cf. *C. A.* 21, 3901). With aromatic oximes this is not always the case, since *syn*-Ph ( $\beta$ ) oximes rearrange under the influence of metal

salts to the *syn*-H ( $\alpha$ ) form. *E. g.*  $\uparrow$   $\begin{array}{c} \text{C}_6\text{H}_5 \text{ CH} \\ \parallel \\ \text{-NOH} \end{array}$  yields  $\left( \begin{array}{c} \text{C}_6\text{H}_5 \text{ CH} \\ \parallel \\ \text{HON} \cdots \end{array} \right)_{2 \text{ or } 4} \text{MX}_2$ . With ar

matic  $\alpha$ -diketone oximes, metal salts yield an inner complex,  $\begin{array}{c} \text{R}-\text{C}-\text{C}-\text{R}' \\ \parallel \quad \parallel \\ \text{HON} \quad \text{N}-\text{OH} \end{array} \text{ (I),}$

which in some cases may lose HX, yielding a complex-salt,  $\begin{array}{c} \text{MX}_2 \\ \text{R}-\text{C}=\text{N}-\text{OH} \\ | \\ \text{R}'\text{C}=\text{N}=\text{O} \end{array}$ . M

(II). Where the oxime N is unreactive (*viz.*, corresponding to the  $\beta$ -oxime), the complex is not formed.  $\text{Cu}(\text{OAc})_2$  and  $\alpha$ -benzildioxime, heated in alc. aq.  $\text{NH}_4\text{OH}$  yield dark brown *Cu- $\alpha$ -phenyl-dioxime* (type II). Treating an ether suspension with HCl gas yields *Cu chloride- $\alpha$ -benzil-dioxime* (type I) and free dioxime. The compd. of type I is obtained directly when  $\text{CuCl}$  replaces the  $\text{Cu}(\text{OAc})_2$  in the reaction. *Ni- $\alpha$ -benzil-dioxime* (type II) is much more stable and can be converted to the inner complex (type I) only under abs. anhyd. conditions. *Ni* salts and  $\gamma$ -benzil-dioxime in  $\text{NH}_4\text{OH}$  yield

, the oxime acting as a dibasic acid. The formula is supported by

the yellow color of the compd., in contrast to the deep red *Ni* inner salt of the  $\alpha$ -dioxime, where metal is bound to oxime N only.  $\text{CuCl}$  produces a rearrangement of  $\gamma$ -benzil-dioxime into the  $\alpha$ -dioxime, and yields the identical inner-complex noted above. The oxime of phenylglyoxylic acid [prepd. according to Meyer, *Ber.* 21, 1314 (1888)] yields the  $\alpha$ -form (III), which is converted into the  $\beta$  form (IV) by treating an ether soln. with HCl gas. Metal salts do not add to III directly, but produce ( $\text{Cu}' > \text{Co}$ ) a slow rearrangement of III into IV, then forming an inner complex which may lose HX to give an inner salt (V)

Anhyd. CuCl and IV shaken in dry CHCl<sub>3</sub> suspension for 70 hrs., evapd. and washed with ether, yield *Cu chloride-β-phenylglyoxylic acid oxime* (type IV), which may be isolated, but loses HCl easily to give the inner complex-salt *Cu-di-[β-phenylglyoxylic acid oxime]* (type V). CoCl<sub>2</sub> and IV in alc. yield the inner complex *Co β-phenylglyoxylic acid oxime* (type IV), which spontaneously loses HCl, yielding *Co di-[β-phenylglyoxylic acid oxime]* (type V). With *chloro-anti-glyoxime*, Ni(OAc)<sub>2</sub> gives a red-brown inner complex salt, as with other *anti-dioximes*. Ni(OAc)<sub>2</sub> with *chloro-amphi-glyoxime* yields an amorphous product with varying Ni content, which, treated with aq. KOH,

the color being destroyed by the addn. of acid, and reappearing in alk. soln. Salts of the heavy metals added to the aq. soln. give colors varying from yellow to brown. With NiCl<sub>2</sub> the same product is obtained as in the original reaction between Ni(OAc)<sub>2</sub> and the oxime. The existence of the nickel-bischloro-*amphi-glyoxime* anion is also shown by cond. measurements of the aq. soln. of the K salt. T. H. RIDER

Elimination of amino groups from tertiary amino alcohols. VII. Migration of hydrocarbon radicals in derivatives of optically active desylamine. ALEX. MCKENZIE AND ARTHUR K. MILLS. *Ber.* 62B, 1784-94(1929); cf. C. A. 23, 1892.—*l*-Desylamine-HCl (I) and MeMgI gave *l*-1,2-diphenyl-2-amino-1-methylethanol, m. 73-4°. HNO<sub>2</sub> changed this compd. to Ph<sub>2</sub>CHCOMe, in a semipinacolin deamination, migration in this case being strictly limited to the Ph group. α-C<sub>10</sub>H<sub>7</sub>MgI and I gave *l*-1,2-diphenyl-2-amino-1-α-naphthylethanol, m. 177-8°. This, with HNO<sub>2</sub>, yielded predominantly the inactive diphenylacetone and very little *l*-PhCOCH(C<sub>10</sub>H<sub>7</sub>)Ph. *p*-MeO-C<sub>6</sub>H<sub>4</sub>MgBr and *d*-desylamine gave *d*-1,2-diphenyl-2-amino-1-anisylethanol, m. 146-7°, which, with HNO<sub>2</sub>, yielded MeOC<sub>6</sub>H<sub>4</sub>COCHPh<sub>2</sub>, and very little *d*-PhCOCHPhC<sub>6</sub>H<sub>4</sub>OMe. The Ph group in these instances showed a greater tendency to migrate than either the Me, α-C<sub>10</sub>H<sub>7</sub>, or anisyl group. Quite similar reactions are cited, which show the opposite tendency. K. H. ENGEL

Isomerism of derivatives of 2-phenylnaphthylene-1,3-diamine. MARY S. LESSLIE AND EUSTACE E. TURNER. *J. Chem. Soc.* 1929, 1512-7.—In considering the existence of the 2 isomeric forms of *N,N'*-dimethyl-2-phenylnaphthylene-1,3-diamine (Lees and Thorpe, C. A. 2, 125) L. and T. consider the possibility of the diamine (I) reacting in the tautomeric form (II) and review the reactions in favor of such a view. Since

II contains an asym. C atom, it should be capable of optical resolution; this has been accomplished. Using *d*-camphorsulfonic acid, there is obtained *d*-I *di-d*-camphorsulfonate, [α]<sub>5461</sub><sup>20</sup> 40.5°; *d*-I, m. 109-11°, [α]<sub>5461</sub><sup>20</sup> 14.8 (EtOH, c 0.5070). *l*-I *di-l*-camphorsulfonate, [α]<sub>5461</sub><sup>20</sup> -40.7°. C. J. WEST

Reactions of a mixture of ethyl ether, acetyl bromide and naphthol. HAROLD L. BASSETT AND KATHERINE F. TAYLOR. *J. Chem. Soc.* 1929, 1568-78.—Starting with 1 mol. each of Et<sub>2</sub>O (I), AcBr (II) and α- or β-C<sub>10</sub>H<sub>7</sub>OH (III), and allowing the reaction to proceed at 25°, the final distribution of the Ac and Br actually recovered was: α-III: III acetate, 0%; AcOEt, 33; EtBr, 98; AcOH, 53; β-III: III acetate, 15%; AcOEt, 45; EtBr, 100; AcOH, 26. Because of the difficulty of analysis, the values are only approx. Consideration of these figures lead to the following series of reactions: III + II = III.II; III.II = C<sub>10</sub>H<sub>7</sub>OAc + HBr; 2HBr + I = 2EtBr + H<sub>2</sub>O; C<sub>10</sub>H<sub>7</sub>OAc + H<sub>2</sub>O = III + AcOH; 2AcOH + I = 2AcOEt + H<sub>2</sub>O. Although there must be some overlapping, it is considered that these 5 reactions are, in the main, consecutive and that the order in which they are written also represents the order of their velocities,

the 1st being the most rapid. The changes taking place are such that no equil. is ever reached. The various reactions are discussed. The exptl. part gives in detail the methods of detn. of the various components

C. J. WEST

**Conjugated systems. Factors which disturb the valence field. V. Action of substances with reactive methylene on carbindogenides.** M. V. IONESCU AND A. GEORGESCU. *Bull. soc. chim.* 45, 428-35(1929); cf. C. A. 21, 3362; 22, 1353. —*o*-Chlorobenzylideneindandione (I), (also the *m*- and *p*-Cl isomers), in alc., and in the presence of piperidine as a catalyst, adds to malonic ester, yielding, exclusively, colorless  $\text{CO}_2\text{C}_6\text{H}_4\text{CO}_2\text{CHCH}(\text{C}_6\text{H}_4\text{Cl})\text{CH}(\text{CO}_2\text{Et})_2$ . The more strongly reactive dimethyl-

dihydroresorcinol yields *o*-chlorobenzylidenebisdimethyldihydroresorcinol, m. 203.5°; furthermore, *o*-chlorobenzylideneindandioneindone (II), m. 288° (*m*-Cl isomer, m. 265-7° (decompn.); *p*-Cl isomer, m. 275° (decompn.)); and also truxenequinone (III) in small amts. Similarly, phenylmethylpyrazolone and I, besides small amts of II and III, yields mostly *o*-chlorobenzylidenebisphenylmethylpyrazolone, m. 229-31° (*m*-Cl isomer, m. 206-7°; *p*-Cl isomer, m. 208°).

K. H. ENGEL

**Oxidation of anthracene with nitric oxide.** M. IL'INSKII AND B. MAKOROV. *Z. Farbenind.* 20, 244-5(1929); cf. C. A. 22, 3888; 23, 4214. —In the oxidation of crude anthracene (I) with NO, carbazole (II) and phenanthrene (III) as well as I are oxidized, while with  $\text{CrO}_3$  I is oxidized first. Crude I causes more anthraquinone (IV) to remain in the mother liquor. Sulfonation and reduction methods applied to crude II contg. large quantities of II and III do not result in pure IV.

F. C. H.

**Catalytic reduction under pressure in the presence of nickel salts. XIII.  $\alpha$ - and  $\beta$ -hydroxy- and amino derivatives of anthracene.** JULIUS V. BRAUN AND OTTO BAYER. *Ann.* 472, 90-121(1929); cf. C. A. 22, 1586. —Reduction of  $\alpha$ -anthrol with EtOH and 6-7 atoms Na gives 75% of dihydroanthrol (I), b<sub>18</sub> 216-20°, m. 100° (Ac deriv., m. 84°, as found by Pleus, *Ber.* 35, 2926(1902)). There also results an amorphous, dark colored product, which is not a reduction product but a transformation product of anthrol, which also results when the anthrol is heated in N under pressure. Tetrahydroanthracene ketone (II), on reduction, yields a viscous oil, b<sub>17</sub> 205-13° from which no definite product could be isolated; heating II to boiling for a few min. lowers the m. p. from 96° to 87-90° and crystn. from EtOH gives  $\text{C}_{14}\text{H}_{10}$ ;  $\text{KMnO}_4$  oxidation gives *o*- $\text{C}_6\text{H}_4(\text{CO}_2\text{H})_2$  but no trace of 2,3- $\text{C}_{10}\text{H}_6(\text{CO}_2\text{H})_2$ . The phenylhydrazone of II, yellow, m. 116°, yields with dil.  $\text{H}_2\text{SO}_4$ , but more smoothly with concd. HCl, the hydrocarbazole deriv. (III), m. 245°, easily dehydrogenated by heating to boiling, by heating in  $\text{PhNO}_2$  or by distn. with PbO or with 2-3% Cu powder to carbazole (IV), yellow, m. 325°, sol. in concd.  $\text{H}_2\text{SO}_4$  with a deep blue color, and oxidized by  $\text{CrO}_3$  in AcOH to an *o*-quinone (V), brown, does not m. 360°, giving with Zn dust and alkali a brown vat. Reduction of I in 30% decalin soln. at 210° gives a mixt. of tetrahydroanthrol, m. 109-10° (phenylurethan, m. 153-4°), which is easily oxidized; on standing in MeOH with  $\text{H}_2\text{NNHCONH}_2$ , there results the semicarbazone of II, m. 250°, II and  $\alpha$ -octahydroanthracene ketone. Complete hydrogenation of  $\alpha$ -anthrol gives octahydroanthracene  $\beta$ -Anthrol (VI), m. 255° (Liebermann, *Ann.* 212, 50(1882) gives 200°). *meso*-Dihydro- $\beta$ -anthrol (VII), obtained by Bamberger and Hoffmann (*Ber.* 26, 3069(1883)) from VI with Na and EtOH, is much more easily obtained (60% yield) from  $\beta$ -hydroxyanthrone with excess Na and AmOH and also in 60% yield from  $\beta$ -hydroxyanthraquinone, Zn dust and 20% NaOH. Reduction of VI with 2 atoms H at 200° gives VII, *ac*-tetrahydro- $\beta$ -anthrol (VIII), m. 148° (Ac deriv., m. 75-6°; phenylurethan, m.

NH-C<sub>6</sub>H<sub>5</sub> (III)

NH-C<sub>6</sub>H<sub>5</sub> (IV)

NH.C<sub>6</sub>H<sub>5</sub> (V)

150°; picrate, orange, m. 142°), and about 3% of *ac*- $\beta$ -tetrahydroanthracene ketone, m. 148-50° (semicarbazone, m. 250°). VIII is not oxidized by  $\text{CrO}_3$  to the ketone but to *o*- $\text{C}_6\text{H}_4(\text{CO}_2\text{H})_2$ . VIII is stable when heated to boiling for several hrs.; heating with  $\text{ZnCl}_2$  causes a complete resinification of the material. The phenylurethan, however,

when heated in the dry state yields  $\text{CO}_2$ ,  $\text{EtOH}$ ,  $\text{PhNH}_2$ ,  $\text{PhNCO}$  and 1,2-dihydroanthracene (1,2-diacene), m.  $150^\circ$  (picrate, brick red, m.  $115^\circ$ ; dibromide, m.  $102^\circ$ ). VII can be reduced in 2 steps to *ac*-octahydro- $\beta$ -anthrol, m.  $122^\circ$  (phenylurethan, m.  $183^\circ$ ), which can not be oxidized to the ketone. Dry distn. of the phenylurethan gives hexahydroanthracene, m.  $70^\circ$ . Reduction of  $\alpha$ -aminoanthraquinone with Zn in  $\text{NH}_4\text{OH}$  gives 80–5% of dihydro- $\alpha$ -anthramine, m.  $85^\circ$  (Dienel, *Ber.* 38, 2862(1905) gives 60–70%), which on distn. gives 80% of  $\alpha$ -anthramine (IX), m.  $127^\circ$ . Boiling with  $\text{AcOH}$  gives  $\alpha$ , $\alpha$ -dianthramine, yellow, m.  $252^\circ$ . The *Ac* deriv. of IX, m.  $212^\circ$  (D. gives  $198^\circ$ ). Reduction of IX in 25% decalin soln. at  $200^\circ$  gives octahydroanthramine,  $b_{14}$   $188$ – $93^\circ$  (picrate, sinters  $220^\circ$ , decomp.  $255^\circ$ ; *Ac* deriv., m.  $185^\circ$ ), and the tetrahydro m.  $170^\circ$ . *ac*-Tetrahydro- $\beta$ -anthramine, pale green, m.  $154^\circ$  (picrate, golden yellow, decomp.  $215^\circ$ ; *Ac* deriv., m.  $159$ – $60^\circ$ ; phenylthiourea, m.  $127^\circ$ ; aminoazo compd., red, m.  $174^\circ$ ); this compd. is very stable and is scarcely changed by heating with 10%  $\text{KOH}$  at  $160^\circ$ . Octahydro deriv., m.  $69$ – $70^\circ$  (picrate, m.  $245^\circ$ ; *Ac* deriv., m.  $165^\circ$ ).

C. J. WEST

Certain 3,9-halodibenzoyl derivatives of perylene. New synthesis of isoviolanthrone. V. V. SHARVIN AND L. Z. SOBOLOVSKII. *J. Russ. Phys.-Chem. Soc.* 61, 789–94 (1929).—3,9-Di-*o*-chlorobenzoylperylene (I), obtained in 85% yield when 1 part of perylene, 1.4 parts of *o*- $\text{ClC}_6\text{H}_4\text{COCl}$  and 1.2 parts of anhyd.  $\text{AlCl}_3$  were introduced into 30 parts of  $\text{CS}_2$ , allowed to stand for 12 hrs., then heated 3 hrs. in a water bath, the  $\text{CS}_2$  was expelled, the residue treated with ice, the red ppt. worked up and then treated with hot alc. and  $\text{PhMe}$  to remove impurities; the crude I was recrystd. from a mixt. of  $\text{PhNO}_2$  and  $\text{C}_6\text{H}_5\text{Me}_2$ , red needles, do not melt up to  $320^\circ$ , readily sol. in  $\text{PhNO}_2$ ,  $\text{PhNH}_2$ , less sol. in  $\text{C}_6\text{H}_5\text{Me}_2$ . 3,9-Di-*o*-bromobenzoylperylene and 3,9-di-*o*-iodobenzoylperylene are prepd. from perylene and the corresponding *o*-bromo- and *o*-iodobenzoyl chlorides as described above, after recrystn. the 1st compd. forms red and the 2nd one brick-red needles, sol. and melt similarly to I. Isoviolanthrone (II) was prepd. from I by 2 methods. (1) One part of I was powdered with 5 parts of anhyd.  $\text{AlCl}_3$  and heated within a flask sealed with a  $\text{CaCl}_2$  tube in a glycerol bath to  $100^\circ$ , then in the course of 2 hrs. to  $170^\circ$ , where it was maintained for an addnl. 2 hrs.; after cooling the mass was worked up with ice and hot  $\text{HCl}$ , the black ppt. dissolved in concd.  $\text{H}_2\text{SO}_4$ , the soln. poured drop by drop into  $\text{H}_2\text{O}$ , the deep violet ppt. reduced with  $\text{NaOH}$  and hyposulfite at  $60^\circ$  and air was blown through the soln. until complete pptn. of the vat dye II. (2) One part of I was powdered with 6 parts of  $\text{NaOH}$ , the mixt. heated 30 min. while stirring in boiling quinoline, then allowed to stand for 24 hrs., the ppt. worked up with dil.  $\text{HCl}$ , washed with  $\text{H}_2\text{O}$  and alc., the resulting violet-black powder washed with weak alkali, which exts. a substance with green fluorescence; the II was treated with  $\text{NaOH}$  and hyposulfite and then oxidized with air as described above.

CHAS. BLANC

Anthrahydroquinol- $\alpha$ -carboxylic lactones. ROLAND SCHOLL AND FRITZ KENNER (WITH OSKAR BÖTTGER, SIGFRID HASS AND H. KURT MEYER) *Ber.* 62B, 1278–95 (1929); cf. *C. A.* 23, 2710.—In addn. to the 2 methods described in the earlier papers (treatment of anthrahydroquinol- $\alpha$ -carboxylic acids with  $\text{Ac}_2\text{O}$  and of anthraquinone- $\alpha$ -carboxylic anhydrides with  $\text{Na}_2\text{S}_2\text{O}_4$  alone or in the presence of dil.  $\text{NH}_4\text{OH}$  or  $\text{AcOH}$ ), anthrahydroquinol-1-carboxylic lactone (I) and its 2-Me deriv. (II) have been prepd. by the following methods: (1) Short heating of the anthraquinone acids with Zn dust and  $\text{AcOH}$  in the presence of  $\text{Ac}_2\text{O}$ . (2) Reduction of the esters of the quinone acids with acid or alk. reducing agents. The aryl esters are readily reduced by  $\text{Na}_2\text{S}_2\text{O}_4$  or Zn dust and  $\text{NH}_4\text{OH}$ , best by Zn dust and boiling  $\text{AcOH}$ . Of the alkyl esters, only those of the 2,1- $\text{C}_6\text{H}_4(\text{CO})_2\text{C}_6\text{H}_4\text{MeCO}_2\text{H}$  (III) react in this way; those of the unmetlylated  $\text{C}_6\text{H}_4(\text{CO})_2\text{C}_6\text{H}_4\text{CO}_2\text{H}$  (IV) are converted exclusively into the hydroquinol acid. (3) From the acid chlorides with  $\text{Na}_2\text{S}_2\text{O}_4$  and  $\text{NaOH}$ . (4) From the acid amides with  $\text{Na}_2\text{S}_2\text{O}_4$  and very dil.  $\text{NaOH}$  or  $\text{AcOH}$ . The methods involving alkalies or  $\text{NH}_4\text{OH}$  are not practical as the alk. solns. of the lactones are very unstable and sensitive to the air. The lactones, themselves red, dissolve easily in aq.  $\text{NH}_4\text{OH}$ , less readily in  $\text{NaOH}$  and  $\text{Na}_2\text{CO}_3$ , with vivid pure blue color and are reprecip. red by acids, including  $\text{CO}_2$ ; in the blue alk. solns. they change more or less rapidly, by addn. of  $\text{H}_2\text{O}$ , into the red anthrahydroquinolcarboxylates; in the  $\text{NH}_4\text{OH}$  solns. into the anthrahydroquinolcarboxamides. In  $\text{C}_6\text{H}_5\text{N}$ , I dissolves with its own red color and on cooling seps. from a hot concd. soln. as a red homopolar compd.  $\text{III} \cdot \text{C}_6\text{H}_5\text{N}$ , but if  $\text{H}_2\text{O}$  is added to the red soln., it becomes deep blue with formation of the heteropolar true pyridinium salt which is dissoed. back into the red form by heat or much  $\text{C}_6\text{H}_5\text{N}$ . The lactones are sensitive to air in alk., acid or neutral soln., especially in  $\text{C}_6\text{H}_6$  or xylene in the

light. Typical oxidizing agents ( $\text{PbO}_2$ ,  $\text{FeCl}_3$ ,  $\text{K}_2\text{Fe}(\text{CN})_6$ ,  $\text{Br}$ ,  $\text{KMnO}_4$ ) oxidize them more or less rapidly at room temp.; for practical purposes hot  $\text{PhNO}_2$  is best. **II** in all cases gave chiefly 2,2'-dimethyl-9,9'-dihydroxy-9,9'-bianthranyl-1,1'-dicarboxylic dilactone (**V**). The oxidation with  $\text{KMnO}_4$  in  $\text{Me}_2\text{CO}$ - $\text{AcOH}$  and with  $\text{Br}$  in  $\text{C}_6\text{H}_5\text{N}$  is instantaneous and quant. and may be used to titrate the lactones. **V** is also formed from the acid chloride of **III** in  $\text{C}_6\text{H}_6$  with finely divided  $\text{Ag}$  or  $\text{PhNMe}_2$ . Concd.  $\text{H}_2\text{SO}_4$  decomps. **V** into **III**.  $\text{Zn}$  dust and  $\text{AcOH}$ ,  $\text{Na}_2\text{S}_2\text{O}_4$  and  $\text{NH}_4\text{OH}$  very slowly, reduce **V** to the monomeric **II**. Aq. and especially alc. alkalis dissociate **V** with formation of an olive-green soln. contg. the salts of the anthraquinone and the anthrahydroquinol acids apparently in quinhydrone-like combination. Probably the primary process is a radical dissocn. into an anthroxyl with univalent  $\text{O}$ . Exposure of **V** in  $\text{AcOH}$  to ultra-violet light and heating in certain org. solvents apparently also brings about a similar dissocn. **I**, brown-red, decolorizes above  $175^\circ$  and begins to sublime. *Ph* ester of **IV**, m.  $213^\circ$ . 10-Acetate of **I**, from **IV** and  $\text{Zn}$  dust in boiling  $\text{Ac}_2\text{O}$ , m.  $196^\circ$ . *Me* ester of **III**, light yellow, m.  $178-9^\circ$ ; *Et* ester, m.  $144^\circ$ ; *Ph* ester, pale yellow, m.  $218-9^\circ$  (2-methylpyridazonanthrone, from the *Ph* ester and  $\text{N}_2\text{H}_4 \cdot \text{H}_2\text{O}$  in boiling  $\text{C}_6\text{H}_6$ , yellow, m.  $332^\circ$ ); *p*-bromophenyl ester, yellowish, m.  $226^\circ$ . 2-Methylanthrahydroquinol-1-carboxylic acid is pptd. as a yellow jelly from the alk.  $\text{Na}_2\text{S}_2\text{O}_4$  vat of **III**. The lactone (**II**), red, becomes lighter about  $235^\circ$ , m. around  $265^\circ$  (decompn.). Amide of **III**, from **II** allowed to stand in  $\text{NH}_4\text{OH}$  and then shaken with air, or from the chloride of **III** in  $\text{C}_6\text{H}_6$  with  $\text{NH}_3$ , begins to sinter  $255^\circ$ , darkens  $260^\circ$ , decomps. completely at higher temps. Acetate of **II**, orange, m.  $238^\circ$ . 2,2'-Di-Me homolog of **V**, turns brown on rapid heating about  $270^\circ$ , m. around  $290^\circ$  (decompn.). It had been concluded, from the work on the quinone anhydrides, that the latter have the normal structure

the reduction of the free quinone acid (**III**) to **II** the intermediate hydroquinol acid has been isolated and the amide is repptd. unchanged by air from its alk. vat, it is concluded that the free anthraquinonecarboxylic acids and their amides likewise have the normal structure, and the same is shown for the esters in the following abstr.

C. A. R.

The nature of the anthraquinone- $\alpha$ -carboxylic esters. ROLAND SCHOLL AND JOACHIM DONAT. *Ber.* 62B, 1295-1301(1929).—The synthesis of the esters of anthraquinone- (**I**) and 2-methylanthraquinone-1-carboxylic acid (**II**) was effected or attempted by the following methods: (1) from the acid with an alc. and  $\text{HCl}$  or  $\text{H}_2\text{SO}_4$ ; (2) from the acid chloride with an alc. or phenol; (3) from the  $\text{Ag}$  salt and an alkyl iodide; (4) by oxidation of esters of 2-methylanthracene-1-carboxylic acid (**III**). **I** is readily esterified by alcs. with  $\text{HCl}$  or  $\text{H}_2\text{SO}_4$  but **II** is not. The chlorides were prepd with both  $\text{PCl}_5$  and  $\text{SOCl}_2$ ; no indication that, as with  $o\text{-BzC}_6\text{H}_4\text{CO}_2\text{H}$  and analogous acids, isomeric chlorides and esters were formed was obtained. The esters of **I** prepd by methods 1, 2 and 3 and those of **II** prepd. by methods 2, 3 and 4 were identical, and it is concluded that the esters of the 2 acids have the normal structure (cf. preceding abstr.). *Ca* salt of **I**. Chloride, yellow, from **I** heated with  $\text{SOCl}_2$  until dissolved, or from 8 g. **I** refluxed 3 hrs. with 8.5 g.  $\text{PCl}_5$  in 15 cc.  $\text{C}_6\text{H}_6$ ; boiled a short time with only a little more than 0.5 part  $\text{PCl}_5$  in *m*-xylene, **I** gives the yellow anhydride, m.  $206^\circ$ , instead of the chloride. **III** (with LOTHAR WANKA), from **II** refluxed with  $\text{Zn}$  dust in concd.  $\text{NH}_4\text{OH}$ , pale yellow, m.  $212.5^\circ$ ; chloride; *Et* ester, vivid yellow, m.  $87-90^\circ$ ; *Ph* ester, pale yellow, m.  $137-40^\circ$ .

C. A. R.

Constitution of hydroxymethylanthraquinone. **II**. Synthesis of 1-methyl-3-hydroxyanthraquinone and 2-methyl-4-hydroxyanthraquinone. S. KEIMATSU, I. HIRAMO AND T. TANABE. *J. Pharm. Soc. Japan* 49, 531-41(1929); cf. C. A. 23, 4214.—Chloromethylbenzoylbenzoic acid, the condensation product of  $o\text{-C}_6\text{H}_4(\text{CO})_2\text{O}$  and  $m\text{-ClC}_6\text{H}_4\text{Me}$ , may have the structures: 1-methyl-3-chloroanthraquinone or 2-methyl-4'-chloroanthraquinone, and by substituting  $\text{OH}$  for  $\text{Cl}$  it is possible to have 2-hydroxymethylanthraquinones. Only 2'-methyl-4'-hydroxyanthraquinone is reported in the literature. Condensation of  $o\text{-C}_6\text{H}_4(\text{CO})_2\text{O}$  (15 g.) with  $m\text{-ClC}_6\text{H}_4\text{Me}$  (50 g.), with  $\text{AlCl}_3$  (30 g.), gave 2'-methyl-4'-chlorobenzoylbenzoic acid (**I**), (yield 16.5 g.),  $\text{AcOH}$ -insol., m.  $110-1^\circ$ , and 2'-chloro-4'-methylbenzoylbenzoic acid (**II**), (yield 5.5 g.),  $\text{AcOH}$ -sol., m.  $86-7^\circ$ . **I** (12 g.) treated in 20% fuming  $\text{H}_2\text{SO}_4$  (120 g.) (cf. C. A. 23, 3466) gave 1-methyl-3-chloro-9,10-anthraquinone (**III**), m.  $191^\circ$  (yield 8.3 g.). **III** (2.6 g.) treated with  $\text{NaOMe}$  at  $150-70^\circ$  gave 1-methyl-3-methoxy-9,10-anthraquinone (**IV**), m.  $128-9^\circ$  (yield 2.2 g.). **IV** (1.5 g.) treated with  $\text{Br}$  in glacial  $\text{AcOH}$  gave 1-methyl-3-hydroxy-9,10-anthraquinone, a new compd., m.  $285^\circ$  (yield 1.0 g.), *Ac* deriv.,

151–2° **III** (2.5 g.) treated with Br at 160–70° gave 1-*ω*-dibromomethyl-3-chloro-9,10-anthraquinone (**V**), decomps. 252–3° (yield 3.7 g.). **V** (3 g.) treated with concd. H<sub>2</sub>SO<sub>4</sub> (16 cc.) and fuming H<sub>2</sub>SO<sub>4</sub> gave 3-chloro-9,10-anthraquinone-1-aldehyde (**VI**), decomps. 257° (yield 1.7 g.). Oxidation of the aldehyde radical of **VI** gave 2-chloro-9,10-anthraquinone, m. 200–3° (yield 0.4 g.). This is in harmony with 2-chloroanthraquinone, derived from anthraquinone-2-sulfonic acid, the Cl atom taking the β-position. **II** (7 g.) treated with 20% fuming H<sub>2</sub>SO<sub>4</sub> gave 4-chloro-2-methyl-9,10-anthraquinone (**VIII**), m. 187–8° (yield 4.5 g.). **VIII** (2.6 g.) treated with NaOMe gave 4-methoxy-2-methylanthraquinone (**IX**), m. 142–3° (yield 2.3 g.). **I** (1.5 g.) treated with Br gave 4-hydroxy-2-methylanthraquinone (**X**), m. 178° (yield, 1.4 g.). Ac deriv. of **X**, m. 152–3°. **VIII** (2 g.) treated with Br gave 2-*ω*-dibromomethyl-4-chloroanthraquinone (**XI**), decomps. 223–4° (yield 2.9 g.). **XI** (3 g.) treated as **V** gave 4-chloroanthraquinone-1-aldehyde (**XII**), decomps. 209–10°. Oxidation of the aldehyde radical of **XII** gave 4-chloroanthraquinonecarboxylic acid (**XIII**), decomps. 256–7°. **XIII** treated as **VII** gave α-chloroanthraquinone, m. 162°. This is in harmony with 1-chloroanthraquinone, deriv. of 1-aminoanthraquinone. It is certain that the Cl atom is located at the α-position.

F. I. NAKAMURA

**Migration of the acyl group in partly acylated phenolic compounds. II. Synthesis of anthragallol 1,2- and 1,3-dimethyl ethers.** ARTHUR G. PERKIN and CHARLES WM. H. STORV. *J. Chem. Soc.* 1929, 1399–1421; cf. C. A. 22, 1354 —Anthragallol 2-Me ether (1.5 g.), ground to a paste with 8 cc. Ac<sub>2</sub>O and treated with 1 g. AcOK, gives 1.5 g. of the 3-Ac deriv., orange, m. 167–9.5°; 1.5 g. of the 3-Ac deriv. with CH<sub>2</sub>N<sub>2</sub> gives a mixt. of 0.7 g. of 3-acetylanthragallol 1,2-di-Me ether, bright yellow, m. 177–9° (identical with the Ac deriv. of the 1,2-di-Me ether which occurs in Chay roots) and about 15% of the 1,2,3-tri-Me ether, m. 167–9° (the yield of the latter varied with the concn of the CH<sub>2</sub>N<sub>2</sub>). 2,3-Diacetylanthragallol and BzCl in CHCl<sub>3</sub> and C<sub>6</sub>H<sub>5</sub>N give a mixt. of the 2-benzoyl-3-acetyl deriv. (**I**), golden yellow, m. 203–6°, and probably the 3-benzoyl-2-acetyl deriv. (**II**), yellow, m. 189–90°; hydrolysis of either product gives 2-benzoylanthragallol (**III**), orange, m. 241–3°. Acetylation of **III** with boiling Ac<sub>2</sub>O and C<sub>6</sub>H<sub>5</sub>N gives the tri-Ac deriv.: adding Ac<sub>2</sub>O to **III** in ice-cold C<sub>6</sub>H<sub>5</sub>N gives the 1,3-di-Ac deriv. (**IV**), m. 211–3°; partial acetylation of **III** in Ac<sub>2</sub>O contg. a trace of AcOK gives **I**; complete acetylation gives **IV**. **II**, fully acetylated, also gives a di-Ac deriv., m. 203–5°, but not identical with **I**. Methylation (CH<sub>2</sub>N<sub>2</sub>) of **III** gives approx. 60% of 1-benzoylanthragallol 2,3-di-Me ether, pale greenish yellow, m. 216–8° (sapon. with boiling 1% MeOH-KOH gives anthragallol 2,3-di-Me ether), 15.5% of 2-benzoylanthragallol 1,3-di-Me ether and 13% of 3-benzoylanthragallol 1,2-di-Me ether, the last 2 being identified after hydrolysis of the anthragallol ethers. Anthragallol 3-Me ether (**V**), m. 242–3° (Ac deriv., m. 204–6°), is identical with the product obtained by the action of CH<sub>2</sub>N<sub>2</sub> on 2,3-diacetylanthragallol. **V** and BzCl in CHCl<sub>3</sub>-C<sub>6</sub>H<sub>5</sub>N give the 2-Bz deriv., orange, m. 221–3°, which gives with CH<sub>2</sub>N<sub>2</sub> about 80% of 1-benzoylanthragallol 2,3-di-Me ether, greenish yellow, m. 216–8° and about 16% of 2-benzoylanthragallol 1,3-di-Me ether. Acetylation of **V** gives 2-benzoylacetylanthragallol Me ethers, pale yellow, m. 195–6° and deep yellow, m. 214–7°. 2-Acetylanthragallol, m. 219–20°, on methylation gives a mixt. of 69% of 1-acetylanthragallol 2,3-di-Me ether, about 15% of the 1,3-di-Me ether and some 1,2-di-Me ether. 1,3-Diacetylanthragallol 2-Me ether in Me<sub>2</sub>CO with excess of NH<sub>3</sub> gives 1-acetylanthragallol 2-Me ether, yellow, m. 205–8°; methylation of this gave the 2,3-di-Me ether, m. 168–70°. Triacetylpuropur-oxanthin with concd. NH<sub>4</sub>OH in boiling Me<sub>2</sub>CO gives 1-acetylpuropur-oxanthin, pale orange-yellow, m. 231–5°; in partly cooled Me<sub>2</sub>CO the 1,3-diacetylpuropurin, orange-yellow, m. 203–5°, results from triacetylpuropurin. 3-Nitroalizarin in KOH with Me<sub>2</sub>SO<sub>4</sub> gives the di-Me ether, yellow, m. 168–71°, reduced by Na<sub>2</sub>S to the 3-NH<sub>2</sub> deriv., red, m. 203–5° (Ac deriv., m. 237–40°). 2,3-Ditoluene-*p*-sulfonylanthragallol (**VI**), yellow, m. 196–8° (Ac deriv., m. 212–5°); with CH<sub>2</sub>N<sub>2</sub> it gives anthragallol 1-Me ether, deep yellow, m. 248–50° (di-Ac deriv., pale greenish yellow, m. 165–6°); Ba(OH)<sub>2</sub> gives a green ppt.; Pb(OAc)<sub>2</sub>, a red ppt. **VI** and excess of 1% MeOH-KOH give monitoluene-*p*-sulfonylanthragallol 1-Me ether, yellow, m. 289–91°; methylation gives the 1,3-di-Me ether (?), m. 175–7°; sapon. of the crystals and mother liquor gives, resp., the 1,3- and 1,2-di-Me ethers. 2-Ethylcarbonato-1-acetylalizarin, pale greenish yellow, m. 177–9°, results on acetylation in the cold; in a warm soln., the EtCO<sub>2</sub> group is replaced by Ac. The action of CH<sub>2</sub>N<sub>2</sub> on 2,3-diethylcarbonatoanthragallol gives 80% of 1,3-diethylcarbonatoanthragallol 2-Me ether (cf. C. A. 22, 1354) and 2% of a compd., probably the 2,3-diethylcarbonato 1-Me ether. 2-Ethylcarbonatoalizarin, reduced with SnCl<sub>4</sub> in AcOH-HCl, gives 2-ethylcarbonato-1-hydroxyanthrone (**VII**),

$C_{17}H_{14}O_6$ , pale yellow, m.  $130-3^\circ$ , yielding with  $Ac_2O$  in cold  $C_6H_5N$  2-ethylcarbonato-1,9-diacetoxyanthranol, m.  $177-80^\circ$ . The methylation of VII is also described, although pure products were not isolated. 3,4-Dihydroxyanthranol and  $CH_3N_2$  give 4,4'-dihydroxy-3,3'-dimethoxydianthrone, m.  $290-2^\circ$ . 5,6-Dihydroxy-1-benzylidenecoumaran-2-one (VIII) gives a ditoluene-*p*-sulfonyl deriv. (IX), m.  $178-80^\circ$ . Two monotoluene-*p*-sulfonyl derivs. were obtained, yellow, m.  $217-9^\circ$ , and greenish yellow, m.  $237-40^\circ$ ; Ac derivs. m.  $177-8^\circ$  and  $145-6^\circ$ , resp. Sapon. of IX with EtOH-KOH in the cold gives X. VIII also yields a diethylcarbonato deriv., pale yellow, m.  $104-7^\circ$ , and a mono deriv., yellow, m.  $177-80^\circ$ ; acetylation of the latter gives the di-Ac deriv. The original should be consulted for the theoretical discussion of these various reactions.

C. J. WEST  
**1-Methyl-2-furfurylcyclopropane.** N. KIZHNER. *J. Russ. Phys.-Chem. Soc.* 61, 781-8(1929); cf. *C. A.* 6, 2915.—1-Methyl-2-furfurylcyclopropane (I) is prepd from 3-methyl-5-furfurylpyrazoline (II), which is obtained when 25 g. furfuralacetone in 50 cc. alc. is mixed with 15 cc. 90%  $N_2H_4 \cdot H_2O$ , the alc. and the excess of hydrazine are expelled at  $110^\circ$ , the distn. is continued at reduced pressure, the residue is dissolved in  $Et_2O$ , dried with KOH, the  $Et_2O$  evapd., and distd. under reduced pressure; it is a heavy, almost colorless liquid, easily oxidized in the air with green color,  $b_{748} 127.8^\circ$ , sol. in  $H_2O$ ,  $d_{40}^{20} 1.1507$ . II is converted to I when into a flask having a reflux condenser and contg. 1 g. KOH and 0.5 g. pieces of platinized porous porcelain are introduced drop by drop 5 g. II; the reacting mixt. begins at once to boil and I distils over; when completed it is washed with  $H_2O$ , steam distd. and dried with  $CaCl_2$ , yield 75%, after boiling over metallic Na, it  $b_{748} 144.2^\circ$  and  $b_{748} 145.2^\circ$ ; it is colorless liquid giving a furfuran gr en reaction with a pine splinter, is easily oxidized in the air with yellow color, absorbs 4 atoms of Br, forming  $C_8H_{10}OBr_4$ , which method can be used for titration of I; by oxidation with  $KMnO_4$  is obtained probably 2-methylcyclopropane-1-carboxylic acid.

CHAS. BLANC  
**Inner complex-salts of pyrrole derivatives.** B. FEMMERT, K. DIEHL and F. GOLLWITZER. *Ber.* 62B, 1733-8(1929); cf. *C. A.* 22, 425.—Pyridylpyrrole-nickel (I)  $NiK_2$

( $R = \begin{bmatrix} \text{NC}_5H_7 \\ \diagup \quad \diagdown \\ \text{NC}_5H_7 \end{bmatrix}$ ), is obtained by slowly adding 1 g. NiO to a gently boiling soln. of 1 g. pyridylpyrrole (II) in 2 g.  $C_{10}H_8$ , cooling, extg. with  $CHCl_3$ , filtering and pptg. I by addn. of petroleum ether. Evapn. *in vacuo* of a soln. of I in a mixt. of 4 parts PhH and 5 parts ligroin yields red-brown needles, m.  $165^\circ$ . I is decompd. by acids, not by abs. alc. NaOH. Pyridylpyrrole-aluminum (III),  $AlR_3$  is obtained by boiling 1 g. II, 0.5 g. Al dust in 2 g.  $C_{10}H_8$  for 10 min. Extd. with anhyd. PhH, filtered, III was pptd. by addn. with shaking of 3 vols. petroleum ether. Purified by repptn. from PhH with ligroin, and dried over  $CaCl_2$ , it m.  $310^\circ$  approx. The crystals are orange gold in transmitted light and blue in reflected light. Pyridylpyrrole-cadmium (IV),  $CdR_2$ , obtained in like manner to III, with 0.5 g. CdO, very finely pulverized. The cooled reaction mixt. washed with PhH left green crystals of IV, mixed with unreacted oxide.  $\alpha$ -Pyrrolealdehyde (V) was prepd. according to Bamberger and Djerdjan (*Ber.* 33, 536(1900)). Mol. wt. detns. showed the keto form to predominate over the dimol enol form in  $H_2O$ .  $FeCl_3$  gave no color reaction.  $\alpha$ -Pyrrolealdehyde-copper, obtained

(VI)

(VII)

by heating a soln. of V with an excess of pptd. CuO in xylene. Slow evapn. under reduced pressure yields dark green crystals. Formula VI is favored.  $\alpha$ -Pyrrolealdehydimide (VIII) was prepd. by warming V with 33% aq.  $MeNH_2$  until the soln. was a clear yellow. Cooling ppts. VIII, m.  $57^\circ$ . Freshly prepd. VIII heated with pptd. CuO

in xylene yields  $\alpha$ -pyrrolealdehydimide-copper (IX),  $CuR'_2$  ( $R' = \begin{bmatrix} \text{NMe:CH} \\ \diagup \quad \diagdown \\ \text{N} - C_4H_7 \end{bmatrix}$ ).

m.  $163-5^\circ$  (from xylene or PhH-ligroin). IX is unchanged by abs. alc. KOH, but is decompd. by HCl.  $\alpha$ -Pyrrolealdehydimide-cobalt (X),  $CoR'_2$ , obtained by heating  $Co_2O_3$  and V in anisole, the solvent removed *in vacuo*, yields an addn. product of X and anisole. Recrystd. from PhH or xylene, it loses anisole and yields X, m.  $250.2^\circ$ . X is unaffected by alc. KOH, and is slowly attacked by HCl.

T. H. RIDER

**New metallic derivatives of thiophene.** II. Thallium, silicon, bismuth, tel-

lurium and mixed tin and lead thiényls. ERICH KRAUSE AND GERHARD RENWANZ. *Ber.* 62B, 1710-6(1929); cf. C. A. 22, 76.—To 25 g. thiophene in 125 cc. cold AcOH (10°) was added 16 cc. Br in 250 cc. AcOH. The oil was pptd. with H<sub>2</sub>O, extd. with Et<sub>2</sub>O and distd., b<sub>m</sub> 42-46°; yield 27 g.  $\alpha$ -bromothiophene (I). A series of thiényl-metallic compds. were prepd. with this starting material. Ten g. I, 1.5 g. Mg and 5.7 g. TiCl<sub>3</sub> in Et<sub>2</sub>O yield a gray ppt.; recrystd. from abs. alc. boiled 6 min. in alc. NaBr and recrystd. from abs. alc. it forms white needles of *di- $\alpha$ -thienylthallic bromide*, (C<sub>4</sub>H<sub>3</sub>S)<sub>2</sub>TlBr, m. 270°. Ten g. iodothiophene (II), 1.5 g. Mg and 0.8 g. SiCl<sub>4</sub> in Et<sub>2</sub>O yield *tetra- $\alpha$ -thienylsilicon*, (C<sub>4</sub>H<sub>3</sub>S)<sub>4</sub>Si, extd. with C<sub>6</sub>H<sub>6</sub>, recrystd. from abs. alc., m. 133.5° (cor., 135.5°). Twenty g. II, 3 g. Mg, 6 g. BiCl<sub>3</sub> and 130 cc. Et<sub>2</sub>O give after recrystn. with C<sub>6</sub>H<sub>6</sub> 1 g. *tri- $\alpha$ -thienylbismuth*, (C<sub>4</sub>H<sub>3</sub>S)<sub>3</sub>Bi, m. 135.5° (cor., 137.5°). Eight g. TeBr<sub>2</sub>, 16.3 g. I, 2.5 g. Mg and 100 cc. Et<sub>2</sub>O yield after extn *di- $\alpha$ -thienyltellurium dibromide* (III), (C<sub>4</sub>H<sub>3</sub>S)<sub>2</sub>TeBr<sub>2</sub>, m. 190.5° (cor., 195°), b. 220° (decompn.). III was reduced in SnCl<sub>2</sub> soln. to *di- $\alpha$ -thienyltellurium* (IV). IV in Et<sub>2</sub>O and Cl in CCl<sub>4</sub> give *di- $\alpha$ -thienyltellurium dichloride*, m. 185.5° (cor., 189.5°) decomp. 250°. IV yields with I in Et<sub>2</sub>O, *di- $\alpha$ -thienyltellurium diiodide*, m. 125° (cor., 126.5°). In a similar manner were prepd. *tri- $\alpha$ -thienyltellurium bromide*, (C<sub>4</sub>H<sub>3</sub>S)<sub>3</sub>TeBr, m. 244.5° (cor., 253°); *triphenyl- $\alpha$ -thienyllin*, (C<sub>6</sub>H<sub>5</sub>)<sub>3</sub>SnC<sub>4</sub>H<sub>3</sub>S, m. 201.5° (cor., 206°); and *triphenyl- $\alpha$ -thienyllead*, (C<sub>6</sub>H<sub>5</sub>)<sub>3</sub>PbC<sub>4</sub>H<sub>3</sub>S, m. 203.5° (cor., 208°), decomp. 305°. A. E. B.

Course of the indole synthesis according to Emil Fischer. P. W. NEBER, GERTRUD KNÖLLER, K. HERBST AND A. TRISSLER. *Ann.* 471, 113 45(1929).—In an attempt to decide between the mechanism proposed by Robinson and Robinson (C. A. 18, 2161), which assumes an *o*-benzidine rearrangement, and that by N. (Chem.-Ztg. 1925, 709), which assumes the formation of a tetrahydrocinnoline deriv. it is concluded that neither view can explain all the exptl. facts. (PhCH<sub>2</sub>)<sub>2</sub>CO and MePhNNH<sub>2</sub> in AcOH at room temp. give *1-methyl-2-benzyl-3-phenylindole*, straw-yellow, m. 129-30°; Et-PhNNH<sub>2</sub> gives the *1-Et homolog*, pale yellow, m. 106°; PhCH<sub>2</sub>NPhNH<sub>2</sub> gives *1,2-dibenzyl-3-phenylindole*, m. 138°. *Isonitrosodibenzyl ketone* (I), m. 116°; with Me-PhNNH<sub>2</sub> this gives *1-methyl-2-benzyl-3-phenylindole oxime*, deep yellow, m. 195°; *1-Et homolog*, m. 150°. PhCH<sub>2</sub>C(=NOH)COCH<sub>2</sub>Ph and PhNNH<sub>2</sub> in EtOH give the phenylhydrazone of I, m. 185° and with NH<sub>2</sub>OH, HCl and Na<sub>2</sub>CO<sub>3</sub>,  $\alpha,\beta$ -*diisonitroso- $\alpha,\gamma$ -diphenylpropane*, m. 213°. (PhCH<sub>2</sub>)<sub>2</sub>CO and Ph<sub>2</sub>NNH<sub>2</sub> give the diphenylhydrazone, yellow, m. 71-2°, giving with EtOH-HCl *1,3-diphenyl-2-benzylindole*, m. 124°. *o*-O<sub>2</sub>NC<sub>6</sub>H<sub>4</sub>CH<sub>2</sub>COCO<sub>2</sub>H yields a *methylphenylhydrazone* (II), yellow, m. 110° (decompn.), which gives with EtOH-HCl *1-methyl-3-[*o*-nitrophenyl]indole-2-carboxylic acid* (III), yellow, m. 226° and a *diphenylhydrazone* (IV), m. 125°, crystg. with 1 mol EtOH, and giving with EtOH-HCl *1-phenyl-3-[*o*-nitrophenyl]indole-2-carboxylic acid*, pale yellow, m. 220°; PhCH<sub>2</sub>NPhNH<sub>2</sub> gives after several days *1-benzyl-3-[*o*-nitrophenyl]indole-2-carboxylic acid*, m. 186°. Starting with *o*-O<sub>2</sub>NC<sub>6</sub>H<sub>4</sub>CH<sub>2</sub>COCO<sub>2</sub>Et there result the *Et esters* of II, pale yellow, m. 99° of III, light yellow, m. 107°, and of IV, m. 107°. Dihydro-3-hydroxycinnoline and BzCl in C<sub>6</sub>H<sub>5</sub>N give a *di-Bz deriv.*, m. 167°. 3-Hydroxycinnoline is reduced by HI and red P to oxindole. (PhCH<sub>2</sub>)<sub>2</sub>CO and 2,5-Me<sub>2</sub>-C<sub>6</sub>H<sub>3</sub>NHNH<sub>2</sub> give the *2,5-dimethylphenylhydrazone*, m. 105°; with EtOH-HCl this gives *2-benzyl-3-phenyl-4,7-dimethylindole*, m. 139°. Formyl[2,5-dimethylphenyl]hydrazine, from 2,5-Me<sub>2</sub>-C<sub>6</sub>H<sub>3</sub>NHNH<sub>2</sub> and 50% HCO<sub>2</sub>H, with Me<sub>2</sub>SO<sub>4</sub> and 45% NaOH give  $\alpha,\beta$ -*dimethyl- $\beta$ -formyl[2,5-dimethylphenyl]hydrazine*, light yellow, b<sub>m</sub> 172-4°; with EtOH and concd. HCl by boiling for 6 hrs., there results *2,5-dimethylphenyl- $\alpha,\beta$ -dimethylhydrazone*, yellow, b<sub>m</sub> 106-8°; the corresponding *hydrazone* of (PhCH<sub>2</sub>)<sub>2</sub>CO, m. 86° and 104° (stereoisomers?), both of which, with EtOH-HCl, yield *1-methyl-2-benzyl-3-phenyl-4,7-dimethylindole*, m. 108°. AcCO<sub>2</sub>H yields a *2,5-dimethylphenylhydrazone*, m. 172° (decompn.), which gives with EtOH a substance of low m. p. not investigated; the *2,5-dimethylphenylhydrazone* of *o*-O<sub>2</sub>NC<sub>6</sub>H<sub>4</sub>CH<sub>2</sub>COCO<sub>2</sub>H, honey-yellow, m. 156°, also gives a similar low-melting substance. *Et Ph ketone diphenylhydrazone*, pale yellow, m. 83°, gives with EtOH-HCl *1,2-diphenyl-3-methylindole*, m. 116°. *iso-Pr Ph ketone diphenylhydrazone* (V), yellow, m. 72°, with EtOH-HCl gives *1,2-diphenyl-3,3-dimethylindolin-2-ol* (VI), m. 156° (decompn.), isolated as the *chloride* (VII), m. 196° (decompn.); *perchlorate*, m. 209° (decompn.). Me<sub>2</sub>CHCOPh and Ph<sub>2</sub>NNH<sub>2</sub>, allowed to stand several days in AcOH, give *o-anilinophenylisobutyrophenone* (?) (VIII), m. 96-8°, which also results from V in EtOH-AcOH, and a little VI; with HCl it gives VII. VI and NaNO<sub>2</sub> in AcOH give the *N-NO deriv.*, straw-yellow, m. 115° (decompn.), which, warmed with MePhNNH<sub>2</sub>, gives VIII, while warming with EtOH at 40-50° gives the *C-NO deriv.*, emerald-green, m. 146° (decompn.). VII and MeOK give the *O-Me ether* of VI, m. 118°. Reduction of VI with Zn and AcOH gives *1,2-diphenyl-3,3-dimethyl-2,3-dihydroindole*, m. 104°. PhN:NCMeCHCO<sub>2</sub>Et and Et<sub>2</sub>O-HCl give a mixt. of 1-

[*o*- and *p*-chlorophenyl]-3-methylpyrazolone, m. 165°; the pure *o*-deriv., pale yellow, m. 201°.  $\text{AcCO}_2\text{H}$  gives a *methyl-4-nitrophenylhydrazone*, deep yellow, m. 150° (decompn.) on nitration of the hydrazone; reduction with Zn and HCl, followed by the action of  $\text{BzCl}$ , gives *N,N'*-dibenzoyl-*N*-methyl-*p*-phenylenediamine, m. 165°. 4-Nitro-2-aminostilbene and  $\text{Me}_2\text{SO}_4$  give 44% of the *mono-Me deriv.* (IX), dark carmine-red m. 172°, and the *di-Me deriv.*, yellow, m. 75°. IX yields a *N-NO deriv.*, yellow, m. 175°, which gives with Br in  $\text{CHCl}_3$   $\alpha$ -[2-methylamino-4-nitro-5-nitrosophenyl]- $\beta$ -phenyl- $\alpha,\beta$ -dibromoethane-HBr, m. 274°; soln. in hot EtOH transforms this into 1-methyl-2-phenyl-5-nitroso-6-nitroindole, yellow, m. 170°. 4-Hydroxycinnoline is reduced by P and HI to the *tetrahydro deriv.*, yellow, m. 220° (decompn.). Reduction of 4-phenylcinnoline with Zn and  $\text{NH}_4\text{OH}$  gives the *dihydro deriv.*, m. 115–6°. Heating 4-phenylcinnoline or its dihydro deriv. with amalgamated Zn and HCl gives 3-phenylindole. Catalytic reduction of the dihydro deriv. gives the *tetrahydro deriv.*, m. 83°; *HCl salt*, m. 201°; *picrate*, yellow, m. 128°. *o*-Aminophenylacetamide, m. 93°, crystg. with 1 mol.  $\text{H}_2\text{O}$ , results by reducing the  $\text{NO}_2$  compd.; *Ac deriv.*, m. 130°; the diazo compd. gives the  $\beta$ -naphtholazo deriv., blood-red, m. 252°.  $\alpha$ -2,5-Dichlorophenyl- $\beta$ -formylhydrazine, m. 222° (91% yield);  $\text{Me}_2\text{SO}_4$  gives the  $\alpha$ -Me deriv., m. 112°, which gives with HCl and EtOH  $\alpha,\alpha,2,5$ -dichlorophenylmethylhydrazine,  $b_{11}$  142–8°; *HCl salt*, m. 183°; *Ac deriv.*, m. 134°.  $\alpha,\alpha$ -Diphenylmethyl- $\beta$ -formylhydrazine, m. 68°. C. J. W.

**Formation of thionaphthindole.** ERNEST W. McCLELLAND. *J. Chem. Soc.* 1929, 1588–93.—2-Keto-1,2-dihydrobenzothiazole and  $\text{Ac}_2\text{O}$  under ordinary conditions yield the *N*-Ac deriv. (M. and Longwell, C. A. 18, 676) but when heated with  $\text{Ac}_2\text{O}$  and  $\text{AcOK}$  at 120° for 10 min. there results 1-acetyl-2-methylene-1,2-dihydrobenzothiazole (I), m. 168–70°. Hydrolysis of I gives 3-hydroxy-1-thionaphthene and  $\text{NH}_3$ . In  $\text{CHCl}_3$ , I absorbs Br, yielding after 21 hrs. the *Br deriv.*, m. 201–2°. In the purification of I steam distn. gives a yellow, volatile oil, from which alkali exts. 2-acetyl-3-hydroxy-1-thionaphthene; the residue is assumed to be *o*-thiolacetophenone, since it yields the requisite semicarbazone, m. 235° (decompn.), and with  $\text{PhNHNH}_2$  gives *thionaphthindole* (II), m. 252–3°; concd.  $\text{H}_2\text{SO}_4$  gives an intense blue color with II and isatin and a red color with phenanthraquinone; II is not affected by boiling concd. HCl and is not readily reduced; concd.  $\text{HNO}_3$  gives an intense yellow color and concd.  $\text{H}_2\text{SO}_4$  gives a yellow color. *N*-Ac deriv., m. 160–1°. The structure of II was confirmed by its synthesis from *o*- $\text{HSC}_6\text{H}_4\text{CO}_2\text{H}$ , through the *o*-nitrobenzyl ester to the thionaphthene (III), which was reduced to II, and also by the synthesis from *o*- $\text{H}_2\text{NC}_6\text{H}_4\text{Ac}$ , which was diazotized, treated with Et K xanthate, boiled with EtOH-KOH, reduced with Zn and condensed with  $\text{PhNHNH}_2$ .

C. J. WEST

**Further investigation of the relative firmness of union of organic radicals.** K. V. AUWERS AND F. BERGMANN. *Ann.* 472, 287–314 (1929).—Oettinger (*Diss. Jena*, 1894) showed that 3,4,4,5-tetramethylpyrazole (I) adds and splits off MeI, giving the 1,3,4,5-deriv. The effect of other alkyl halides is now studied; in general the quaternary salts are decompd. by heating to their m. p., the alkyl halide distd. off and the product distd. *in vacuo*, the resulting products being sepd. as picrates; instead of giving the % of each product formed, the % of Me split off from the C atom and of the alkyl from the N atom are given, the group bound to the N atom being given: Et, 74, 26; Pr, 89, 11; iso-Pr, 100, 0; allyl, 35, 65;  $\text{PhCH}_3$ , 33.5, 66.5. The following quaternary salts of I were prepd.: *EtI*, m. 167°; *PrI*, m. 142–2.5°; *iso-PrI*, m. 157–8.5°; *allyl iodide*, m. 165°;  $\text{PhCH}_2\text{I}$ , m. 132–3°. For comparison the following 1-derivs. of 3,1,5-trimethylpyrazole were prepd.: *Et*, by heating 6 hrs. at 110–20°, b. 192–3° (*picrate*, m. 156–7°; all picrates are more or less intense yellow); *Pr*,  $b_{11}$  94–5° (*picrate*, m. 107–7.5°); *iso-Pr*,  $b_{11}$  89–91° (*picrate*, m. 137–8.5°); *allyl*,  $b_{11}$  94–6° (*picrate*, m. 119–20°);  $\text{PhCH}_3$ ,  $b_{11}$  163° (*picrate*, m. 148–8.5°). In order to study the relative effect of the Me and Et groups, there was studied 3,5-dimethyl-4,4-diethylpyrazole (II),  $b_{11}$  131–3°, m. 52–3° when first crystd. from  $\text{Et}_2\text{O}$ , changing to 72–3.5° after 1 day in a desiccator. The % of C-Et and N-alkyl split off were as follows (radical bound to N given): Me, 79, 21; Pr, 100, 0; iso-Pr, 100, 0; allyl, 90, 10;  $\text{PhCH}_3$ , 75.5, 24.5. *Picrate* of II, m. 193°; quaternary salts: *MeI*, m. 186°; *PrI*, m. 106–12°; *iso-PrI*, m. 161.5–2°; *allyl iodide*, m. 123.5–5°;  $\text{PhCH}_2\text{I}$ , m. 148.5–9°. 3,5-Dimethyl-4-ethylpyrazole,  $b_{11}$  133–5°, m. 53.5–4.5°; *picrate*, m. 211–2°; 1-Me deriv.,  $b_{11}$  84–6° (*HCl salt*, m. 114.5–5°; *picrate*, m. 134.5–5.5°); 1-Et deriv.,  $b_{11}$  86–9° (*picrate*, m. 108–9°);

*1-Pr deriv.*,  $b_{12}$  98–100° (*picrate*, m. 116.5–7°); *1-iso-Pr deriv.*,  $b_{12}$  90–2° (*picrate*,  $n$  112.5–3.5°); *1-allyl deriv.*,  $b_{12}$  100–3° (*picrate*, m. 75–6°); *1-benzyl deriv.*,  $b_{12}$  162–4 (*picrate*, m. 126–7.5°). The effect of temp. upon the rearrangement was studied with

which, on heating, yields *1-methyl-4-ethyl-3,5-diphenylpyrazole*, m. 80–2° (*picrate*, yellow, m. 138–9°); allyl iodide and  $\text{PhCH}_2\text{I}$  do not yield definite products. *4-Ethyl-3,5-diphenylpyrazole (III)*, m. 167° (a *picrate* could not be prepd. by the usual methods); *3,5-diphenylpyrazole picrate*, m. 161–3°. *1,4-Diethyl-3,5-diphenylpyrazole*, m. 63–4° (*picrate*, m. 122.5–3.5°). *1-Benzyl deriv. of III*, m. 83–3.5° (*picrate*, m. 111.5–2.5°). *Thiopyrine-pseudo-propyl iodide*, m. 138.5–9.5°; *butyl iodide*, m. 95–6°. *1-Phenyl-3-methyl-5-iodopyrazole-PrI*, m. 225–6°. Heating caused splitting off of the following % of *N-R* and *S-R* from salts contg.: *S-Et* and *N-Me*, 28, 13 (2 expts.), 72, 87; *S-Pr*, *N-Me*, 45, 55; *S-Bu*, *N-Me*, 55, 45; *S-allyl*, *N-Me*, 10.5, 89.5; *S-Me*, *N-Et*, 89, 94 (2 expts.), 11, 6; *S-Me*, *N-allyl*, 87, 13. *4-Methylantipyryne*,  $d_4^{99.2} n$  1.55411, 1.56064, 1.57744 at 99.2° for  $\alpha$ ,  $\text{He}$ ,  $\beta$  (same order for the following); homoantipyryne,  $d_4^{99.7} n$  1.0692,  $n$  1.54945, 1.55566, 1.57182 at 99.7°; 1-phenyl-2,3,4-trimethylpyrazol-5-one,  $d_4^{99.7} n$  1.52460, 1.54070, 1.56000. 1-phenyl-3-methyl-5-methoxypyrazole,  $d_4^{21.6} n$  1.1147,  $n$  1.56909, 1.57533, 1.69131 at 21.6°; 1-phenyl-3-methyl-5-methylthiopyrazole,  $d_4^{21.0} n$  1.1464,  $n$  1.60195, 1.60875, 1.62597.

C. J. WEST

**Oximes of unsaturated ketones (preliminary communication).** K. v. AUWERS. *Ber.* 62B, 1320–3 (1929).—Stockhausen and Gattermann obtained with alk.  $\text{NH}_2\text{OH}$  from the condensation products of  $\text{PhCH}:\text{CHCOCl}$  with anisole and phenetole alkali-insol. isoxazolines. Their results have been confirmed (with M. SEYFRIED) and it has also been found that with  $\text{NH}_2\text{OH} \cdot \text{HCl}$  are obtained alkali-sol. compds. with an oxime character. From analogy, it would be natural to assume that the isoxazolines are derived from unstable *syn*-oximes (I) and that the alkali-sol. oximes are the *anti*-compds. (II), but of the latter the *phenetole deriv.*, m. 134–40°, smoothly gives  $\text{PhCH}:\text{CHCONHC}_6\text{H}_4\text{OEt}$  by the Beckmann rearrangement. To avoid conflict with the Meisenheimer conception of the rearrangement it would have to be assumed that the oxime has the *syn*-form or rearranges into it before undergoing the Beckmann reaction.  $\text{PhCH}:\text{CBrCOPh}$  with alk.  $\text{NH}_2\text{OH}$  yields 3,5-diphenylisoxazole and with  $\text{NH}_2\text{OH} \cdot \text{HCl}$  a Br-contg. *oxime*, m. 151°, which slowly rearranges into the isoxazole in alk. soln. According to Meisenheimer, a *m*-alkyl group drives the HO of the  $:\text{NOH}$  group away from the  $\text{C}_6\text{H}_5$  nucleus; in conformity with this, the condensation product of  $\text{PhCH}:\text{CHCOCl}$  with *p*-xylene was found (with H. RISS) to give only an alkali-insol. compd. with either alk. or acid  $\text{NH}_2\text{OH}$ .

C. A. R.

**Formation and stability of the 2-thio-1,2-dihydrobenzisothiazoles.** ERNEST W. McCLELLAND, LEONARD A. WARREN and JANE H. JACKSON. *J. Chem. Soc.* 1929, 1582–8.—M. and Longwell (*C. A.* 18, 676) have shown that while 2-dithiobenzoyl (I) reacts with  $\text{NH}_3$  to give 2-keto-1,2-dihydrobenzisothiazole, primary amines give disulfides and not cyclic compds. It is now shown that the substitution of S for O in the system increases the stability of the S-N link towards reducing agents. I and  $\text{P}_2\text{S}_5$  in  $\text{C}_6\text{H}_5\text{Me}_2$  give 2,3-dithiosulfindene (II), m. 94–5°; with  $\text{MeNH}_2$  in EtOH there results 2-thio-1-methyl-1,2-dihydrobenzisothiazole (III), yellow, m. 138–9°, feebly basic, and sparingly sol. in 2 *N* HCl; *1-Et deriv.*, m. 62–3°; *1-benzyl deriv.*, m. 122–3°; *1-Ph deriv.*, m. 77°. The action of  $\text{H}_2\text{S}$  on these derivs. gives II, indicating that the reaction is reversible. They are not affected by  $\text{SO}_2$ . Oxidation of III in AcOH with  $\text{H}_2\text{O}_2$  gives *N-methyl-o-benzoic sulfinide*, m. 131°; the other derivs. behaved similarly, giving the corresponding deriv. of the sulfinide, which may also be obtained by oxidizing the 2,2'-dithiobenzamides obtained by the action of the amine on I or its chloride. 2,2'-Dithiobenzamide with  $\text{P}_2\text{O}_5$  in  $\text{C}_6\text{H}_5\text{Me}_2$  gives 2,2'-dithiobenzonitrile, reduced by  $\text{H}_2\text{S}$  to II. Attempts to prep. 2-thio-1,2-dihydrobenzisothiazole have not been successful.

C. J. WEST

**Constituents of the bark of the peach tree.** J. SHINODA and S. UYEDA. *J. Pharm. Soc. Japan* 49, 575–8 (1929).—The study of flavanone in nature was previously reported

(cf. C. A. 22, 1592, 2946; 23, 4210). S. and U. extd. from the bark of the peach tree with MeOH a phenolic substance (I), m. 248°, which does not depress the m. p. of naringenin. Alc. I gives a pos. reaction with FeCl<sub>3</sub> and H<sub>2</sub>SO<sub>4</sub> similar to the naringenin reaction. Ac deriv., m. 194-5°, does not depress the m. p. of tetraacetylnaringenin (C. A. 23, 2956). Oxime of I, m. 233°, does not depress the m. p. of naringenin oxime (m. 231°). A paraffin-like substance, m. 280-3°, was also obtained. This gives the flavanone reaction but its phytosterol reaction is negative. This is probably triacontane or pentatriacontane (cf. Tutin, *Proc. Am. Pharm. Ass.* 54, 352, 1906). F. I. N.

Combination of methyl-, dimethyl-, trimethylamine, ethylenediamine and choline with flavianic acid. H. SIEVERS AND E. MÜLLER. *Z. Biol.* 89, 37-40(1929).

Flavinate	Ratio base: acid	N content	Soly. in 100 g. at 18° alc.	water	Decompn. temp
Methylamine	1:1	12.7	0.28	3.42	265-8
Dimethylamine	1:1	11.70	0.51	7.54	230-5
Trimethylamine	1:1	11.26	0.85	12.14	217-23
Ethylenediamine	1:2	12.21	0.04	0.16	265-7

FRANCES KRASNOW

The naphthophenoxanthones. A. PIERONI. *Atti accad. Lincei* 9, 420-4(1929). A preliminary paper discussing the known naphthophenoxanthones and outlining work which P. proposes to undertake concerning their constitution. A. W. CONTIERI

Isoflavone group. V. New general method applicable to the synthesis of derivatives of 7-hydroxyisoflavone. WILSON BAKER, ALFRED POLLARD and ROBERT ROBINSON. *J. Chem. Soc.* 1929, 1468-73; cf. C. A. 23, 2180.—m-MeOC<sub>6</sub>H<sub>4</sub>OH and Ph-COCH<sub>2</sub>Br in Me<sub>2</sub>CO and aq. NaOH, heated on the H<sub>2</sub>O bath for 15 min., give 6:6'-O of ω-methoxyphenoxycetophenone (I), m. 85-6°; H<sub>2</sub>SO<sub>4</sub> gives an orange soln with a green fluorescence, from which H<sub>2</sub>O ppts. a compd., probably 6-methoxy-3-phenylcoumarone. I and KCN with 30% H<sub>2</sub>SO<sub>4</sub> give almost quant. α-m-methoxyphenoxymethylmandelonitrile (II), m. 84-5.5°, which regenerates I on boiling with dil. EtOH and which is saponid. to a mixt. of α-m-methoxyphenoxymethylmandelic acid (III), m. 95-7° (apparently forming an unstable hydrate, m. 74-6°), and its amide, m. 122-3°, the Me ester m. 48-9°. Numerous expts. on the dehydration of III did not result in the production of γ-pyrone derivs. and the action of 80% H<sub>2</sub>SO<sub>4</sub> at 60° on the Me ester gave a poor yield of 7-methoxy-3-phenylcoumarin, m. 124°. II undergoes cyclization to a ketimine-HCl with ZnCl<sub>2</sub> and HCl in Et<sub>2</sub>O, which is hydrolyzed to 3-hydroxy-7-methoxyisoflavanone (IV), m. 133-5°. Reduction of IV with Na-Hg in MeOH gives 3,4-dihydroxy-7-methoxyisoflavane, m. 153°, giving in concd. H<sub>2</sub>SO<sub>4</sub> a yellow soln with a deep green fluorescence. 7-Methoxy-2-styrylisoflavone is oxidized by KMnO<sub>4</sub> in dil. C<sub>6</sub>H<sub>5</sub>N to 7-methoxyisoflavone-2-carboxylic acid, m. 241° (decompn.), which gives a pale yellow H<sub>2</sub>SO<sub>4</sub> soln.; on heating to 250° for 5 min., there results 7-methoxyisoflavone, also obtained from IV in cold concd. H<sub>2</sub>SO<sub>4</sub> after standing 30 min.

C. J. WEST

Synthesis of hexahydro-β-collidine. M. DE MONTMOLLIN AND M. MARTINET. *Helv. Chim. Acta* 12, 604-9(1929).—Com. PrOH was converted to EtCHO by catalytic oxidation, the aldehyde treated with aq. K<sub>2</sub>CO<sub>3</sub> to yield the aldol and this reduced with Al-Hg to 2-methylpentane-1,3-diol (I). These 3 reactions were carried out with large amts. of material with good yields. I with PBr<sub>3</sub> gave 2-methyl-1,3-dibromopentane (II), b<sub>12</sub> 80-2°, and a bromohydrin (III) of undetd. structure, b<sub>12</sub> 86-94°. II reacted with KCN in 80% EtOH, forming 2-methylpentane-1,3-dinitrile (IV), b<sub>12</sub> 189-93°. IV reduced with Na and EtOH gave 2-ethyl-3-methylpentamethylenediamine (V), b<sub>12</sub> 100-3°. V converted to the HCl salt and dry-distd. formed 2-ethyl-3-methylpiperidine ("hexahydro-β-collidine") (VI), b<sub>12</sub> 63-5°.

M. A. DAHLEN

Inner complex-salts of methyl α-pyridyl ketoximes. B. EMMERT AND K. DIEHL. *Ber.* 62B, 1738-42(1929).—Inner complex-salts of Ph-α-pyridyl ketoximes are described by Chugaev (cf. *Ber.* 39, 3382(1906)). Me α-pyridyl ketoxime (I), due to its ability to form complex-salts, is regarded as the syn-Me form (cf. Pfeiffer and Richarz, C. A. 22, 1291). The compds. prepd. by E. and D. from I form rather stable complexes with additional mols. of solvent, etc. An exception is Me pyridyl ketoxime cobalt (II), obtained by refluxing Co(OH)<sub>2</sub> with aq. I. The reaction mixt. is filtered and evapd. on a water bath, the excess of I removed by extr. with hot ligroin and the residue recrystd. from pyridine yields crystals, decomp. 275-80°. The water soln. of II is stable toward acid and alkali. In the following complexes, E. and D. attribute the coordination of solvent mols., etc., to the metal atom where feasible, elsewhere to

the mol. as a whole. *Me pyridyl ketoxime-copper* +  $2H_2O$  (III), obtained by boiling I in  $H_2O$  with  $CuO$  or powd.  $Cu$ , filtering and cooling, recrystg the ppt. from water. *2 Me pyridyl ketoxime-nickel* + 1 anisole (IV), obtained by refluxing I with  $NiO$  in anisole, and pptg. by removing the anisole *in vacuo*. Heating with water removes anisole and the colored aq. soln. so obtained is stable toward alkali, but is decolorized by dil. acid. *Me pyridyl ketoxime-zinc* +  $ZnO$  (V) and *Me pyridyl ketoxime zinc* +  $H_2O$  (VI) (in which  $ZnO$  and  $H_2O$  are coordinated by the whole mol. as in IV) are obtained by heating I and  $ZnO$  with a small quantity of water for 1–2 hrs. The reaction mixt. is filtered warm and evapd. at  $60^\circ$ . Light yellow crystals of V ppt. On continuing the pptn. dark yellow crystals of VI ppt. Both V and VI decomp. when heated in dil. aq. soln. *Me pyridyl ketoxime-nickel* + 4 pyridine (VII), obtained as was IV, using pyridine as the solvent instead of anisole. *Me pyridyl ketoxime-cadmium* + 2 *Me pyridyl ketoxime* (VIII), pptd. by addn. of  $CdSO_4$  in  $NH_4OH$  to I in warm dil. alc., decomp.  $250^\circ$  (from alc. or hot water). VIII in alc. is attacked slowly by  $KOH$ , rapidly by acids. Of the possible formulas VIIIa and VIIIb, the former is favored since the compd. is more easily sol. in org. solvents than in water.

T. H. RIDER

Natural rotation of polarized light by optically active bases. III. Rotation, refraction and volume of organic bases in solution. WOLFGANG LEITHE. *Monatsh.* 52, 151–62 (1929); cf. *C. A.* 23, 3451.—Data are given for  $n$  and  $d$  for pipercoline and its  $HCl$  salt, cyclohexane,  $PhCH_2CH_2NH_2$  and its  $HCl$  salt,  $PhEt$ , tetrahydroquinoline and its  $HCl$  salt and  $\alpha$ -methylindoline and its  $HCl$  salt in several of the following solvents:  $H_2O$ ,  $EtOH$ ,  $MeOH$ ,  $C_6H_6$ ,  $CCl_4$ ,  $CHCl_3$ ,  $AcOH$ , pyridine, piperidine,  $AcOEt$ ,  $C_2H_5Cl$  and  $Me_2CO$ .

C. J. WEST

A complex (polynuclear) ring system. B. EMMERT AND FR. MEIXNER. *Ber.* 62B, 1731–3 (1929).—*Di[benzaldipiperidyl]* (I),  $H_5C_6HC \left( \begin{array}{c} NH_2C_6H_4C_6H_5N \\ NH_2C_6H_4C_6H_5N \end{array} \right) CHC_6H_5$ , is obtained by treating 8 g.  $\gamma$ - $\gamma'$  dipiperidyl (II) with 5 g. freshly distd.  $BzH$  in 35 cc. hot abs. alc. Crystals contg. 1 mol. alc. ppt. on cooling in ice water. Warmed to  $80^\circ$  *in vacuo*, over  $P_2O_5$ , they m.  $189^\circ$ . The formula given for I is supported by mol. wt. detns. Boiled with water, I is unchanged, whereas boiling with dil.  $HCl$  splits I into its components.  $HCHO$  with II in water yields an amorphous product  $(C_{11}H_{20}N_2)_x$ , which decomp. on treatment with hot dil.  $HCl$ .  $MeI$ ,  $EtCl$  and  $COCl_2$  with II yield amorphous products of undetd. constitution. *Di[p-hydroxybenzaldehyde]dipiperidyl*,  $HOC_6H_4CH(OH)NH_2C_6H_4NCH(OH)C_6H_4OH$ , is obtained by refluxing 10 g. II with 6 g.  $p$ - $HOC_6H_4CHO$  in 70 cc. abs. alc. for 1 hr. On concg. and cooling the cryst. product, recrystd. from alc., m.  $153^\circ$ .

T. H. RIDER

Phenolic bases from angostura bark. Synthesis of galipolin. ERNST SPÄTH AND GEORG PAPAIOANOU. *Monatsh.* 52, 129–40 (1929).—Extn. of angostura bark with  $EtOH$  for 8 days and working up the alkali-sol. portion gives galipolin [2-( $\beta$ -3',4'-dimethoxyphenyl)ethyl-4-hydroxyquinoline] (I), m.  $193^\circ$ , which gives galipin on methylation (*C. A.* 19, 520). Since there was not sufficient material to prove the constitution by oxidation, the compd. was synthesized, as well as the other 2 possible isomers. 2-Methyl-4-methoxyquinoline and vanillin condense with  $ZnCl_2$  after heating 6 hrs. at  $108$ – $10^\circ$  to give 2-[ $\beta$ -4'-hydroxy-3'-methoxyphenylethylene]-4-methoxyquinoline, m.  $210$ – $1^\circ$ ; acids give deep orange salts; catalytic reduction gives the corresponding ethyl compd., m.  $186$ – $7^\circ$ . Similarly 2-methyl-4-methoxyquinoline gives 2-[ $\beta$ -3'-hydroxy-4'-methoxyphenylethylene]-4-methoxyquinoline, m.  $267$ – $8^\circ$ ; the  $HCl$  salt is orange-

yellow; reduction gives the *ethyl compd.*, m. 147–8°. 2-Methyl-4-chloroquinoline and 3,4-(MeO)<sub>2</sub>C<sub>6</sub>H<sub>3</sub>CHO, heated with ZnCl<sub>2</sub>, 1.25 hrs. at 120° give 2-[β-3',4'-dimethoxy-phenyl]ethylene-4-chloroquinoline, yellow, m. 144–5°; EtOH-HCl gives an orange HCl salt; heating with PhCH<sub>2</sub>OH and Na at 100° for 18 hrs. gives the 4-benzyl ether, m. 138–9°; catalytic reduction and hydrolysis gives I. 2-Methyl-4-hydroxyquinoline m. 241–2° (Conrad and Limpach, *Ber.* 20, 947(1887) give 230–1°); 2-methyl-4-chloroquinoline m. 25–6° (C. and L. give 42–3°, which may be the m. p. of a hydrate); heating with MeONa at 150–5° splits off the MeO group from 2-methyl-4-methoxyquinoline, giving the 4-HO deriv.

**Action of phosphoric oxide on β-anilinobutyral.** FREDERICK A. MASON. *J. Chem. Soc.* 1929, 1560–2; cf. *C. A.* 19, 2343; 20, 2330.—Further study of the action of P<sub>2</sub>O<sub>5</sub> on β-anilinobutyral shows that the only products are quinajdine and PhNH<sub>2</sub>. Attempts to condense β-chlorobutyral with *p*-MeC<sub>6</sub>H<sub>4</sub>SO<sub>2</sub>NHPh failed.

**Substances of the phenarsazine type containing the acenaphthene nucleus.** CHARLES S. GIBSON AND JOHN D. A. JOHNSON. *J. Chem. Soc.* 1929, 1621–2.—3-Amino-acenaphthene, *o*-BrC<sub>6</sub>H<sub>4</sub>AsO<sub>2</sub>H<sub>2</sub>, K<sub>2</sub>CO<sub>3</sub>, AmOH and a trace of Cu give 17.5% of *o*-[3-acenaphthylamino]phenylarsonic acid, decomp. 180–1°, purified through the NH<sub>4</sub> salt. Reduction with SO<sub>2</sub> in a hot mixt. of EtOH, concd. HCl and a trace of I gives 7-chloro-1,2,7-dihydroisoacenaphthabenzarsazine, orange-red, m. 241° (decompn.); 7-Br deriv., deep orange-red, m. 244–6° (decompn.). Oxidation of the Cl compd. does not appear to proceed smoothly.

**1,3,5-Dithiazine (formothialdine).** T. G. LEVI. *Atti accad. Lincei* 9, 424 7 (1929).—This product is obtained when a cold soln. of CH<sub>2</sub>O is treated with S, or, preferably, (NH<sub>4</sub>)<sub>2</sub>S, as a tarry product which solidifies after several hrs. The trithioformaldehyde, (CH<sub>2</sub>S)<sub>3</sub>, formed at the same time is decanted off. The reaction is 3CH<sub>2</sub>O + 2H<sub>2</sub>S + NH<sub>3</sub> = NH(CH<sub>2</sub>S)<sub>2</sub>CH<sub>2</sub> + 3H<sub>2</sub>O. The reaction will not take place with urotropine and H<sub>2</sub>S, as the former is a ring structure already. The impure product may be purified by prolonged extrn. (70–80 hrs.) in a Knöfler extractor with CS<sub>2</sub>. It cannot be purified by recrystn. as it is very slightly sol. in all solvents and at 70° it decomps. Heated in a current of CO<sub>2</sub> at 100°, CS<sub>2</sub> is liberated, while at 150° H<sub>2</sub>S, NH<sub>3</sub>, and CS<sub>2</sub> are liberated. Added to aq. AgNO<sub>3</sub> soln. Ag<sub>2</sub>S is pptd. Heated with concd. HCl it is decompd. to (CH<sub>2</sub>S)<sub>3</sub> and NH<sub>4</sub>Cl.

**10-Chloro-5,10-dihydrophenarsazine and its derivatives.** X. The 1- and (or) 3-methyl derivatives. The condensation of arsenious chloride and phenyl-*m*-tolylamine. CHARLES S. GIBSON AND JOHN D. A. JOHNSON. *J. Chem. Soc.* 1929, 1473–6; cf. *C. A.* 23, 4473.—Razuvaev (*C. A.* 23, 4474) has recently prepd. 10-chloro-1-(or 3)-methyl-5,10-dihydrophenarsazine (I) from AsCl<sub>3</sub> and *m*-MeC<sub>6</sub>H<sub>4</sub>NHPh, and gives the m. p. as 195–6°. Since both the 1- and 3-Me derivs. have been synthesized (*C. A.* 23, 3446) and shown to be indistinguishable isomers or the same substance, m. 215–6.5°, it seemed desirable to det. whether R.'s compd. was isomeric with these substances. It is shown to be the same, the low m. p. probably being due to impure *m*-MeC<sub>6</sub>H<sub>4</sub>NHPh. *m*-MeC<sub>6</sub>H<sub>4</sub>N:CPhCl and PhOH condense with EtONa to give *N*-*m*-tolylbenziminophenyl ether (II), m. 60°; similarly PhN:CPhCl and *m*-MeC<sub>6</sub>H<sub>4</sub>OH give *N*-phenylbenziminophenyl ether (III), m. 65°; heating either II or III at 280–300° for 2 hrs. gives phenyl-*m*-tolylamine benzoate, m. 104–6°, hydrolyzed to *m*-MeC<sub>6</sub>H<sub>4</sub>NHPh, b<sub>17</sub> 183 4°, m. 27.5°. Condensation with AsCl<sub>3</sub> under conditions previously described gives I, m. 215–6°.

**Synthesis of lobelia alkaloids.** G. SCHEUING AND L. WINTERHALDER. *Ann* 473, 126–36(1929).—2,6-Distyrylpyridine tetrabromide (Shaw, *C. A.* 19, 518), shaken with 2 *N* EtOH-KOH in C<sub>6</sub>H<sub>6</sub>, gives 2,6-di-β-phenylethynylpyridine (I), m. 137–8°. Heating I with H<sub>2</sub>SO<sub>4</sub> (1:1) 10 min. gives 2,6-diphenacylpyridine (II), yellow, m. 92° (sulfate, m. 197°; HCl salt, decomp. 223°); catalytic reduction (Pt oxide-BaSO<sub>4</sub>) gives 2,6-di[β-hydroxy-β-phenethyl]pyridine, oily, whose HCl salt m. 219° (decompn.). further reduced during 8 hrs. to norlobelanidine (III), the yield of HCl salt being about 50%. Norlobelanine is reduced by PtO<sub>2</sub> and H to *dl*-norlobeline, m. 104°, further reduction giving III. I and *p*-MeC<sub>6</sub>H<sub>4</sub>SO<sub>2</sub>Me give 90% of a quaternary salt, m. 168°; H<sub>2</sub>SO<sub>4</sub> gives the corresponding salt of II, m. 224°; reduction gives lobelanidine (absorption of 5 mols. H<sub>2</sub>) or lobelanine (absorption of 3 mols.). Reduction of α-phenacylpyridine (4 mols. H<sub>2</sub>) gives phenyl-α-pipecolylcarbinol, b<sub>4</sub> 165°, m. 85°.

**Synthetical experiments on the aporphine alkaloids.** VI. Isothebaine. Attempted syntheses of 3,4,5-trimethoxyaporphine. ROBERT K. CALLOW, JOHN M. GULLAND AND ROBERT D. HAWORTH. *J. Chem. Soc.* 1929, 1444–56; cf. *C. A.* 23,

3473.—Klee (C. A. 9, 298) was probably correct in classifying isothebaine as an aporphine alkaloid but on the other hand the location of the O atoms in positions 3, 4 and 5 was based on more slender evidence. Because of the difficulty of securing isothebaine, an attempt was made to synthesize 3,4,5-trimethoxyaporphine in order to com-

parisons with those of thebaine. *2'-nitro-3',4'-dimethoxyphenylaceto-β-4-methoxyphenylethylamide*, m. 97.5–8.0° (crystals with 1 mol. C<sub>6</sub>H<sub>6</sub>, m. 76–88°); this was not converted into basic material by the action in cold CHCl<sub>3</sub> of PCl<sub>5</sub>, P<sub>2</sub>O<sub>5</sub>, a mixt. of PCl<sub>5</sub> and P<sub>2</sub>O<sub>5</sub>, FeCl<sub>3</sub>, FeCl<sub>2</sub> and PCl<sub>5</sub> or AlCl<sub>3</sub> and PCl<sub>5</sub>. The action of PCl<sub>5</sub> in cold CHCl<sub>3</sub>, a mixt. of P<sub>2</sub>O<sub>5</sub> and POCl<sub>3</sub> or best P<sub>2</sub>O<sub>5</sub> and PCl<sub>5</sub> in boiling C<sub>6</sub>H<sub>6</sub> or PhMe for 15–30 min. gives a small amt. of *2'-nitro-3',4'-dimethoxyphenyl-β-4-methoxyphenylethylamino* acetylene, pale yellow, m. 143.5–4°. This indicates that the facile closure of the isoquinoline ring is dependent on the presence of a strongly *p*-directive group in the *p*-position to that at which condensation is to take place. An attempt was then made to introduce an NH<sub>2</sub> group in position 3 of I. I is not nitrated in concd. HNO<sub>3</sub> in the cold; I is not attacked by an AcOH soln. of fuming HNO<sub>3</sub> and CO(NH<sub>2</sub>)<sub>2</sub>. HNO<sub>3</sub> until the temp. is raised to 50–75°, when 4,3,5-HO(O<sub>2</sub>N)<sub>2</sub>-C<sub>6</sub>H<sub>2</sub>CH<sub>2</sub>CH<sub>2</sub>NH<sub>2</sub> is formed; in concd. H<sub>2</sub>SO<sub>4</sub> HNO<sub>3</sub> gives *β-3-nitro-4-methoxyphenylethylamine-5-sulfonic acid*, crystg. with 1 mol. H<sub>2</sub>O, dimorphous (plates and needles), darkens 290° but does not m. 310°; fuming HNO<sub>3</sub> in a freezing mixt. gives *β-3,5-dinitro-4-methoxyphenylethylamine nitrate*, pale yellow, m. 161° (decompn.); the free base could not be obtained, demethylation taking place at the same time as the hydrolytic disocn. Nitration of *p*-MeOC<sub>6</sub>H<sub>4</sub>CH<sub>2</sub>CH<sub>2</sub>CO<sub>2</sub>H with HNO<sub>3</sub> (d 1.4) yields a mixt. of the *3-NO<sub>2</sub> deriv.* (II), pale yellow, m. 128–30.5°, and the *3,5-di-NO<sub>2</sub> deriv.*, m. 136.9° (NaOH soln. is red; hot H<sub>2</sub>O gives an orange soln. turned yellow by a few drops of dil. H<sub>2</sub>SO<sub>4</sub>). II with SOCl<sub>2</sub>, followed by concd. NH<sub>4</sub>OH, gives the *amide*, pale yellow, m. 126.5–7°, which is converted by the Hofmann reaction into *β-3-nitro-4-methoxyphenylethylamine* (III), oily (*HCl* salt, yellow, m. 231–2°; Bz deriv., yellow, m. 129–30°, becoming red in the light); in 1 expt., when too little alkali was used, a compd., C<sub>20</sub>H<sub>22</sub>O<sub>7</sub>N<sub>4</sub>, m. 137–8°, was obtained. Reduction of III with SnCl<sub>2</sub> and HCl gives the *NH<sub>2</sub> deriv.*, analyzed as the *di-HCl salt*, m. 253–4° (decompn.), which gives with 2,3,4-O<sub>2</sub>N(MeO)<sub>2</sub>C<sub>6</sub>H<sub>2</sub>CH<sub>2</sub>COCl *2'-nitro-3',4'-dimethoxyphenylaceto-β-3-[2'-nitro-3',4'-dimethoxyphenylacetamido]-4-methoxyphenylethylamide*, m. 158–9°. The action of PCl<sub>5</sub> in CHCl<sub>3</sub>, followed by hydrolysis, gives *2'-nitro-3',4'-dimethoxyphenyl-β-3-amino-1-methoxy-β-phenylethylamino* acetylene, yellow, m. 169.5–70° (*picrate*, yellowish brown, m. 194–5° (decompn.)). Other methods of attack will be employed to solve the question of the constitution of isothebaine.

C. J. WEST

**Constitution of sinomenine.** I. E. OCHIAI. *J. Pharm. Soc. Japan* 49, 556–65 (1929); Abstract sect. 49, 91–3.—In a previous publication (C. A. 22, 4531) O. reported that the Clemmensen reduction of sinomenine gave *deshydroxytetrahydrosinomenine* and showed that it is an optical antipode of *dihydrothebaine* (I) (Speyer and Siebert, C. A. 15, 3975) and also that the Clemmensen reduction of *dihydrothebaine* gives I. It was further shown (*Ibid* No. 538) that the OMe group which is situated at C<sub>7</sub> of the sinomenine nucleus, *i. e.*, in the *β*-position to the >C—O, can be easily replaced by H. Recently Goto (*J. Agr. Chem. Soc.* 5, No. 53(1929)) confirmed the work of O. on the constitution of sinomenine, except that they did not agree on the position of the double bond. G. suggested that sinomenine is an *α,β*-unsatd. ketone. Clemmensen reduction of *dihydrooxycodone* gave C<sub>15</sub>H<sub>21</sub>NO<sub>3</sub> (II), m. 138–9°, [α]<sub>D</sub><sup>25</sup> —58.15°, insol. in KOH, and gives a negative result with FeCl<sub>3</sub>. II has 10Me and 2OH groups. O. named this *dihydro-ox-14-thebaine* (Gulland and Robinson, C. A. 17, 2584). Similarly Clemmensen reduction of *dihydrocodone* gave III, m. 150–1°, which does not depress the m. p. of the I of Speyer and Siebert. Na-Hg reduction of *dihydrocodone* gave a phenolic substance which does not depress the m. p. of *dihydrothebaine* prepd. from *dihydrothebaine*. O. also prepd. *β-tetrahydrodesoxycodone* (IV) (Freund, *J. prakt. Chem.* [2], 101, 29(1920)) and studied its properties. O. claims that I, IV and *deshydroxytetrahydrocodone* (Mannig, Löwenheim, *Arch. Pharm.* 258, 299) are identical substances. Catalytic reduction of *thebaine* gave *β-dihydrothebaine*, an isomer of *thebaine* and *dihydrothebaine* (Schöpf, C. A. 22, 430). O. previously reported that *dihydrothebaine* is an antipode of *7-methoxydihydrothebaine* and also showed that sinomenine is an antipode of *7-methoxythebaine*. O. thinks that the term "euthethebaine" for *thebaine* (according to Goto sinomenine is an optical isomer of *7-methoxy-euthethebaine*) should be discontinued.

F. I. NAKAMURA

**Bimolecular alkaloids.** I. On bisinomenine and *ψ*-bisinomenine. KAKUJI

GOTO AND HIDRO SUZUKI. *Bull. Chem. Soc. Japan* 4, 107-11(1929).—The oxidation with mild oxidizing agents ( $\text{AuCl}_3$ ,  $\text{AgNO}_3$ ,  $\text{K}_2\text{FeCN}_6$ ,  $\text{KMnO}_4$ ,  $\text{FeCl}_3$  and  $\text{H}_2\text{O}_2$ ) of sinomenine (I) gives 2 bimol. alkaloids, bisinomenine (II) and  $\psi$ -bisinomenine (III) which differ in the following characteristics: m. p. free base of II,  $222^\circ$ , of III,  $227^\circ$ ; decompn. m. p. free base II,  $245^\circ$ , of III,  $227^\circ$ ; crystal form II hexagonal plates, of III needles; m. p. HCl salt of II  $> 290^\circ$ , of III  $> 290^\circ$ ; soly. HCl salt of II 0.6%, of III  $\infty$ ; decompn. p. methiodide of II  $263^\circ$ , of III  $268^\circ$ ; m. p. oxime of II  $265^\circ$ , of III  $290^\circ$ ; m. p. semicarbazone of II  $> 290^\circ$ , of III  $> 290^\circ$ ;  $[\alpha]_D^{25}$  II  $149.98^\circ$ ,  $[\alpha]_D^{25}$  III  $-127.03^\circ$ . The acetolysis of both substances gives the same tetrabisinomenol, the derivs. of which are identical with those from bisinomenol obtained by boiling I with 66% KOH. II and III can readily be sepd. by recrystn. of the HCl salts which shows that they are not enantiomorphous. The strong diazo reaction of I is greatly diminished in these products. The diazo reaction is similarly diminished in bromosinomenine, which on oxidation does not give II and III. From these facts it may be assumed with some certainty that the linking of the two I mols. takes place in the position 2, opposite to the free phenolic hydroxyl, which gives the formula IV for these alkaloids. II occurs in nature accompanying I. III has not been isolated so far from *sinomenium acutum*.

F. J. G. DE LEEUW

**Lobelia alkaloids. III. Constitution of the lobelia alkaloids.** HEINRICH WIELAND AND OTTO DRAGENDORFF. *Ann.* 473, 83-101(1929); cf. C. A. 19, 2827. Oxidation of lobelanidine,  $\text{C}_{22}\text{H}_{29}\text{O}_2\text{N}$ , or lobeline,  $\text{C}_{22}\text{H}_{29}\text{O}_2\text{N}$ , with  $\text{CrO}_3$  in AcOH gives lobelanine (I,  $\text{C}_{27}\text{H}_{35}\text{O}_2\text{N}$ ). I and  $\text{PhNHNH}_2$  give an addn. compd.,  $\text{C}_{34}\text{H}_{45}\text{O}_2\text{N}$ , light yellow, m.  $187^\circ$  (decompn.). I and  $\text{H}_2\text{O}_2$  in AcOH give, after 2 days, lobelanine N-oxide, m.  $84-6^\circ$  (HCl salt, m.  $169^\circ$ ), reduced by  $\text{SO}_2$  to I. Distn. of I.HCl with Zn dust gives PhAc. I yields a dioxime, m.  $209^\circ$ , which, by means of the Beckmann rearrangement ( $\text{SOCl}_2$  in  $\text{CHCl}_3$ ), gives the dianilide, m.  $218-9^\circ$  (decompn.), of lobeline acid,  $\text{C}_{10}\text{H}_{17}\text{O}_4\text{N}$ , m.  $225-8^\circ$  (decompn.). (Au salt). I, oxidized with  $\text{CrO}_3$  in 33%  $\text{H}_2\text{SO}_4$ , yields scopolinic acid. I and MeI yield a difficultly soluble quaternary iodide, whose base is unstable and splits off  $\text{Me}_3\text{N}$  on treatment with  $\text{Ag}_2\text{O}$ ; extn. with HCl gives unchanged I (up to 50%) and a small amt. of a compd.,  $\text{C}_{22}\text{H}_{29}\text{NO}_3$ , m.  $164^\circ$  (HCl salt, m.  $236^\circ$  (decompn.)). The neutral portion is strongly unsatd. and on catalytic reduction in EtOH gives 1,7-dibenzoylheptane (II), m.  $56-7^\circ$  (Etaise, *Ann. chim.* 9, 391 (1896)); oxidation with  $\text{CrO}_3$  in AcOH gives  $\omega$ -benzoylheptylic acid, m.  $84-5^\circ$ . Reduction of the neutral part in AcOH gives 1,9-diphenyl-1,9-dihydroxynonane, b.  $210-20^\circ$  (in vacuo, pressure not given), oxidized to II. Thus I is  $\alpha, \alpha'$ -diphenacyl-N-methylpiperidine. In lobeline 1 of the CO groups is reduced to CHOH and in lobelanidine, both are reduced. IV. Synthesis of lobelia alkaloids. H. WIELAND AND IRMGARD DRISHAUS. *Ibid.* 102-18.—Reduction of benzallutidine by Na and EtOH gives the 2 stereoisomeric nor-bases, the  $\alpha, \alpha'$ -diphenylethylpiperidine, the HCl salts of which m.  $195^\circ$  (meso-norlobelan-HCl; HI salt, m.  $187^\circ$ ), and  $162-5^\circ$  (HI salt, m.  $187-9^\circ$ ), which is probably the trans-lobelan; the methiodides m.  $234^\circ$  and  $217-9^\circ$ , resp. Condensation of 188 g.  $\text{CH}_3(\text{CH}_2\text{CO}_2\text{Et})_2$  with 480 g. PhAc ( $\text{NaNH}_2$  in  $\text{EtO}_2$ ) gives 55-60 g. 6-benzoyl- $\delta$ -ketocaproic acid (I), m.  $130^\circ$  (Me ester, m.  $43^\circ$ ), both of which give a deep red  $\text{FeCl}_3$  reaction, and 25-30 g. 1,7-dibenzoylhepta-2,6-dione (II), m.  $72^\circ$ , which gives an intensely red  $\text{FeCl}_3$  reaction. Further reaction of I with PhAc gives II. Two by-products of II were a compd.  $\text{C}_{19}\text{H}_{21}\text{N}$  or  $\text{C}_{19}\text{H}_{19}\text{N}$ , m.  $64.5^\circ$  (picrate, yellow, m.  $185^\circ$ ), and a compd.  $\text{C}_{21}\text{H}_{23}\text{O}$ , m.  $135^\circ$ . Condensation of II with dry  $\text{NH}_3$  at  $100^\circ$  gives 30% of  $\alpha, \alpha'$ -diphenacylidene-piperidine, deep yellow, m.  $237^\circ$  (tetrabromide, m.  $183^\circ$ , catalytically reduced (H and Pt oxide) to  $\alpha$ -, m.  $148^\circ$ , and  $\beta$ -lobelanidine (III), m.  $173^\circ$  together with the compd.  $\text{C}_{22}\text{H}_{29}\text{O}_2\text{N}$ , m.  $125^\circ$ . Reduction of  $\beta$ -III with amalgamated Al in moist  $\text{Et}_2\text{O}$  gives a mixt. of norlobelanidine, m.  $120^\circ$  (HCl salt, m.  $244^\circ$ ), and an oily base, oxidized by  $\text{CrO}_3$  to norlobelanine (IV), m.  $120^\circ$  (HCl salt, m.  $195^\circ$ ).  $\alpha$ -III,

similarly reduced and then oxidized, gives IV. V. Several bases accompanying lobeline and the reciprocal relations of the lobelia alkaloids. H. WIELAND, WALTER KOSCHARA AND ELISABETH DANE. *Ibid* 118-26.—The mother liquor from *l*-lobeline yields a small amt. of *di*-lobeline (I), m. 110° (*HCl* salt, m. 170°; *nitrate*, decomps. 159-60°); oxidation with  $\text{CrO}_3$  gives lobelanine, m. 96-7°. I was previously termed lobelidine. Isolobelanine is now termed norlobelanine (II), which yields a *Bz* deriv., m. 125-6°. Reduction of II gives norlobelanidine (III), m. 120°, which is also isolated from the mixt. with lobelanidine (IV) (obtained from the lobelia alkaloids) by extg. the latter with boiling abs. EtOH (the *nitrate* m. 179-80°; the *iodide* m. 211°). Methylation of III with  $p\text{-MeC}_6\text{H}_4\text{SO}_3\text{Me}$  gives IV. Oxidation of III with  $\text{CrO}_3$  in AcOH gives II, while oxidation of IV with  $\text{KMnO}_4$  in 0.1 *N*  $\text{H}_2\text{SO}_4$  gives I. I may be resolved by tartaric acid, giving *l*-lobeline.

C. J. WEST  
Quaternary bases of *Berberis vulgaris*. ERNST SPATH AND NIKOLAUS POLGAR. *Monatsh.* 52, 117-28(1929).—A systematic investigation of the bases of *Berberis vulgaris* is reported, for the details of which the original should be consulted. Tertiary bases, which were not sepd., accounted for 3.9% of the dried plant material. The quaternary bases were sepd. into the non-phenolic and phenolic bases. The former (9.4%) consisted almost entirely of berberine, with about 1/4% of palmatine, which has previously not been isolated, and a trace of a base not of the berberine type. The phenolic bases (2.03%) were reduced to the tert. tetrahydro bases; the principal component was tetrahydrojatrorrhizine, with some tetrahydrocolumbamine and tetrahydroberberrubine. Simple basic building units, such as homopiperonylamine and homoveratrylamine, could not be isolated.

C. J. WEST  
Strychnos alkaloids. XLIX. Oxidation with potassium permanganate of the compounds  $\text{C}_{19}\text{H}_{27}\text{O}_5\text{N}_2$  and  $\text{C}_{19}\text{H}_{25}\text{ON}_2$  obtained from Hanssen's acid. HERMANN LEUCHS AND ALFRED HOFFMANN. *Ber.* 62B, 1253-61(1929), cf. *C. A.* 23, 3230.—Oxidation with  $\text{KMnO}_4$  in  $\text{Me}_2\text{CO}$  of brucine to brucinonic acid leaves unchanged the  $\text{C}_6\text{H}_5$  nucleus carrying the  $\text{MeO}$  group, whereas in the degradation through cathodine to Hanssen's acid,  $\text{C}_{19}\text{H}_{25}\text{ON}_2$  (I), this ring is destroyed. It was of importance, therefore, to obtain, if possible, definite compds. from I or its transformation products by attacking it with  $\text{KMnO}_4$  at the same points of the mol. as in brucine. This has been successfully effected, not with I itself but with the acid  $\text{C}_{19}\text{H}_{25}\text{O}_6\text{N}_2$  (II), obtained by oxidizing I with Br to the acid  $\text{C}_{19}\text{H}_{25}\text{O}_8\text{N}_2$  (III) and then treating III with HgO. In faintly alk. soln. II almost instantly decolorizes  $\text{KMnO}_4$  (up to about 4 atoms O), yielding  $(\text{CO}_2\text{H})_2$  and an acid  $\text{C}_{17}\text{H}_{19}\text{O}_8\text{N}_2 \cdot \text{H}_2\text{O}$  (IV) which contains a  $\text{C}=\text{O}$  and 1 free  $\text{CO}_2\text{H}$  group, and one  $\text{CO}_2\text{H}$  group neutralized by the basic N. IV is also obtained directly from III but only in 25% yield and with a large consumption of  $\text{KMnO}_4$ . IV is quite stable to  $\text{KMnO}_4$  at 0° and is not oxidized at 100° by either Br-HBr or HgO in  $\text{H}_2\text{O}$ . With boiling AcOH it yields a yellow dianhydride,  $\text{C}_{17}\text{H}_{14}\text{O}_8\text{N}_2$  (V), which regenerates IV with  $\text{H}_2\text{O}$ . IV loses its  $\text{H}_2\text{O}$  of crystn. only at 150-70°, becomes brownish about 300°, is easily sol. in *N* HCl,  $\text{HNO}_3$  or  $\text{KHCO}_3$ ; *HCl* salt, prisms and needles with  $2\text{H}_2\text{O}$ , sinters 250-90°; *oxime*; *semicarbazone*, crystals with  $2\text{H}_2\text{O}$ , easily sol. in *N*  $\text{KHCO}_3$ , quite sol. in *N* NaOAc and 5 *N* HCl, sol. in hot *N* HBr; *di*-Me ester, prisms with  $1\text{H}_2\text{O}$ . V, prisms with 1AcOH which it loses *in vacuo* at 130°.

Isomerism and catalytic decomposition of sandaraco-pimaric acid. F. BALÁŠ AND J. BRZÁK. *Collection Czechoslov. Chem. Comm.* 1, 352-9(1929); cf. *C. A.* 23, 4224.—Boiling in various solvents and even distn. does not isomerize this acid. At 240° in  $\text{CO}_2$  an isomer, m. 153-4°, results. At 310° in  $\text{CO}_2$  a compd.  $\text{C}_{19}\text{H}_{28}\text{O}_6$ , b<sub>2</sub> 195°, results by loss of  $\text{CO}_2$ . 4.5 g. of the acid in 100 cc. of AcOH with 70 cc. (0.5 g.) of colloidal Pt soln. at 60° under 0.1 atm. of  $\text{H}_2$  yields a dihydrogenated acid, m. 180°. The properties of the various isomeric sandaraco-pimaric acids are reviewed.

V. F. H.  
Constituents of the seeds of *Arctium lappa* L. I. J. SHINODA AND M. KAWAGOEY. *J. Pharm. Soc. Japan* 49, 565-75(1929).—S. and K. extd. from the seeds of *Arctium lappa* L. (700 g.) with ether (750 cc.) I, m. 99-102° (yield 15.0-21.5%) which does not depress the m. p. of arctigenin. The ether ext. residue gave II, m. 111-2°;  $[\alpha]_D^{25}$  -38.8° (in alc.) (yield 18-20%). II is probably arctiin, reduces Fehling and  $\text{NH}_3 \cdot \text{AgNO}_3$  soln. Catalytic reduction and methylation of II gave neg. results. Hydrolysis of II gave the *alcohols* arctigenin (yield 64%).  $\text{C}_{20}\text{H}_{30}\text{O}_6 + \text{H}_2\text{O} = \text{C}_{22}\text{H}_{32}\text{O}_6 +$

of II, which does not depress the m. p. of veratric acid (m. 110-111°). Hydrolysis of II gave III, m. 194°, and  $\text{HCO}_2\text{H}$ (?). III does not depress the m. p. of protocatechuic acid. I gives bromoarctigenin (IV), m. 194-5°. Oxidation of IV with  $\text{KMnO}_4$ ,

gave a compd., m. 182-4°, which does not depress the m. p. of 6-bromoveratric acid (m. 183-4°). Methylation of I with  $\text{Me}_2\text{SO}_4$  gave methylarctigenin (V), m. 125-7°. Nitration of V gave a nitro deriv., m. 204-6°. Reduction of II gave I. Acetylation of I by the usual method gave a compd., m. 52-60°. Alc. I treated in KOH and acidified with either AcOH or HCl gave a compd., m. 117-8° which gives I on recrystn. in dil.

F. I. N.

**Constitution of nonadekin, a new glucoside from *Peucedanum decursivum* Maxim.**  
**II. JUNZO ARIMA.** *Bull. Chem. Soc. Japan* 4, 113-9 (1929).—The similarity of nonadekin with the coumarin series described in Part I (*C. A.* 23, 2445) was proven further. Nonadekin absorbs 1 mol.  $\text{Br}_2$  and forms a mono-Br deriv., m. 230-1°, which gives with alc. KOH nodakilic acid, m. 214-5°, a monobasic acid,  $\text{C}_{10}\text{H}_8\text{O}_6$ , which has no lactonic or phenol HO group, and contains one O more than nonadekin. This is similar to the formation of coumaric acid from coumarin. Oxidation with  $\text{CrO}_3$  of nonadekin gives a monobasic phenolcarboxylic acid  $\text{C}_{10}\text{H}_8\text{O}_6$ , m. 244-6°. This acid has one lactonic group, colors violet with  $\text{FeCl}_3$  and gives a di-Me deriv., m. 165-6°. This acid was proven to be identical with a hydroxycoumarincarboxylic acid synthesized from  $\beta$ -resorcylic acid and malic acid according to the method of Pechmann. This acid gives on heating under evolution of  $\text{CO}_2$  the 7-hydroxycoumarin (umbelliferone, m. 230-1°). From the facts it is concluded that the formula for nonadekin is:

F. J. G. DE LEEUW

**Several rearrangements of ergosterol peroxide.** A. WINDAUS, W. BERGMANN AND A. LÜTTRINGHAUS. *Ann.* 472, 195-201 (1929).—Distn. of 0.5 g. ergosterol peroxide (I) at 0.0007 mm. and 180-215° (bath temp.) gives 15% of a compd.,  $\text{C}_{27}\text{H}_{44}\text{O}_3$  (II),  $[\alpha]_D^{17}$  55.5°, which contains 1HO and 1CO group; the third O is probably oxidic in character. Titration with  $\text{BzO}_2\text{H}$  indicates 1 double bond and gives a monoxide,  $\text{C}_{27}\text{H}_{44}\text{O}_4$ , m. 218°,  $[\alpha]_D^{17}$  94.6°. MeMgI indicates 1 active H. II yields an *Ac* deriv., m. 168-9°,  $[\alpha]_D^{17}$  41°; an *oxime*, m. 260° (decompn); and with MeMgI the *tert. alc.*,  $\text{C}_{28}\text{H}_{46}\text{O}_3$ , m. 190°; catalytic reduction gives the *dihydro deriv.*, m. 152-3°,  $[\alpha]_D^{20}$  94.6°, whose *Ac* deriv., m. 161°,  $[\alpha]_D^{17}$  74.6°. I with Zn and alkali gives a triol (W. and Linsert, *C. A.* 22, 4534) (correct rotation,  $[\alpha]_D^{20}$  -13.7°), also obtained with Al-Hg; reduction with EtOH and Na gives dihydroergosterol, while catalytic reduction (Pd + H) gives a *diol*,  $\text{C}_{27}\text{H}_{46}\text{O}_2$ , m. 234°,  $[\alpha]_D^{20}$  14.7°;  $\text{Ac}_2\text{O}$  gives a *monoacetate*, m. 227°,  $[\alpha]_D^{18}$  14.7°; complete catalytic reduction (Pt + H for 8 hrs. at 70°) gives *allo- $\alpha$ -ergosterol*, also obtained from I.

**Rearrangement of ergosterol.** A. WINDAUS AND E. AUHAGEN. *Ann.* 472, 185-94 (1929).—Ergosterol (I) in the absence of air gives with ultra-violet light isomeric alcs, which are not pptd. by digitonin (II). Some of these have been prepd. by chem. methods and will be compared with those obtained by photochem. methods. I (5 g) and 0.9 g. finely divided Ni, heated in  $\text{CO}_2$  3.5 hrs. at 225°, give 0.5 g. *ergostadienone* (III),  $\text{C}_{27}\text{H}_{44}\text{O}$ , yellow, m. 182-3°,  $[\alpha]_D^{19}$  2°; the Liebermann-Burchard test with  $\text{Ac}_2\text{O}$  and concd.  $\text{H}_2\text{SO}_4$  gives red, blue and then green colors;  $\text{AsCl}_3$  and  $\text{SbCl}_3$  give no color; *oxime*, decomp. 240-50°; reduction with Na and EtOH gives dihydroergosterol (IV) while catalytic reduction gives *allo- $\alpha$ -ergosterol*. Besides III there results 80% of a red oil, which contains some III and other compds., and also *u-ergostadienone*, which was not obtained pure but was reduced to *u-ergostadienol*,  $\text{C}_{27}\text{H}_{44}\text{O}$ , m. 170°,  $[\alpha]_D^{17}$  42°; *Ac* deriv., m. 128°,  $[\alpha]_D^{18}$  58°. Catalytic reduction gives *u-ergostanol*,  $\text{C}_{27}\text{H}_{46}\text{O}$ , m. 184°,  $[\alpha]_D^{18}$  34°; *Ac* deriv., m. 96°,  $[\alpha]_D^{17}$  39°; this is not pptd. by II. Heating dehydroergosterol (V) with Ni gives *ergostatrienone D* (VI), m. 199-200°,  $[\alpha]_D^{20}$  50°; *oxime*,

decomps. 245°. Reduction with Na and EtOH gives *ergostatrienol D* (VII), m. 165–6°,  $[\alpha]_D^{20}$  22°; *Ac deriv.*, m. 171°,  $[\alpha]_D^{17}$  17.5°. VII also results by heating 5 g. V in 250 cc EtOH with 10 g. Hg(OAc)<sub>2</sub> and 5 cc. AcOH 45 min. The mother liquor of VI contains *u-ergostatrienone*, m. 130–1°,  $[\alpha]_D^{19}$  53°; *oxime* reduction with Na and EtOH gives *u-ergostatrienol*, C<sub>27</sub>H<sub>46</sub>O, m. 154°,  $[\alpha]_D^{16}$  88°, is not pptd. by II; *Ac deriv.*, m. 151°,  $[\alpha]_D^{17}$  103°; catalytic reduction gives the *Ac deriv.*, m. 96° (see above).

Catalysts for hydrogenation and dehydrogenation of organic compounds. HOLZ-VERKOHLLUNGS-INDUSTRIE A.-G. Brit. 305,198, Feb. 2, 1928. A soln. of a sol. compd. of the catalyst such as Cu formate is applied to a carrier such as granulated magnesia which acts as a precipitant for the soln. A mixed soln. of Cu and Mn nitrates may be applied to granular lime, and Ni nitrate may be applied to magnesia. The impregnated carrier is dried and may be reduced in H.

Catalysts for reduction and hydrogenation of organic nitrogen compounds. A. O. JAEGER (to Selden Co.). Brit. 304,640, Jan 23, 1928. In reducing PhNO<sub>2</sub> to PhNH<sub>2</sub>, forming piperidine from pyridine, and effecting various generally similar reactions, catalysts are used which are formed of zeolites or non-siliceous base-exchange materials with which catalytically active components are assoc. either combined in an exchangeable or non-exchangeable form or in phys. admixt. or assocd. with diluents or in the form of anions forming salt-like compds. Numerous examples, modifications and details are given.

Organic bases. I. G. FARBENIND. A.-G. (Otto Nicodemus, inventor). Ger. 479,351, Jan. 6, 1927. See Brit. 283,163 (C. A. 22, 3892).

Esters. STANDARD OIL DEVELOPMENT CO. Brit. 305,308, Nov. 21, 1927. Esters, such as those of secondary alcs., *e. g.*, of iso-Bu alc. and Pr Me carbinol, are made in the presence of a solvent for the ester (such as a white petroleum oil, b 300°) which is capable of sepg. it from the reaction mixt. The ester is then sepd. from the solvent by distn.

Ketonic acid esters. A. WACKER GES. FÜR ELEKTROCHEMISCHE INDUSTRIE GES. Brit 304,118, Jan. 14, 1928. See Fr. 654,413 (C. A. 23, 3714).

Esters of orthosilicic acid. MARTIN MÜLLER-CUNRADI and GRETE LECHNER (to I. G. Farbenind. A.-G.). U. S. 1,725,620, Aug. 20. SiCl<sub>4</sub> is treated with EtOH or other alc. in the presence of an inert diluent such as benzene.

Halogenated alcohols. JÜRGEN CALLSEN (to Winthrop Chemical Co.). U. S. 1,725,054, Aug. 20. In forming halogenated alcs., *e. g.*, tribromoethyl alc., a halogenated aldehyde such as bromal, dissolved in a secondary alc. such as iso-Pr alc., is heated with an Al alcoholate, in the presence of H.

Alcoholates. A. WACKER GES. FÜR ELEKTROCHEMISCHE INDUSTRIE GES. Brit. 304,585, Jan. 21, 1928. Alcoholates are prepd. from alcs. contg. more than 3 C atoms in the mol. by boiling the alc. with a metal hydroxide, *e. g.*, Bu alc. is boiled with NaOH in a distn. app. Mention is made also of the prepn. of metallic derivs of cyclic alcs. such as benzyl alc. and cyclohexanol.

**Alkylene phenols.** SCHERING-KAHLBAUM A.-G. Brit. 304,727, Jan. 25, 1928. See Fr. 657,122 (C. A. 23, 4229).

**Disubstituted guanidines.** I. G. FARBENIND. A.-G. Brit. 304,360, Oct. 19, 1927. Disubstituted guanidines are made by treating a cyanogen halide with a primary org. base in the presence of a salt of such a base. An example is given.

**Thioureas.** CARL N. HAND and CLARENCE E. SMITH (to Rubber Service Laboratories Co.). U. S. 1,724,580, Aug. 13. In making a thiourea such as diphenylthiourea, reaction between a primary aromatic amine such as aniline and  $\text{CS}_2$  is effected at a temp. of 46–46.2°, vapors and gaseous by-products are removed from the reaction zone, the vapors are condensed and the condensate is returned to the reacting materials for revaporization to remove a further quantity of gaseous by-products. An arrangement of app. is described.

**Xanthates.** THOMAS W. BARTRAM and WM. C. WELTMAN (to Rubber Service Laboratories Co.). U. S. 1,724,549, Aug. 13. Compns. such as Na ethyl xanthate are stabilized by adding a basic metallic compd. such as lime.

***ar*-Tetrahydronaphthylamines.** LEOPOLD CASSELLA & Co., G. M. B. H. (Felix Klingemann, Ernst Korten, Wilhelm Lommel and Theodor Goost, inventors). Ger. 479,401, Oct. 11, 1925. *ar*-Tetrahydronaphthylamines are prepd. by hydrogenation of acylated naphthylamines and sapon. the products to obtain the free base. Examples are given.

**Alkali metal salts of nitrosamines of halogenated and methyl-substituted anilines.** ARTHUR ZITSCHER and WILHELM SEIDENFADEN (to General Aniline Works). U. S. 1,724,062, Aug. 13. The *K* salt of the nitrosamine of 4-chloro-*o*-toluidine, probably 4,2-ClMeC<sub>6</sub>H<sub>3</sub>NKNO, is obtained from the *syn*-diazotate of 4,2-ClMeC<sub>6</sub>H<sub>3</sub>NH<sub>2</sub> prepd. at lower temp. and run, with stirring, into KOH soln. at about 115°. In the same manner at a temp. of conversion of about 110° is formed the *K* salt of the nitrosamine of 5-chloro-*o*-toluidine. Similar derivs. are prepd. from 3,4-dichloro-*o*-toluidine and 3,5-dichloro-1-amino-2,4-xylene at about 120°, 5-bromo-*o*-toluidinenitrosamine, 2-chloro-5-bromo-*p*-toluidine, 6-chloro-*m*-toluidine, 4,5-dichloro-*o*-toluidine, 2,5-dichloro-*p*-toluidine, 2,3-dichloro-*p*-toluidine and 3-chloro-*o*-toluidine.

**Alkylaminoanthraquinone derivatives.** BRITISH DYESTUFFS CORP., LTD. Ger. 478,739, Dec. 8, 1927. These derivs. are prepd. by heating 1,4-dialkylaminoanthraquinone with highly concd.  $\text{H}_2\text{SO}_4$  to temps. over 150° in presence or absence of  $\text{H}_3\text{BO}_3$ . An example is given.

**Anthraquinone derivatives.** I. G. FARBENIND. A.-G. Brit. 304,436, Dec. 9, 1927.  $\text{H}_2\text{SO}_4$ -ester salts of nitroanthraquinols are formed by treating a nitroanthraquinone with a metal such as Cu powder in the presence of a tertiary base such as pyridine and  $\text{SO}_3$ , halogen sulfonic acids or alkylsulfuric halides. When treated with acid oxidizing agents, the esters regenerate the nitroanthraquinones; non-oxidizing acids cause a reaction with formation of a mixt. of nitro- and amino-anthraquinone. Examples are given.

**Anthraquinone derivatives.** I. G. FARBENIND. A.-G. (Max A. Kunz and Erich Berthold, inventors). Ger. 479,350, Aug. 13, 1926. Isoxazoles of the anthraquinone series are prepd. by heating an *o*-nitromethylanthraquinone with anhyd.  $\text{AlCl}_3$  to 150–200°. The reaction can be applied to 3-nitro-2-methylanthraquinone and its nuclear substitution products as well as to 1-nitro-2-methylanthraquinone and its nuclear substitution products, and is thus an improvement on the method of Ger. 360,422 (using fuming  $\text{H}_2\text{SO}_4$ ), which is applicable to 1-nitro-2-methylanthraquinones only. Examples are given. Anthraquinone-2,3-isoxazole is a yellow-brown powder insol. in the usual org. solvents but sol. in pyridine; it cannot be melted without decompn. Cf. C. A. 23, 4349–50.

**2-Aminoanthraquinone-3-carboxylic acid.** I. G. FARBENIND. A.-G. (Max A. Kunz and Erich Berthold, inventors). Ger. 479,355, Sept. 1, 1926. 2-Aminoanthraquinone-3-carboxylic acid is prepd. by sapon. anthraquinone-2,3-isoxazole. The prepn. of the initial material is described in Ger. 479,350 (preceding abstract). Examples are given.

**Benzanthrone derivatives.** I. G. FARBENIND. A.-G. (Hugo Wolff, inventor). Ger. 479,286, Jan. 15, 1927. Addn. to 459,366. See Brit. 291,131 (C. A. 23, 1138).

**Benanthrone derivatives.** I. G. FARBENIND. A.-G. (Paul Nawiasky, Eduard Holzapfel and Otto Braunsdorf, inventors). Ger. 479,230, May 21, 1925. Yellow thio ethers of benzanthrone, useful as pigments or as intermediates for dyes, are prepd. by condensing halobenzantrones with mercaptans, other than benzanthranyl mercaptans. The examples describe the prepn. of (1) the *Bs*-1- and *Bs*-2-thio-*p*-tolyl ethers, m. 218–222° and 170–171°, resp., (2) the *Bs*-1-thioethyl ether, m. 116–118°,

(3) the *Bs*-1-thio- $\alpha$ -anthraquinonyl ether, m. 368–370°. Cf. Brit. 256,059 (C. A. 21, 2907).

**Pyrazoleanthrone derivatives.** I. G. FARBENIND. A.-G. (Paul Nawiasky, Arthur Krause, and Alfred Holl, inventors). Ger. 479,284, Dec. 15, 1926. Addn. to 454,760. According to Ger. 454,760 *N*-alkyl derivs. are prepd. from pyrazoleanthrone by treating it, in the presence of an acid condensing agent, with alkyl sulfates or sulfonates or with mixts. of EtOH and H<sub>2</sub>SO<sub>4</sub>. This method is now modified by omitting the acid condensing agent, and preferably substituting therefor an acid-binding agent. Other alkylating agents, *e. g.*, alkyl halides, may then be used.

**Pyridine derivatives.** IWAN OSTROMISLENSKII (to Pyridium Corp.). U. S. 1,724,305, Aug. 13. Phenyldiazoamino- $\alpha$ -monoaminopyridine-HCl and similar compds. are obtained by reaction of phenyl diazonium salts with  $\alpha,\alpha$ -diaminopyridines in a slightly acidified aq. medium. When boiled with aniline the hydrochlorides of the diazoamido compds. are transformed, quantitatively, to the corresponding azoamido compd. Analogous diazo compds. are easily obtained under the same conditions by coupling  $\alpha,\alpha$ -diaminopyridine with the diazotized homologs and analogs of aniline, such as diazotized toluidines, phenetidine, anisidine, etc. Analogous with the first and simplest member of the homolog series, the hydrochlorides of all these salts of diazoamido compds. are easily converted to the corresponding azoamido compds. under similar conditions, for example, prolonged boiling of the substances in distd. water, aniline, or the like. The base and its hydrochlorides occur in fine crystals in different shades of brown and yellow-brown, or reddish orange.

**Triazine derivatives.** F. MERCK CHEMISCHE FABRIK (Otto Diels, inventor). Ger. 479,349, Dec. 5, 1926. A monoacylurea and -thiourea treated with CH<sub>2</sub>O in concd. H<sub>2</sub>SO<sub>4</sub> soln. at a low temp. and the product sapond. give, resp., CH<sub>3</sub>(NHCONH<sub>2</sub>)<sub>2</sub> and CH<sub>2</sub>(NHCSNH<sub>2</sub>)<sub>2</sub>, m. 252°. These compds. with strong mineral acids form, resp., 2,4-diketohexahydro-*s*-triazine, m. 245°, and 2,4-dithiohexahydro-*s*-triazine, m. 230° (decompn.), which forms Cu, Ag and Hg salts. The triazine derivs. are of *therapeutic value*.

**Stable diazo compounds.** I. G. FARBENIND. A.-G. Brit. 305,498, Oct. 28, 1927. Stable diazo compds. derived from *p*-aminoazo compds. contg. no sulfonic or carboxylic groups but contg. an alkoxy aralkoxy or aryloxy group in *o*-position to the amino group are obtained in solid form by adding an alkali halide, H<sub>2</sub>SO<sub>4</sub> or a sulfate (or both), a heavy metal salt or an aryl sulfonate to the diazo soln. Numerous examples are given.

**Substituted ammonium compounds.** LEOPOLD CASSELLA & Co. G. M. B. H. (Georg Kalischer and Karl Keller, inventors). Ger. 479,476, July 16, 1925. Substituted NH<sub>4</sub> compds. are prepd. by the action of an equimol. proportion of an alkyl sulfate or sulfonate on a dialkylarylamine substituted with halogen in the *o*-position or in the *o*- and *p*-positions. The components may react directly or in the presence of an org. solvent. The products are useful as *alkylating agents*.

**Acids, alcohols and hydrocarbons from waxes.** I. G. FARBENIND. A.-G. Brit. 304,150, Jan. 14, 1928. Beeswax, montan wax, wool fat and the like are sepd. into the corresponding hydrocarbons, acids, and alcs., by saponifying, atomizing the product to convert it into a dry powder, extg. with solvents and acidifying the soaps. Various details are given.

**Acetic and formic acids.** I. G. FARBENIND. A.-G. Brit. 305,594, Feb. 7, 1928. Acetic and formic acids are sepd. by adding a liquid such as C<sub>2</sub>HCl<sub>3</sub> which is miscible with HOAc but not with formic acid and distg.

**Acetic acid.** IMPERIAL CHEMICAL INDUSTRIES, LTD., S. W. ROWELL and H. S. HIRST. Brit. 304,350, Oct. 18, 1927. In a continuous process of producing HOAc, a current of HOAc and a catalyst, such as small proportions of Mn and Co acetates, is fed down through a tower which may be filled with Raschig rings of Al and acetaldehyde vapor and air or O are supplied at the bottom of the tower. Various details of app., temps. of operation, etc., are described.

**Acetic acid.** H. SUIDA. Brit. 303,494, Jan. 5, 1928. HOAc is extd. from its aq. solns. by a mixt. of a base such as quinoline and its homologs, dimethylaniline and the like, which is not readily acetylated, and a hydrocarbon material such as anthracene oil, "heavy oil," paraffin oil, spindle oil, hydrogenated naphthalene, solvent naphtha, gas oil, solar oil, heavy benzine, oil from the destructive hydrogenation of coal or pentachloroethane; all ingredients of the solvent should b. above 150° to facilitate sepn. of the HOAc from the ext. Brit. 303,495 specifies the use of similar extg. substances for recovery of HOAc vapor from gaseous mixts. Cf. C. A. 23, 4230.

**Citric acid.** GIUSEPPE BOSURGI and PAUL STUKART. Ger. 477,844, July 29, 1926. Citric acid is extd. from the pulp of lemon presses by diffusion.

**Maleic acid.** C. H. BOEHRINGER SOHN. (Fritz Zumstein, inventor). Ger. 478,726, Feb. 17, 1927. Maleic acid or anhydride is prepd. by the catalytic treatment of vaporized compds. of the furfuran series with O. The catalyzers may be acidic oxides or metal salts. Thus, crude furfural, obtained by heating corncobs or oat husks with dil.  $H_2SO_4$  under pressure, is atomized with pure O and led over Zn vanadate on granulated Al heated to 300–350°. The actual yield is 30% of the theoretical. Starting with pyromucic acid, 50–60% of the theoretical yield is obtained. Molybdic and dehydromucic acids are mentioned as starting materials in other examples.

**3-Amino-2-naphthoic acid.** SOC. ANON. POUR L'IND. CHIM. A BAËLE. Ger. 479,227, Mar. 16, 1926. See Brit. 250,598 (C. A. 21, 1127).

**4-Alkoxybenzene-1-carboxy-amino-2-thioglycolic acids.** ERWIN HOFFA, RUDOLF BRUNE and JENS MÜLLER (to General Aniline Works). U. S. 1,725,080, Aug. 20. A 4-alkoxy-1-cyanobenzene-2-thioglycolic acid is treated for a period of not substantially longer than 18 hrs. with not more than about 5 times the quantity of 90%  $H_2SO_4$ .

**2-Naphthol-3-carboxylic acid.** PAUL DIETERLE (to National Aniline & Chemical Co.). U. S. 1,725,394, Aug. 20. A dry alkali metal salt of  $\beta$ -naphthol is subjected to the action of  $CO_2$  at a temp. ranging from about 120° to 285°, under atm. pressure.

**Aliphatic anhydrides.** BRITISH CELANESE, LTD., H. DREYFUS and C. I. HANEY. Brit. 304,156, July 15, 1927.  $Ac_2O$  and other aliphatic anhydrides are produced by mixing the acid, as a spray or vapor, with an inert gas such as steam (which may be superheated), N or H heated to a sufficient temp. (suitably about 600–1200°). The acid is preferably preheated to 150–300°. Numerous details and modifications of procedure and an app. are described.

**Acetic anhydride, etc.** H. DREYFUS. Brit. 305,147, July 30, 1927.  $Ac_2O$  or other aliphatic anhydrides are formed by passing the vapor of the corresponding acids through a heated reaction zone formed of or lined with reducible metals or their alloys such as Cu, Ni, Fe, Co and bronze; metals, the acetates of which yield HIOAc on heating, such as Ni or Cu, are especially suitable. H, coal gas, producer gas, CO or similar reducing gas is passed through the app. continuously or intermittently during or before the passage of the acid vapor. A temp. of 500–700° is preferred and dil. acid may be used. Various details are given. Cf. C. A. 23, 850.

**Acetaldehyde and acetic acid.** I. G. FARBENIND. A.-G. Brit. 304,855, Nov. 2, 1927. Acetaldehyde and HOAc are formed by passing a mixt. of  $CH_4$  with H and O or substances yielding O over catalysts having both oxidizing and hydrating properties. Acetaldehyde is produced at 40–180° especially with Hg or V compds. as catalysts (the O not being in excess unless the acetaldehyde is to be further oxidized to form HOAc). For direct production of HOAc, more O is used and salts of Sn, Ag or Hg (especially, such as contain V in the acid radical) may be used as catalysts with or without other substances. Various details and examples are given. Cf. C. A. 23, 1910.

**Butyraldehyde and butyl alcohol by hydrogenation of crotonic aldehyde.** HIRAM C. HOLDEN (to Carbide and Carbon Chemicals Corp.). U. S. 1,724,761, Aug. 13. Hydrogenation is effected without use of steam and without formation of any serious quantities of undesired products of high b. p., by treating crotonic aldehyde (in the presence of a Ni catalyst) with H at a temp. below 140° until most of the crotonic aldehyde has been converted to satd. compds. contg. the propyl group; and then treating the product with H at a higher temp. to produce Bu alc.; both said treatments with H being carried out in the presence of less water than is necessary effectively to prevent the formation of undesired high-boiling substances during subsequent distn. of the reaction product; making up the necessary amt. of water by suitable addn. after the hydrogenation; and then distg. the reaction product.

**Separating isobutyl alcohol and isoamyl alcohol or other liquids by distillation.** SOC. ANON. DES DISTILLERIES DES DEUX-SEVRES. Brit. 305,528, Feb. 6, 1928. In effecting distn. sepns. of liquids contained in aq. mixts. such as a liquid A which is insol., or but slightly sol. in water and another liquid B miscible or not with water but more volatile than A, the mixt. of A and B is preliminarily dehydrated in continuous manner in a dehydration column by the ordinary azeotropic method. An app. and various details of procedure are described.

**Hexahydroaniline.** I. G. FARBENIND. A.-G. Brit. 305,507, Nov. 5, 1927. See Can. 283,752 (C. A. 22, 4540).

**Dichloro-*p*-toluidines.** I. G. FARBENIND. A.-G. (Wilhelm Schumacher and Karl Seib, inventors). Ger. 479,492, Mar. 31, 1926. 2-Chloro-4-acetamido-1-methylbenzene

is chlorinated in aq. AcOH at a low temp. 2,5-Dichloro-4-acetamido-1-methylbenzene seps., while 2,3-dichloro-4-acetamido-1-methylbenzene can be pptd. from the mother liquor by diln. Each of these compds. yields the corresponding dichloro-*p*-toluidine on sapon.

**Purifying anthracene.** A. O. JAEGER (to Selden Co.). Brit. 304,179, Jan. 16, 1928. See U. S. 1,693,713 (C. A. 23, 851).

**Hydrogenating naphthalene.** TECHNICAL RESEARCH WORKS, LTD., and E. J. LUSH. Brit. 304,403, Nov. 4, 1927. Tetrahydronaphthalene in pure form is obtained by hydrogenating naphthalene in the vapor phase under conditions precluding any condensation. A Ni catalyst is used as described in Brit. 203,218 (C. A. 18, 502).

**Nitrosafrole.** FIRMA E. MERCK (Max Oberlin, inventor). Ger. 478,844, May 7, 1925. In the prepn. of 6-nitrosafrole by treating a soln. of safrole in glacial AcOH with HNO<sub>3</sub>, an amt. of conc. H<sub>2</sub>SO<sub>4</sub> not exceeding 25% of the vol. of the safrole is present.

**Crotyl bromide.** KURT MEISENBURG (to Winthrop Chemical Co.). U. S. 1,725,156, Aug. 20. 1,3-Butadiene is reacted on with HBr.

**Choline monoborate.** VEREINIGTE CHEMISCHE WERKE A.-G. Ger. 479,016, July 9, 1927. Choline monoborate is prepd. by dissolving between 1 and 3 mols. of H<sub>3</sub>BO<sub>3</sub> in an aq. soln. of 1 mol. of the base, concg. the soln. in vacuo, dissolving in EtOH, and pptg. the salt with acetone, Et<sub>2</sub>O, AcOEt, C<sub>6</sub>H<sub>6</sub>, or other diluent in which the salt is insol. Alternatively, the acid and the base may be brought to reaction in alc. soln. and the salt pptd. with acetone, etc. Choline monoborate is a white microcryst. compd. which crystallizes with 1 mol. H<sub>2</sub>O. It is alk. to litmus and m. above 300°.

**Condensation products of aldehydes and amines.** THE GRASELLI CHEMICAL Co. Ger. 478,948, Mar. 8, 1926. One mol. of a primary or secondary amine is allowed to react with 2 or more, preferably 3 to 7, mols. of a satd. or unsatd. aldehyde in the presence of an acid and with or without heating. A table of amines, aldehydes, acid catalyzers, proportions and products is given.

## 11—BIOLOGICAL CHEMISTRY

PAUL E. HOWE

### A—GENERAL

FRANK P. UNDERHILL

**The enzymic activity of mummy muscle, 3000 years old. (Precipitin reaction glucolysis, respiration enzyme.)** E. SEHRT. *Arch. expil. Path. Pharmacol.* 143, 35-45 (1929).—Mummy muscle gives the precipitin reaction. It acts like fresh ox muscle, in cooperation with pancreas tissue, in producing glucolysis, and it gives a pos. oxidase reaction.

**Diastatic conversion of uric acid to allantoinic acid.** R. FOSSE, A. BRUNEL AND R. DE GRAEVE. *Compt. rend.* 189, 213-5 (1929); cf. C. A. 23, 2450, 3875, 4495.—Juices of many plants have been found capable of converting uric acid (I) to allantoinic acid (II). This fermentation is especially active in the juice of legumes (e. g., *Soya hispida*, *Phaseolus multiflorus*, *P. lunatus*, *P. vulgaris*, *Melilotus alba*, etc.); it is the work of two enzymes, one an oxidase producing allantoin (III) from I and the second hydrolyzing III to II.

A. S. CARTER

**Examinations of the amylase of potato.** J. BURGER. *Magyar Chem. Folyóirat* 34, 120-8, 135-40, 150-4 (1928).—The optimum pH for hydrolyzing starch of potato amylase is 7.0. Salts show an activating influence in the following order: cations: Na → K → NH<sub>4</sub>; anions: SO<sub>4</sub> → Cl → Br → F → NO<sub>3</sub>. Optimum diln. is 1:5. Optimum time of autolysis is 20 hrs. Optimum pH of autolysis is 7.0. The activating influence of salts at autolysis: K → Na → NH<sub>4</sub>; F → Cl → SO<sub>4</sub> → NO<sub>3</sub> → Br. Conc. of amylase is increased on storing; that is zymogen changes to amylase. The original pH of potato is 5.8-5.9 after harvest and reaches the value of 6.3-6.4 after 2-3 weeks; this remains const. Potato amylase is very similar to animal amylases; therefore no distinction should be made between enzymes of animals and those of plants. S. S. DE FINÁLY

**The 100th anniversary of Edward Pflüger's birth.** R. ROSEMAN, BLEIBTREU, A. BETHE AND F. RUNKEL. *Arch.-Ges. Physiol.* (Pflüger's) 222, 548-74 (1929).

ARTHUR GROLLMAN

**Hermann Wieland.** J. SCHÜLLER. *Deut. med. Wochschr.* 55, 1059 (1929).—An obituary.

ARTHUR GROLLMAN

The structure and composition of hemosiderin. SHERBURNE F. COOK. *J. Biol. Chem.* 82, 595-609(1929).—Hemosiderin is shown to consist of org. granules impregnated with some colloidal form of  $\text{Fe}(\text{OH})_3$ . The granules may be obtained, free from tissue, by alk. digestion, and the  $\text{Fe}(\text{OH})_3$  extd. and observed *in vitro*. ARTHUR GROLLMAN

Studies on the combination between certain basic dyes and proteins. L. M. C. RAWLINS AND CARL L. A. SCHMIDT. *J. Biol. Chem.* 82, 709-16(1929).—Casein, fibrin, gelatin and edestin were titrated with methylene blue and safranin Y and the first 3 dyes mentioned also titrated with induline Scarlet. The results indicate that the union between protein and dye occurs in stoichiometric proportions. ARTHUR GROLLMAN

Hydrolysis of the *d*-glucosides of *d*- and *l*-methyl-*n*-hexylcarbinol with emulsin. STOTHERD MITCHELL. *J. Biol. Chem.* 82, 727-30(1929).—*d*-Methyl-*n*-hexylcarbinyl-*d*-glucose was hydrolyzed by emulsin 8.4 times as rapidly as the *l*-modification. ARTHUR GROLLMAN

A study of the action of trypsin on casein. H. W. VAHLTEICH. *J. Biol. Chem.* 82, 737-49(1929).—Tryptic hydrolysis of casein was studied by following the progress of production of amino N, proteose N and the transformation of casein N into products of digestion at varying temps. and for several concns. of enzyme. ARTHUR GROLLMAN

The structure of insulin and its relation to the enzymes and catalysts. ERHARD GLASER AND GEORG HALPERN. *Wiener med. Wochschr.* 79, 363(1929).—A review with 42 references to the literature. ARTHUR GROLLMAN

Polysaccharides. XXXIX. The enzymic degradation of chitin and chitosan. 1. P. KARRER AND A. HOPMANN. *Helv. Chim. Acta* 12, 616-37(1929); cf. *C. A.* 22, 2055.—Finely powd. chitin (I) (from lobster shell) is attacked slowly by snail liquid. The attack is strongly increased, as with cellulose, by pptg. I from cold  $\text{HCl}$ . The chitin-splitting enzyme is called *chitinase*. It acts best in weakly acid soln.,  $p_H$  5.2 (maintained by phosphate buffer). The enzyme hydrolysis at the start nearly follows the rule of Schütz, that is the split substrata mass is proportional to  $\sqrt{\text{time}}$ . Doubling the enzyme mass results in 1.3-1.5 fold increase in action. *N*-acetylglucosamine (II) is produced in 50% yield in pure cryst. form. Glucosamine (III) is present only in traces. Chitosan, prepd. by treating I with concd. alkali, is attacked quickly by the enzyme, the optimum acidity being  $p_H$  4.4-4.5. The reaction closely follows Schütz's rule. Doubling the enzyme mass gives 1.7 fold increase in hydrolysis. The product does not contain II or III, but is a mixt. of compds. that forms a colorless, amorphous hydrochloride which was sepd. into 2 fractions by extn. with hot alc., a sol. fraction, mol. wt. 540 and an insol. fraction, mol. wt. 630-657. FREDERICK C. HAHN

Distribution of reducing substances between plasma and corpuscles; a comparison of various blood-sugar methods. FREDA K. HERBERT AND JUDA GROEN. *Biochem. J.* 23, 339-51(1929).—With different methods, widely varying results are obtained for the distribution of "sugar" between plasma and corpuscles. The authors suggest that the discrepancies are due to the presence of a non-glucose reducing substance in the corpuscles, which is present in tungstic filtrates, and is either absent in Fe and Zn filtrates, or present in them in smaller quantity. BENJAMIN HARROW

Isolation of a carbohydrate derivative from serum proteins. CLAUDE RIMINGTON. *Biochem. J.* 23, 430-43(1929).—The substance isolated has the compn.  $\text{C}_{13}\text{H}_{20}\text{O}_{10}\text{N}$ ; it shows no reducing properties and no measurable optical activity. The constituent sugars are glucosamine and mannose. BENJAMIN HARROW

Activation of certain oxidase preparations. CAECILIA E. M. PUGH. *Biochem. J.* 23, 456-71(1929).—The authors have confirmed the finding of Bach and Chodat on the apparent activation by peroxidases of a constituent of the *Lactarius* fungi separable from it by 40% alc. This is probably due to an autoxidizable substance. The action of tyrosinase on tyrosine and on *p*-cresol is shown to be autocatalytic. B. H.

The nature of the sugar residue in the hexosemonophosphoric acid of muscle. JOHN PRYDE AND EDWARD T. WATERS. *Biochem. J.* 23, 573-82(1929).—The hexose-phosphoric acid of normal muscle press-juice from rabbit, goat and donkey is a mono-phosphoric acid. The diphosphoric acid, identical with that of yeast fermentation, is only obtained when the fermentative resynthesis using  $\text{NaF}$  is employed. The carbohydrate residue of muscle hexosemonophosphoric acid consists of 90% aldose, identified as *d*-glucose, and 10% ketose. BENJAMIN HARROW

The relation of organic chemistry to biology. GEORGE BARGER. *Chemistry and Industry* 48, 751-7(1929). E. H.

Oxidation-reduction potential of protoplasm. ROBERT CHAMBERS. *Bull. Natl. Research Council* 69, 48-50(1929).—The most reliable  $p_H$  values for living protoplasm, as detd. by microinjection of indicators, are: ameba 17-19, eggs of starfish and sea urchins

21-22. If the egg cells are placed under anaerobic conditions, the level of  $r_H$  drops to a value corresponding to those found by Cannan, Clark and Cohen (C. A. 20, 2779).

Permeability and bioelectrical phenomena. W. J. V. OSTERHOUT. *Bull. Natl. Research Council* 69, 170-228(1929).—A review. W. D. LANGLEY

Viscosity of protoplasm. WM. SEIFRIZ. *Bull. Natl. Research Council* 69, 229-61 (1929).—A review with a bibliography of 142 references. W. D. LANGLEY

X-ray examination of insulin, edestin and hemoglobins. WM. H. GEORGE. *Proc. Leeds Phil. Lit. Soc. Sci.*, Sect. I, Pt. 9, 412-5(1929).—No crystal diffraction effects due to insulin, edestin or hemoglobins of sheep or horse blood were found in powder photographs with soft x-rays (Cu or Fe, K  $\alpha$ ). Laue photographs of methemoglobin were probably due to foreign matter. MARY E. LEAR

Autolysis and phosphagen. G. FALCO AND V. SIRACUSA. *Boll. soc. ital. biol. sper.* 4, 409-10(1929).—During autolysis, the increase in amino acids and phosphoric acid ran parallel but the phosphagen disappeared rather slowly. PETER MASUCCI

Studies in the qualitative reaction of proteins. II. Action of salts in the acetic acid-sodium chloride test. SUN OGATA. *Hokkaido J. Med.* 6, 148-60(1928); cf. C. A. 23, 1147, 1799.—In the AcOH-NaCl test of proteins, the quantity of the NaCl required to cause the pptn. of protein is different with different  $p_H$  values of the soln. Since this fact is attributed to the disson. of proteins. O. tested the similar pptn. reaction caused by other salts, with a soln. of gelatin, to which has been added HCl and  $(NH_4)_2SO_4$ . The quantity of  $(NH_4)_2SO_4$  necessary for pptn. becomes const. when the concn. of HCl is 0.07 N ( $p_H$  2.69). The influence of added salt appears to affect the state of disson. of proteins, and the quantity of acids necessary to cause pptn. by salts is supposed to make the disson. of the protein complete. When  $Na_2HPO_4$  is used, HCl of any concn. fails to ppt. the protein, the pptn. being effected only by the combined use of  $Na_2HPO_4$  and NaCl. In this case the phosphate acts to furnish the H ion and keep the  $p_H$  value of the medium above a certain value. When  $K_4Fe(CN)_6$  is used, part of the salt appears to affect the H ion of the soln. IV. Anion series. *Ibid* 567-76.—O. first examd. the ease of pptn. caused by KCl solns. of various concns. of the serum of a healthy horse from the mixt. contg. it and  $1/6$  of its vol. of  $NH_4Cl$ , finding, as mentioned in earlier work, that the degree of ease of the pptn. is in the reverse order of the lyotrope series, and that with glue, only a few K salts are capable of causing pptn., although the order of the series is the same. In order to exam. the effect of a small quantity of H ions formed by adding ferrocyanide, citrate or tartrate ions to the acid soln. of the serum and  $NH_4Cl$ , the mode of pptn. of the colloid caused by the addn. of the above ions was observed. The glue is pptd. only when the soln. contains HCl of a concn. greater than 0.00125 N and when the HCl is increased, the quantity of ferrocyanide necessary for the glue pptn. becomes larger, the  $p_H$  value of the supernatant clear soln. being always kept at 3.8. Comparing this result with the  $p_H$  curve of the AcONa-HCl soln., O. concludes that the action of ferrocyanide consists in giving the soln. a definite  $p_H$  value. The elec. conductivities of KCl,  $K_4Fe(CN)_6$  and HCl, and some mixts. contg. them, were measured, from which result the disson. const. of the ferrocyanic acid is concluded to lie at  $10^{-4}$ - $10^{-5}$ . The effect of the presence of EtOH upon the pptn. caused by various chlorides and AcOH was also observed; the concn. of the salts necessary to cause pptn. cannot be interpreted as due to the action of the salts upon EtOH. K. SOMEYA

The hydrogen-ion concentration of sea water off the coast of Southern California. E. G. MOBERG. *Proc. 3rd Pan-Pacific Sci. Congr.* 1926, I, 221-8(Publ., 1928).—The  $p_H$  of sea water depends upon the interrelation between alk. salts and  $CO_2$ . Since the amt. of alk. salts is relatively const., changes in  $p_H$  are due chiefly to fluctuations in amt. of  $CO_2$ , so that the  $p_H$  of sea water may be used as an index of  $CO_2$  present. These factors may be influenced by metabolic activity of organisms, by decay of org. materials, by changes in temp. of water or atm. and by changes in  $CO_2$  content of the atm. E. M. SYMMES

The phosphate, silica and fixed nitrogen content of sea water. E. G. MOBERG. *Proc. 3rd Pan-Pacific Sci. Congr.* 1926, I, 229-32(Publ., 1928).—Rapid, sensitive colorimetric methods have been adopted for the study of chem. substances in sea water. E. M. SYMMES

The action of peroxidase on glycerophosphates. J. RAE. *Pharm. J.* 122, 354 (1929).—A current of air was passed through a 5% soln. of Na glycerophosphate (A) for 2 hrs.; no increase was noted in the 0.05% of mineral phosphate (B) it originally contained. Then soln. A was left in contact with (a) 10% N NaOH, (b) 10%  $NH_4SO_4$ , (c) 1% dextrose and (d) 40% cane sugar for 6 months in each case and the quantity of B formed was detd. by the Lizius method (C. A. 15, 3893). With a and c, no increase in B

took place; *b* gave an increase of 0.5%; *d* gave an increase of 0.6%. Much stronger effects were obtained by addn. of solns. of peroxidases. Ten % addn. of an aq. filtered 10% raw potato ext. to *A*, when kept for 2 months (a little  $\text{CHCl}_3$  added for preservation), showed 2.4% increase of *B*. Addn. of 10% mucilage of acacia (*C*) showed even 5% increase after only 14 days; however, with *C* sterilized by 5 hrs. heating at  $110^\circ$ , there was still 1.9% increase of *B* after 2 months. The oxidizing enzymes in cudbear and certain other colorants may be responsible for pptn. often noted in compd. sirup of glycerophosphates.

Enzymes. KALLE & Co. A.-G. (Hans Altgelt, inventor). Ger. 479,285, July 4, 1924. See Brit. 251,405 (*C. A.* 21, 1282).

Urease. HENKEL & Cie G. M. B. H. Ger. 478,947, Sept. 16, 1926. A dry, stable, slightly sol. light colored prepn. of urease is obtained from the aq. ext. of soy beans, or other vegetable matter contg. urease, by treating the ext. with a soln. of an alkali salt, such as  $\text{Na}_3\text{PO}_4$ ,  $\text{Na}_2\text{BO}_3$ ,  $\text{Na}_2\text{SO}_4$ , Na citrate, Na lactate,  $\text{AcONa}$ , a mixt. of these, and atomizing in a current of dry air or gas. Cf. *C. A.* 22, 2639.

## B—METHODS AND APPARATUS

STANLEY R. BENEDICT

Staining of glial cells. R. ALTSCHUL. *Atti accad. Lincei* 8, [6], 594-5(1928).—By mordanting nervous tissue with a soln. contg. 2 cc. of HBr and 2 g. of  $\text{NH}_4\text{Br}$  to 100 cc. of water, staining with either methyl violet or Victoria blue, and differentiating with xylene-aniline oil, the glial cells are revealed more certainly and more simply than by Weigert's process.

B. C. A.

Determination of the carbohydrates in animal organs and in blood by characteristic color reactions. I. Color reactions of the carbohydrates and their use in the microchemical determination of different sugars in dilute solution. Z. DISCHE. *Mikrochemie* 7, 33-68(1929).—The soln. (1 vol.) is mixed with 0.1 vol. of 10%  $\alpha$ -naphthol soln. and 8 vols. of concd.  $\text{H}_2\text{SO}_4$  without cooling—a brown color indicates glucuronic acid and a red color glycolaldehyde or a sugar. In the latter case a further portion of the soln. (1 vol.) is heated with 9 vols. of a mixt. of 8 vols. of concd.  $\text{H}_2\text{SO}_4$  and 1 vol. of water for 3 min. in a water-bath, cooled, and treated with 0.2 cc. of a 5%  $\alpha$ -naphthol soln.—a brown color develops in 10 min. if glycolaldehyde or a triose is present and a red color in other cases. If a red color is obtained, a third portion of the original soln. (2 vols.) is heated for 30 min. in a water-bath with 4 vols. of a mixt. of 100 vols. of concd.,  $\text{HCl}$ , 80 vols. of glacial acetic acid, and 20 vols. of a 10% alc. soln. of diphenylamine; pentoses give a brown, hexoses a blue and carbohydrates or thymonucleic acid a violet-red color. To distinguish between glycolaldehyde and trioses the soln. (1 vol.) is mixed with 0.1 vol. of a 10%  $\alpha$ -naphthol soln. and 4 vols. of concd.  $\text{H}_2\text{SO}_4$  without cooling; glycolaldehyde gives a greenish blue and the trioses give a red color. The presence of the latter may be confirmed by mixing 1 vol. of the sugar soln. with 4 vols. of  $\text{H}_2\text{SO}_4$ , cooling, and adding 0.1 vol. of a 10%  $\alpha$ -naphthol soln.; a green color indicates trioses. If the hexose test is pos. 1 vol. of the original soln. is mixed with 0.1 cc. of a 2% alc. soln. of  $\alpha$ -naphthol and 9 vols. of 75 vol.-%  $\text{H}_2\text{SO}_4$ ; a blue color indicates levulose or hexosediphosphoric acid and a red color aldoses. On diln. with water the red soln. becomes colorless and a red ppt. is formed, but the blue soln. is stable. The aldoses are differentiated by repeating the diphenylamine test previously mentioned but heating only for 1.5 min.; galactose produces a violet, mannose a brown and dextrose a blue soln. To distinguish levulose from hexosediphosphoric acid the diphenylamine test is repeated with only a 3-min. heating; the acid gives a violet and levulose a brown color. All the above tests serve to detect the respective compds. when they are present alone in a soln., but it is possible to use the tests for the approx. detn. of levulose, mannose and galactose in the presence of dextrose by indirect analysis.

B. C. A.

Loeffler's methylene-blue. H. J. CONN. *Stain Tech.* 4, 27(1929).—An alc. soln. of methylene blue dild. with  $\text{H}_2\text{O}$  is recommended instead of the standard Loeffler formula.

B. C. A.

**Differentiation of safranine in cytology.** RACHEL HAYNES. *Stain Tech.* 4, 27-8 (1929).—An acid dye such as light green S F yellowish is preferable to HCl for the differentiation of safranine. B. C. A.

**Estimation of sugar and residual nitrogen in the blood.** HANS MELCHER. *Pharm. Zentralhalle* 44, 883-5(1929).—In connection with the discussion of methods for detg. sugar and residual N in the blood, certain practical suggestions are offered and several types of app. illustrated, the use of which is calcd. to simplify the technic usually followed. W. O. E.

**Practical methods for the most important quantitative investigation of blood and urine.** W. BRANDRUP. *Pharm. Ztg.* 74, 961-4(1929).—In the present paper concise practical methods are given for use in the apothecary in the quant. examn. of urine, blood and blood serum, such examn. to be carried out in collaboration with the local physician. W. O. E.

**Detection of acetone-producing substances in the urine.** B. SCHWENKE. *Pharm. Ztg.* 74, 992-4(1929).—The principal substances producing  $\text{Me}_2\text{CO}$  are  $\beta$ -hydroxybutyric acid and acetoacetic acid. An exptl. study of certain methods available for their detection tends to substantiate the findings of Lorber, Fischer and Horkheimer, that Na nitroprusside tests are insufficient for the detection of  $\text{Me}_2\text{CO}$ , but are chiefly useful in detecting acetoacetic acid. In testing for substances yielding  $\text{Me}_2\text{CO}$  the Lieben  $\text{CHI}_3$  reaction should be applied in addn. to the nitroprusside test. If a pos. reaction is obtained, the presence of  $\text{Me}_2\text{CO}$  is assured. The presence of acetoacetic acid should be confirmed by application of the Liplawsky test. W. O. E.

**Staining fats with natural dyes.** A. HADJIOLOFF. *Bull. histol. appl.* 5, 183(1929); *Stain Tech.* 4, 94-5.—Tests were made of the pigments of the carrot, tomato, pepper, orange, pumpkin, beet, red cabbage, cherry and grape as fat stains. The exts. were made by extg. the dried fruits or vegetables in 85% EtOH and allowing them to stand for several days at 37°; this soln. is twice filtered and used for staining fat in adipose tissues. Tomato, pepper and pumpkin gave the best results, being similar to Sudan. Carrot was fair but beets, red cabbage, cherries and grapes gave no fat staining. C. R. FELLERS

**The chromosome and nuclear structure in the living cell and in the fixed cell.** P. MARTENS. *Bull. histol. appl.* 5, 229-52(1928); *Stain Tech.* 4, 95.—The resting nucleus of the living cell appears to be made up of a reticular filamentous structure, with granular embedding at the intersections of the network. A method of studying nuclear structure is by observation during the process of fixation especially with Benda's fluid. The only result of fixation is that visibility of the existing structure is accentuated. No new structure is created by the process. C. R. FELLERS

**A new method of staining fats.** G. DOLFINI. *Bull. histol. appl.* 6, 137(1929); *Stain Tech.* 4, 94.—The method of Galesesco and Bratiano (*Stain Tech.* 4, 52; cf. C. A. 23, 1295) using an alc. ext. of carrots is inferior to fat staining with Sudan and it is useless in identification of different kinds of fat. C. R. FELLERS

**Progress in stain standardization. Safranine.** H. J. CONN. *Stain Tech.* 4, 65-9 (1929); cf. C. A. 23, 403.—Safranine, which has proved satisfactory for cytological staining, is normally also well adapted for bacteriol. or histological staining. The spectrophotometric curve for safranine O has its absorption max. at about 515  $\mu$ . A great variation in speed of staining among different batches of safranine was noted. This variation was not due to differences in ash content but is attributed to other impurities. A dye content of 90% is about the best that can be hoped for in the case of any dye, and even this degree of purity represents an expense that may be perhaps seldom justified. C. R. FELLERS

**Stain solubilities. IV.** W. C. HOLMES. *Stain Tech.* 4, 73-4(1929); cf. C. A. 22, 1170.—Soly. data ( $\text{H}_2\text{O}$  and EtOH) for 28 dyes are expressed as g. of anhyd. dye per 100 cc. of satd. soln. at 26°. Many of the values recorded have reference to the solubilities of various salts of fluorescein and of its halogenated derivs. Salts of erythrosin are less sol. than the corresponding salts of eosin, but salts of phloxin are more sol. than eosin. Salts of rose bengal are more sol. than those of erythrosin. Soly. is decreased by substitution within resorcinol residues of the dye and is decreased more by I than by Br. Substitution in the phthalic anhydride residue increases soly. The solubilities of Na, Mg, Ca and Ba salts of these dyes were found to decrease in the above order. C. R. FELLERS

**The mechanism of staining. The case for the physical theories.** W. C. HOLMES. *Stain Tech.* 4, 75-80(1929).—The chemistry, soln. and adsorption theories of dyeing are discussed. It is held that adsorption is the principal factor in color retention. Adsorption is affected by the chem. nature of the adsorbing and adsorbed substances, and is also influenced by such phys. factors as the surface area (and probably the density) of the

adsorbing medium and the size of the adsorbed particle. Among the reasons given for accepting the adsorption theory of staining are that wool, silk, and animal fiber are amphoteric and in all probability adsorb dyes. Bacteria are not considered to differ in essential particulars from these substances. Metachromasy and differentiation are considered in this connection.

C. R. FELLERS

Smear method for the study of chromosomes. J. M. WEBBER. *Univ. Calif. Pub. in Botany* 14, 345-52 (1929); *Stain Tech.* 4, 96.—Fixing and staining techniques for matured chromosomes, cytokinesis and tetrad cells are described.

C. R. FELLERS

A preliminary note on a color reaction for "693" and its application in the estimation of that compound in the urine. T. C. BOYD AND A. C. ROY. *Indian Med. Gaz.* 64, 382 (1929).—Upon diazotizing diethylamine *p*-aminophenyl stibinate with dil. HCl and HNO<sub>3</sub> soln., and coupling this with  $\alpha$ -naphthol in alk. soln., a fine red color is produced, and the depth of this color is proportional to the concn. of the Sb compd. present.

FREDERICK G. GERMUTH

The methods of Bang for the determination of fatty substances in the blood. W. RADSMÅ. *Geneeskund. Tijdschr. Nederland-Indie* 69, 479-91 (1929).—A critical discussion with a description in detail of Bang's methods as used by R. on samples of blood, including some slight modifications which he recommends to get more accurate results.

J. C. JURRIJENS

Iodine in water, food and urine. H. W. CLARK AND GEORGE O. ADAMS. *Am. J. Pub. Health* 19, 898-900 (1929).—*Detn. of I<sub>2</sub> in urine*: Evap. 2.5-4 l. of urine with 10 g. NaOH to consistency of a thick sirup; transfer to a small iron pan; add 20 g. more of NaOH; heat slowly until fumes cease to come off. Grind the resulting black clinker in a lab. hand mill and let stand overnight in a beaker with about 200 cc. of alc. Decant through a filter, wash the residue by decantation several times with alc.; finally place the residue upon a filter and thoroughly wash with alc. again. Distill off a large part of the alc. of the filtrate; evap. the residue nearly to dryness with 3 g. NaOH in a nickel dish; heat the dish slowly until the org. matter extd. is broken up, the volatile portion driven off and the remainder present as free C. Dissolve, filter, evap. to a small vol. and add 1-2 drops of approx. 0.1 N H<sub>3</sub>AsO<sub>3</sub>. Acidify with H<sub>2</sub>SO<sub>4</sub>, transfer to a separatory funnel and add a few drops of strong H<sub>2</sub>SO<sub>4</sub>, transfer to a separatory funnel and add a few drops of strong H<sub>2</sub>SO<sub>4</sub> satd. with NaNO<sub>2</sub>. Ext. I<sub>2</sub> with purified CCl<sub>4</sub> and det. amt. present by comparison with a standard soln. of I<sub>2</sub> in CCl<sub>4</sub> in a Duboscq colorimeter. This procedure gave check results on duplicate samples and showed an av. recovery of 75% of known amts. of KI added to urine.

J. A. KENNEDY

The use of iodized rape-seed oil (capiodol) for röntgenographic exploration. CHARLES H. FRAZIER. *Ann. Surgery* 89, 801-12 (1929).—The iodized oils have a definite use in the röntgenographic exploration of some of the internal organs. Iodized rape-seed oil (capiodol) has proven a highly satisfactory prepn. It is well tolerated by all types of tissues studied.

FRANCES KRASNOW

The Carpenter form of the Haldane gas-analysis apparatus. Changes made in the apparatus and details regarding its use. THORNE M. CARPENTER, EDWARD L. FOX AND ARTHUR F. SEREQUE. *J. Biol. Chem.* 83, 211-30 (1929); cf. *C. A.* 17, 3685; 20, 3709.—"A description is given of changes in the compensating system of a gas-analysis app. for outdoor and respiratory-chamber air, together with the method of adjustment for adequate compensation, of a modified pipet for K pyrogallate, of an alteration in the combustion unit for CH<sub>4</sub>, of a short method of calibrating the measuring buret, and of an arrangement for operating the motor. Remarks are included on the use of the app. with special reference to dead space in sampling, H<sub>2</sub>O in buret, sp. gr. of KOH soln. and prepn. and storage of K pyrogallate, suitable size of tube for compressed air used for stirring in water jacket, variable at. pressure, and tests for tightness and adequate compensation."

A. P. LOTHROP

The importance of oxidation-reduction processes in biology and the knowledge of the  $r_H$ . RENÉ WOLFF. *Presse méd.* 36, 1225-6 (1928).—A general discussion of oxidation-reduction systems is given, the significance and importance of  $r_H$ , the influence of buffers and the  $p_H$  are explained, and a list of indicators is given.

A. E. MEYER

Colorimetric estimation of glucuronic acid. I. A. OGATA AND T. YAMANOUCHI. *J. Pharm. Soc. Japan* 49, 541-56 (1929).—Colorimetric estn. of glucuronic acid was previously reported by Tollens (*C. A.* 3, 2709). O. and Y.'s method is simple and applicable, especially for the estn. of a very small quantity in aq. soln. The standard soln. was prepd. with mentholglucuronic acid (1 cc. = 1 mg. glucuronic acid), and naphthoresorcinol soln. freshly prepd. from 1,3-dihydroxynaphthalene-2-carboxylic acid was used as reagent. To liberate glucuronic acid from complex glucuronic acid it was boiled with HCl just before estn. Under proper conditions (concn. of HCl, temp. and time of

heating, etc.) colorimetric estn. is best done when the sample soln. contains about 0.5 mg. glucuronic acid in 5 cc. The presence of NaCl does not interfere, but excess H and sugar in aq. soln. influence the final reaction. This is under investigation now.

F. I. NAKAMURA

The Strzyzowski reaction for blood. P. V. OUSTINOFF. *Ann. méd. légale criminol. police sci.* 9, 477-82(1929).—The 2 chief drawbacks of Strzyzowski's reagent are that it does not keep more than 24 hrs., and HI is none too convenient to procure. They have been overcome by substituting  $\text{HIO}_3$  for HI, and the following formulas give good results: (1)  $\text{AcOH}$  1 cc., 25% gum arabic soln. 1 cc., 1%  $\text{HIO}_3$  soln. 3-5 drops; (2)  $\text{AcOH}$  1 cc., 25% gum arabic soln. 1 cc., alc. 1 cc., 1%  $\text{HIO}_3$  3-5 drops; (3)  $\text{AcOH}$  1 cc.,  $\text{H}_2\text{O}$  1 cc., 1%  $\text{HIO}_3$  3-5 drops. The crystals obtained are identical with those obtained with Strzyzowski's original reagent. Addn. of gum arabic facilitates the production of the crystals; it also stabilizes the original reagent for about 2-3 weeks. A. P.-C.

Uric acid and its detection in blood and urine. FISCHER. *Süddeut. Apoth.-Ztg.* 68, 448-50(1928); *Chem. Zentr.* 1928, II, 1468; cf. C. A. 22, 100.—Occurrence and formation of uric acid in the human body are discussed and more detailed information is given concerning the degradation of the nucleoproteins. Hopkins' method as modified by Folin and Shaffer is described for the detn. of uric acid in the urine. For detg. the blood uric acid F. cites Flatow's titrimetric method, which is based on the principle that in the protein-free blood serum the uric acid is oxidized to allantoin by means of  $\text{K}_3\text{Fe}(\text{CN})_6$ . The quantity of  $\text{K}_3\text{Fe}(\text{CN})_6$  used is estd. by titrating back with Na indigosulfate. The blue indigo soln. is rendered yellow or colorless by  $\text{K}_3\text{Fe}(\text{CN})_6$ . G. S.

Respiratory tests for determining the rate of oxygen metabolism. ALBERT SCHNEIDER. *J. Am. Pharm. Assoc.* 18, 105(1929). L. E. WARREN

A simple spectroscopic measure of tissue metabolism. ALBERT SCHNEIDER. *J. Am. Pharm. Assoc.* 18, 106(1929). L. E. WARREN

HADEN, RUSSELL L.: *Clinical Laboratory Methods*. St. Louis: C. V. Mosby. 317 pp. \$5.

## C—BACTERIOLOGY

CHARLES B. MORREY

Serum-egg-tellurite medium for culture and demonstration of *B. diphtheriae*. M. PERGOLA. *Boll. ist. sieroterap. milanese* 7, 585-98(1928); *Stain Tech.* 4, 96.—A technic is described by which the Babes-Ernst polar or metachromatic granules are black to dark blue while the bacterial bodies are light blue. C. R. FELLERS

A note on the Gram stain. ALEXANDER ZEISSIG. *Stain Tech.* 4, 91-2(1929).—A modification of the Gram stain in which I-EtOH is substituted for 95% EtOH as a decolorizing agent is particularly useful in staining Gram-neg. organisms in tissues and also for smears. C. R. FELLERS

In vitro studies of the nature of Besredka antivirus. H. ALDERSHOFF. *Centr. Bakt. Parasitenk.*, I Abt., 112, 273-81(1929).—The growth-inhibiting factor of Besredka antivirus is non-sp. It is not the result of bacterial growth as filtered bouillon has the same inhibiting effect. The strength is proportional to the no. of filtrations. No difference was found between this factor in inoculated and uninoculated bouillon; it is thermostable in both cases. The inhibition seems to be due to changes in the proteins of the bouillon. JOHN T. MYERS

The nature of antivirus. B. G. MATVEYEVSKII. *Centr. Bakt. Parasitenk.*, I Abt., 112, 464-9(1929).—Staphylococci and streptococci will grow in Besredka filtrates after the addn. of carbohydrates or meat infusion, but not of peptone or ascites. Dln. with isotonic NaCl soln. decreases the inhibitory power, but restoration of the original pH increases it. The important factor in such growth inhibition is the exhaustion of some dynamic food factor. JOHN T. MYERS

Two-part dish for cultivating bacteria with exclusion of oxygen. M. WAFIK ZAHER. *Ger.* 479,304, July 14, 1926.

## D—BOTANY

THOMAS G. PHILLIPS

L-Asparagine in the fresh flowers of *Ulex europæus*. M. BRIDEL. *Bull. soc. chim. biol.* 10, 1378-9(1928).—L-Asparagine (7.7 g. from 25 kg. of fresh flowers) is obtained from the mother liquor from the prepn. of ulexoside (C. A. 21, 937). B. C. A.

The  $p_H$  of the cell sap of flowers. B. H. BUXTON AND F. V. DARBISHIRE. *J. Roy. Hort. Soc.* 54, 203-13 (1929).—Colorimetric detns. have been made of the variation with time of the  $p_H$  of aq. solns. of dried petals from various flowers. B. C. A.

Assimilation of nutrients by the rice plant. D. L. SAHASRABUDDHE. Dept. Agr. Bombay, *Bull.* 154, 17 pp. (1928).—During the seedling stage of the rice plant the percentages of  $Et_2O$  ext., albuminoids, N,  $K_2O$  and  $P_2O_5$  decrease with age, while sol. carbohydrates and woody fiber increase, and  $CaO$  remains fairly const. The % of water decreases slightly. After the seedlings are transplanted the % of water continues to decrease and there is a sudden drop at the time of full ripening. The percentages of  $Et_2O$  ext. and albuminoids continue to decrease while the sol. carbohydrates increase and the woody fiber remains fairly const. N and  $P_2O_5$  decrease while  $K_2O$  and  $CaO$  remain fairly const. The rice plant continues to assimilate its constituents up to the full ripening period and does not stop when the flowering period begins. When the plant comes to flowering, its powers of assimilation are increased and max. assimilation occurs at the "milk" stage. In fertilizing rice with  $(NH_4)_2SO_4$  the fertilizer should be applied in 3 doses—namely, at the time of transplanting, just before flowering and just before the "milk" stage. The rice crop removes an av. of 28 lb. N, 20 lb.  $P_2O_5$ , 60 lb.  $K_2O$  and 28 lb.  $CaO$  per acre. K. D. JACOB

An apple disease occurring in the Elgin district. C. J. HOPKINS. Dept. Agr. Union S. Africa, *Sci. Bull.* 61, 17 pp. (1927).—The disease is confined to the bark of apple trees and appears to be the same as that described by Rose (*Phytopathology* 7, (1917); cf. C. A. 13, 857) and Rhoads (*Phytopathology* 14, (1924)). The organism grows on nutrient agar, glycerol agar, gelatin and bouillon cultures, at acidities varying from -10 to +20 on Fuller's scale. It produces a slight amt. of  $NH_3$  when grown on nutrient broth, but does not reduce nitrates. A trace of indole was produced in peptone water in 10 days. No strains of the organism produced acid or gas in solns. of the common sugars, but one strain produced acid in galactose and mannose and one produced acid in arabinose soln. The disease was best controlled by treating the affected parts of the tree with aq. solns. of  $ZnCl_2$  (1:100) contg. a few drops of  $HCl$ . K. D. J.

Regulation of the reaction of an external solution by plants. D. A. SABININ AND E. G. MININA. *Bull. inst. recherches biol. univ. Perm* (Russia) 6, No. 4, 165-90 (English 190-2) (1928).—The theory that plants having pronounced ability to assimilate  $Ca_3(PO_4)_2$  come to equil. with the nutrient soln. at more acid reactions was tested and not confirmed. The assumption that the difference in compn. of root secretions may account for the different assimilating power was also tested. Plants which assimilate  $Ca_3(PO_4)_2$  readily secrete more org. acids at the zone of  $p_H$  equil. than the non-assimilating plants. H. R. KRAYBILL

Physiological meaning of guttation. V. S. SHARDAKOV. *Bull. inst. recherches biol. univ. Perm* (Russia) 6, No. 4, 193-207 (In English 207-8) (1928).—The concn. of ions in the sap from hydathodes is directly dependent upon the salt concn. of the substratum and changes with time. The decline in concn. of bleeding sap with the distance it moves through the tissue indicates a role of guttation in plant nutrition. A marked increase in the concn. of bleeding sap after removal of hydathodes indicates an absorption of ions from the bleeding sap when it passes through the tissues. H. R. KRAYBILL

Assimilation of phosphoric acid by barley in a water solution. O. TUEVA. *Bull. inst. recherches biol. univ. Perm* (Russia) 6, No. 6, 261-75 (In English 275-6) (1929).—Barley plants of pure line were grown in Knop's soln. with different amts. of phosphate. With high concn. of phosphate absorption of phosphate occurred to the end of the vegetative period and the migration of phosphate from vegetative to reproductive organs did not occur. With temporary restriction of quantity of phosphate, P migrated from vegetative to reproductive organs. The quantity of P absorbed up to 5 weeks is enough for normal development of plants. A further supply of P reduces yield of crop. H. R. KRAYBILL

Inorganic combinations of nitrogen in the sap of plants. I. E. BIKOV. *Bull. inst. recherches biol. univ. Perm* (Russia) 6, No. 6, 277-90 (In English 290) (1929).—The quantity of nitrate in corn decreases when transferred to a soln. free of nitrate or to  $H_2O$ . The quantity of ammonia N and nitrate in the sap of corn grown in solns. of  $NH_4$ , nitrate and nitrite salts resembles that when grown in soil. Nitrite is transformed into other forms more rapidly and nitrate less rapidly than the other forms of mineral N. H. R. KRAYBILL

Antagonistic action of calcium and magnesium ions upon seeded peas. FR. BOLŠLOVSKÝ. *Zeměd. Archiv.* 9, 493 (1928); *Listy Cukrovar. Rozhledy* 47, 6.—The legumes absorb the most Ca of all seeded plants. Peas absorb Ca during the whole vegetative period; immediately after sprouting Ca is necessary; the quantity consumed

increases and becomes maximal during the formation of stalks and leaves; after the formation of the nodules, the consumption of Ca decreases. During the early development of peas, the absorption of Mg is low. After the formation of the nodules, the consumption of Mg increases and becomes greater than the intake of Ca at this stage. It is necessary to have a ratio  $\text{Ca/Mg} = \frac{2}{1}$  for in this combination the assimilation of  $\text{P}_2\text{O}_5$  is greater than when Ca is in excess. Further expts. showed that Ca and Mg are replaceable; peas without Ca tended to replace the Ca with Mg, which is an antagonist, according to the percentage in ash analysis. Physiologically Ca and Mg cannot be replaced. The peas tend to replace a nutritive element by a related antagonist when the element is deficient. An excess of antagonistic elements reacts unfavorably. The peas withstand an excessive quantity of Ca and Mg, but during a deficiency of either one, an excess of Ca or Mg has a detrimental effect upon the growth of peas. A lack of Mg effects to a large measure the yield of pea grains—it lowers the yield more than a lack of Ca. The detrimental effects of Ca and Mg are compensatory when both are present, and it is only when both elements are present that their physiological functions are effective and a good yield of peas is assured under normal conditions. F. M.

The influence of humidity upon sugar concentration in the nectar of various plants. O. W. PARK. *J. Econ. Entomol.* 22, 504-44(1929); cf. *C. A.* 23, 1180.—The sugar concn. of flower nectar varies inversely with the relative humidity of the air, the relation being much closer in some types of flowers than in others. Sugar concn. of nectar was detd. with an Abbé refractometer. Bibliography. C. H. RICHARDSON

Damage to oats by salt constituents of the soil. R. SCHERPE. *Arbb. biol. Reichsanst. Land- u. Forstwirtschaft.* 16, 169-96; *Chem. Zentr.* 1928, II, 1223.—In order to eliminate absorption by the roots, the expts. with  $\text{Na}_2\text{CO}_3$ ,  $\text{K}_2\text{CO}_3$ ,  $\text{CaH}_2(\text{CO}_3)_2$ ,  $\text{NaCl}$ ,  $\text{KCl}$  and  $\text{MgSO}_4$  were conducted on oat stalks without roots. The salts caused discoloration (which was probably due to formation of anthocyanin) with subsequent withering and drying up. Alkali carbonates and  $\text{MgSO}_4$  augmented the transpiration considerably. Weak concns. aided the growth of the roots.  $\text{CaH}_2(\text{CO}_3)_2$  in equal concn. caused more harm than did alkali bicarbonate. In all cases there was a rapid accumulation of salt in the leaves. G. SCHWOCH

Effect of freezing on the catalase activity of apple fruits. D. B. CARRICK. *Cornell Agr. Expt. Sta. Mem.* 122, 18 pp.(1929).—The vascular tissues of the McIntosh apple gave an increased catalase activity when tested immediately after 3, 6 and 9 hrs. of freezing at an air temp. of  $7.5^\circ$ . The vascular tissue had a greater catalase activity than the parenchyma. However, the catalase in both these tissues was greatly reduced after 20 hrs. of freezing. Four days after freezing the catalase in both the pulp and the vascular tissues was somewhat higher in the 6 and 12 hrs. exposures than in the controls, but lower in the 3 and 9 hrs. treatments. After 20 hrs. of freezing the activity was almost extinct in each instance. Detns. on the vascular tissue of other McIntosh fruits 20 hrs. after freezing showed a decrease in catalase activity in the 3, 6 and 9 hrs. treatments. The catalase measurements on the vascular tissue of Baldwin fruits were generally unsatisfactory. Immediately after freezing the 6 and 24 hrs. treatments and possibly the 9 hrs. exposure, showed a slight gain in catalase activity. The 3 hrs. exposure gave results similar to those in the normal fruit. Three days after freezing, the 6 and 9 hrs. freezing induced a slight increase of catalase in the tissue of the Baldwin fruits, while the apples frozen for 3 and for 24 hrs. did not vary from the control. Seven days after freezing, the Baldwin fruits in the 3 and 6 hrs. treatments gained slightly in catalase activity; the tissue frozen for 9 hrs. was somewhat retarded; and the fruits in the 12 and 24 hrs. exposures were similar to the control. J. J. SKINNER

Chemical composition of marine plankton. E. G. MOBERG. *Proc. 3rd Pan-Pacific Sci. Cong.* 1926, I, 233-6(Publ. 1928).—Biochem. microchem. methods of detg. protein and fat avoid many difficulties. E. M. SYMMES

Insectivorous plants. GORDON PERKINS. *Pharm. J.* 122, 74-6(1929).—An address is given on the environment and the insect-devouring mechanism of British species of *Drosera* (Sun-dew), *Pinguicula* (butterwort) and *Utricularia* (bladderwort), and foreign species of *Nepenthes* (pitcher plant) and *Sarracenia* (side-saddle plant). In *Drosera*, the glandular tentacles exude a glairy matter contg. a weak acid and an enzyme converting the proteins of the captured insect's body into peptones which are absorbed by the leaf. In *Pinguicula*, the enzyme secreted is capable of digesting even cartilage. In *Nepenthes* (Ceylon), the pitchers are partly filled with  $\text{H}_2\text{O}$  contg. malic acid, a little citric acid,  $\text{KCl}$  and salts of Na, Ca and Mg; it usually swarms with bacteria which cause decompn. of the body of the drowned insect; the sol. products are absorbed. S. W.

The crystal habit and form of calcium oxalate as a species characteristic. P. JACCARD AND A. FREY. *Naturforsch. Ges. Zurich (Festschrift Hans Schinz)* 73, 127-61

(1928).—In the bulb scales of onions (*Allium* species) Ca oxalate crystallizes both as the monohydrate and the trihydrate, and in forms which are characteristic of the species. Ten types are recognized: (a) the trihydrate in various forms of prisms and bi-pyramids (*A. cepa*, *sativum*, *ursinum*, *shoenoprasum*, *oleraceum*); (b) special groupings of trihydrate crystals (*A. sphaerocephalum*); (c) the mono- and trihydrate appearing together (*A. montanum*, *ursinum*); (d) the monohydrate alone in the form of crystal sand (*A. globosum*); (e) no crystals of Ca oxalate (*A. victorialis*). J. J. WILLAMAN

Studies on the growth of root hairs in solutions. The  $p_H$  molar-rate relation for *Brassica oleracea* in calcium sulfate. WANDA K. FARR. *Proc. Nat. Acad. Sci.* 15, 464-70(1929); cf. *C. A.* 22, 1793, 3904.—A study of the rate of elongation of root hairs of *Brassica oleracea* has been made in solns. of  $CaSO_4$  in concn. from 0.000448 to 0.0140 *M*. Each salt concn. was studied over the  $p_H$  range from 2.5 to 12.0. The results are presented in 3-dimensional models. The typical curve was trimodal, with 2 maxima on the alk. and 1 on the acid side. In consideration of the simple nature of the solution, growth was very rapid. These results being compared with those previously, the growth effect of the anions is  $OH > SO_4 > Cl_2 > NO_3$ , with the Ca cation const. J. J. WILLAMAN

The nature of the carbohydrate found in the Jerusalem artichoke (THAYSAN, *et al.*) 12. Oil content of sunflower seeds and factors controlling it (USPENSKII) 27. Constituents of the bark of the peach tree (SHINODA, UYEDA) 10.

## E—NUTRITION

PHILIP B. HAWK

Vitamins. L. SCOTTI FOGLIENI. *Arch. fisiol.* 26, 83-153(1928).—In absence of air, vitamins A, B and C withstand exposure to 120-134° without loss of activity. Vitamin-B consists of 2 components which separately have only a small and transient action; one gives Folin's reaction, is non-volatile and has no effect on yeast growth, while the other gives Folin's reaction, is largely volatile between 120° and 134° and stimulates the development of yeast. Similarly, vitamin C appears to consist of 2 substances; one is non-volatile, gives Bezssonoff's test and alone has a healing effect on acute, but not chronic, scurvy, while the other is volatile, fails to respond to Bezssonoff's test and has no antiscorbutic action. In both cases the substances together exert a strong effect. When a soln. contg. vitamin C is made slightly alk. with NaOH and heated, the vitamin is rapidly inactivated. B. C. A.

Experimental black tongue and the black-tongue preventive in yeast. J. GOLDBERGER, G. A. WHEELER, R. D. LILLIE AND L. M. ROGERS. *U. S. Public Health Repts.* 43, 657-94(1928).—Expts. indicate that black tongue in dogs is due to a dietary deficiency capable of correction by a preventive present in yeast. This preventive, which can be distinguished from the antineuritic factor, shows considerable heat resistance, and is probably identical with the anti-pellagra vitamin. B. C. A.

Fructosuria. P. A. HEERES AND HERMAN VOS. *Arch. Internal Med.* 44, 47-64 (1929).—Observations on a case of fructosuria are reported in detail. Fructosuria disappeared at once if food free from fructose was eaten. Administration of fructose led to rise in blood sugar due almost entirely to increase in fructose. About 14% of the amt. of fructose given was excreted in the urine, regardless of the size of the dose or whether the dose was divided. The results by mouth and intravenously were the same. The fructosuria caused by rectal administration was more severe. When given in combination with other sugars more fructose was excreted. The metabolism of dextrose, galactose, maltose and mannose was not disturbed. Sorbose when fed was excreted in large quantities. Ingestion of fructose caused no change in respiratory quotient. Insulin had no effect on fructosuria. J. B. BROWN

Vitamin-D and iso-ergosterol. A. VAN WIJK AND E. H. REERINK. *Nature* 122, 648(1928).—Absorption spectra of ergosterol and iso-ergosterol were studied. The former has two types of absorption bands, connected with different parts of the mol. By irradiation with formation of vitamin D the first system makes way for the characteristic band of iso-ergosterol, suggesting that the corresponding part of the mol. undergoes the same change in constitution by irradiation as by chem. transformation. Vitamin D and iso-ergosterol behave similarly. J. B. BROWN

The effect on digestion and assimilation of including bananas in the mixed diet of some children over five years of age. ALAN BROWN AND ANGELIA M. COURTNEY. *Can. Med. Assoc. J.* 21, 37-42(1929).—The chief effects noted on a diet contg. bananas, compared with one without this ingredient, were a somewhat smaller output of urine and a greater output of feces (but never diarrhea), and a distinctly more alk. urine (suggesting that the banana may be of value for addn. to diets in acidic conditions). A. T. C.

The carbon: nitrogen (C/N) ratio in the urine of rats deprived of one or both factors of the vitamin B complex. STANISLAUS K. KON. *J. Nutrition* 1, 467-73 (1929).—Thirty-six female rats were used. The animals, which were kept on a diet deficient in the heat-stable component of the vitamin-B complex, show an increased C/N ratio in the urine as compared with individual controls receiving equiv. amts. of a complete diet. The difference is less marked for animals deprived of the whole vitamin-B complex and is negligible in rats receiving autoclaved yeast. The hypothesis is entertained that the heat-stable factor is in some way linked with the metabolic processes of the body. It is not apparent that this is the case with the heat-labile moiety of the vitamin-B complex. The nature of the metabolic disorder following withdrawal of the vitamin-B complex is unknown but the carbonaceous bodies excreted in the urine do not appear to belong to the class of intermediate products of carbohydrate breakdown. The literature is fully reviewed. C. R. FELLERS

The measurement of the basal heat production of pigeons. I. Instrumental technic. FRANCIS G. BENEDICT AND OSCAR RIDDLE. *J. Nutrition* 1, 475-95(1929).—Various types of app. are described in sufficient detail to permit duplication. A bibliography of 44 references is given. II. Physiological technic. *Ibid* 497-536.—The app. and technic are described. Prolonged fasting results in a distinct increase of the metabolism in both the pigeon and the dove. Immature but full-grown doves and pigeons have somewhat higher rates of heat production than birds at older ages, probably a true age effect. Further expts. using the technic and app. here described are being conducted. C. R. F.

Vitamin requirements of nursing young. VII. The production of uncomplicated vitamin B deficiency in the nursing young of the albino rat. BARNETT SURE AND MARGARET E. SMITH. *J. Nutrition* 1, 537-40(1929); *C. A.* 23, 1159, 3491.—A biol. technic is described. A ration furnishing as much as 10% autoclaved yeast must contain sufficient undestroyed vitamin B to keep the nurslings that partake of the maternal diet at maintenance for a considerable length of time. The technic is varied to produce the various desired phases of the avitaminosis in nursing young in order to study the biochem. changes in the blood and tissues. The pathological lesions of uncomplicated avitaminosis are severe hemorrhages in the vertebral column, hypertrophy of the heart, particularly the right auricle, liver atrophy and capillary congestion. All the animals showed either progressive hypoglycemia or an accentuated form in the premortal state. Constipation was present. The liver showed a marked reduction in glycogen content. Anhydremia, assocd. with disturbance in hematopoietic function, has also been found in polyneuritic nursing young. C. R. FELLERS

What place have aluminum, copper, manganese and zinc in normal nutrition? MARY S. ROSE. *J. Nutrition* 1, 541-54(1929).—A review bringing our knowledge of the role of metals in nutrition up to date. C. R. FELLERS

The effect of drying and of sulfur dioxide upon the antiscorbutic property of fruits. AGNES F. MORGAN AND ANNA FIELD. *J. Biol. Chem.* 82, 579-86(1929).—Sulfured peach products retained their full antiscorbutic vitamin content while unsulfured, sun-dried or dehydrated peaches lost their vitamin C. ARTHUR GROLLMAN

Further progress towards the isolation of the antineuritic vitamin (vitamin B) from brewers' yeast. ATHERTON SEIDELL. *J. Biol. Chem.* 82, 633-40(1929).—The antineuritic concentrate previously prepd. was further purified by benzoylation in alk. soln. and extn. with  $\text{CHCl}_3$ . Doses contg. 0.15 mg of N protected pigeons against loss in wt. ARTHUR GROLLMAN

Vitamin D and fecal reaction. A. L. BACHARACH AND H. JEPHCOTT. *J. Biol. Chem.* 82, 751-8(1929).—The assay of vitamin D, based on an examn. of the fecal  $\text{pH}$  of rats on a rachitogenic diet, was found to be useful, provided certain exptl. conditions were observed. ARTHUR GROLLMAN

Sparing action of fat on the antineuritic vitamin B. HERBERT M. EVANS AND SAMUEL LEPKOVSKY. *J. Biol. Chem.* 83, 269-87(1929); cf. *C. A.* 23, 422.—Natural fats have a sparing action on the antineuritic vitamin B. ARTHUR GROLLMAN

A note on the creatine-creatinine excretion during fasting. SERGIUS MORGULIS. *J. Biol. Chem.* 83, 299-310(1929).—The "creatinine-creatinine crossing" is not necessarily a *pre mortem* phenomenon but is rather a peculiarity of the fasting metabolism. The creatinine coeff. is very const. even during a long fast and is not materially different from that found during feeding. The expts. indicate the synthesis of creatine during inanition and its retention during refeeding following a long fast. ARTHUR GROLLMAN

The effect of  $\text{pH}$  control in the autoclaving of yeast with respect to the vitamin B factors. ROBERT R. WILLIAMS, ROBERT E. WATERMAN AND SAMUEL GURIN. *J. Biol. Chem.* 83, 321-30(1929).—The  $\text{pH}$  of yeast is a factor in detg. the efficiency of the de-

struction of the B<sub>1</sub> factor by autoclaving. A vitamin-B<sub>1</sub>-free autoclaved yeast could not be obtained without great loss of vitamin B<sub>2</sub>. Alkaline autoclaving destroys a very large part of the B<sub>2</sub> factor.

ARTHUR GROLLMAN

The effect of avitaminosis on hematopoietic function. I. Vitamin A deficiency. BARNETT SURE, M. C. KIK AND DOROTHY J. WALKER. *J. Biol. Chem.* 83, 375-85 (1929).—In the ophthalmic stage of vitamin-A deficiency, the blood picture is affected by anhydremia. In the preophthalmic stage there is a suggestion of an anemia. II. Vitamin B deficiency. *Ibid* 387-400.—Vitamin-B deficiency leads to a loss of serum proteins, marked hematopoietic disturbances, slight edema and anhydremia. III. Vitamin E deficiency. *Ibid* 401-8.—Vitamin E has no influence on hematopoietic function of females during the period of resorption of the fetus.

ARTHUR GROLLMAN

Comparison of biological and colorimetric assays for vitamin A as applied to fish oils. EARL R. NORRIS AND IRVIN S. DANIELSON. *J. Biol. Chem.* 83, 469-75 (1929).—The blue color produced by fish oil and SbCl<sub>3</sub> is not proportional to the amt. of oil used. The authors claim that the color test checks within reasonable limits with the biol. assay.

ARTHUR GROLLMAN

The vitamin-C content of commercially pasteurized milk. Antiscorbutic potency of raw cow milk and the effects of heating. MASATARO MIURA. *Bull. Inst. Phys. Chem. Research (Japan)* 8, 502-5 (1929); *Abstract sect. 2*, 59.—Autoclaved milk, as used in scorbutic basal rations, contains vitamin C, sometimes in non-negligible quantities. Feeding expts. show that 40 cc. of milk so treated supplies about one-half of the daily antiscorbutic requirement for guinea pigs. Commercially pasteurized milk contains vitamin C in larger amts. than does autoclaved milk. Raw milk contains still more of that vitamin.

ALBERT L. HENNE

Effects of the temperature of water applied for the infusion of Japanese green tea, upon its antiscorbutic potency. MASATARO MIURA. *Bull. Inst. Phys. Chem. Research (Japan)* 8, 506-9 (1929); *Abstract sect. 2*, 59-61.—Infusions of Japanese green tea were made with water at various temps. The infusions were forcibly fed to guinea pigs, with a little sugar and pasteurized milk. Brewing the tea at 70-5° for 5 min. destroyed about 74% of its antiscorbutic properties. The properties of infusions made at higher temps. varied greatly, depending on their treatment before feeding. If the infusion was used immediately, it showed about 33% of the antiscorbutic properties present in the tea. A method of making infusions is proposed by which the antiscorbutic properties are not lost after standing at room temp. for 2 hrs.

ALBERT L. HENNE

Report of the physiological chemist. A. VISWANATHA IYER. *Agr. Research Inst., Pusa, Bull. Sci. Repts.* 1927-28, 124-31 (1928).—The effect of the type of food on the excretion of hippuric acid and urea by cattle was investigated.

K. D. JACOB

The effect of summer grazing on the composition of milk. R. O. DAVIES AND A. J. PUGH. *Welsh J. Agr.* 5, 109-16 (1929).—When cows are on a high level of nutrition immediately before grass and are turned to a sparse pasture of poor quality there is a diminution in fat secretion, while the concn. of casein and inorg. P remains const. When the animals are on a low level of nutrition before grazing and are given enough pasture of good quality, an increase in fat secretion takes place, accompanied by a rise in casein and inorg. P concn. The investigations are being continued to obtain sufficient exptl. data to define the relationship which exists between the change in total amt. of fat secretion and the change in the P contg. compds. at the commencement of summer grazing.

K. D. JACOB

The therapy of rickets. ETHEL BROWNING. *Am. Med.* 35, 377-80 (1929).—General discussion centered about vitamin D, irradiated ergosterol, ultra-violet radiation and hypervitaminosis.

FRANCES KRASNOW

The behavior of nucleoprotamine and its components in animal metabolism. HANS HENSCHEL. *Z. Biol.* 88, 594-603 (1929).—The ratio of the N:P in the dog is dependent on the ratio of these substances contained in the diet. The nucleic acid of herring sperm has a greater influence on the N/P<sub>2</sub>O<sub>5</sub> quotient than the protamine. The P<sub>2</sub>O<sub>5</sub>:uric acid is const., approaching 1:1 entirely independent of the diet. This is especially significant in the dog since most of the uric acid is metabolized to allantoin.

FRANCES KRASNOW

Purine metabolism. II. The effect of the ingestion of glycine on the excretion of endogenous uric acid. A. A. CHRISTMAN AND E. C. MOSIER. *J. Biol. Chem.* 83, 11-9 (1929); cf. *C. A.* 22, 459.—The ingestion of glycine by a fasting man is followed by an increased hourly excretion of uric acid. It begins during the 1st hr. and continues for the following 2 hrs. The concn. of amino acids in the urine immediately following the ingestion of 10 g. of glycine is 5-6 times that for the control periods. The method of Benedict and Franke for the direct detn. of uric acid gives much too low results for urines

contg. high concns. of amino acids and the failure of Zwarenstein (*C. A.* 22, 2598) to obtain pos. results under similar exptl. conditions was probably due to the use of this method. The results confirm those of Lewis, Dunn and Doisy (*C. A.* 12, 2352).

A. P. LOTHROP

**Chemical investigations of embryonic metabolism. III. A study of the nitrogen distribution in the developing hen's egg by the modified Van Slyke procedure.** H. O. CALVERY. *J. Biol. Chem.* 83, 231-41(1929); cf. *C. A.*, 22, 2970.—“A complete study has been made of the N distribution in the developing hen's egg (from white Leghorn hens on a const. diet) throughout the entire incubation period of 21 days. The large no. of eggs used (5 each day) and the study of the daily changes that occur throughout the whole period make this a much more extensive series of data than any previously reported. There are no distinct changes in the acid melanin, amide or cystine N. In the fraction pptd. by phosphotungstic acid there is a small increase in the total amino and non-amino N. There is a decrease of 3% in the total N of the filtrate, but the most decided change that occurs is the increase in the non-amino N of the filtrate from about 2% to a value above 6%, with a corresponding decrease in the amino N. The arginine N presents an interesting curve with a fall in the middle and a much more evident rise at the end of the incubation period. The data show a tendency for the histidine N to decrease, but the daily fluctuations are such that no definite conclusion is justified. There is a slight increase indicated for lysine N. It should be emphasized that the changes in arginine, histidine and lysine represented by the data obtained by this method may not be an indication of the actual changes which occur. It should be kept in mind that the material from the whole egg obtained by the procedure described is not pure protein and may contain many interfering substances which would be pptd. by phosphotungstic acid. A further investigation of this fraction will be reported later.” A bibliography of 34 references is included.

A. P. LOTHROP

**Iron in nutrition. VIII. The ineffectiveness of high doses of iron in curing anemia in the rat.** J. WADDELL, H. STEENBOCK AND E. B. HART. *J. Biol. Chem.* 83, 243-50(1929); cf. *C. A.* 22, 3199.—“A pure Fe salt, namely,  $\text{FeCl}_3$ , when fed at very high levels did not serve to correct the anemia induced in young rats by a milk diet. So-called pure Fe salts prepd. from standard Fe wire, when fed at sufficiently high levels, did cure this anemia unless they were freed from traces of Cu by treatment with  $\text{H}_2\text{S}$ . These results may serve in some measure to explain the many and conflicting reports in the literature with regard to the effect of Fe in curing or preventing various exptl. and clinical anemias.” **IX. Further proof that the anemia produced on diets of whole milk and iron is due to a deficiency of copper.** J. WADDELL, H. STEENBOCK, C. A. ELVEHJEM AND E. B. HART. *Ibid* 251-60.—“The supplementing of a basal diet of whole milk and Fe with several liver preps., with  $\text{H}_2\text{S}$  fractions of the acid exts. of the ashes of 2 of them, and with Cu as a soln. of  $\text{CuSO}_4$ , all on the same levels of Cu intake, has shown that all serve equally well to cure the nutritional anemia produced by the basal diet. This is additional and convincing proof that the deficiency of this basal diet is inorg. in nature and that this inorg. deficiency is Cu only.”

A. P. LOTHROP

**The relation of rate of growth in infants to diet.** AMY L. DANIELS, MARY K. HUTTON, GENEVIEVE STEARNS AND LUCEA M. HEJINIAN. *Am. J. Diseases Children* 37, 1177-86(1929).—Infants receiving diets of modified cow milk and cod-liver oil show a greater gain in wt. and eliminate larger amts. of urinary creatinine than infants receiving the same diet without cod-liver oil. The accepted standards of growth for infants may be too low.

E. R. MAIN

**Comparative studies of meat extracts and vitamin-containing yeast extracts with special reference to their biochemical, bacteriological and serological behavior.** F. REMY. *Arch. Hyg.* 101, 27-38(1929).—The meat exts. examd. showed no vitamin-B potency; that of the yeast exts. was high. The yeast exts. contained more org. P, lecithin P and tryptophan, but less org. S than the meat exts. The addn. of either prepn. to an ordinary agar medium permitted the growth of strains of *Streptococcus viridans* and meningococcus, but appeared to inhibit the growth of strains of gonococcus, influenza bacillus and pneumococcus. The yeast protein appeared to be denatured during the prepn. of the ext., since its antigenic properties were lost. The color reaction of Jendrassik for testing for the presence of vitamin B appeared to be non-specific.

E. R. MAIN

**The action of irradiated ergosterol (Vigantol) and the relation of the changes produced to arteriosclerosis.** HELENE HERZENBERG. *Beitr. path. Anat.* 82, 27-56(1929).—The administration of large quantities of irradiated ergosterol to rats results in the production of a necrosis in the smooth and transversely striated musculature and a deposition of Ca salts in the necrotic areas, in the heart muscle and in the elastic muscle

fibers. The changes appear to have no similarity to those occurring in arteriosclerosis.

E. R. MAIN

**Nutritional anemia in infancy. A deficiency disease.** LEWIS W. HILL. *New Engl. J. Med.* 201, 261-5(1929).—The nutritional anemia observed in infants between the ages of 6 months and 2 yrs. appears to be caused by a dietary deficiency of Fe and the pigments essential to the synthesis of hemoglobin. An increase in the hemoglobin content of the blood of anemic infants is produced most rapidly by the addn. of both Fe and liver to the diet, although either Fe or liver alone may sometimes be effective.

E. R. MAIN

**Studies on the metabolic action of lecithin and cholesterol.** ALFONSO CRUTO. *Biochim. terap. sper.* 16, 175-88(1929).—A comparison was made of the variations produced in the metabolism of rabbits by injections of 5% emulsions of lecithin and of 5% lecithin plus 4% cholesterol esters (oleate and palmitate). The injection of lecithin alone diminished considerably the amt. of glycogen in the liver and muscles. The addn. of cholesterol esters to the lecithin decreased still further the amt. of glycogen but increased markedly the wt. of the animals. The liver of the animals which had been injected with lecithin and cholesterol esters showed a decrease in neutral fats. Conclusion: Cholesterol retards the catabolic functions of lecithin without diminishing its anabolic action. Data are also given showing the variations produced in the lipid content of the blood, spleen and suprarenals.

PETER MASUCCI

**The action of lecithin and cholesterol esters on protein metabolism.** VITTORIO PIOVANO. *Biochim. terap. sper.* 16, 189-95(1929).—The injection into rabbits over a period of 33 days of lecithin alone (2.5 g.) produced an increase in the elimination of creatinine and a decrease in the elimination of urea. The injection of the same amt. of lecithin plus 2 g. cholesterol esters produced exactly the opposite effect. It seems, therefore, that lecithin alone accelerates both the catabolic and anabolic action but that the addn. of cholesterol shifts the equil. by increasing the anabolic and diminishing the catabolic action.

PETER MASUCCI

**The value of gluteins and other fractions of wheat flour on the growth of albino rats.** A. GALAMINI. *Boll. soc. ital. biol. sper.* 4, 386-8(1929).—Rats fed exclusively with wheat flour and vitamins did not show a normal growth. The lack of growth is attributed to the insufficient nutritive value of the food administered.

PETER MASUCCI

**The feeding of albino rats with bread crust and crumbs and with wheat and corn proteins.** A. GALAMINI. *Boll. soc. ital. biol. sper.* 4, 389-91(1929).

P. M.

**The biological control and standardization of substances containing vitamins.** E. LÉSNÉ AND ROBERT CLÉMENT. *Presse méd.* 36, 1254-6(1928).—The physiol. unit of a vitamin is the daily dose sufficient to protect an animal of standard weight if kept on a prescribed diet. The methods for vitamin A, B, C and D are given.

A. E. M.

**Some new publications concerning the precautions required as to the proper dosage of irradiated ergosterol.** J. MOUZON. *Presse méd.* 36, 1546-50(1928).

**The utilization value of different classes of bread.** HUGO SALOMON. *Semana méd.* (Buenos Aires) 35, 602-4(1928).—Young rats develop better on a diet with black bread, than with white. This is due not only to the higher food value, but to the fact that they eat more of it.

A. E. MEYER

**Artificial infant feeding and the milk problem.** MARIANO ETCHEGARAY. *Semana méd.* (Buenos Aires) 35, 1070-2(1928).—A criticism concerning the special conditions in Argentine.

A. E. MEYER

**Barlow's disease caused by dried condensed milk.** M. ACUÑA AND J. M. MACERA. *Semana méd.* (Buenos Aires) 36, 187-90(1929).—Scurvy is produced by exclusive feeding for 3-6 months with dried milk.

A. E. MEYER

**The so-called specific dynamic action of foodstuffs.** G. MANSFELD AND Z. HORN. *Biochem. Z.* 209, 34-54(1929); cf. *C. A.* 22, 2965.—In unicellular organisms dextrose, unlike protein, increases oxidation only to a limited degree, and the effect of dextrose and protein is a summation of both effects on the rate of metabolism.

S. MORGULIS

**Observations on epiphyses and liver extracts of rats fed on carotinoids.** BETH V. EULER, HANS V. EULER AND P. KARRER. *Biochem. Z.* 209, 240-5(1929).—Normal growth obtained in rats even in the absence of vitamin D if the diet contains 0.03 mg. carotin per day. Furthermore, even with a sufficient amt. of vitamin D the calcification was found rather defective unless carotin was also present in the diet. The presence of carotin or carotinoid was demonstrated in the liver exts. provided the rats received no less than 0.03 mg. daily.

S. MORGULIS

The Metchnikof theory and the influence of diet on intestinal flora, impregnation, abortion and blood picture of the white rat. I. Introduction. The properties of the intestinal contents, especially feces, with a mixed diet. MART SCHIEBLICH. *Centr. Bakt. Parasitenk.*, I Abt., 112, 188-205(1929). II. The influence of a marked preponderance of vegetables and carbohydrates in the diet on the intestinal flora of the white rat. *Ibid* 206-30.—On a diet with a slight excess of vegetable over animal matter, the fecal flora was chiefly a mixt. of lactic acid bacilli, lactic acid streptococci, and members of the colon group. There was little anaerobic putrefaction. The addn. of a large amt. of lactose markedly increased the no. of lactic acid bacilli but not the streptococci. Also the anaerobe, *B. bifidus*, appeared in noticeable nos. There was no putrefaction. Dextrose, levulose, maltose and starch did not make this change in flora, nor did dextrin, which is contrary to the findings of some others. III. The nature of the intestinal contents on an animal diet. *Ibid* 497-505. IV. The importance of intestinal spirochetes and a consideration of the types of flora which vary from the normal. *Ibid* 505-7.—On a pure animal diet, protein-splitting processes predominate, brought about largely by aerobes rather than by putrefactive anaerobes. The no. of spirochetes in the feces is not an index of intestinal putrefaction. JOHN T. MYERS

Phosphorus metabolism. II. The role of the spleen in phosphorus metabolism. A. Y. KHARIT. *Ark. Biol. Nauk* 28, 145-7(1928); *Chem. Zentr.* 1928, II, 1897; cf. C. A. 22, 4599.—The blood flowing out of the spleen contains more inorg. P than does the blood flowing in. An increase or decrease of P in the blood does not alter this relation. It must be assumed that complex org. P compds. are dissoc. in the spleen, thus causing free inorg. P to enter the blood circulation. III. Action of adrenaline on phosphorus metabolism. *Ibid* 149-54; *Chem. Zentr.* 1928, II, 1897.—Adrenaline introduced subcutaneously causes a 28-30% reduction of inorg. P. Glucose and insulin introduced during the hypophosphatemia produced by adrenaline do not cause further diminution of the P content of the blood. K. assumes that the inorg. P of the blood consists of 2 parts, only one of which is able to react with the carbohydrates. A certain quant. relation must exist between these 2 parts. G. SCHWOCH

A technical study of the maintenance and fattening of lambs and their utilization of a ration of alfalfa hay and corn. H. H. MITCHELL, W. G. KAMMLADE AND T. S. HAMILTON. *Univ. Illinois Agr. Expt. Sta. Bull.* 314, 31-60(1928).—The digestibility of a ration consisting of equal parts by wt. of alfalfa hay and shelled corn was investigated at 2 levels of feeding. E. F. SNYDER

A new method of investigating nutrition. TADASU SAIKI. *Proc. 3rd Pan-Pacific Sci. Congr.* 1926, II, 2619-20(Publ. 1928).—There are included in the tests, the food requirements of Japanese, the utilization of rice, the relationship between vitamin B and the catalase content in rice, the production of carcinoma, and the formation of urinary and biliary calculi, on a diet deficient in vitamin A. E. M. SYMMES

Value of calcium salts in poultry feeding. W. AUTON. *Gardeners' Chronicle* 83, 399(1928); *Pharm. J.* 121, 159(1928).—By feeding crushed limestone (8.7 g. per hen per day) or rock gypsum (6.3 g.), egg production was distinctly increased. As large quantities of these Ca salts pass through the birds unchanged, the value of poultry manure as a substitute for guano might be important. Cf. Lapp, C. A. 22, 126. S. WALDBOTT

Recent research on the vitamins. KATHARINE H. COWARD. *Pharm. J.* 121, 572-5, 579-80; *Chemist and Druggist* 109, 733-4(1928); cf. Carr, C. A. 21, 762.—A comprehensive survey of recent advances in the study of the vitamins, with 35 recent references. S. WALDBOTT

Factors influencing calcium balance. Influence of potential alkalinity on the utilization of supplementary calcium lactate in young rachitic rats. VERSA V. COLE, JOHN H. SPEER AND FREDERICK W. HEYL. *J. Am. Pharm. Assoc.* 18, 107-10(1929).—Rickets was induced in young rats by Steenbock's diet for 21 days. The animals were then placed on basal diets A or B for 21 days. A contained 0.021% Ca, 0.029% P and 0.12% Mg. B is the starch-case in diet (casein 18, yeast 2, NaCl mixt. 1, starch 79). Two sets of tests were carried on with Diet A to test the mineral retention on an acidotic and an alk. ration. The alk. was produced by 500 mg. Na citrate per day to the ration. The controls received none. Base-forming or neutral diets are more favorable to Ca retention than acidotic diets. They favor Mg, and probably P retention. Incomplete alkalization produces better mineral retention than the acidotic diets. Na citrate is a better source of alk. than a mixt. of Na and K citrates. Cf. C. A. 23, 4502. L. E. WARREN

Physiological action of carotin. Kōzō KAWAKAMI AND RYANG-HA KIMM. *Proc. Imp. Acad. (Japan)* 5, 213-5(1929).—Euler, Euler and Hellström (C. A. 23, 1941) have recently shown that when 0.005 mg. pure carotin was given daily, together with irradi-

ated ergosterol, the avitaminosis rats, previously fed on a diet deficient in vitamins A and D, were completely cured and resumed growth at a normal rate. The present paper confirms these results. The min. daily dose required for a cure lies between 0.03 and 0.05 mg. of carotin. C. J. WHEAT

**The toxic action of milk and other substances exposed to ultra-violet irradiation.** P. REYHER AND E. WALKHOFF. *Munch med. Wochschr.* 75, 1071-3(1928).—Mice and guinea pigs were fed a normal diet and various substances which had been pretreated with ultra-violet rays. The substances included raw cow milk, a dry milk, an egg yolk prepn., plasmon and ergosterol. All the animals showed pathol. changes of different types, degrees and duration. Nitrite-free raw milk contained nitrites after ultra-violet irradiation. R. C. WILLSON

## F—PHYSIOLOGY

E. K. MARSHALL, JR.

**Variations in monocytic response to peroxidase test.** F. A. MCJUNKIN. *Proc. Soc. Exptl. Biol. Med.* 26, 55-7(1928).—Rabbit monocytes neg. to the peroxidase test may acquire a pos. reaction when cultured on smears of dry human blood. Since rabbit monocytes in tissue cultures may, by phagocytosis, acquire a peroxidase content it seems possible that the mononuclear phagocytes of human blood may get their peroxidase granules by the same process. C. V. BAILEY

**Some experiments on reducing reaction of cerebrospinal fluid.** ROGER S. HUBBARD. *Proc. Soc. Exptl. Biol. Med.* 26, 78-9(1928).—Benedict's copper method for blood sugar was applied to specimens of cerebrospinal fluid; the results were about 3 mg. % lower than published results of the application of the method of Folin and Wu. It seems probable that the non-glucose reducing compds. which cause marked differences in the sugar values in whole blood and plasma do not enter the spinal fluid in appreciable amts. The different results obtained when these methods are applied to blood are supposed to be due to compds. which reduce "uric acid reagents" in acid solns but which are not pptd. by silver lactate. These compds. were not found in the spinal fluids. The reducing material in the cerebrospinal fluid other than carbohydrate is present in concns. of about 1 mg. % expressed as glucose. C. V. BAILEY

**Fate of blood sugar during glucolysis.** ICHIRO KATAYAMA AND TERESA GARCIA. *Proc. Soc. Exptl. Biol. Med.* 26, 122-4(1928).—The sugar of shed blood gradually decreases on standing without bacterial contamination. The loss is accounted for by the formation of a corresponding amount of lactic acid. C. V. BAILEY

**Effect of changes in ion concentration of blood upon reflex time.** W. F. WENNER AND A. B. TAYLOR. *Proc. Soc. Exptl. Biol. Med.* 26, 188-9(1928).—Patellar tendon reflex time of dogs is markedly reduced following acid, and to a less degree following alkali, administration. C. V. BAILEY

**Influence of mechanical factors on "basal" gastric secretion.** ROBERT K. S. LIM AND HSIANG-CH'UAN HOU. *Proc. Soc. Exptl. Biol. Med.* 26, 270-1(1929).—In dogs with autotransplanted gastric pouches, the feeding of 100-300 g. of broken bones with a cereal gruel in the evening causes a marked gastric hypersecretion the following morning and at this time the pyloric antrum invariably contains pieces of broken bone. This secretory phenomenon may be the result of a purely mech. factor acting upon the pyloric humoral mechanism. C. V. BAILEY

**Tissue lactates and blood lactates as affected by muscular exercise.** E. G. MARTIN, J. FIELD, 2nd AND V. E. HALL. *Proc. Soc. Exptl. Biol. Med.* 26, 292-3(1929); cf. following abstr.—Lactates accumulate in muscles during periods of exercise; they diffuse into the blood and are taken up by non-exercised muscles during the same period. In resting periods all the muscles dispose of their lactate accumulations. The partition coeff. for lactates between blood and tissue is not the same in the dog as has been assumed by Hill, Long and Lupton for man. Arterial pressure is a significant factor in the disposition of lactates formed during exercise. C. V. BAILEY

**Metabolism following anoxemia. I. Oxygen consumption and blood lactates after experimentally induced exercise.** E. G. MARTIN, J. FIELD AND V. E. HALL. *Am.*

*J. Physiol.* **88**, 407–19(1929); cf. preceding abstr.—Artificial exercise was induced in anesthetized dogs by the rhythmic tetanization of the spinal cord. The excess  $O_2$  consumption following such exercise was not detd. by the amt. of lactate disappearing from the body concurrently.

J. F. LYMAN

**The demethoxylation of lignin in the animal body.** MAX PHILLIPS, HERMAN WEIHE, D. B. JONES AND F. A. CSONKA. *Proc. Soc. Exptl. Biol. Med.* **26**, 320–1(1929).—The Kirpal and Bühn modification of the Zeisel method was used for the estn. of the  $OCH_3$  group which is present in lignin. A dog fed lignin "liberated" over 15% of the methoxyl initially present in the lignin; with a cow, 37% loss was observed. Demethoxylation of lignin takes place in the stomach and this is not the result of bacterial action but probably due to an enzyme in the gastric juice. When lignin was fed in doses larger than 2 g. per kg., toxic symptoms assocd. with impaired renal function developed.

C. V. BAILEY

**The male hormone.** CASIMIR FUNK AND BENJAMIN HARROW. *Proc. Soc. Exptl. Biol. Med.* **26**, 325–6(1929).—Castration was successfully performed on 30 cocks about 2 months of age. Urine from young men was extd. with alcohol, filtered and evapd.; the resulting ext. was injected daily into the castrated cocks and the length of comb measured each week. In every instance injections caused an increase, and cessation caused shrinkage in the size of the comb. Six of the castrated animals received daily urinary injections for 2 weeks; the ext. was from the urine of men 70–80 years of age. The combs decrease 9% in size.

C. V. BAILEY

**Changes in lactic acid and glucose in the blood on passage through organs.** H. E. HIMWICH, Y. D. KOSKOFF AND L. H. NAHUM. *Proc. Soc. Exptl. Biol. Med.* **25**, 347–9(1928).—The main source of lactic acid is the muscle. The organ chiefly concerned in its removal is the liver. Since all organs, excepting the liver, remove glucose from the blood and the liver adds glucose there seems to be a carbohydrate cycle between muscle and liver, muscles sending lactic acid through the blood to the liver and the liver returning glucose to the muscles.

C. V. BAILEY

**The mechanism of glucose absorption from the intestinal tract.** CARL F. CORI, GERTY T. CORI AND HILDA L. GOLTZ. *Proc. Soc. Exptl. Biol. Med.* **26**, 433–6(1929).—The rate of absorption of glucose is uninfluenced, within wide limits, by the amt. of sugar present in the intestine. The authors defend the findings of Cori and refute the criticisms of Pierce, Osgood and Polansky.

C. V. BAILEY

**Tissue respiration and endocrine function. III. Influence of thyroidectomy on tissue respiration.** J. A. DYE AND G. H. MAUGHAN. *Proc. Soc. Exptl. Biol. Med.* **26**, 439–41(1929); cf. *C. A.* **22**, 3688–9.—Skeletal muscle of cretin pups, 7 months after thyroidectomy, show a diminution of 25 to 60% in their power to consume atm. O.

C. V. BAILEY

**The chemistry of the estrus-producing hormone.** CASIMIR FUNK. *Proc. Soc. Exptl. Biol. Med.* **26**, 568–9(1929).—Estrin is very sparingly sol. even in hot water; most of the hormone occurs in the free state in the ovary, placenta or urine. Sapon. is not necessary. It forms salts with strong alkalies which are fairly well sol. in ether, and also forms sol Na, K,  $NH_4$  and Ba salts. Making use of these properties estrin fractions weighing 0.01 mg. per rat unit are easily obtained. Such preps. show an acidity equiv. to 43.2 cc. of 0.1 N NaOH soln. per 100 mg. of substance. The similarity in chem. behavior of estrin and phenols does not render further purification easy. It is very difficult to sep. the hormone from phenolphthalein which is often present in urine following its use as a laxative. Aq. solns. of estrin appear to be slightly less active than solns. of equal strength in oil; this may be due to a more rapid elimination of the aq. ext.

C. V. B.

**Blood catalase.** H. BISCHOFF. *Arch. Kinderheilk.* **82**, 189–98(1927).—The catalase content of the blood of children does not differ greatly from that of adults, but varies according to the point of extn. of the sample. The value is unchanged in infection or irradiation.

B. C. A.

**Is there an iodine value of the blood dependent on the thyroid gland?** F. BLUM. *Schweiz. med. Wochschr.* **57**, No. 34, 14 pp.(1927).—The thyroid gland does not pass I into the blood. Fellenberg's method for the detn. of I is not suitable for blood.

B. C. A.

**The reducing power (blood sugar) of filtrates from the blood of the rabbit.** ERNEST L. SCOTT. *Arch. Internal Med.* **43**, 393–412(1929).—Rabbit blood obtained from a vein of the ear and tested by the method of Shaffer and Hartmann gave a mean reducing power of 123 mg. per 100 cc. in a series of 1625 observations. The amt. seemed to be independent of age, wt., sex, time of year when housed in lab. and time of day. A short

period of inanition caused a slight drop in blood sugar in the rabbit and the rat.

**Pancreatic function. IV. The humorneural regulation of the gastric, pancreatic and biliary secretions.** SEIZABURO OKADA, KWANICHI KURAMOCCHI, TOSHIO TSUKAHARA AND TATSUO OGINOUE. *Arch. Internal Med.* 43, 446-71(1929); cf. *C. A.* 23, 4258.—Injection of insulin when accompanied by hypoglycemia provokes gastric pancreatic and biliary secretion. This effect is produced even in cases of achlorhydria. Injection of glucose or of atropine prevents the insulin effect on secretion. Adrenaline and ephedrine inhibit the secretions. This paper is largely physiol. and includes an extended bibliography of the physiology of these secretions. J. B. BROWN

**Estrus hormone in bile.** M. A. GSELL-BUSSE. *Arch. expil. Path. Pharmacol.* 139, 328-40(1929); cf. *C. A.* 22, 4161.—The estrogenic action of preps. of taurocholic acid or its Na salt is due to an impurity. Neutral ethereal exts. of fresh bile contained the following amts. of estrogenic substance in rat units per l.; ox bile, 80-200; human bile, 35-600. An ext. of 0.5 kg. of fresh liver tested neg. for estrus hormone. Meconium gave the highest yield of hormone obtained (6000 rat units per kg.). B. C. B.

**The metabolism of muscle in activity.** J.-K. PARNAS. *Compt. rend. soc. biol.* 101, No. 23, 37-70(1929).—A review, accompanied by an extensive bibliography.

**The oxidation-reduction potential of mammalian cells.** E. AUBEL AND R. WURMSER. *Compt. rend. soc. biol.* 101, 880-1(1929).—Nile blue, methylene blue and 2,6-dibromophenol indophenol were intravenously injected in doses of 0.15 g. per kg. into rabbits and dogs. After 5 min. the animals were killed and the tissues examd. at once. The results are summarized as follows: Spleen, pancreas, intestine, stomach— $r_H$  16-20; muscle and kidney— $r_H$  14-16; gray matter of the brain, liver— $r_H$  about 9. B. C. B.

**Water content of blood at rest, walking and during running.** U. CASSINIS AND L. BRACALONI. *Atti accad. Lincei* [6], 9, 355-8(1929).—The  $H_2O$  in blood is about 78-79.8%. In walking there is a slight change in different individuals, the change varying from + 0.10 to -2.11%; in running, the loss is greater, i. e., from 0.39% up to as high as 2.15% for every 600 km. There is no definite relation between the two.

**Studies on the acidosis of young athletes after running over various distances.** HARALD A. SALVESEN. *Norsk Mag. Laegevidenskap.* 89, 121-30(1928).—The acidosis produced after 100-, 400-, 1500- and 10,000- m. runs is investigated. The acidosis is most pronounced after 1500 m. where the lowering of the alkali reserve may amount to 30 vol. %. ARNE DROGSETTI

**Normal calcium impregnation of aortic wall.** P. P. RAVAUULT. *Bull. hist. appl. physiol. et path.* 5, 40-8(1928); *Physiol. Abstracts* 13, 615; cf. *C. A.* 22, 620.—Fragments from 25 aortas were examd. by the usual staining methods and also by micro-incineration, the sections in the latter case being examd. by lateral illumination. The media coat appeared well impregnated with Ca salts, the other coats contg. relatively little; the Ca impregnation was most dense at the origin of collateral vessels. The suggestion is made that this deposition of Ca material is produced by the delay of circulation of nutritive fluids in this coat, due chiefly to the thick elastic lamina present. H. L. D.

**Chemical study on the marine mammals. I. The adrenal of the whale. Adrenaline.** MAKOTO YAMAGAWA AND SHOMATSU NISHIMURA. *J. Imp. Fish. Inst. (Tokyo)* 22 (2), 22-3(1926); *Biol. Abstracts* 2, 1038-9.—Although the adrenal gland in the whale contains a smaller percentage of adrenaline than that of the ox, the gland weighs 30 times as much. Material which may have been pure adrenaline was prepd. III. **The pancreas of the whale insulin.** MAKOTO YAMAGAWA AND NOBUTOMO NAKAMURA. *Ibid* 26-8; *Biol. Abstracts* 2, 1039.—Insulin prepd. from pancreas of the whale was of low potency because of autolysis during the 5-6 hrs. between capture and dissection. H. L. D.

Studies in the metabolism of tissues growing in vitro. III. Cyanic acid as a possible precursor of the ammonia and urea formed by embryo kidney tissue. BARBARA E. HOLMES AND ELSIE WATCHORN. *Biochem. J.* 23, 199-205(1929); cf. *C. A.* 22, 1183.—Cyanic acid in the presence of embryo kidney tissue is broken down to ammonia and urea, and the tissue catalyzes the reaction. *l*-Hydantoinacetic acid, the result of a possible reaction between *l*-aspartic acid and cyanic acid, is also broken down by embryonic tissue, yielding urea and ammonia. BENJAMIN HARROW

Clinical significance of the water of metabolism in children. HYMAN GOLDSTEIN. *Arch. Pediatrics* 46, 371-81(1929).—A study of the factors governing retention and loss of water in metabolism, and of the consequences of changes from the normal water equil. JOSEPH S. HEPBURN

Reid Hunt reaction and pregnancy. H. EUFINGER, H. WIESBADER AND L. FOC-SANEANU. *Arch. Gynäkol.* 136, 12-8(1929).—The resistance of the white mouse to acetonitrile is markedly increased by previous subcutaneous injections of serum from a pregnant woman. The gradual increase in the Reid Hunt reaction grows more marked as pregnancy advances, reaches its max. during labor and rapidly returns to normal in the puerperium. Serum was also used from patients suffering from the toxicoses of pregnancy. In cases of hyperemesis the serum had about the same effect as normal serum. Serum from eclamptic patients increased the acetonitrile resistance more than normal serum. The blood from the umbilical cord increased the acetonitrile resistance only slightly or not at all. The Reid Hunt reaction was first carried out with thyroid preps. and seems to offer a clinical method for detecting hyperthyroidism. It is probable, but not proved, that the reaction with serum from a pregnant woman is due to the hyperfunction of the thyroid during pregnancy. HARRIET F. HOLMES

Studies in comparative hematology. III. Marsupialia. ERIC PONDER, J. FRANKLIN YEAGER AND H. A. CHARIPPER. *Quart. J. Exptl. Physiol.* 19, 273-83(1929); cf. *C. A.* 23, 1961.—Morphology of the leucocytes is similar to that of the leucocytes in man. 8000 is the av. figure for the leucocyte count. The mean diam. of the red cells in genus *Macropus* is 8.6 $\mu$ ; in the wombat, 7.2 $\mu$  and in the opossum 9.2 $\mu$ . There is a very high hemoglobin content in genus *Macropus*. The red cell count is 8,000,000. The resistance to hypotonic saline is either the same or a little less than that of the cells of man; resistance to saponin and Na taurocholate varies considerably. F. K.

Origin and destination of the cellular fats. JULES AMAR. *Compt. rend.* 188, 1626-8(1929).—Fats form in the body as a reserve of least effort of the cell, or a secretion of degradation or inactivity in the cytoplasm. A simple hydrolysis of albumin forms triolein in the absence of oxygen. When the cell is in repose, glycogen is not needed, and fats form as an economic fuel and source of glycogen. Pathology shows that diseases which impede oxidation favor the formation of fat. AMY LEVESCONTE

Spectrographic analysis of the ash of blood and of organs. PAUL DUTOIT AND CHRISTIAN ZBINDEN. *Compt. rend.* 188, 1628-9(1929).—The arc spectra of the ash of blood always show Ag, Al, Ca, Cu, Fe, K, Mg, Mn, Na, P, Si, Ti and Zn. The Ag is in sufficient amt. for a detn. Other elements sometimes found are Co, Cr, Ge, Pb, Ni, Sn and Sr. When the albumins are coagulated by heat Ag, Ca, Cu, Mn, Ni, Pb, Sn and Zn are concd. while Al and Ti are diminished. Studies on the ash of organs and of tumors indicate a concn. of Ni, Co and Pb in the pancreas of Sn in the suprarenal capsules and of Zn in the liver and kidney. Ag and Cu seem to disappear in tumors. A. LÉV.

The respiratory quotient. HENRY B. RICHARDSON. *Physiol. Rev.* 9, 61-125(1929).—Review with extensive bibliography. E. R. LONG

Phosphocreatine. CYRUS H. FISKE AND YELLAPRAGADA SUBBAROW. *J. Biol. Chem.* 81, 629-79(1929); cf. *C. A.* 22, 1184.—Phosphocreatine can be obtained from protein-free muscle filtrates as a cryst. Ca salt which is a mixt. of the secondary and tertiary salts and is convertible into the pure secondary salt,  $C_4H_9O_5N_3PCa \cdot 4H_2O$ . Practically the theoretical amt. of creatine can be obtained by hydrolysis of this salt which indicates that phosphocreatine is probably  $(OH)_2OPNH(C:NH)NMeCH_2CO_2H$ . The amt. of the Ca salt obtained represents only 70% of the labile P present in the protein-free filtrate but this is all phosphocreatine, for the 30% loss in the succeeding steps of the isolation occurs also in control expts. with known amts. of the pure substance. "The labile P compd. in the protein-free filtrate hence contains nothing but creatine and

$\text{H}_3\text{PO}_4$ , and the physiol. significance of the physicochem. properties of phosphocreatine is nil without knowledge of this fact. The 2nd acid disson. const. of phosphocreatine, detd. by the titration of 0.005 *M* solns. of the secondary Ca salt, is  $2.6 \times 10^{-4}$ . Since the method of intravital staining with indicators has shown that the interior of the muscle fiber is distinctly acid and since the labile P of muscle has now been shown to be phosphocreatine itself (and not some substance of which it is a decompn. product), it follows that the hydrolysis of this substance during muscular contraction is accompanied by the liberation of a large amt. of base and consequently functions as a mechanism for neutralizing acid. The rate of hydrolysis of phosphocreatine by acid in a mixt. of the primary and secondary salts is proportional to the mol. fraction of the primary salt. In other words, the primary salt is hydrolyzed by  $\text{H}_2\text{O}$ ; the secondary salt is not. Analytical data are presented showing the compn. of normal resting cat muscle, as well as the hydrolysis of phosphocreatine during contraction and after shutting off the circulation and its resynthesis during recovery. Hydrolysis has been demonstrated also after the intravenous injection of lactic acid and of KCl. Intravenous injection of creatine (alone or mixed with  $\text{Na}_2\text{HPO}_4$ ) does not increase the concn. of phosphocreatine in muscle. It has so far been impossible to show conclusively that the contraction of one set of muscles induces the hydrolysis of phosphocreatine elsewhere in the body." Methods are given for the detn. of phosphocreatine (and inorg. phosphate) in muscle. One is a direct colorimetric method which gives accurate results only when properly controlled with known solns. The other method is based on the preliminary sepn. of the inorg. phosphate by means of Ca and is more reliable, particularly when the tissue contains only a small amt. of the substance.

A. P. LOTHROP

Is copper a constituent of the hemoglobin molecule? The distribution of copper in blood. C. A. ELVEHJEM, H. STEENBOCK AND E. B. HART. *J. Biol. Chem.* **83**, 21-5 (1929).—"If the mol. wt. of hemoglobin is accepted as 16,700 or 66,800 as recently reported by Svedberg and Fahraeus, then the hemoglobin of rat blood does not contain Cu as part of its mol. The Cu content of horse blood is approx. 0.05 mg. of Cu per 100 cc. of blood. The corpuscle fraction of blood, whether prepd. by centrifuging oxalated blood or defibrinated blood, contains the largest portion of the Cu." A. P. L.

The effect of diet on the copper content of milk. C. A. ELVEHJEM, H. STEENBOCK AND E. B. HART. *J. Biol. Chem.* **83**, 27-34 (1929).—The milk from cows on a normal ration contains about 0.15 mg. of Cu per l. and this amt. cannot be increased by feeding sufficient  $\text{CuSO}_4$  to increase the Cu content of the ration 5-fold. There were very slight differences in the Cu content of samples of milk collected from 13 herds located in different states. Increasing the Cu content of the ration 5- to 10-fold did not increase the Cu content of goat milk, which contains about the same quantity of Cu as cow milk.

A. P. LOTHROP

The effect of whole skeletal muscle on blood sugar *in vitro*. MELVILLE SAHYUN AND CARL L. ALSBERG. *J. Biol. Chem.* **83**, 129-36 (1929).—When normal skeletal muscle is incubated with blood the decrease in blood sugar at the end of the 3rd hr. is as small as when blood is incubated alone. On the other hand, when deglycogenated muscle (from adrenaized animals) is used there is a marked drop whether or not insulin has been added. Deglycogenated muscle, therefore, has the power of utilizing glucose *in vitro* but whether the glucose that disappears is burned or changed into glycogen it is not possible to state.

A. P. LOTHROP

The equation expressing the excretion of a diuretic and its relation to diffusion processes. II. E. J. CONWAY. *Am. J. Physiol.* **88**, 1-28 (1929); cf. *C. A.* **20**, 3464.---Various formulas have been derived for urinary secretion from the fundamental diffusion relation, viz.: output of tubules into unit vol. of glomerular fluid =  $\sqrt{t} \times$  the diffusion head  $\times K$ . The diffusion-secretion formula, viz.,  $\sqrt{1/t} (C_u - C_B) = K$  applies to glucose, urea and with slight modification to NaCl and at high blood values to  $\text{Na}_2\text{SO}_4$ .  $\sqrt{1/t \times D} \times (C_u - C_B) / (C_{\text{max.}} - C_B) = K$ . This expression holds for all substances when the plasma concn. exceeds a certain value.  $C_u$  and  $C_B$  are the concns. of urine and plasma,  $t$  is the time of unit vol. of urine,  $D$  is the diffusion coeff. and  $C_{\text{max.}}$  the highest value of  $C_u$  as  $V$  or  $1/t$  is indefinitely diminished. III. E. J. CONWAY AND F. KANE. *Ibid* 29-51.—The diffusion-secretion theory of urinary secretion states that in the excretion of NaCl and  $\text{H}_2\text{O}$ , for example, the direction and rate of NaCl diffusion alone are influenced by the concn. of plasma NaCl; no water is absorbed in the tubules. The glomerulus is the site for control of  $\text{H}_2\text{O}$  output. The Cl threshold is defined as the highest value of  $C_B$  (the plasma concn.) at which  $C_u$  (the urine concn.) is  $< C_B$  for all rates of urine flow. The threshold for the rabbit is 0.574. The injection of glucose had no effect on the Cl threshold; but sulfate or urea in saline caused a marked increase.

The chloride absorption equation developed in this paper is  $(C_B - C_u)/C_B = \sqrt{tK} \times \sqrt{T - C_B}$ .  $T$  = the Cl threshold,  $t$  = time of unit vol. of urine. The theory advanced is in harmony with the main pertinent facts of renal physiology and is capable of explaining them by relations based on simple diffusion processes and a vital state of the kidney cells which can be adequately represented as to time and concn. relations by a simple physical parallel, *i. e.*, the diffusion of I from  $\text{CHCl}_3$  into KI solns. J. F. L.

The physiology of animals surviving complete exclusion of sympathetic nerve impulses. W. B. CANNON, H. F. NEWTON, E. M. BRIGHT, V. MENKIN AND R. M. MOORE. *Am. J. Physiol.* 89, 84-107(1929).—After the removal of the sympathetic nervous system, *i. e.*, the two chains of ganglia, from the stellate to the pelvic, in cats, good health was maintained for many months. Additional removal of one adrenal and the destruction of the medulla of the other demonstrated that the chromophil tissue is of no vital importance. After removal of the sympathetic system emotional excitement caused no erection of hairs, no consistent increase of blood sugar, no polycythemia, no relative increase in mononuclear cells and no marked rise in arterial blood pressure. The sympathetic system seems to be of physiological value in critical emergencies but is not essential to life under protected conditions. J. F. LYMAN

Nerve metabolism. V. Phosphates. R. W. GERARD AND J. WALLEN. *Am. J. Physiol.* 89, 108-19(1929).—Rest in  $\text{O}_2$  resulted in a slight increase of acid-stable phosphate in the sciatic nerve at the expense of the inorg. acid-labile phosphate. Rest in  $\text{N}_2$  caused a partial breakdown of both the acid-labile and acid-stable phosphates and rest in  $\text{O}_2$  restored the original condition. Total sol. phosphate tended to increase in nerves kept in  $\text{O}_2$  and still more when kept in  $\text{N}_2$  or stimulated. Tetanization in  $\text{O}_2$  caused the same changes as asphyxia but to a less extent. J. F. LYMAN

Physiological variations in the cardiac output of man. II. Changes in the cardiac output, metabolism, blood pressure and pulse rate of man following ingestion of fluids. ARTHUR GROLLMAN. *Am. J. Physiol.* 89, 157-63(1929).—After the ingestion of 1000 to 1500 cc. water by man the cardiac output rose in some cases 26%, usually about 10%. The respiratory metabolism was increased about 8% by the ingestion of large vols. of  $\text{H}_2\text{O}$ , but Locke's soln. or 1% NaCl soln. had no such effect. J. F. LYMAN

The hydrogen-ion concentration of the reproductive organs of the white leghorn chicken. G. D. BUCKNER AND J. H. MARTIN. *Am. J. Physiol.* 89, 164-9(1929).—The  $p_{\text{H}}$  of the funnel portion and of the upper and lower parts of the albumin-secreting section of the oviduct varied from 6.3 to 6.6 in hens that were laying and not laying. The  $p_{\text{H}}$  of the mucosa of the isthmus, uterus and vagina in hens actively laying was between 5.6 and 5.9; in hens that were not laying the range was 6.2 to 6.6. Semen had a  $p_{\text{H}}$  of 7.3. J. F. LYMAN

The role of the liver and other abdominal viscera in the destruction of adrenaline in the body. J. MARKOWITZ AND F. C. MANN. *Am. J. Physiol.* 89, 176-81(1929).—Adrenaline destruction occurred all over the body and not in any particular organ. J. F. LYMAN

The physiology of the pancreas. IV. The elimination of dyes in the external secretion of the pancreas. L. A. CRANDALL, E. OLDBERG AND A. C. IVY. *Am. J. Physiol.* 89, 223-9(1929); cf. *C. A.* 21, 3947.—Of 90 dyes tested 10 were eliminated in the pancreatic juice following their intravenous injection. Among those eliminated there appears to be no common physical or chem. relationship. No dye was eliminated in sufficient amt. to be of practical value as a pancreatic functional test. J. F. LYMAN

The regulation of respiration. XXXI. The effect of hemorrhage, reinjection and low alveolar oxygen on the reflex activity of the cord. A. W. WINKLER. *Am. J. Physiol.* 89, 243-52(1929).—The activities of the respiratory muscles and of the lower spinal arcs studied, in the majority of cases, varied in the same direction following hemorrhage, reinjection and low alveolar  $\text{O}_2$  tension followed by readministration of room air. J. F. LYMAN

The renal threshold for chloride in man. R. S. AITKEN. *J. Physiol.* 67, 199-210 (1929).—The plasma Cl was reduced in 2 men by the ingestion of a diet very low in Cl over a period of 7 days together with forced sweating. The concn of Cl in plasma and urine was measured at intervals over a wide range of plasma Cl concns. At plasma NaCl concns. above 0.585% there was a large increase in excretion for a small increase in plasma concn. Below about 0.555% of plasma NaCl there was a steady rate of excretion at about 5 mg. per hr. down at least to 0.537% of plasma NaCl. The renal threshold for Cl is not a definite point but simply a region in which the relation of renal excretion to plasma concn. changes rapidly. It is suggested that the idea of a renal threshold for Cl be abandoned. J. F. LYMAN

The action of extract of pituitary on the blood sugar after pancreatectomy. C. G. IMRIE. *J. Physiol.* 67, 264-9(1929).—In a dog whose pancreas had been removed and which was maintained in a healthy state by injections of insulin and a diet contg. raw pancreas, pituitrin produced a rise in blood sugar as long as there was glycogen present in the liver. Liver glycogen and not muscle glycogen seems to be the source of the extra glucose in the hyperglucemia caused by ext. of the pituitary. J. F. LYMAN

Adsorption of hemoglobin by muscle tissue. M. N. J. DIRKEN. *J. Physiol.* 67, 282-7(1929).—Minced muscle can be completely decolorized by washing it with Ringer fluid or with 1% NaCl soln. After removing the salt from the extd. muscle by washing with H<sub>2</sub>O, the tissue is colored intensely red if shaken up with H<sub>2</sub>O to which a little blood has been added. This color in the tissue can be removed with 1% NaCl but not with H<sub>2</sub>O. Conditions of concn. of hemoglobin, temp., salt concn. and  $p_H$  under which coloring and decolorization take place are reported. The phenomenon is thought to be due to adsorption. Muscle hemoglobin of the living tissue seems to be in soln. rather than adsorbed. For the detn. of muscle hemoglobin extn. should be made with a salt soln., rather than with H<sub>2</sub>O. J. F. LYMAN

Water evaporated during work. J. A. CAMPBELL. *Proc. Physiol. Soc., J. Physiol.* 67, x(1929).—At temps. of 10°, 15° and 20° during exercise there was no H<sub>2</sub>O lost by the skin in some tests. At 25° the H<sub>2</sub>O loss from the lungs was very much less than that from the skin. J. F. LYMAN

A central chemical control of the heart rate. R. J. S. McDOWALL. *Proc. Physiol. Soc., J. Physiol.* 67, xxi(1929).—Asphyxia of the cerebral centers in a chloralose cat, provided sensory stimulation is absent, caused marked acceleration of the heart. This result must be due to the chem. effect of asphyxia on the sympathetic system. J. F. LYMAN

The antidiuretic action of the separated principles of the posterior lobe of the pituitary. A. HEMINGWAY AND J. M. PETERSON. *Proc. Physiol. Soc., J. Physiol.* 67, xxiv(1929).—Both vasopressin and oxytocin had a prolonged antidiuretic action, the action of vasopressin being more powerful. Accompanying the antidiuretic action, there was an increase in the Cl concn. of the urine and often an increase in the total excretion of Cl per unit of time. J. F. LYMAN

Studies upon the glycogen in the nerve cells of the central nervous system of mammals. IV. The changes in glycogen distribution after the injection of insulin. V. The postmortal changes of the glycogen distribution in the central nervous system. HYOSAKU TANAKA. *Sei-i-kwai Med. J.* 48, No. 3, 1-17, Abstract sect., 1-2(1929).—The injection of insulin caused a marked diminution in the glycogen in the nuclei of the floor of the fourth ventricle as well as in those of the cerebral peduncle, the cerebral cortex, the optic thalamus, the corpus striatum and in the Purkinje cells and nerve cells of the nucleus of the cerebrum. Insulin did not produce a marked diminution of glycogen in the nerve cells in the gray substance of the spinal cord. Only a slight diminution was effected in the nerve cells of the intervertebral ganglia. No change in the glycogen content of the anterior lobe of the hypophysis or of the epithelium of the choroid plexus could be found. Insulin injection caused marked changes in the nerve cells of the motor centers of the lower medulla oblongata and in the gray matter and ganglion cells of the spinal cord. The injection of glucose after insulin produces a return to the normal picture except in the case of the spinal cord. After this return to normal no cells were found in which the vol. was not normal, the form irregular or the number of Nissl bodies not appreciable. V. The postmortal changes of the glycogen distribution in the central nervous system. *Ibid* 18-26, Abstract sect., 2-3.—After death the glycogen of the ganglion cells of the central nervous system diminished in the course of time until it disappeared. That of the cerebral cortex disappeared first. Glycogen remained longest in parts of nuclei of the fifth and seventh nerves and in the nucleus of the third nerve and in the red nucleus. In general the glycogen is held better by the large cells whose form is not readily altered. In others it shows a gray diffuse color after about 12 hrs. It remains chiefly in cells of quite definite structure and low in glycogen in contrast to cells of disorganized structure even though they were previously rich in glycogen. VI. *Ibid* 27-40, Abstract sect., 3-4(1929).—Glycogen is found in all ganglion cells and its form falls into three or four classes. It attains a max. value at the time of birth of guinea pigs, decreases to the 16th day and then rises suddenly to a normal at the end of a month. Glycogen is recognized in only a few cells of rabbits or guinea pigs after they have been dead 6-12 hrs. This glycogen is more resistant than that of the liver cells of the same animals. During fasting the glycogen present in the central nervous system of rabbits and guinea pigs is first lost extracellularly and then reduced intracellularly. Its decrease is much less than in the livers of the same animals. The glycogen of guinea pigs and

rabbits is diminished in insulin hypoglycemia. At the same time the cells shrink, become stained deeply with hematoxylin and the Nissl bodies are disturbed. Soon after glucose injection these disturbed conditions within the cells disappear. This glycogen is attacked slightly by organic acids and readily by strong ones. It shows the same reactions as liver glycogen. This glycogen is attacked by the enzymes that digest carbohydrates but not by proteases. Ganglion cells show glycogen after immersion in a 6% fructose soln. and become very rich in a 24% glycogen soln. Preps. stained by the author's method show the Nissl bodies very plainly but only the glycogen is stained with carmine. The substance in these cells termed "glycogen" by the author must be true glycogen judged from both its microchemical and biological properties. C. M. McC.

**Respiration in atmospheres of high oxygen content.** BOUNHIOL. *Compt. rend.* 188, 1340-2(1929).—Guinea pigs survived only two to three days in an atm. composed of 80% O<sub>2</sub>, and only 16 hrs. in 85-90% O<sub>2</sub>. The total N content of the blood decreased from 1.6% in the normal animal to about 1% at the time of death. The urea content increased from 0.4% to 0.59%. J. G. McNALLY

**A contribution to the knowledge of hypo- and hyperglucemic substances present in the blood of the dog.** E. MORACCI. *Boll. soc. ital. biol. sper.* 4, 329-31(1929).—An ordinary mixed diet was given to 2 dogs. Two hrs. after the meal, samples of blood were taken from which it was possible to ext. a substance capable of lowering the blood sugar of a rabbit. From blood taken during a digesting period, that is, feeding the animals after a fast of 72 hrs., a substance was extd. which had both hypo- and hyper-glucemic properties. These results confirm those of G. Martino. PETER MASUCCI

**The presence of phosphagen in the gastric muscles of certain birds.** G. ZANGHI. *Boll. soc. ital. biol. sper.* 4, 332-3(1929).—Phosphagen was found in the gastric muscles of the chicken, rooster and sparrow. The presence of phosphagen in the stomach muscles of the ox, dog or rabbit was doubtful; the min. quantity found came within the exptl. error of the detn. PETER MASUCCI

**Hormones and vitamins.** CAMILLE SOULA. *Presse méd.* 36, 1234-6(1928).—A general critical discussion is given. A. E. MEYER

**The scientific basis of cortical suprarenal opotherapy.** J. MOUZON. *Presse méd.* 36, 1379-81(1928).—The cortical suprarenal hormone is antagonistic to the adrenaline concerning its action on the blood pressure. It reactivates the fatigued muscle. The adrenaline in the ext. can be destroyed by oxidation of the alk. soln.—Prepn.: grind the gland with sand, ext. hot with 0.2 N HCl and adjust the extg. liquid to pH 4.1. Filter, ppt. with NaCl, dissolve in alc. of 70°, filter, ppt. with 5 vols. of AmOH. Dissolve the ppt. in EtOH of 80°, dry in *vacuo* and repeat the dissolving and drying. It is a white powder, sol. in alc. and dil. acids, insol. in H<sub>2</sub>O, dil. alkali, Et<sub>2</sub>O and CHCl<sub>3</sub>. It contains 24% Cl. The free substance contains N 13.3, C 43, H 5.1, O 37.3 and S 1.3%. A. E. MEYER

**The pancreas, glucemia and adrenaline in blood coagulation.** D. ESTEBAN S. TURCATTI. *Rev. sudamericana endocrinol., inmunol., quimioterap.* 12, 389-95(1929).—The pancreas secretion and sugar content in the blood do not have a definite influence on the coagulation of the blood. Adrenaline produces an increased coagulability by causing contraction of the spleen. A. E. MEYER

**Inorganic phosphorus in the blood of the newborn.** S. I. BETTINOTTI. *Semana méd.* (Buenos Aires) 35, 562-3(1928).—The average is 5.5 mg. per 100 cc. of serum. No difference in reference to sex, weight or age was observed. A. E. MEYER

**The sexual cycle of the rat and the endocrine factors.** E. B. DEL CASTILLO. *Semana méd.* (Buenos Aires) 36, 1530-57(1929); cf. C. A. 23, 887.—A complete study is given of the sexual functions of the rat, the relation between ovary and the other glands, the influence of folliculin and its chem. and physiol. qualities. A. E. MEYER

**Is fibrinogen present in natural plasma in free or combined state?** E. HEKMA. *Biochem. Z.* 209, 90-102(1929).—The view is maintained that fibrinogen in natural plasma is in a free state. S. MORGULIS

**The possibility of the existence of fibrinogen complexes together with free fibrinogen in plasma fluids.** E. HEKMA. *Biochem. Z.* 209, 128-33(1929).—Under certain artificial conditions independent, inactive fibrinogen complexes are formed in plasmatic fluids, the remainder of the plasma still contg. fibrinogen so that both free and combined fibrinogen may coexist. S. MORGULIS

**The behavior of carbohydrates in perfusion experiments on muscles of limb preparations.** A. BORNSTEIN AND HANS VÖLKER. *Biochem. Z.* 209, 102-18(1929).—The blood sugar of a dog limb perfused with dog blood tends to diminish. To maintain this sugar level const. it is necessary to supply continuously 0.225 g. glucose per kg. per hr. or 0.250 g. of fructose. The addn. of lactic acid or alc. always exerts a small but definite

sugar-sparing influence and helps in maintaining the sugar level const. If, in addn. to a continuous administration of 0.250 g. glucose, sufficient in itself to raise the sugar level, insulin is used in the perfusion there is a marked drop in the blood sugar, and the insulin produces quant. the same effect as it does in the intact animal. The glycogen and total carbohydrate content of the muscles show no const. relation to the amt. of added sugar, although with a continuous supply of glucose to maintain the blood sugar level the muscle glycogen at the end of 1½ to 2 hrs. actually increases. If a similar expt. is made with the addn. of insulin, the glycogen diminishes. The amt. of glucose necessary to maintain the blood sugar level is 50% greater than can be anticipated from the O<sub>2</sub> consumption of the extremity, so that part of the sugar must be deposited in the limb as reserve material (either carbohydrate or fat).

S. MORGULIS

**The behavior and action of indigestible materials (keratin, kaolin) in the mammalian organism.** ANNA GOLDFEDER. *Biochem. Z.* 209, 154-71(1929).—Keratin acts as an entirely indifferent material. The indigestibility of keratin was deduced from a number of observations on the insol. N and S of the feces and other matters. No mechanical effect of the keratin was noted and the coeff. of the ratio of body length to intestine length in control and exptl. mice showed only minimal variations. Neither keratin in a proportion of 50-60% nor kaolin in a proportion of 80%, although these indigestible materials fill the intestinal tract, has any effect upon the organism of the mouse.

S. MORGULIS

**Respiratory metabolism of eviscerated dogs.** A. BORNSTEIN. *Biochem. Z.* 209, 172-80(1929).—Upon removing the abdominal viscera from fasting dogs the respiratory metabolism falls, on the av., 40-45%. The respiratory quotient gradually rises, but stays between 0.8 and 0.9. The lung ventilation is too great in comparison with the lowered respiratory metabolism, so that the high respiratory quotient is really due largely to overventilation, the true quotient for the combustion of material being much lower. The intravenous administration of glucose in amts. greater than the caloric requirement of the animal causes a permanent rise in the respiratory quotient. Carbohydrate and fat play, therefore, the same role in the metabolism of eviscerated animals as in that of normal animals.

S. MORGULIS

**The inorganic phosphate content of arterial and venous blood.** AUGUST HOFF. *Biochem. Z.* 209, 195-9(1929).—Simultaneous detns. of inorg. P in arterial and venous dog blood show that the latter contains a somewhat higher concn. of P.

S. M.

**Studies on the physiology of glands. CXVIII. The influence of the liver on the secretion of urine.** LEON ASHER AND HANS MEIER. *Biochem. Z.* 209, 200-17(1929).—A method is described for a frog prepn. in which the heart itself serves as the motor to propel blood exclusively through the kidney, so that this is similar to Starling's heart-lung-kidney prepn. If the blood is circulated through the heart and kidney, then through the heart, liver and kidney, a much more pronounced diuresis was obtained in the latter case. The possibility that either urea or sugar is the cause of the increased diuresis was carefully excluded, since even the presence of a very small portion of liver, exptly. completely isolated, is able to induce the diuresis. It is concluded, therefore, that the liver must act humorally in regulating the kidney activity.

S. MORGULIS

**The protein metabolism of organs of animals living under reduced pressure.** H. ANGELESCU. *Biochem. Z.* 209, 236-9(1929).—The protein catabolism of spleen, heart, liver and muscle proceeds further under the influence of O<sub>2</sub> want than normally. The total N was 2-7% less, while the total non-protein N was 9% greater in heart or muscle, and 100% higher in spleen and liver under the greatest reduction of pressure. The alteration first appears in the spleen, then liver and in heart or muscle only under condition of extreme reduction of atmospheric pressure.

S. MORGULIS

**Experimental studies on blood ammonia.** SUGIZO KARAZAWA. *J. Biochem. (Japan)* 10, 389-94(1929).—The highest NH<sub>3</sub> content in dogs is found in the blood of the kidney vein, then in the inferior vena cava, while the blood from the aorta and of the neck arteries contains much less NH<sub>3</sub>.

S. MORGULIS

**Studies on the behavior of cholesterol within the animal body. II. The content of free and ester cholesterol in various tissues of normal rabbits.** JINYE ONIZAWA. *J. Biochem. (Japan)* 10, 409-11(1929); cf. *C. A.* 23, 1658.—The free cholesterol content of many tissues is almost const. Even in a few tissues with great variability the free cholesterol varies very much less than the esters, with the exception of the adrenal gland. The cholesterol esters of normal organs are subject to considerable variation. However, some tissues are invariably rich and others almost lacking in cholesterol esters. Then adrenal glands contain more than 5%; spleen, liver and kidney more than 0.5%; skin, testicles, diaphragm and brain more than 0.01%; while lung and heart contain less than 0.01%. The variations in both free and ester cholesterol are especially great in blood

plasma. Furthermore the cholesterol content is greater in the fall and winter than in the spring and summer. III. The influence of various autonomous nervous poisons on the content of cholesterol in each organ and tissue. *Ibid* 413-24.—Only drugs acting upon the sympathetic nerve have a marked effect on the free cholesterol content of tissues. Adrenaline raises the free cholesterol in nearly all tissues, this effect being completely annulled by previous treatment with ergotoxin, although ergotoxin injected alone tends to increase the tissue-free cholesterol. This is attributed to the fact that ergotoxin has an excitatory effect upon the sympathetic only for 90 min., producing paralysis later. It is pointed out that in these expts. the adrenaline was injected 3 hrs. after the ergotoxin, when its paralyzing effect has already been evoked so that the adrenaline action was completely suppressed. IV. The role of thyroid gland in the content of cholesterol in each organ and tissue. *Ibid* 425-34.—Extirpation of the thyroid gland has only a slight effect on the free cholesterol content of tissue. The cholesterol ester content also remains unchanged except in the adrenals and in the blood plasma where it increases noticeably. S. MORGULIS

Allantoin in dog bile. SHIGEO YOSHIMURA. *J. Biochem. (Japan)* 10, 435-42(1929).—Under usual conditions the uric acid content of the bile in dogs is 0.55% of the urinary uric acid, and even when uric acid is given either intravenously or *per os* it only increases to 2.3 and 1.3%, resp. However, allantoin is found in the bile in large amt. (18.9 mg. %, or in the av. the daily elimination is 14.3 mg.). The administration of uric acid causes a great increase in the bile allantoin, and the elimination may even reach 98.2 mg. per day. Following P poisoning the allantoin excretion both in the urine and bile diminishes to about half. S. MORGULIS

The fate of hippuric acid in the chicken organism. MASAO TAKAHASHI. *J. Biochem. (Japan)* 10, 457-61(1929).—Hippuric acid fed to chicken can be recovered to the extent of 90% in the excreta while 10% is found in the form of benzoic acid. The hydrolysis takes place more effectively in the kidney than in the liver or muscle. Benzoic acid was also found when the kidney was perfused with blood contg. hippuric acid. S. M.

Biochemical studies on the auriculoventricular junctional system of the heart. I. The glycogen content. KAGEYU YAMAZAKI. *J. Biochem. (Japan)* 10, 481-90(1929).—The glycogen content of the Tawara bundle of the horse and ox heart was detd. quantitatively. It was greater than the glycogen content of the heart muscle. S. MORGULIS

Physiological ontogeny. A. Chicken embryos. XIV. The hydrogen-ion concentration of the blood of chicken embryos as a function of time. A. E. COHN AND A. E. MIRSKY. *J. Gen. Physiol.* 12, 463-8(1929); cf. *C. A.* 22, 1799.—The H-ion concn. of the blood of chicken embryos 8-20 days old was studied by means of glass electrodes. At the beginning of this period the blood is acid ( $p_H$  6.92), at the end of the period alk. ( $p_H$  7.30). This initial reaction is probably characteristic of rapidly growing tissues. As the curve of change of  $p_H$  under these conditions resembles the curve of  $O_2$  consumption under similar conditions, it is suggested that the changes in  $p_H$  may indicate change in metabolism. C. H. RICHARDSON

Ethyl alcohol in urine and its significance. SEI OTANI. *Chiba J. Med. (Japan)* 6, 1715-43(1928).—The urine of healthy nurses, 16-27 yrs. old, who have never drunk, contains 0.01701-0.00559 vol. per mille (mean of 42 cases 0.01114 vol. per mille) of EtOH, while it is not found in the feces. Reference to the literature indicates that 2 cc. of EtOH is formed in the human body in 24 hrs. In many kinds of illness no remarkable change in EtOH formation is observable. In liver diseases the production greatly increases, the max. sometimes attaining 0.02898 vol. per mille (av. 0.01452 per mille). In tuberculosis there is also an increase due to the imperfect excretion from the lungs and not to the increase in the production within the body, as is the case in some liver diseases. In diabetes and other kidney diseases there is also an increase. K. SOMEYA

Gastric lipase in healthy babies fed with mother's milk. KUMATARO GONDO. *Nagasaki J. Med.* 6, 681-95(1928).—The gastric lipase was measured by the Rona-Michaelis method with 10 babies 45 days to 1 year old. G. took into consideration the fact that the human milk has a marked lipase action while cow milk has not. After giving milk the lipase action increases with the lapse of time, but the individual variation is fairly large. In 3 hrs. after giving milk the action is invariably intense and the individual variation is also small. K. SOMEYA

The nitrogen content of the bile and its relation to the nitrogen content of urine. SHIGEO YOSHIMURA. *Nagasaki J. Med.* 6, 740-75(1928).—Although there is a marked fluctuation of the bile taken from the bile bladder of a dog by means of a fistula, the approx. av. is: residual N 8.45 mg. (accumulated in 1 day), 32.44% of which is urea, 25.35% allantoin, 6.7% amino N, 4.37%  $NH_3$  N, 0.88% creatinine N, 0.28% uric acid N. Comparing these quantities with those excreted in the urine, Y. found in urine urea 0.9%,

$\text{NH}_3\text{N}$  10%, uric acid 0.55%, allantoin 2.40%,  $\text{NH}_3\text{N}$  8.10% and total creatinine N 2.-20%. Urea and uric acid given perorally go into the bile. In P poisoning, urea and allantoin in the bile decrease while  $\text{NH}_3$  and uric acid increase. There is no remarkable change in the residual N (70.9 mg. accumulated in 1 day); it corresponds to 1.5% of the total N.

K. SOMBYA

**Influence of pyruvic acid and acetaldehyde upon the iodic acid value of the blood serum of hungry animals.** TEISHI SUGITA. *Osaka J. Med.* 28, 151-64 (1929).—When 5 g. of  $\text{AcH}$  is given per kg. of the wt. of a dove or a dog to which no food has been given for 8 days and whose serum iodic acid value has become markedly high, the iodic acid value of the blood increases more in 1-2 hrs. and then gradually decreases. With 2.5 g. for every kg. there is no initial rise but a decrease from the outset. When pyruvic acid is given the same phenomenon can be made to take place more rapidly.  $\text{AcH}$  in such a quantity as causes no narcotic action has no influence, from which S. concludes that although the intermediate product of the sugar metabolism can accelerate the complete combustion of the product of the incomplete combustion which has been accumulated in the blood, its accelerating action is inferior to that of sugar, while such a lower oxidation product as  $\text{AcH}$  has no accelerating action.

K. SOMBYA

**Metabolism of nerves.** W. O. FENN. *Medicine* 7, 433 (1928).—A review.

H. G. WELLS

**Comparison of the manner of excretion of neutral red and phenol red by the frog kidney.** JEAN OLIVER AND ESHREF SHEVKY. *J. Exptl. Med.* 50, 15-29 (1929).—Phenol red is excreted chiefly by the perfused frog kidney through the glomerulus, while neutral red is excreted through the tubules. Some slight excretion of each of these dyes by the converse mechanism is possible, although there is no evidence in the expts. that necessitates such a conclusion. The importance of methods leading to the production of a normal vol. of urine by the perfused kidney is emphasized.

C. J. WEST

**Cause of the change in the urinary constituents due to the partial closure of the ureter.** JURO KAWASOE. *Proc. Imp. Acad. (Japan)* 5, 257-9 (1929).—When the Tamura method is applied to the Japanese toad, the amt. of  $\text{SO}_4$  excreted from the tubules is comparatively small, regardless of whether  $\text{SO}_4$  had been injected into the animal or not; but the relative concn. of  $\text{SO}_4$  was higher in the urine excreted under pressure. In a moist condition, when the glomerular circulation was retarded and was of a pulsatory nature, the total amt. of each urinary constituent was diminished considerably; the diminution of Cl was larger than that of  $\text{H}_2\text{O}$  while  $\text{SO}_4$  diminished less than the latter. When the glomerular circulation was not much impaired and of a non-pulsatory nature, the total amt. of each constituent did not diminish as much; in this case  $\text{SO}_4$  diminished slightly less than  $\text{H}_2\text{O}$ , while Cl was considerably larger than that of the other 2. In an arid condition, the diminution of  $\text{H}_2\text{O}$  was definitely higher than that of  $\text{SO}_4$ . Thus the cause of the changes in the urinary constituents, when excreted against a higher pressure, is to be attributed to the changes in glomerular circulation, resulting in the diminution of the sp. physiol. filtration of the glomeruli.

C. J. WEST

**Blood cholesterol: after fasting and after cholesterol ingestion.** G. W. PUCHER AND G. E. SLV. *Bull. Buffalo Gen. Hosp.* 7, 10-4 (1929).—The blood cholesterol of the same individual even under controlled conditions varies from day to day to almost as great an extent as that of different individuals. In 4 of 6 expts. there was a small rise in blood cholesterol after the administration of cholesterol. Cream alone does not increase the blood cholesterol but cream and cholesterol have an effect similar to that of pure cholesterol.

R. C. WILLSON

**Amylase concentration in normal urine.** WALTER BREM MAYER AND HAROLD FINKELSTEIN. *Bull. Johns Hopkins Hosp.* 45, 105-7 (1929).—Detns. in the same individual, apparently normal, over a period of 2 months varied from 0.8 to 8.8 units (amylase) per cc. urine. The daily variation in the same individual was 1.4-5.7 units. Amylase concn. in 24-hr. specimens from another subject varied from 7.4 to 12.3 units. There was no deterioration in amylase concn. when specimens were kept overnight at 4° with and without toluene.

R. C. WILLSON

**Influence of thymus on cholesterol metabolism in early childhood.** G. A. PIANA. *Clin. pediatrica* 11, 217-28 (1929); *J. Am. Med. Assoc.* 93, 243.—After the thymus gland was removed from young animals, the cholesterol content of the blood increased from  $\frac{1}{4}$  to  $\frac{1}{2}$  in the first 24 hrs., and in the surviving animals subsequently returned to normal. The extirpation of the thymus results in an increased production of adrenaline, which in turn produces an increase of cholesterol mobilized from the tissues and the suprarenal cortex. It appears that the removal of the thymus checks the normal processes of cholesterol destruction.

R. C. WILLSON

**Hormone of anterior lobe of pituitary (Prolan).** B. ZONDEK. *Zentr. Gynäkol.* 53,

834-48(1929); *J. Am. Med. Assoc.* 93, 247.—Prolan is modified at 60° and is quickly destroyed by strong acid or alkali. It is dialyzable, sol. in H<sub>2</sub>O, insol. in ether and is pptd. by alc. and acetone. Given to mature female rabbits it produces marked congestion and hypertrophy of all the organs of reproduction. In young male rabbits it causes an increased growth of the genital apparatus.

## G—PATHOLOGY

H. GIDEON WELLS

Significance of cholesterol in the formation of gall-stones. S. HANSEN. *Acta Chir. Scand.* 67, 483-542(1927).—A critical discussion.

B. C. A.

Protein and energy economy in pancreatic diabetes of dogs. E. ENDERLEN, H. GLATZEL AND PÜ. *Arch. expl. Path. Pharm.* 139, 20-31(1929).—Fever-free, non-infected, depancreatized dogs showed on the av. the following increases: protein metabolism 45%, (28-66%); basal metabolism 12% (3-28%). Respiratory quotients showed no significant deviations from normal.

B. C. A.

The effect of  $p_H$  on the bactericidal power of blood. L. BOEZ. *Compt. rend. soc. biol.* 101, 848-50(1929).—Rabbit blood was adjusted to different H-ion concns. from  $p_H$  5 to 9, then was treated with suspensions of *B. proteus*, *B. dysenteriae* Shiga, *B. typhosus*, *B. paratyphosus* B, *B. anthracis*, *V. cholerae* and *Streptococcus*. After exposures from 1 min. to 8 hrs., bacterial counts were made. B. found that the bactericidal power of whole blood and of plasma is a function of the H-ion concn., the critical zone being approx.  $p_H$  7.20 to  $p_H$  7.40. Above this range, bacteriolysis is great; below it, bacteriolysis is suppressed or prevented.

B. C. BRUNSTETTER

Carotinemia and diabetes. I. M. RABINOWITCH. *Can. Med. Assoc. J.* 18, 527-30(1928).—Of 1014 diabetics 59 showed xanthosis. Since most of the patients were practically on the same diet, diet seemed to be not the only factor. The proportion of insulin patients was high, as was also the incidence of cardio-vascular disease. Insulin-edema was present in 4 cases, hyperglucemia difficult to control with insulin in 11 and raised renal threshold for sugar in 3. Hypercholesterolemia was a marked feature, although this is not easily interpretable. R. considers that xanthosis in diabetes is of clinical importance and suggests an unfavorable prognosis. He believes that a test for it should form part of the routine management of the diabetic. For this test to 3 cc. of plasma add sufficient plaster of Paris to make a paste, and to the paste add 3 cc. of 95% EtOH. Shake for a few min. Then add 3 cc. of petroleum ether (b. 30-50°). Shake 10 min. and then centrifuge. Carotin remains in the upper layer. Remove this to a clean dry test tube. Prep. standards by dissolving oleic acid in petroleum ether. A 10% soln. (giving a color corresponding to the max. amt. of pigment found in the blood of more than 100 normal individuals) is taken as equiv. to 1 unit of pigment. Make up a series of such solns. and compare with the unknown. Diabetics may show up to 5 units.

A. T. CAMERON

The importance of the protein-relations in the diagnostic study of cerebrospinal fluid. V. KAFKA AND K. SAMSON. *Deut. med. Wochschr.* 55, 1122-4(1929).

ARTHUR GROLLMAN

The effect of hydrogen-ion concentration on saponin hemolysis. MEYER BODANSKY. *J. Biol. Chem.* 82, 567-77(1929).—The effect of  $p_H$  and inorg. acids and bases on the saponin hemolysis of dog and human erythrocytes was detd. The resistance of the cells increases with increasing  $p_H$ , reaching a max. at  $p_H$  10.

ARTHUR GROLLMAN

Biochemical findings in a rare case of acute yellow atrophy of the liver. With particular reference to the origin of urea in the body. I. M. RABINOWITCH. *J. Biol. Chem.* 83, 333-5(1929).—In acute yellow atrophy with kidney involvement and anuria, no urea was found in the blood. The other findings did not deviate greatly from the normal except for an hypoglucemia and a very high amino acid N (216 mg. per 100 cc.) in the blood.

ARTHUR GROLLMAN

Studies of serum electrolytes. IV. The chloride and nitrogen balances, and weight changes in pneumonia. F. W. SUNDERMAN. *J. Clin. Investigation* 7, 313-32(1929); V. Urinary electrolyte excretion in pneumonia. J. HAROLD AUSTIN AND F. W. SUNDERMAN. *Ibid* 333-7(1929).

ARTHUR GROLLMAN

Metabolism of chloride and total fixed base in pneumonia and the relation to salt and water retention. T. S. WILDER AND T. G. H. DRAKE. *J. Clin. Investigation* 7, 353-64(1929).

ARTHUR GROLLMAN

Lecithin and streptococcal hemolysin. J. GORDON AND F. R. STANSFIELD.

*Brit. J. Exptl. Path.* 10, 191-3(1929).—Lecithin added to cultures of hemolytic streptococci neutralizes the hemolytic activity. Treatment with ligroin does not remove or destroy hemolysin. The hemolytic activity of streptococcal cultures cannot be restored by treatment with a lecithin solvent (ligroin) after it has once been destroyed by addn. of lecithin.

HARRIET F. HOLMES

**Hypersecretion (gastro-succorhea or Reichmann's disease).** HERBERT J. PATERSON. *Am. Med.* 35, 261-4(1929).—Discussion.

FRANCES KRASNOW

**Blood sugar in trypanosome infections.** P. REGENDANZ. *Arch. Schiffs-Tropen Hyg.* 33, 242-51(1929).—Rats infected with trypanosomes show low sugar only during last stages. Infections of monkeys with *T. rhodesiense* are accompanied by blood-sugar decreases which are independent of the no. of the parasites. In such cases adrena-line administration brings the blood sugar back to normal. The liver is rich in glycogen.

FRANCES KRASNOW

**The occurrence of reducing substances in the stomach contents during gastritis.** NORBERT HENNING. *Arch. Verdauungs-Krankh.* 44, 311-5(1928).—In 35 of 50 gastric-ulcer cases there was no reduction of methylene blue by the contents of the fasting stomach. A rapid decoloration of the dye was obtained in only 5 cases suffering from carcinoma. After administration of coffee (1 case treated with methylene blue), the contents withdrawn at 10 min. intervals were colorless. This is probably brought about by the bacteria present.

FRANCES KRASNOW

**Physicochemical properties of normal and pathological organisms. Application to the tumor problem.** F. VLÈS AND A. DE COULON. *Bull. Natl. Research Council* 69, 262-93(1929); cf. *C. A.* 23, 3509.—A review.

W. D. LANGLEY

**The action of heat on the agglutinins of blood group I.** V. SIRACUSA. *Boll. soc. ital. biol. sper.* 4, 410-2(1929).—The agglutinins  $\alpha$  and  $\beta$  of group I serums are attenuated or completely destroyed if exposed for  $\frac{1}{4}$ ,  $\frac{1}{2}$  or 1 hr. at 60°. If both agglutinins are not destroyed, the one which originally was more active remains.

PETER MASUCCI

**Blood cholesterol studies in cancer. IV. With special reference to other lipid partitions.** WALTER L. MATTICK AND KENNETH W. BUCHWALD. *J. Cancer Research* 13, 157-66(1929); cf. *C. A.* 23, 196.—The partitioning of total fatty acids, lecithin and cholesterol was detd. in the whole blood and plasma of 21 unselected cancer patients and 10 healthy controls while in a post-absorptive state. Values for the corpuscles were calcd. from the data obtained. Results in both the cancerous and control group are tabulated for each of these fractions in whole blood, plasma and corpuscles together with the cell vol. in each case. It would seem that definite normal values are yet to be established and methods standardized in order to furnish a more satisfactory basis for comparison of results of different investigators. This work demonstrates the tendency in cancer to a hypercholesterolemia in the plasma with little change in the corpuscles. Lecithin values fail to show significant changes except for slight lower values in the plasma. Total fatty acids show the most marked changes, being especially higher than normal values in the plasma, with a less but similar tendency in the corpuscles. Thus it would appear in cancer that either fat absorption is increased or the utilization decreased with resulting accumulation of total fatty acids and fats especially in the plasma.

H. G. WELLS

**Factors influencing the precipitation of colloidal lead.** HELEN Q. WOODWARD. *J. Cancer Research* 13, 173-9(1929).—The coagulation of Bredig Pb sols is hastened greatly by rise in temp. Up to 37° it is retarded by the addn. of the strong reducing agents HCHO and glucose, and hastened by H<sub>2</sub>O<sub>2</sub>. HCHO and glucose, when added to Bredig Pb sols, react with part of the colloidal Pb to form sol. compds.

H. G. W.

**Enzyme studies on hemolysis. II. Purification experiments on an amboceptor of hemolysis.** H. v. EULER AND EDWARD BRUNIUS. *Arkiv Kemi, Mineral. Geol.* 10B, 1-6(1929); cf. *C. A.* 23, 2996, 3272.—By using goat blood corpuscles in dogs for the production of amboceptor, and with guinea-pig serum for complement, purification of the amboceptor was attempted by various methods. Pptn. by half-satd. (NH<sub>4</sub>)<sub>2</sub>SO<sub>4</sub> increased its activity 6-fold; this followed by adsorption on colloidal Fe(OH)<sub>3</sub> increased it 15-fold; both of these treatments, followed by adsorption on Al(OH)<sub>3</sub>, increased it 25-fold; repetition of the Fe(OH)<sub>3</sub> treatment increased it 30-fold.

J. J. W.

## H—PHARMACOLOGY

A. N. RICHARDS

**Excretion of bismuth from the human organism.** W. ENGELHARDT. *Arch. Dermatol. Syphilis* 156, 1-42(1928).—Considerable quantities of Bi are excreted in

the feces and urine during treatment of syphilis by Bi preps. Up to 50% is so excreted, most rapid excretion taking place after intravenous injection. Oil suspension are irregularly excreted. B. C. A.

[Physiological] action of sulfur. L. PINCUSSEN AND E. GORNITZKAJA. *Z. klin. Med.* 108, 369-77(1928).—After application of S the sugar, diastase and catalase of the blood are unchanged, but the tributyrin esterase is diminished. B. C. A.

The influence of ergotamine on blood-sugar concentration. L. RIGØ AND L. VESZELSZKY. *Arch. expul. Path. Pharmacol.* 139, 10-3(1929).—See C. A. 23, 2487.

B. C. BRUNSTETTER

The effect of ovarian extracts on the  $p_H$  of the blood. E. IMPARATO. *Compt. rend. soc. biol.* 100, 165-6(1929).—Subcutaneous injections of exts. of the corpus luteum (I) or of follicles (II) or of the entire ovary (III) into rabbits did not affect blood  $p_H$  or alk. reserve except in the case of III, where a decrease from 54.2 to 45.9 was noted. Intravenous injection of I (1.0 cc.) caused an av. drop in  $p_H$  from 7.52 to 7.49, and in alk. reserve from 50.4 to 41.5 (1 hr. after injection). The alk. reserve only was changed after the intravenous injection of II, increasing from 50.3 to 57.2. Intravenous injection of III caused an increased in  $p_H$  (7.50 to 7.54) but a decrease in alk. reserve (59.1 to 50.8).

B. C. BRUNSTETTER

A case of extensive atrophy of the subcutaneous fat following injections of insulin. I. M. RABINOWITZ. *Can. Med. Assoc. J.* 21, 67-8(1929).—A case report, with photographs.

A. T. CAMERON

The use of vitamins A and D and sodium iodide in the pre-operative treatment of Graves' disease. ROY H. FRASER AND A. T. CAMERON. *Can. Med. Assoc. J.* 21, 153-5(1929); cf. Adamson and Cameron. *C. A.* 23, 197.—A combination of vitamins A and D and NaI produces the same beneficial effect as "vitiodum" and as Lugol's solution in the pre-operative treatment of Graves' disease. The vitamins alone appear to be without action.

A. T. CAMERON

The effects of iodine treatment, with and without vitamins, on the basal metabolic rate in exophthalmic goiter. I. M. RABINOWITZ. *Can. Med. Assoc. J.* 21, 156-60(1929).—Analyses of thyroids from normal (autopsy) material and from hyperthyroid patients (tissue removed at operation) showed that the latter are not deficient in I, the amt. present frequently exceeding the normal av. This suggests that lack of I cannot be the only factor responsible for the clinical signs of exophthalmic goiter, in spite of the fact that administration of I (Lugol's soln.) leads to improvement. These and other observations led R. to test the effect of a mixt. of vitamins A and D and iodized jeccoleic acid ("vitiodum") on 12 cases of Graves' disease. The rate of decrease of the basal metabolic rate, as compared with that in 12 similar patients on Lugol's soln., was somewhat greater. It is considered that administration of large amts. of A and D influences the course of exophthalmic goiter, and the various possibilities of the mechanism of the action are discussed.

A. T. CAMERON

A new anesthetic gas: cyclopropane. G. H. W. LUCAS AND V. E. HENDERSON. *Can. Med. Assoc. J.* 21, 173-5(1929).—Expts. on cats and rabbits suggest that cyclopropane is a highly potent anesthetic, 10 to 12% producing deep surgical anesthesia in cats.

A. T. CAMERON

The cardiac hormone. XII. Pharmacological investigations of the cardiac hormone. L. HABERLANDT. *Arch. ges. Physiol. (Pflüger's)* 222, 259-70(1929); cf. C. A. 23, 3504.

ARTHUR GROLLMAN

The vasomotor and secretory reactions of the salivary glands to acetylcholine. P. ANOCHIN AND A. ANOCHINA-IVANOVA. *Arch. ges. Physiol. (Pflüger's)* 222, 478-92(1929).

ARTHUR GROLLMAN

The blood-sugar after the administration of opiates. ARNOLD HIRSCH. *Deut. med. Wochschr.* 55, 1129(1929).

ARTHUR GROLLMAN

Calcium and magnesium relations in the animal. W. P. ELMSLIE AND H. STEENBOCK. *J. Biol. Chem.* 82, 611-32(1929).—Mg administered in large doses to rats did not affect Ca assimilation, the digestive tract being capable of excluding any excess of Mg.

ARTHUR GROLLMAN

Studies on creatine. I. The effect of creatine on the blood sugar. Robert M. HILL AND INEZ H. MATTISON. *J. Biol. Chem.* 82, 679-85(1929).—Creatine administered subcutaneously or *per os* reduces the blood sugar of dogs. Given with glucose, it diminishes the rise in blood sugar. Creatine is apparently non-toxic. II. The effect of creatine administration upon rabbits. W. A. PEABODY AND ROBERT M. HILL. *Ibid* 687-92.—Creatine caused no liver injury, as tested by the glycine method, and in only 1 case did it cause urea retention. The hypoglucemia observed in dogs did not occur in rabbits after creatine administration.

ARTHUR GROLLMAN

The prevention of the tetany of parathyroidectomized dogs. III. Ammonium chloride. ISIDOR GREENWALD. *J. Biol. Chem.* 82, 717-25(1929); cf. *C. A.* 23, 3970.—Administration of  $\text{NH}_4\text{Cl}$  relieved or prevented tetany. There was an increased excretion of P, Na and K. The  $[\text{Ca}^{++}]$  of the blood was sometimes increased while that of the inorg. P was diminished.

ARTHUR GROLLMAN

The action of sodium chloride, ammonium chloride and sodium bicarbonate on the total acid-base balance of a case of chronic nephritis with edema. FULLER ALBRIGHT and WALTER BAUER. *J. Clin. Investigation* 7, 465-86(1929).

A. G.

The effect of potassium salt upon the hyperglucemia. TSURUKICHI HIRAMATSU. *Sei-i-kwai Med. J.* 48, 105-12, Abstract sect. 4(1929).

E. H.

Radium in malignancy. JOSEPH MUIR. *Am. Med.* 35, 404-17(1929).—General discussion centered about the beneficial action of radium.

FRANCES KRASNOW

Effect of iodine and thyroid feeding on the thyroid gland. CHARLES H. FRAZIER and W. BLAIR MOSSER. *Ann. Surgery* 89, 849-56(1929).—Ingestion of I increases the amount of colloid in the gland. Colloid retention compresses the cell lining of the acini. Prolonged I administration may produce a stage of exhaustion in the thyroid of the normal dog. This may be followed by a state of partial recovery. Such administration to human beings with hyperthyroidism produces a similar effect. The effect of desiccated thyroid on the gland is not the same as that of I.

F. K.

Experience with tryparsamide in sleeping sickness. MARK LAUTERBURG. *Arch. Schiffs-Tropen Hyg.* 33, 251-6(1929).—Tryparsamide was beneficial in 66% of the very advanced cases of African sleeping sickness. In infections with *Trypanosome rhodesiense*, this drug does not effect any relief.

FRANCES KRASNOW

Experience with plasmochin. E. STERN. *Arch. Schiffs-Tropen-Hyg.* 33, 273-6(1929).—Plasmochin is very valuable in tropical and subtropical practice. It plays the same role as quinine in being a cure but is more agreeable.

FRANCES KRASNOW

The action of rivanol, yatren and emetine on the intestine. OTTO GESSNER. *Arch. Schiffs-Tropen-Hyg.* 33, 277-81(1929).—Rivanol was slightly toxic (1:20,000); it effected an increase in tone (1:1000) and irreparable contraction in diln. of 1:100. Emetin had a similar effect. Influence was already noticed at a concn. of 1:10<sup>7</sup>, in guinea pigs, 1:10<sup>8</sup> in rats. Yatren showed stimulation in concns. to 1:100. Greater concn. produced injury.

FRANCES KRASNOW

Plasmochin and plasmochin compound in treatment of malaria. MARK FREEMAN. *J. Trop. Med.* 32, 165-9(1929).—These drugs have a specific action on the different malaria parasites. They have a tendency to cause methemoglobinuria and methemoglobinemia. There is an individual limit to plasmochin tolerance.

F. K.

The influence of morphine and like substances on the skin sensory qualities, together with a contribution on morphinism. PAUL HOFER. *Z. Biol.* 89, 21-36(1929).—In all cases there is an acute action of morphine and pantopon on the pain and pressure sense. If the same dose (0.006-0.01 g.) is repeated for several days, the pain sense is finally no longer influenced and greater doses must be used. Warmth and cold are not affected. Like results were obtained with dikodid and eukodal.

FRANCES KRASNOW

Paraldehyde poisoning. ST. BAU. *Deut. Z. ges. gericht. Med.* 13, 337-52(1929).—Chronic paraldehyde poisoning produces effects similar to chronic alcoholism.

F. K.

A case of vernal poisoning. A. SCHRÖDER. *Deut. Z. ges. gericht. Med.* 13, 353-7(1929).—Death was caused by the thrombosis of the sinus longitudinalis.

F. K.

Mercury poisoning. R. N. V. PODROUŽEK. *Chem. Listy* 22, 529-31(1929).—Hg poisoning is more hazardous than Pb; the poisoning remains concealed, and characteristic symptoms are manifested only in later stages of the intoxication. Less than a mg. of Hg vapor per cu. m. of air is considered dangerous. This concn. may be produced by open manometers, gas pipets, tensiometers, Hg cups and contacts used in lab. Symptoms and diagnoses are discussed.

FRANK MARESH

Pharmacological studies on japaconitine A and japaconitine B. R. BENIGNI. *Boll. soc. ital. biol. sper.* 4, 399-400(1929).—When injected intravenously into warm-blooded animals in doses of 0.009 mg. per kg. body wt., both drugs modify the intensity and frequency of respiration. Doses 10 times as large stop the heart and respiration. In cold-blooded animals (frogs) the symptomology is mostly peripheral. On the isolated heart of the frog, japaconitine A in a diln. of 1:20,000,000 produces effects which are characteristic of aconitine in general, while japaconitine B has a specific action in a diln. of 1:5,000,000 to 1:1,000,000. On the isolated mammalian heart, doses of 0.1 to 0.5 mg. are very toxic—the action being mostly systolic. The m. l. d. of both drugs is between 0.06 and 0.05 mg. per kg. body wt. for warm-blooded animals and 0.44 mg. per kg. body wt. for frogs.

PETER MASUCCI

The influence of histamine hydrochloride on the number of leucocytes. G. RUGGERI. *Boll. soc. ital. biol. sper.* 4, 415-7(1929).—Histamine produced a definite leucocytosis; in certain animals this was preceded by a leucopenia analogous to that caused by the ingestion of HCl.

PETER MASUCCI

Studies on the isolated uterus: the action of glucose. MARIANO MESSINI. *Boll. soc. ital. biol. sper.* 4, 421-3(1929).

PETER MASUCCI

Studies on the isolated uterus: the action of tri-sodium citrate. M. MESSINI. *Boll. soc. ital. biol. sper.* 4, 418-21(1929).

PETER MASUCCI

Pharmacological studies on certain derivatives of pyrrole. V. The antithermic and antipyretic action of pyrrole and of pyrrolalkyl ketones. ANGELO RABBENO. *Boll. soc. ital. biol. sper.* 4, 429-32(1929); cf. *C. A.* 23, 3978.—The general action and toxicity of pyrrole and its derivs. are described. The min. antithermic dose of pyrrole is 0.5 millimol. The lowering of the temp. is slight and transitory. With a dose of 1-2 millimol. the lowering is more intense and persists for hrs. With lethal doses, if death is rapid, the fall in temp. is continuous and precipitous; if death is delayed for a few hrs., the intense hypothermy may be followed by a transitory rise to normal temp. In rabbits rendered hyperpyretic by intravenous injection of a mixed vaccine, the fever is either checked or abolished. The derivs. of pyrrole have the same antithermic and antipyretic action in doses which do not produce narcosis. With acetylpyrrole the antithermic action prevails over the narcotic; with 0.004 g.-mol. the lowering of temp. is  $-2.4^{\circ}$ . The min. antithermic dose of the Ac deriv. is 0.0013 g.-mol. per kg.; of the benzoylpyrrole 0.00029 g.-mol. The propylpyrrole acts on the temp. and also causes narcosis; butylpyrrole produces only a lowering of temp. The pyrrole derivs. have the property of breaking up or abolishing the pyrexia in rabbits injected with a mixed vaccine and their activity is comparable to acetanilide, pyramidone and acetylsalicylic acid.

PETER MASUCCI

The action of cocaine hydrochloride on the nerve trunk. Comparison of the action on the sensory fibers and that on the motor fibers. JEAN RÉGNIER. *Bull. sci. pharmacol.* 36, 401-7(1929).—In different fibers of different nerves, the chronaxie decreases considerably at first, when increasing doses of cocaine are given; further doses produce a comparatively small decrease. All the curves differ only by a const.

A. E. MEYER

The action of the derivatives of phenylquinoline on the liver. J. MOUZON. *Presse méd.* 36, 1256-7(1928).

A. E. MEYER

The cholesterol esters in antibacterial therapy. JUAN A. SÁNCHEZ. *Semana méd.* (Buenos Aires) 35, 443-5(1928).—Free cholesterol is worthless in subcutaneous application. The palmitate and oleate are recommended.

A. E. MEYER

The therapeutic use of cholesterol esters. JUAN R. GOYENA. *Semana méd.* (Buenos Aires) 35, 882-7(1928).—A case of successful use against pleurisy is reported.

A. E. MEYER

Chlorine in the regulation of the acid-base equilibrium in blood. JUAN R. GOYENA. *Semana méd.* (Buenos Aires) 35, 1162-5(1928).—Intravenous injections of NaCl soln. reduce the alk. reserve in the plasma; the Cl content is higher. The ingestion of NaCl increases the alk. reserve; the Cl content remained unchanged.

A. E. MEYER

Acute poisoning caused by a tincture for shoe dyeing. LUIS E. ALCAYAGA AND A. BERCOVICH. *Semana méd.* (Buenos Aires) 36, 642-8(1929).—A soln. of an aniline dye in 75% alc. absorbed from wet shoes caused bluish color over the whole body and blue vision (cyanopsia) but no important subjective symptoms. A general review of dye poisoning is given.

A. E. MEYER

The treatment of pulmonary tuberculosis with metals in very small doses by the method of Walbum. GUMERSINDO SAYAGO AND ALBERTO MARSAL. *Semana méd.* (Buenos Aires) 36, 648-51(1929).—The catalytic action of certain metals, as Au, Cd, Al, etc., stimulates the formation of antitoxins.

A. E. MEYER

Pharmacodynamics of the colloids, rare earths and radioactive substances. SIMON LIBEDINSKY. *Semana méd.* (Buenos Aires) 36, 748-56(1929).—Colloidal Ag produces leucocytosis; it is fixed in the liver producing an increase of the destructive power of the liver secretions against streptococcus and pyocyanus toxin. The agglutination and the opsonic index are increased. Se and colloidal metals have a favorable influence on the enzymes and the globular stability. They affect leucocytosis and elimination of uric acid. Metals of the Ce group produce a slight increase of the red, and an enormous increase of the white corpuscles without any bodily disorder. Radioactive substances are deposited in the bones and the bone marrow and to a lower extent in the spleen and the liver. Rn has a special affinity to the suprarenal gland. The affinity to the tissues is in direct relation to their content in nucleinic P. An elective affinity exists to

embryonal and cancer cells. In cancer treated with Ra the nuclear P decreases. The radioactive substances are fixed in the protoplasm by the elec. charges of the colloidal particles. The effects of small doses are: stabilization of the globulins, hyperleucocytosis, polyglobulia and stimulation of the secretion of adrenaline and uric acid. High doses produce destruction of the hematopoietic organs, decrease of the red and white cells, of the blood pressure and its coagulability, injuries in the liver lungs, bone marrow and kidneys. Rn is eliminated by the lungs; the other substances by the urine, saliva and through the intestine. The therapeutic results in cancer, anemia and leucemia are incomplete; in gout they are satisfactory. Also in *Rev. farm.* (Buenos Aires) [2], 2, 350-69(1929).

A. E. MEYER

**Therapeutics with metal salts in pulmonary tuberculosis.** N. LUNDE. *Semana méd.* (Buenos Aires) 36, 771-5(1929).—The use of Mn, Be, Cd and sanocrysin and their effect is reported.

A. E. MEYER

**The mechanism of morphine habituation.** ROBERT A. HATCHER AND HARRY GOLD. *J. Pharmacol.* 35, 257-79(1929).—Morphine was found in the blood of normal or habituated animals in traces only when exsanguination was begun after an interval of more than 5 min. from the time of injection. The amt. of morphine found in tissues was variable, although skeletal muscles and kidneys contained it in greatest amt. There appeared to be no essential differences between the amt. in tissues of normal and of habituated animals. The liver of habituated animals, when perfused with fluid contg. morphine sulfate, had no greater power to destroy morphine than the liver of normal animals so perfused. Different animals showed great individual variations in the amt. of morphine excreted in the urine and in the rate of excretion. No evidence was found that the organs or tissues of habituated animals have a greater capacity for destroying morphine than those of normal animals.

C. RIEGEL

**Concerning the antipyretic properties of benzyl benzoate.** DAVID I. MACHT AND HARRIET P. LEACH. *J. Pharmacol.* 35, 281-90(1929).—Aq. suspensions of benzyl benzoate administered to normal rabbits by stomach tube did not cause fall in body temp. When given to rabbits whose temp. was above normal because of infection, peptone injections or injections of hay infusion, the lowering of temp. was marked. Much less effect was noted after the fever produced by injections of cocaine, atropine,  $\beta$ -tetrahydronaphthylamine, caffeine or after heat puncture. Perfusion of frog lower extremities or of a rabbit ear, with fluid contg. benzyl benzoate, caused vasodilatation. It is concluded that benzyl benzoate has no marked depressant or narcotic action on the brain, but produces fall in temp. because of a greater dissipation of heat through dilatation of blood vessels.

C. RIEGEL

**The action of adrenaline on the respiratory center, with remarks upon the treatment of severe respiratory depression.** CARL F. SCHMIDT. *J. Pharmacol.* 35, 297-311(1929).—Production of apnea following injection of adrenaline is due to increase in cerebral blood flow because: (1) if the brain of a cat is perfused via the vertebral arteries, the addn. of adrenaline causes marked rise in systemic pressure but perfusion pressure is not raised and respiration is only slightly depressed, whereas, when the carotids are opened, typical adrenaline apnea occurs; (2) when const. blood flow through cerebral vessels is maintained, adrenaline does not produce apnea. Evidence is presented against the theory that adrenaline apnea is the result of direct cerebral depression, or of acute anemia of the respiratory center. Reflex inhibition is thought to be a factor. Adrenaline may stimulate respiration when it is markedly depressed, as after morphine. This is attributed to improvement in oxygen supply to the center through augmented blood supply.

C. RIEGEL

**A comparative study of new ether derivatives of barbituric acid.** FRANK P. UNDERHILL AND OSCAR R. JOHNSON. *J. Pharmacol.* 35, 441-8(1929).—The effect of the following compds. administered to white mice was studied: (1) ethyl(benzyloxymethyl)-barbituric acid, (2) ethyl(ethoxymethyl)barbituric acid, (3) ethyl(butoxymethyl)-barbituric acid, (4) ethyl(methoxymethyl)barbituric acid, (5) ethyl(propoxymethyl)-barbituric acid, (6) ethyl(isobutoxymethyl)barbituric acid. Nos. 2, 3 and 5 produced no narcosis. Nos. 1, 4 and 6 produced narcosis, but with 4 and 6 paralysis of the hind legs resulted also. No. 1 approached barbital most closely. The m. c. d. was 150 mg. per kg.; the m. t. d. 200 mg. per kg., and the m. l. d. dose 225 mg. per kg. For barbital, these doses were, respectively, 200 mg., 350 mg. and 400 mg. per kg. C. R.

**The influence of some salts on the secretory capacity of the gastric glands.** I. RAZENKOV. *Russ. physiol. J.* 9, 75-86(1926); *Chem. Zentr.* 1929, I, 257-8.—Distd.  $H_2O$  and 0.025 N solns. of NaF, NaCl,  $Na_2CO_3$ ,  $Na_2HPO_4$ ,  $NaH_2PO_4$  and  $Na_2SO_4$  were introduced into the stomach of a dog with an "isolated small ventricle." NaCl produces a smaller, NaF a greater, secretion of gastric juice than does  $H_2O$ . With the salt

concn. doubled ( $\text{Na}_2\text{CO}_3$ ,  $\text{Na}_2\text{SO}_4$  and  $\text{NaF}$ ) the secretion is increased from 2.8 to 3.7, from 3.6 to 4.6 and from 6.2 to 12.1, resp. K salts inhibit the secretion almost completely.  $\text{Na}_2\text{SO}_4$  produces secretion of mucus only. Anions as well as cations are of influence on the activity of the stomach; univalent anions cause secretion of gastric juice, while bivalent anions cause secretion of mucus. G. SCHWOCH

Quantity of cholesterol in the rabbit given lecithin. C. KAMEDA. *Osaka J. Med.* 28, 35-66(1929).—When 0.5-1 g. per day of lecithin is given mixed with the ordinary vegetable food of the rabbit, there appeared an increase in wt. of the animal, the increase reaching a max. in 20-30 days, and then decreased afterward. When the same substance is subcutaneously injected, the quantity of cholesterol in blood also increases, the increase apparently reaching a max. in 6-9 hrs. K. SOMEYA

Influence of insulin upon the formation of hippuric acid. SHINZO SAKATA. *Osaka Med. Coll. Osaka J. Med.* 28, 189-94(1929).—When insulin is injected into a rabbit fed with ordinary vegetable food, it slightly increases the excretion of hippuric acid. K. SOMEYA

Fluctuation of the cholesterol content due to the vegetable stimuli. III. C. KAMEDA. *Osaka Med. Coll. Osaka J. Med.* 28, 335-50(1929).—When 20-50 mg. of choline is injected subcutaneously into a rabbit, the amt. of cholesterol in the blood generally decreases, the decrease being the more marked the larger the quantity injected. With 0.2-0.5 mg. of atropine sulfate, the corresponding decrease is slight. When choline chloride and adrenaline, or pilocarpine and insulin is used in combination, the actions of both of the injected substances appear independently. K. S.

The modalities of the action of cocaine. L. HALLION. *Rev. prat. biol.* 21, 321-31 (1928).—The physiol. effects of cocaine are discussed in detail, showing that its action is exerted upon all living matter; however, with less and less differentiated animals and plants, one finds that the quant. sensibility toward cocaine is gradually decreasing, while in qual. respects its action gradually reverses itself in such a manner that the paralyzing action becomes more and more predominant over the stimulating action. G. TOENNIES \*

Dermatological use of titanium oxide. B. L. MEREDITH and W. G. CHRISTIANSEN. *J. Am. Pharm. Assoc.* 18, 607-8(1929).—A specimen of  $\text{TiO}_2$  was found to be free from foreign metals except traces of the Sn group. Ointments were prepd. with paraffin and white petrolatum as bases. The ointments had no greater antiseptic value than the vaseline control. Scarified areas were treated with  $\text{TiO}_2$  ointment,  $\text{ZnO}$  ointment and  $\text{TiO}_2$ . The areas healed more rapidly than the untreated controls. The ointments were more effective than the powder. No irritation resulted when  $\text{TiO}_2$  was applied to the skin of normal rabbits for 15 days. L. E. WARREN

The mineral waters of Rosheim. Analytical and therapeutical study (LEGIN, SCHIRARDIN) 14. The peroxidase activity of mineral waters; the numerical measurement of this activity (MOUGNOT) 14. Activity of mineral springs (HARPUDE) 14. Chaulmoogrylamino phenols and chaulmoogrylbenzylamine (DE SANTOS, WEST) 10.

## I—ZOÖLOGY

R. A. GORTNER

Histochemistry of the insect skeleton. W. KÜHNELT. *Zoöl. Anz.* 75, 111-3 (1928). B. C. A.

Oxidation-reduction potential in larvae of *Galleria mellonella*. E. AUBEL and ROBERT LEVY. *Compt. rend. soc. biol.* 101, 756-7(1929).—Larvae injected with the following dyes, then stored in  $\text{N}_2$ , decolorized at a rate inversely proportional to the  $r_H$  of the dye: cresyl blue, 20 min.; methylene blue, 25 min.; Nile blue, 45 min.; cresyl violet, 60 min. There was no decolorization of Janus green or neutral red. Larvae decolorized in  $\text{N}$  recolored instantly in air. The  $r_H$  of the blood and tissues of larvae in  $\text{N}$  is about 7. Larvae injected with the above dyes did not decolorize in air, but when injected with 2,6-dibromophenolindophenol, the dye was reduced almost instantly. Partial reduction in air occurred after the injection of 1-naphthol-2-sulfonate-indophenol. The  $r_H$  of the blood and tissues of larvae under normal conditions is about 20. B. C. BRUNSTETTER

Pigment of *Arbacia* egg as an indicator of intracellular  $p_H$ . FRED VLAS and EDMOND VELLINGER. *Bull. inst. océanograph* 513, 1-16(1928); *Biol. Abstracts* 2, 891(1928).—The egg of *Arbacia* contains a pigment which in alc. ext., or in mashed eggs, presents spectral variations correlated with  $p_H$  which can serve as an indicator; this pigment is orange, with a band at  $\lambda 495 \text{ m}\mu$  below  $p_H$  4; yellow with 2 bands ( $\lambda 485$  and  $518$ ) above  $p_H$  6; violet with 3 bands ( $\lambda 495$ ,  $515$ ,  $548$ ) between  $p_H$  4 and 6. The microspectra

of the entire egg show that its pigment corresponds to an intermediate stage between 5.2 and 5.9; a microspectrophotometric examn. of the egg bears out these data. There exist, therefore, in the egg of *Arbacia* certain points of which the physicochemical equilibria may be equiv. to a  $p_H$  of  $5.5 \pm 0.3$ .  
H. L. D.

Chemical study on the sperm of the marine animal. I. MAKOTO YAMAGAWA, HIDE Nobu MIKAWA AND TETSUO TOMIYAMA. *J. Imp. Fish. Inst. (Tokyo)* 22, (2) 30-1 (1926); *Biol. Abstracts* 2, 975.—Analyses are given for the cystine and tryptophan content of the milt of 13 varieties of fish identified by Japanese names. The arginine, histidine and lysine values are also given for 4 more varieties. II. The nucleic acid in bonito testis. MAKOTO YAMAGAWA AND TAKESHI ITO. *Ibid* 32-3; *Biol. Abstracts* 2, 975. III. The sperm of the sardine, *Amblygaster immaculatus*. MAKOTO YAMAGAWA AND BUNJI IBUKA. *Ibid* 33-4; *Biol. Abstracts* 2, 975.—The compd.  $C_{40}H_{54}N_{11}O_6 \cdot 2HCl + PtCl_4$  was prepd. from the sperm of *A. immaculatus*. The authors propose name "Amblygine" for the related protamine. A new histone ( $C_4H_{10}N_3SO_3$ ) and a new nucleic acid ( $C_{48}H_{88}N_{11}P_4O_{10}$ ) are also described.  
H. L. D.

The inorganic composition of the body fluids of the Chelonia. HOMER W. SMITH. *J. Biol. Chem.* 82, 651-61 (1929).—The perivisceral and pericardial fluids of turtles are alk. secretions whose  $[HCO_3^-]$  may be 2 or 3 times that of the blood plasma. Analyses of the Na, K, Ca, Mg, Cl,  $SO_4$ ,  $PO_4$ , total base, total anions and  $p_H$  of these fluids as well as of the bile, of several species of turtles, are given.  
ARTHUR GROLLMAN

The blood chemistry of two species of rattlesnakes, *Crotalus atrox* and *Crotalus oregonus*. JAMES M. LUCK AND LEONARDE KEELER. *J. Biol. Chem.* 82, 703-7 (1929).—The bloods of rattlesnakes contained only traces of urea; amino acids and inorg. P were present in greater quantities than in mammalian blood; reducing sugar and cholesterol were low; and  $[Cl^-]$  was high. The non-protein N, creatine, creatinine and lipid P values were of the same order of magnitude as those in mammalian blood.  
ARTHUR GROLLMAN

The influence of hemocyanin on the distribution of chloride between sea water and the blood of *Limulus polyphemus*. GILES W. THOMAS. *J. Biol. Chem.* 83, 71-7 (1929).—The concn. of chloride in the serum of *Limulus polyphemus* is 0.953 times the concn. of chlorides in sea water estd. on the basis of the total vol. of soln. and 0.981 times estd. on the basis of the  $H_2O$  in serum and sea water. The Donnan equil. due to hemocyanin of the serum will account theoretically for a considerable part of the difference in concn.  
A. P. LOTHROP

Urea content of frog muscle. JÓSEF HELLER. *Biochem. Z.* 209, 74-8 (1929).—Expts. show that the muscle urea does not take part in the traumatic  $NH_3$  production. *R. temporaria* has a much higher urea content in the muscle than *R. esculenta* (av. 29.2 and 7.2 mg. %, resp.).  
S. MORGULIS

Studies on the chemical embryology of reptiles. VIII. Behavior of ovomucoid and choline in the development of the sea turtle egg. MASAJI TOMITA AND MASAO TAKAHASHI. *J. Biochem. (Japan)* 10, 443-9 (1929); cf. *C. A.* 23, 3515.—The ovomucoid constitutes quantitatively the largest component of the org. matter of the egg. In the fresh egg the ratio to total org. matter was found 1:3.1, but diminishes to 1:6.1 at 15 days of incubation but increases again at later stages. The results of elementary analyses of the ovomucoid obtained at different stages show certain differences in compn. The free choline is very small in quantity as compared with the total, which diminishes greatly at the end of 45 days of incubation.  
S. MORGULIS

The behavior of the hexone and purine basis which are present in the free state during incubation of the chick egg. MASAO TAKAHASHI. *J. Biochem. (Japan)* 10, 451-5 (1929).—Purine bases are produced during the incubation of the chick egg. The free histidine content of the egg is only about 0.1 mg. but it increases during incubation to 0.38 mg. The arginine is found in much larger amt. (1 mg.) and likewise increases during the incubation. Free lysine is present in the amt. of 6 mg. and increases much more rapidly during the late stages of the development, reaching a max. after 19 days, when its content is 27.4 mg.  
S. MORGULIS

The bionomics of some tree-hole mosquitoes. MARY V. F. BEATTIE. *Bull. Entomol. Research* 20, 45-58 (1929).—In studying the bionomics of mosquitoes which live in the water in rot-holes of beech trees, the water was subjected to physical and chem. analysis including temp.,  $p_H$ , dissolved  $O_2$ ,  $NH_3$ , N, albumoid N, total org. N, total volatile and fixed solids. Larvae of *Anopheles plumbeus* were found in rot-hole water at all times of the year. Total org. N is believed to be an important factor in the life in the rot-hole; it probably aids the female mosquito in her choice of a place for oviposition. The relation of the microorganisms in the water to the nutrition of the larvae is discussed.  
C. H. RICHARDSON

The respiratory exchange of the honey bee. G. H. VANSSELL. *J. Econ. Entomol.* 22, 517-8(1929).—A short description of expts. on the moisture and  $\text{CO}_2$  discharged from a bee hive. The av. hourly output during the winter was:  $\text{H}_2\text{O}$  1.3 mg.,  $\text{CO}_2$  17.6 mg. During the summer when nectar was being brought into the hive by the bees the resp. hourly figures were: 30.8 mg. and 25.2 mg. av. There was a direct correlation between loss in wt. in winter, temp. of the bee cluster and production of  $\text{CO}_2$ . Frequently, in winter, the amt. of moisture in the hive air was less than that in the outside air, indicating that the bees or the stores (honey, etc.) were absorbing moisture. C. H. R.

Metabolic activity and duration of life. I. Influence of temperature on longevity in *Daphnia magna*. J. W. MCARTHUR AND W. H. T. BAILLIE. *J. Exptl. Zool.* 53, 221-42(1929).—Longevity of this crustacean varied inversely with the temp. between  $8^\circ$  and  $28^\circ$ , the temp. coeff. ( $Q_{10}$ ) being 2.12. The duration of life for males was lengthened  $\frac{1}{3}$  more than that of females by a temp. decrease from  $28^\circ$  to  $8^\circ$  and their  $Q_{10}$  values were 15% greater. The effects of sex and temp. upon longevity suggest that av. duration of life is regulated chiefly by metabolic rates. II. Metabolic rates and their relation to longevity in *Daphnia magna*. *Ibid* 243-68.—Heart rate and susceptibility to KCN in *D. magna* more than doubled with a temp. increase from  $8^\circ$  to  $18^\circ$  and nearly doubled with a further  $10^\circ$  increase. Velocity of aging and velocities of metabolic processes were changed in the same direction and nearly the same degree by changes in temp. The more intense catabolism of males was shown by more rapid heart rate, greater  $\text{CO}_2$  output, greater susceptibility to chem. agents and greater sensitivity to changes in temp. The length of life multiplied by heart rate is approx. a const. "It is not time as such, but the tempo of its life that best measures the rate of aging of an organism." C. H. RICHARDSON

The regulation of adult body size in the protozoan Colpoda. EDWARD F. ADOLPH. *J. Exptl. Zool.* 53, 269-311(1929).—Longer life in *Colpoda* is slightly correlated with larger body size; size of parent was highly correlated with size of offspring. Temp., change of temp., quality and quantity of food and  $\text{O}_2$  tension modified av. size and fission rate.  $\text{O}_2$  consumption was measured. Other biol. data are given. C. H. R.

Oxygen consumption of isolated frog skin under the influence of solutions. EDWARD F. ADOLPH. *J. Exptl. Zool.* 53, 313-25(1929).—Fresh skin from *Rana pipiens* gave an av.  $\text{O}_2$  consumption of 133 cu. mm. per g. (wet wt.) per hr. at  $20^\circ$ . A slight but regular decrease in  $\text{O}_2$  consumption accompanied a decrease in  $\text{O}_2$  tension. The reversible influence of various concns. of NaCl was very small. Rate of  $\text{O}_2$  consumption and rate of passage of water through the skin are not closely related. Effects of time of isolation of the skin, temp. and of various salt solns. are described. C. H. R.

Studies on chemical changes during the life cycle of the tent caterpillar (*Mala-cosoma americana* Fab.) IV. Glycogen. WILHELM RUDOLFS. *J. N. Y. Entomol. Soc.* 37, 17-23(1929); cf. C. A. 23, 441.—The glycogen content of the eastern tent caterpillar changes during the life cycle, the greatest change occurring when the larva is actively feeding. During the transformation of egg to larva the changes in glycogen content are unimportant. Glycogen disappears during the pupal stage, indicating that it plays an important role. Glycogen was present in the leucocytes, muscles, fat glands (bodies) and eggs. C. H. RICHARDSON

Some facts relative to the effect of high-frequency radio waves on insect activity. THOMAS J. HEADLEE AND ROBERT C. BURDETTE. *J. N. Y. Entomol. Soc.* 37, 59-64 (1928).—Various species of insects are killed by exposure to high-frequency waves of 24 meters, 12 million cycles per sec. and 1.75 amp. The lethal effect is due to the development of an internal fatal temp. Nervous reaction increases the rate of producing this lethal temp., the more specialized the nervous tissue the greater is the increase in speed of reaction. 32 compds. and mixts., including carbohydrates, fats, oils, fatty acids, waxes, cholesterol, lecithin, proteins, chitin, charcoal, silica and quartz, all of which are more or less characteristic of living tissues, were subjected to the same high-frequency waves and all showed ability to increase in internal heat. Cholesterol which is characteristic of nervous tissue possessed this ability in marked degree. C. H. R.

## 12—FOODS

F. C. BLANCK AND H. A. LEPPEL

Address of the President (American Association of Cereal Chemists). C. E. MANGELS. *Cereal Chemistry* 6, 334-8(1929).—A historical review of the development of the Assocn., its activities and outlook for the future. L. H. BAILEY

History of food laws. T. G. JOYCE. *Food Manuf.* 2, 315(1928).

J. A. K.

Utilization of microorganisms as human food. R. TAKATA. *J. Soc. Chem. Ind. Japan* 32, 497-510, 544-57(1929); Suppl. Binding 32, 155-8B, 169-72B(1929).—T. investigated the nutritive value of *Aspergillus oryzae*. The dried mycelium of *Aspergillus oryzae*, cultivated on a synthetic medium contg. dextrin,  $(\text{NH}_4)_2\text{SO}_4$ , etc., contains about 38% of protein. When used as the sole source of protein for albino rats, the protein showed certain deficiencies. The digestibility of the dried mold was high enough for the feeding of albino rats. The dried mold is rich in vitamin B (both the growth-promoting and the antineuritic), but does not contain vitamins A and C; the latter is also absent from the expressed juice of the fresh mycelium. Analysis of the dried mold gave:  $\text{H}_2\text{O}$  7.43, protein 34.61, fat 1.81, fiber 7.51% and non-N extractives 40.54%; the ash consisted of  $\text{Na}_2\text{O}$  11.21,  $\text{K}_2\text{O}$  28.16,  $\text{MgO}$  3.88,  $\text{CaO}$  1.95,  $\text{Fe}_2\text{O}_3$  1.65,  $\text{SO}_3$  0.11,  $\text{Cl}$  0.07 and  $\text{P}_2\text{O}_5$  48.55%. From 2 kg. of the dried material the following N bases were isolated:  $\text{NH}_3$  (4.5 g. as chloride), adenine (0.4 g. as picrate), hypoxanthine (0.07 g. as nitrate), histidine (0.05 g. as picrate), betaine (0.1 g. as chloride and 0.15 g. as chloroplatinate) and stachydrine (0.03 g. as chloride). Y. TOMODA

The production of pressed foods from dried beets and molasses. E. SAILLARD. *Suppl. Circ. Hebd.* No. 2081(1929); *Listy Cukrovar. Rozhledy* 47, 36.—A mixt. contg. dried beet slices 75% and molasses 25% is pressed into briquets at a pressure of 120-150 atms. The briquets are hard to break, and after soaking in  $\text{H}_2\text{O}$  they fall apart quite easily and yield a good cattle food. They keep indefinitely when stored dry and save in transportation costs. The measurement of rations is exact and very simple. F. M.

The detection of prohibited vegetable and coal-tar colors in foodstuffs. J. R. NICHOLLS. *Analyst* 54, 335(1929).—Two of the supplementary tests, Nos. 16 and 17, (*C. A.* 22, 120) have proved fallacious. W. T. H.

Improvement of flour. M. VUK AND P. SPANYÁR. *Z. Untersuch. Lebensm.* 56, 292-308(1928).—The effects on the baking qualities of flour of addn. of wheat germ, sugar, dextrin,  $\text{KBrO}_3$ ,  $\text{NH}_4$  persulfate, Na borate, "novadelox" and of treatment with N peroxide and "gologas" (Cl contg. 0.5% of nitrosyl chloride) were studied. Wheat germ improves the baking qualities, but cannot be used because of its effect on color and taste of the bread. Sugar or, to a smaller extent, dextrin is beneficial, but addn. of the above salts gave no definite improvement. Novadelox resulted in improved texture and bleaching, N peroxide in bleaching only, but gologas had a very favorable effect, especially on bread vol. and texture. Gologas is a flour improver rather than a maturing agent, as flour matured by aging can be further improved thereby. Its action appears to be due to the production of acidic protein substances in the flour. B. C. A.

Semi-microchemical method for the determination of gluten in flour. A. C. RÖRTINGER. *Mikrochem.* 7, 106-9(1929); cf. following abstr.—The flour (1 g.) is moistened with two drops of water in a bag of suitable material and, after 30 min., the paste is kneaded until no further starch is removed. The small ball of moist gluten obtained is removed from the bag and dried in an evacuated tube immersed in a water-bath. The wt. of dried material obtained multiplied by 3 gives approx. the wt. of moist gluten obtained in the usual test using 30-40 g. of flour. B. C. A.

Semi-microchemical method for the determination of the gluten content in flour. A. RÖRTINGER AND K. WÖDICH. *Z. ges. Getreidewesen* 15, 140-3; *Chem. Zentr.* 1928, II, 949; cf. preceding abstr.—A device is described, which makes it possible to wash 1 kg. of flour with the same accuracy as in the macrochem. process. The app. is manufd. by Mühlenchemie Ltd., Frankfurt a. M. The mean factor 2.95 was found for changing the dry gluten to wet gluten. G. SCHWOCH

Difficulties in improving Czechoslovakian flours. KAREL KŘTINSKY. *Chem. Listy* 23, 104-7(1929).—Using Cl with  $\text{NOCl}$  or alone is difficult because of the large variety of wheats grown and non-uniformity of the lots entering the mills. A large no. of detns. is necessary for each lot to apply the correct bleach. The supply comes from varied and small peasant holdings and cannot be assumed to have a const. compn. F. M.

The determination of carotin in flour. CHARLES C. FERRARI AND C. H. BAILEY. *Cereal Chemistry* 6, 347-71(1929); cf. *C. A.* 23, 3754.—The tentative method of the A.O.A.C. for detg. the gasoline color value of flour was found unsatisfactory when the ext. was used for spectrophotometric examn., as it was never possible to prep. an ext. entirely free from suspended matter. Filter paper did not remove all of the suspended matter and adsorbed some of the carotin. An unglazed porcelain filter removed the suspended matter but also adsorbed some of the carotin. The most satisfactory results were obtained by using aluminum thimbles having the right porosity and then following a special procedure which is given in detail. A capillary siphon procedure of obtaining the ext. is also described. Results by this method compare favorably with those of the

alundum thimble filtration. The carotin content is given on the moisture-free basis in parts per million as follows: patent flour 4.10, clear flour 4.20, shorts 3.55, bran 6.30 and whole wheat 4.40. It is shown that the coloring matter in bran is unlike the carotin in flour. In straight grade of flours milled from 11 varieties of Canadian wheats the carotin content ranged from 1.94 to 3.40 parts per million. In examg. the various mill streams from the Minnesota State testing mill the first break flour had the lowest carotin content 1.20 parts per million and the fifth break flour the highest 3.15 p. p. m. and the straight grade flour had 2.43 p. p. m. of carotin.

L. H. BAILEY

Report of the Committee on Methods of Testing Cake and Biscuit Flours. MARY M. BROOKE, *et al.* *Cereal Chemistry* 6, 312-20(1929).

L. H. BAILEY

Report of the Committee on Standardization of Experimental Baking Test. C. G. HARREL, *et al.* *Cereal Chemistry* 6, 249-310(1929).—Consideration was given to the Standard Baking Test and its modifications; to a report card for reporting the results of baking, and to reference photographs showing internal characteristics of the loaf; to yeast testing; to ovens; dough thermometers; fermentation bowls; baking pans and loaf-measuring app.

L. H. BAILEY

Change of acidity during storing in bread. L. KARÁCSONYI. *Magyar Chem. Folyóirat* 35, 22-5(1929).—Dctn. of H-ion concn. in bread by means of the electrometric method has shown that acidity does not increase in bread during storing. It shows, on the contrary, a diminishing tendency, which is greater with rye bread and darker wheat bread than with white wheat bread.

S. S. DE FINÁLY

Fermentation in bread making. G. GEUNIS. *Bull. assoc. élèves inst. sup. fermentations Gand* 30, 149-58, 202-13(1929).—Addn. of alc. to  $H_2O$  used in extg. flour appreciably lowers the  $p_H$  value of the ext. and brings it to a point more favorable to fermentation; on the other hand this ext. undergoes an almost abs. buffering at a  $p_H$  value of about 7.0, which is much higher than the optimum for fermentation (5.0). Fermentation lowers the  $p_H$  value, but the variation is not large and depends to a considerable extent on the strain of yeast used; moreover, fermentation considerably increases the buffering. Baking of the fermented dough appreciably lowers the  $p_H$  value, and the exts. are properly and uniformly buffered. Addn. of  $KH_2PO_4$  to the water used in prepg. the dough considerably lowers the  $p_H$  values of the exts. of both the dough and the bread, reducing it below the optimum of 5.0; the bread is very light and of low sp. gr. Addn. of a mixt. of  $KH_2PO_4$  and of  $K_2HPO_4$  does not reduce the  $p_H$  of either the dough or the bread, but stabilizes the  $p_H$  value almost completely; the bread obtained is light, but its sp. gr. is higher than when only  $KH_2PO_4$  is added. Generally speaking, the exts. are better buffered in the alk. than in the acid zone. Addn. of salts still further increases the buffering of the exts. Addn. of  $CaSO_4$  to the water used in prepg. the dough gives well-buffered exts. and bread with a high sp. gr. Addn. of  $NH_4Cl$  and of  $MgCl_2$  gives well-buffered bread exts., but very heavy bread with high sp. gr.; and  $NaCl$  gives well-buffered bread exts., but breads with excessively high sp. gr. Conclusion: It would be advantageous to add a mixt. of  $KH_2PO_4$  and  $K_2HPO_4$  in suitable proportions to obtain a  $p_H$  value of about 5.0 in the fermented dough, which is the optimum value for bread fermentation, and which would give a lighter bread. A. PAPINEAU-COUTURE

Loaf volume as produced by different flours under prolonged fermentation. ROWLAND J. CLARK. *Cereal Chemistry*, 6, 338-44(1929).

L. H. BAILEY

Influence of the age of a milk on the result of pasteurization. A. WOLFF. *Milch. Zentr.* 11, 233-8(1927).—Cultures on gelatin and agar-agar were made of samples of fresh milk and of the same milks after sterilizing by heating for  $1\frac{1}{2}$  hr. at 62-63°, followed by rapid cooling, and a comparison was made of the total no. and of the relative proportions of the different kinds of bacteria in the fresh and sterilized milks. Similar tests were made on the milk after keeping for periods varying from 2 to 8 hrs. at temps. from 8° to 30°. The results show that the no. of bacteria surviving pasteurization, as well as the percentage of these calcd. on the total no. present in the unpasteurized milk, are greater for the milks which have been kept for a time than for those which were sterilized at once. In practice, it is therefore preferable to sterilize a milk as early as possible and then to keep it cool, rather than to keep it in cold storage and sterilize later.

B. C. A.

The refraction of milks low in solids-not-fat. G. D. ELDON AND J. R. STUBBS. *Analyst* 54, 318-20(1929).—In the examn. of 2850 samples of milk, in nearly every case a low solids-not-fat corresponded to a low refraction value. This means either that the low solids-not-fat is invariably due to watering or that milks naturally low in these solids do not give a normal refraction of 38 or more. In all, some 8000 samples have now been examd. to show that a milk, which has not soured, will have a low refraction if it has a low solids-not-fat.

W. T. H.

Dyes as an indication of adulteration in butter. D. HENVILLE AND W. M. PAULLEY. *Analyst* 54, 413(1929).—All samples of butter and margarine passing through a London lab. are tested for prohibited coloring matter. From 97 to 98% of the margarines contain a dye which is extd. with  $\text{NH}_4\text{OH}$  while 94–95% of butter samples do not give the test and even then the color is slight. To carry out the test, shake 10 ml. of fat with 10 ml. of petroleum ether and 10 ml. of 3%  $\text{NH}_3$  soln. The test is described as "not definite but helpful."

Fat removal from chocolate sirup and sweet chocolate. R. O. BROOKS. *Chemist Analyst* 18, 8(1929).—To 26 g. of sirup add water to make 100 cc. and Pb subacetate to 110 cc. Add 30 cc. of ether, stopper, shake and filter. Use 25 or 50 cc. for the polarimetric detn. of sucrose and lactose. Take 13–26 g. of solid chocolate, add water to 105 cc. and continue as above. This method does not provide for the removal of ether as in the official detn.

W. T. H.

The Kreis reaction as a method for the detection of incipient rancidity in cacao butter. T. H. COOKE. *Analyst* 54, 411–3(1929).—The Kreis tests consists in shaking the fat with strong  $\text{HCl}$  and a 1% ethereal soln. of phloroglucinol. A rancid fat will give a red or pink color, the depth of color being proportional to the degree of rancidity, because of the presence of aldehydes and ketones in the rancid product. Studies with many samples showed that the test is of little value as it does not give any evidence of incipient rancidity as good as the taste and odor of the fat.

W. T. H.

Some observations on the Fiehe test (for the detection of commercial invert sugar in honey). C. A. GREENLEAF AND C. A. BROWNE. *J. Assoc. Official Agr. Chem.* 12, 319–23(1929).—As compared with the aniline acetate test and the A. O. A. C. resorcinol test, the Fiehe test for com. invert sugar in honey is more sensitive but more difficult of interpretation. Moderate heating of honey is not likely to cause it to give pos. reactions for com. invert sugar. The destructive effect of heat is increased by high acidity, and a highly acid honey subjected to a high temp. might give pos. reactions, especially with the Fiehe test. A more efficient modification of the colorimetric resorcinol test has been developed by Nelson. Cf. following abstr.

A. PAPINEAU-COUTURE

Modification of the Fiehe test for the detection of artificial invert sugar in honey. E. K. NELSON. *J. Assoc. Official Agr. Chem.* 12, 323–4(1929); cf. preceding abstr.—The following procedure is recommended: dissolve 2 g. of honey in 10 cc.  $\text{H}_2\text{O}$ , ext. the soln. rapidly with  $\text{Et}_2\text{O}$  in a Palkin-Watkins extractor for 30 min., conc. the  $\text{Et}_2\text{O}$  to about 5 cc., transfer to a test tube, add 2 cc. of resorcinol reagent, freshly prepd by dissolving 0.2 g. resorcinol in 20 cc. concd.  $\text{HCl}$ , and shake the mixt. immediately; note the color at the end of 5 min. Pure honey gives an extremely faint pink color; honey contg. 10% artificial invert sugar gives a deep pink, and honey contg. 20% artificial invert sugar gives a dark red color.

A. PAPINEAU-COUTURE

Furfural and diastase in heated honey. L. H. LAMPITT, E. B. HUGHES AND H. S. ROOKE. *Analyst* 54, 381–95(1929).—The most sensitive and satisfactory test for hydroxymethylfurfural and for furfuraldehyde in honey proved to be the following: Dissolve 20 g. of honey in 20 cc. of water, ext. with 40 cc. of ether and evap. at room temp. Dissolve the residue in 10 cc. of ether and use 2 cc. for the Fiehe test as follows: Add an equal vol. of 1% resorcinol in concd.  $\text{HCl}$ . If the test is pos. a pink color is obtained at once; this rapidly darkens and after 20 min. there is a deep cherry-red color at the junction of the acid and ether. The resorcinol reagent must be fresh. Take the remainder of the ether ext., evap. at room temp. in a porcelain dish and to the residue add 2 cc. of freshly made soln. of 1 cc. of redistd. aniline in 4 cc. of  $\text{AcOH}$ . A pink to orange color appears in 15 min. if furfuraldehyde is present. When both of these tests are pos., it can be assumed that com. invert sugar is present in the honey. Pos. tests are obtained with 5% of this sugar. Heated honey may give these tests but only when the heating has accomplished a marked deterioration of flavor. Storage of heated honey did not cause the formation of furfural in 8 months. A method was developed for detg. the diastatic activity of honey and the method showed that heating honey causes a considerable loss in diastatic activity although the full significance of this fact is not yet clear.

W. T. H.

**Difference between unripe honey and artificially watered honey under the refractometer.** J. SITTA. *Magyar Chem. Folyóirat* 35, 10-4(1929).—Adulteration of honey with water lowers the refractive index considerably. The detn. of refractive index as a method to prove adulteration of honey with water still needs many statistical data to make final conclusions. S. S. DE FINÁLY

**The influence of the sugar inversion on the gel formation.** K. FIEDLER. *Konserven-Ind.* 15, 405-7, 427-8; *Chem. Zentr.* 1928, II, 1831.—F. investigated how much the pectin employed in the jelly and jam manuf. loses in efficiency by the process of sugar inversion. He further investigated whether pectin as a gelatinizing agent is destroyed by the process of boiling or inversion. The expts. showed that the inversion of cane sugar inhibits the gelatinization and even is able to prevent it altogether. The pectin remains in the goods as an active gelatinizing agent; on account of the sugar inversion, however, it is not able to function. G. SCHWOCH

**The preservation of fruit for the jam manufacturer.** F. HIRST. *Food Manuf.* 4, 224-5(1929).—H. describes briefly the more important methods used in preservation as well as the principles involved in so far as they apply to fruit. J. A. KENNEDY

**The feasibility of standardizing jam products.** J. W. BLACK. *Food Manuf.* 4, 227-9, 232(1929). J. A. KENNEDY

**Vanilla flavoring extract and practical methods of its manufacture.** I. Growth and selection of the beans. E. J. KESSLER. *Glass Packer* 1929, 325-7.—Descriptive. Data of practical value to users of vanilla beans are given. C. R. F.

**Bananas, banana flour, bananin and its value.** W. PEYER. *Apoth. Ztg.* 44, 872-3 (1929).—With fresh bananas (peeled), dried bananas and banana flour, the following values were obtained: moisture 75.0, 24.2, 13.9; dry substance 25.0, 75.8, 86.1; mineral constituents 0.91, 2.4, 1.8; fat (petr. ether ext.) —, 0.4, 0.44; total sugar 18.0, 58.1, 3.5; N substance 1.1, 3.1, 3.2; calories in 100 g. 80, 295, 320; comparative cost in pf. for 100 g. 28.9, 20, 13-14, resp. These values are compared with corresponding ones for oranges, and apples (fresh and dried). Bananin is a com. product consisting of banana flour, milk powder, cocoa and sugar. W. O. E.

**The nature of the carbohydrates found in the Jerusalem artichoke.** AAGE C. THAYSAU, WM. E. BAKES AND BRIAN M. GREEN. *Biochem. J.* 23, 444-55(1929).—The autumn-gathered tubers and the unripe pith of the Jerusalem artichoke contain a carbohydrate apparently identical with inulin. This carbohydrate is displaced by more sol. carbohydrates in the spring. BENJAMIN HARROW

**Fraud in the alimentary casein trade.** MARC FOUASSIER. *Ann. fals.* 22, 362-4 (1929).—Polemical with Porcher and Brigando (*C. A.* 23, 3545). A. P.-C.

**Modern processing in pea canning.** The new Wisbeck plant. S. W. SMEDLEY. *Food. Manuf.* 4, 222-3(1929). J. A. KENNEDY

**Technical preparation of caffeine-free coffee.** F. IHLOW. *Chem.-Ztg.* 53, 629-30 (1929).—A review. E. H.

**Determination of sulfur dioxide in apple musts and in ciders.** G. WARCOLLIER AND LE MOAL. *Ann. fals.* 22, 333-40(1929).—With high SO<sub>2</sub> contents (200-1000 mg. per l.) the Ripper method always gives lower results than the Haas method. This is shown to be due to oxidation of SO<sub>2</sub> to SO<sub>3</sub> in alk. soln. in presence of tannin, and not merely to a more or less stable combination of SO<sub>2</sub> with the tannin. The Haas method gives correct results; but the Ripper method gives approx. the same results provided the time of treatment with NaOH does not exceed 5 min. With low SO<sub>2</sub> contents (150-200 mg. per l.) the Ripper method gives results 30-5 mg. higher than the Haas method. A. PAPINEAU-COUTURE

**The acidification of green fodder rich in protein with particular regard to the hydrochloric acid process.** KLAUS VOLBEHR. *Landw. Vers. Sta.* 108, 115-46(1929).—The application of HCl for the preservation of green fodder rich in protein was verified. It is necessary, at least in the beginning of the preservation, not to exceed a pH value of 2. A pH value of 4 represents the upper limit at which unspoiled fodder is to be expected. The decompn. of the pure protein was all the greater, the greater the protein content of the plant, the smaller the HCl addn. and the longer the duration of the expts. It amounted to 4.6-71%. Losses in total N in general did not occur or were only slight. A preservation with a 5% NaCl addn. produced an excellent silage. The decrease in pure protein was in this case about as large as with the application of HCl. E. F. S.

**Feeding investigations with the biologically prepared feeding stuff "Bovita" on dairy cows in pasture and in stables.** W. GÖRTERS. *Fortschr. Landw.* 4, 265-70 (1929).—From bacteriol. and chem. tests on the milk produced it is concluded that "Bovita" improves the quality of milk. Similar effects, but to a less degree, were obtained through feeding wheat bran. LAWRENCE P. MILLER

Rice husks in bran and sharps. A. J. AMOS. *Analyst* 54, 332-3(1929).—Rice husks are light brown in color; the outer surfaces are dull; the inner surfaces are shiny; their stiff and hard nature can be detected by scraping the outer surface with a needle. Boil a little of a suspected sample with a mixt. of 5 parts chloral hydrate and 2 parts water and exam. a drop of the liquid under the microscope. Rice husks consist of 4 layers of tissue with characteristic cells in the outer epidermis having a sinuous form.

W. T. H.

Rice "pula" and its chemical composition. L. BORASIO. *Giorn. risicoltura* 19, 58-61(1929); cf. *C. A.* 22, 2415.—Analyses of "pula" (meal from the first and second pearling machines) and of "farinaccio" (meal from the third and fourth pearling machines) showed  $H_2O$  11.50, 11.80; ash 9.40, 4.90; ash insol. in  $HCl$  1.30, 0.35; crude cellulose 10.60, 2.80; crude protein 13.70, 11.70; fats 14.50, 9.80 and non-nitrogenous exts. 40.30, 59.00%. Analyses are also given of "pula" mixed with "lolla" (rice husks). "Pula" may contain 5.36%  $P_2O_5$ , of which 4.70% is phytinic and 0.038% lecithinic. "Pula" is used for the extn. of its fat, for the prepn. of organo-phosphatic compds. (especially phytin) and as a cattle food when mixed with "lolla." ALBERT R. MERZ

Preserving foods. A. G. M. STABBACK and STABAVITE SYNDICATE, LTD. Brit. 304,253, July 18, 1927. Foods such as fruit, eggs, poultry or meat are directly coated with, or wrapped in, paper, cloth or the like treated with a mixt. of gum tragacanth or other gum which swells in contact with water without becoming sticky, together with glycerol, with or without a bisulfite or an alkali nitrate or other preservative.

Preserving food in closed receptacles. SUTAX, LTD., and J. W. SUTCLIFFE. Brit. 304,389, Oct. 27, 1927. Receptacles of glass, metal, cardboard or other materials, filled with food and like products, and hermetically sealed, have their closure ends heat treated to sterilize the closing cap and the air space beneath it.

Destroying insect pests in foods or other materials. ADOLF M. KOBIOLEKE. U. S. 1,725,650, Aug. 20. The material is placed in an air-tight kiln from which the air is then withdrawn by suction;  $CO$  is then supplied to the kiln until atm. pressure is attained, the  $CO$  is withdrawn by suction, and a fumigating gas such as  $CS_2$  vapor which has not been in contact with the air is supplied to the kiln, subsequently this is withdrawn by a vacuum pump, and the vacuum is afterward suddenly released by admitting air to the kiln. An app. is described.

Special dough for bread or biscuits, etc. F. PASSEK and H. BOLLMANN. Brit. 305,217, Feb. 3, 1928. Cereal flour is used with added gluten and an admixture of albumin-rich meals such as soy-bean or cottonseed meals. Various details of prepg. the dough are given.

Condensation system for recovery of alcohol from the vapors evolved in baking bread. N. DE NACROTZKY. Brit. 305,223, Feb. 2, 1928. An app. is described.

Baking powders. L. WEIL. Brit. 304,230, Jan. 17, 1928. With baking powders the acid constituent of which is an acid alkali phosphate or acid alkali pyrophosphate, salts such as  $CaCl_2$ ,  $Ca$  tartrate,  $CaCO_3$ , with pyrotartaric acid or  $Ca$  in combination with casein are added to obtain an acid end reaction corresponding to that obtainable with yeast. Cf. *C. A.* 23, 4512.

Receptacles for milk and other foods. K. RICHTER. Brit. 305,114, Oct. 20, 1927. Milk bottles and the like are made of wholly or partially glazed Al silicates; such re-

ceptacles may be sterilized by heating to  $500^{\circ}$ , and are stated to be permeable to air and to cool the contents by allowing evapn.

**Cheese.** MAX CLAASZ. Ger. 478,552, April 15, 1925. Emmenthal cheese is coated with soft cheese by melting with neutral  $\text{Na}_2\text{HPO}_4$  to temps. below  $100^{\circ}$ ; the necessary amt. of  $\text{H}_3\text{PO}_4$  or  $\text{Na}_2\text{CO}_3$  is added to keep the mixt. neutral.

**Preserving egg contents.** JOSEPH FOUSEK. U. S. 1,724,078, Aug. 13. Equal wts. of broken eggs and sugar are mixed at a temp. of about  $62^{\circ}$  until the mixt. is of smooth sirupy consistency.

**Preserving egg yolks.** H. BELHOMMET. Brit. 304,902, Jan. 10, 1928. Yolks to be preserved by drying are preliminarily treated with 4% of sugar or other suitable water-sol. substance which will enable the dried yolks to be reconstituted by addn. of water.

**Preserving fish.** H. K. T. LANGVA. Brit. 304,868, Nov. 16, 1927. Split, salted and dried fish is protected from damage by the "split-fish mite" by placing it in a closed chamber from which the air is exhausted (but which may contain N or  $\text{CO}_2$ ) and leaving it for several days, after which it is stored and transported in the usual way.

**Coating granular sugar with chocolate, etc.** EDWARD A. ZEBULSKY (one-half each to Hyla F. Maynes and Emma C. Maynes). U. S. 1,725,608, Aug. 20. Granular material to be coated is introduced into an air current carrying the coating material and the material thus coated is further carried by the air current until the coating has dried or hardened. An app. is described.

**Cacao.** T. ZELLER. Brit. 304,181, Jan. 16, 1928. In the prepn. of fresh cacao beans, the usual fermentation is interrupted at the termination of the alc. fermentation and before the beginning of the acetic fermentation, by heating (preferably at  $55\text{--}65^{\circ}$  for 24 hrs. to complete the decompn. and loosening of the mucous covering). An app. is described.

**Fermenting cacao beans.** B. MÜLLER. Brit. 305,236, Feb. 2, 1928. Beans freed from the pods are placed in receptacles having ventilating devices and of such size that overheating is avoided, and remain quiescent until completion of the fermentation. Alc. fermentation is allowed to proceed to conclusion but formation of  $\text{HOAc}$  is avoided. After the fermentation in boxes, the beans are subjected to a drying operation for complete destruction of the bean tissue, removal of bitter flavor and completion of the brown coloration. An app. is described.

**Controlling the sulfur dioxide content of dried fruit.** FRANCIS J. PROWSE, RAYMOND D. ROBINSON, ERNEST M. HALL and CHARLES F. FLEMING (to Calif. Packing Corp.). U. S. 1,724,514, Aug. 13. Previously sulfured dried fruits are subjected to the action of heated air after moistening, to remove  $\text{SO}_2$  from the fruit to the desired extent. An app. is described.

**Yeast for use as food for animals.** SELBI SOC. D'EXPLOITATION DE LICENCES DE BREVETS INDUSTRIELS. Brit. 304,314, Jan. 19, 1928. Vinasses from molasses distilleries, sugar or yeast factories are used either alone or with molasses or other suitable vegetable-carbohydrate material for production of yeast for animal food. Superphosphate,  $(\text{NH}_4)_2\text{SO}_4$  and Na phosphate may be added, and the yeast produced may be sepd. and dried.

### 13—GENERAL INDUSTRIAL CHEMISTRY

HARLAN S. MINER

**Chemical industries in Slovakia.** JAR. HOŠEK. *Chem. Listy* 23, 317–22(1929).—A review. FRANK MARESH

**Czechoslovakian chemical industries in 1928.** OTAKAR WEBER. *Chem. Listy* 23, 257–61, 295–9(1929).—A review. FRANK MARESH

**Sixty-fifth Annual Report on alkali, etc., works in England and Wales.** T. LEWIS BAILEY. *Ann. Rept. Alkali, etc., Works Proc. for 1928*, 3–26(1929).—Operations at registered works have been conducted, in general, in a satisfactory manner. Details of operation of the Alkali, etc., Works Regulation Act 1906 and the Alkali, etc., Works Order 1928 cover the following works: alkali and Cu (wet process), cement, smelting,  $\text{H}_2\text{SO}_4$ , chem. manure, gas liquor sulfate and chloride of  $\text{NH}_4$ ,  $\text{HCl}$ , sulfide, As,  $\text{CS}_2$ , paraffin oil, tar, benzene, pyridine, Br and  $\text{HF}$ . In connection with  $\text{NH}_4$  plant effluent disposal the following points deserve attention: (1) Devil-liquor, contg. most of the phenol, can be evapd. by direct heating in a hot chimney, evapd. by direct heating if the vapor

can be taken to a steam boiler chimney, or some may be removed at producer fires; (2) steps can be taken to maintain a properly regulated flow of spent liquor from the works; and (3) as complete sepn. as possible of liquor from tar should always be effected at once. In tar handling, it must be recognized that (1) the introduction of even a small amount of water at any depth beneath the surface of hot tar is dangerous, and (2) tar heated initially to 150° can be distd. by air blowing without external heat—a fact to be borne in mind where blending is effected by air blowing. A section of the appendix gives an outline of the progress on the analysis and constitution of ammoniacal and spent liquors, particularly in regard to the difference between actual  $O_2$  absorption and the sum of the effects due to the known constituents. The different figures represent: 10–20% of the total  $O_2$  absorbed by horizontal retort liquors; 30–50% by vertical retorts, and up to 60% by liquors derived from the low-temp. carbonization of coal.

W. H. BOYNTON

**Alkali, etc., works in Scotland. Report for the Year 1928.** J. W. YOUNG. *Ann. Rept. Alkali, etc., Works Proc. for 1928*, 27–31(1929); cf. C. A. 22, 3470.—Inspection was made of 142 registered works operating 285 scheduled processes. Public complaints were more frequent than usual, but remedial steps were prompt. Inspection covered alkali,  $H_2SO_4$ , chem. fertilizer,  $HNO_3$ ,  $(NH_4)_2SO_4$  or  $NH_4Cl$  and gas liquor, tar and Zn works.

W. H. BOYNTON

**Vital processes and technical methods.** RICHARD WILLSTÄTTER. *Osterr. Chem. Ztg.* 32, 107–12(1929).—A lecture covering present day theories and applications of catalysts, both org. and inorg. Ideal technical processes are those the raw materials of which are acted upon by energy in the presence of catalysts yielding a max. of the desired products and a min. of by-products. The reduction of Fe oxides in a blast furnace is therefore a wasteful process compared with the reduction of  $CO_2$  and the formation of carbohydrates by plant cells.

W. C. BAUGH

**Chemistry goes to sea.** I. A. C. PURDY. *Marine News*, April, 1929, 2 pp. II. May, 1929, 1 p.—A short review of some problems confronting chem. experts in the detn. of damages occurring to ship cargoes, and of the hazards involved in the transportation of petroleum products.

**Distillation and rectification of complex mixtures. III. Continuous distillation with a single column; intermittent distillation.** L. GAY. *Chimie & industrie* 22, 3–18(1929); cf. C. A. 20, 1288, 2214; 22, 286.—A general graphical study of the continuous and intermittent distn. of complex mixts. with a single rectifying column.

A. PAPINEAU-COUTURE

**Evaporation at low temperatures.** VL. STANEK. *Chem. Listy* 23, 316–7(1929).—A 10-l. metallic drum rotates upon hollow trunnions, connected to sources of vapors or liquids by a pipe line. A fine capillary tube enters the liquid in the drum by following the axis of rotation. The drum is sepd. into sections by a metallic net adjusted so that the vapors travel a long path and 5–7 kg. anhyd.  $CaCl_2$  is suspended from it. A vacuum of 3–5 mm. is maintained by an oil vacuum pump. At 10–15° in 1–1½ hrs. about 1½ l. is evapd. off. Evapn. may be also carried out at 0° at a slower rate. The  $CaCl_2$  in the drum is regenerated in 2–3 hrs. by passing hot gases (150–200°) through the drum. Very unstable substances have been evapd. by this method without their decompn. or formation of coloring matter.

FRANK MARESH

**Vapor purification.** R. W. ANDREWS. *Southern and Southwestern Ry. Club Proc.*, May, 1929, 31–54.—A. describes the harmful action of unpurified vapors on different types of machinery and recommends an app. called the Tracyfier for the removal of the dirt.

ALFRED HIRSCH

**Chemical lead and plant involving its use.** W. HENRY IBBOTSON. *Ind. Chemist* 5, 267–8(1929).—Tests and specifications for Pb intended for use in chem. industry are given.

E. G. R. ARDAGH

**The method of operation of sodium peroxide respiration apparatus. I. Serial experiments with sodium peroxide respiration apparatus.** G. STAMPE AND E. HORN. *Z. angew. Chem.* 42, 776–9(1929).—Respiration app. of the Dräger type, depending upon the liberation of  $O_2$  from peroxides, shows variations in operation, and the following expts. are reported: (1) What are the variations in time for an expt., i. e., for  $O_2$  to fall below 15%, for  $CO_2$  to rise above 3%, or for the expt. to stop for physiol. reasons? With a charge of "Proxylit" (950 g.) in a Dräger cartridge one subject required 64, and the other, 58 min. (av.). (2) Catalysts distributed over the active material caused the  $O_2$  to come off more quickly, but otherwise rendered the action more uncertain. (3) Partial drying of the cartridge contents through  $CaCl_2$  showed a better regulation in liberation of  $O_2$ . (4) Cartridges filled to the usual height (about 22 cm.) showed optimum efficiency. (5) Proxylit of 2%  $H_2O$  was too slow in action; that of 8% content acted

quickly, but soon became impervious. The usual form with 6%  $H_2O$  is best, provided the material is not more than 2 to 6 months old.

How heat transmission affects fluid friction in pipes. C. S. KEEVIL AND W. H. MCADAMS. *Chem. Met. Eng.* 36, 464-7 (1929).

Ammonia compared with other refrigerants. W. F. SCHAPHORST. *Ind. Eng. Chem., News Ed.* 7, No. 16, 8 (1929).—A table is given showing the no. of lbs. of the various common refrigerants required to absorb 100 heat units.

Tests on paper cables (insulation). RAYMOND D. SHERMAN. *Elec. World* 94, 277-81 (1929).

Asphalt emulsion has many uses in the chemical plant (KIRSCHBRAUN) 22.

American Standards Year Book, 1929. New York American Standards Assocn. 88 pp. Reviewed in *Am. Dyestuff Reporter* 18, 570 (1929).

BALCKE, HANS: *Die Abwärmtechnik*. Vol. III. (Special Fields for Waste-Heat Utilization.) Munich and Berlin: R. Oldenbourg. 242 pp. Bound, M. 13.50. Reviewed in *Eng. Progress* 10, 190 (1929).

HERMANSEN, A.: *Industrial Furnace Technique*. London: Ernest Benn, Ltd. 25s., net.

Transferring heat from one gas body to another. FRANZ POLLITZER. U. S. 1,724,513, Aug. 13. A compressed gas such as  $C_2H_4$  to be liquefied is caused to ascend through a descending shower of cool liquid in a cooling chamber, the gas is expanded further to cool it, and the gas is then caused to ascend through a descending shower of a warm liquid in a second chamber. An arrangement of app. is described.

Liquefaction of gases. "LENO" GES. FÜR ENERGIEVERWERTUNG M. B. H. (Rudolf F. Mewes and Karl Rudolf Eduard Mewes, inventors). Ger. 478,862, June 11, 1922. A method and app. are described for liquefying by sudden expansion such gas mixts. as air.

Separating gaseous mixtures by liquefaction. SOC. L'AIR LIQUIDE, SOC. ANON. POUR L'ÉTUDE ET L'EXPLOITATION DES PROCÉDÉS GEORGES CLAUDE. Ger. 479,331, July 4, 1925. See Brit. 238,174 (C. A. 20, 1732).

Filtering gases and liquids. DEUTSCHE GASGLÜHLICHT-AUER-GES. M. B. H. Ger. 479,159, Jan. 29, 1925. The gas or liquid is supplied intermittently to a mass of porous filtering material, the free space of which corresponds to the amt. of gas or liquid supplied at one time. The method is best effected with 2 or more filters to be used in turn, and is particularly intended for purifying air for respiration.

Testing liquids; controlling chemical processes. CHRISTIAN HÜLSMEYER. Ger. 467,547, Dec. 10, 1924. Liquids are tested by measuring their elec. cond. before and after subjection to the action of a reagent. The measurements are made simultaneously and are recorded by a measuring instrument acting differentially. Thus, water may be passed through a series of vessels contg. steel wool, marble and permutite, and from the change in cond. observed after each treatment, deductions as to the condition of the water may be made. The measuring instrument may be arranged to actuate means for controlling the reaction, e. g., it may actuate the means supplying the reagents.

Concentrating solutions. NIKODEM CARO and ALBERT R. FRANK. Ger. 477,898, Sept. 1, 1927. A method and app. for removing water from, for example, dil. acids by concd.  $H_2SO_4$  vapor is described.

Separating alcoholic or other mixtures by distillation. SOC. ANON. DES DISTILLERIES DES DEUX-SEVRES. Brit. 304,756, Jan. 26, 1928. In treating alc. worts, mixts. of  $EtOAc$ , alc. and water or other seps. of liquids miscible with water from liquids which are insol. or only slightly sol. in water, the mixt. to be sepd. is fed into a distn. column and a current of water is sprayed into the upper part. The mixt. is fed into the middle of the column as a vapor and the water is preheated to the temp. of the azeotropic mixt. which is formed by the water and the insol. or slightly sol. liquid. The base of the column is heated and the vapors of the azeotropic mixt., which escape at the upper part of the column, are condensed to obtain a liquid which seps. into 2 layers, one of which is sepd. and the other returned to the column.

Crystallizing salts. I. G. FARBENIND. A.-G. Brit. 304,872, Nov. 24, 1927. Crystals of uniformly coarse grain are obtained by allowing a hot satd. soln. of a salt to cool while passing cooling currents of gas or vapor upwardly through the soln. at such a rate that only the coarse crystals fall to the bottom while the surplus crystal nuclei are carried away by the gas stream. An app. is described.  $NH_4HCO_3$  soln. may be formed by blowing a current of  $CO_2$  and  $NH_3$  into a 16% soln. of  $NH_3$ .

Dry distillation or other heat treatments of pulverulent materials. TROCKNUNGS-

**VERSCHWELUNGS- UND VERGASUNGS-GES.** Brit. 305,231, Feb. 2, 1928. The material treated is held against the heating surfaces by electrostatic action, in app. such as traveling hearth or rotary annular plate furnaces.

**Catalytic reactions with suspended catalysts.** SILICA GEL CORP. Brit. 304,269, July 12, 1927. In reactions such as  $\text{SO}_2$  or  $\text{NH}_3$  production, hydrogenation of oils, etc., a pulverized catalyst (such as silica gel which may carry Pt, Fe and Cu or Ni, according to the reaction to be effected) is mixed with the gas and carried through the reaction space, then sepd., revived and reused. The gas need not be freed from contact poisons as these will be taken up by the catalyst and removed from it in the revivification. An app. and numerous details are described.

**Heating and cooling system for catalytic converters of the layer type.** A. O. JAEGER (to Selden Co.). Brit. 305,636, Oct. 27, 1926. Means are provided for vaporizing liquid or solid substances so as to effect a substantially uniform cooling through any cross section of the catalyst. Various structural details are described.

**Heating apparatus by steam.** H. R. MINOR (to General Carbonic Co.). Brit. 305,577, Feb. 7, 1928. In heating app. for vulcanizing rubber, effecting distns., etc., the heating chamber is first supplied with an inert gas such as  $\text{CO}_2$  at a controlled pressure and then with steam at a fixed higher pressure and the temp. is controlled by varying the pressure of the inert gas and thus varying the partial pressure of the steam. Various details are given.

**Heating coal, charcoal, silica gel or other materials to effect drying, heating, cooling or distillation.** J. S. MORGAN. Brit. 305,106, July 28, 1927. The material is mixed with metallic shot of suitable temp. to effect the desired heating or cooling and the shot is then sepd. An app. is described.

**Temperature-control system for enameling apparatus.** BELL TELEPHONE LABORATORIES, INC. Brit. 305,611, Nov. 8, 1927. The temp. in the combustion chamber of an enameling app. (suitable for coating wire) is controlled in accord with the hardness of the baked enamel.

**Coating wire with enamel, etc.** BELL TELEPHONE LABORATORIES, INC. Brit. 305,084, Oct. 28, 1927. Hardening of coatings such as enamel on wire is effected solely by heat obtained by combustion of ingredients of the coating compn. An app. is described.

**Deoxidizing the atmospheres of transformers or other devices.** CLARENCE J. RODMAN (to Westinghouse Elec. & Mfg Co.). U. S. 1,725,160, Aug. 20. A deoxidizing agent such as is described in U. S. 1,557,092 (C. A. 20, 465) is used in the device and means are provided for heating the deoxidizing agent in order to render it highly active. Structural features are described.

**Deposition of aqueous dispersions.** THE ANODE RUBBER CO., LTD. Fr. 657,404, June 23, 1928. An agglomeration of org. material dispersed in water is obtained on molds of solid material, which enters into chem. reaction with the elements of the dispersion and is consequently consumed during the formation of the agglomerated product. The mold may be made of a sol. salt of a metal and may be dipped into an aq. dispersion of rubber slightly alk. with  $\text{NH}_3$ , or of a metal such as Zn; the dispersion contg.  $(\text{NH}_4)_2\text{S}$ .

**Annealing.** "GAFAG" GASFEUERUNGS-GES., WENTZEL & CIE. Ger. 478,990, Jan. 15, 1924. A method of operating a gas-heated annealing furnace by pre-heating gas and air in an Fe recuperator is described.

**Refrigerating apparatus.** O. LIESEGANG. Brit. 305,626, Feb. 8, 1928. Ice is made in the refrigerator by passing  $\text{CO}_2$  through water. Various structural details are described.

**Continuously acting refrigerator.** SIEMENS-SCHUCKERTWERKE A.-G. (Edmund Altenkirch, inventor). Ger. 478,657, Oct. 13, 1927.

**Refrigerating apparatus of the continuous-cycle absorption type.** SIEMENS-SCHUCKERTWERKE A.-G. Brit. 304,762, Jan. 26, 1928. Structural features.

**Absorption refrigerating machine.** PLATEN-MUNTERS REFRIGERATING SYSTEM AKTIEBOLAG. Ger. 479,420, Feb. 9, 1927.

**Refrigerating apparatus of the absorption type.** CLARENCE O. PETTERSSON. U. S. 1,724,219, Aug. 13. Structural features.

**Refrigerating system of the absorption type.** SIEMENS-SCHUCKERTWERKE A.-G. Brit. 304,122, Jan. 14, 1928. Structural features.

**Refrigerating system of the absorption type.** STUART OTTO and LAWRENCE BRUEHL (to Gas Refrigeration Corp.). U. S. 1,725,205, Aug. 20. Structural features.

**Refrigerating apparatus of the continuous absorption type.** GUIDO MAIURI and RAOUL F. BOSSINI. U. S. 1,725,658, Aug. 20.

**Refrigerating apparatus of the compression type.** JOHN A. GRIER. U. S. 1,724,-874, Aug. 13. Structural features.

**Refrigerating apparatus of the compression type.** CLARK ORR (to General Elec. Co.). U. S. 1,725,472, Aug. 20. Structural features.

**Multiple-installation refrigerating system of the compression type.** WELLING F. THATCHER (to Servel, Inc.). U. S. 1,724,233, Aug. 13. Structural features.

**Rotating refrigerating machine.** AKT.-GES. BROWN, BOVERI & CIE. Ger. 479,498, Mar. 20, 1927.

**Refrigerator with alternating hot and cold periods.** LUDWIG HIRSCH. Ger. 478,642, Mar. 19, 1924.

**Thermostatic control for refrigerating systems.** DALLAS D. PARSHALL (to The Jack Frost Co.). U. S. 1,725,415, Aug. 20. Structural features.

**Stopping leaks in refrigerating systems.** THOMAS J. LITTLE, JR. U. S. 1,724,944, Aug. 20. A soln. of a natural or synthetic gum in alc. or other suitable solvent having a freezing point below the lowest temp. in the refrigerating system is circulated through the system to stop leaks. The use of bakelite and pyroxylin is mentioned.

**Generating oxygen for use in respirators.** INHABAD-GES. Brit. 304,292, Jan. 18, 1928. O is generated by heating compds. such as perborates, persulfates, perchlorates, chlorates, permanganates, bichromates, plumbates, or alkali or alk. earth peroxides. An app. is described.

**Closed-circuit respirators.** INHABAD-GES. Brit. 304,248, Jan. 17, 1928. O is supplied by substances which yield it when heated, such as perborates, persulfates, perchlorates, chlorates, permanganates, bichromates, plumbates or alk. earth peroxides, which may be formed into briquets. Various structural details are described.

**Heat insulation.** BRUNO F. BALDUF (to U. S. Gypsum Co.). U. S. 1,723,989, Aug. 13. A dry fluffy insulating material suitable for use in walls, etc., comprises shredded paper and comminuted plaster and may be produced by utilizing gypsum board factory waste.

**Electrical insulation.** HAROLD H. BROWN. U. S. 1,725,335, Aug. 20. The fiber of leaves of plants of the Bromelia family such as caroa is used for paper wrappings for wires, etc.

**Insulating wire for electric conductors.** SIEMENS-SCHUCKERTWERKE A.-G. Brit. 304,192, Jan. 16, 1928. The insulating material is applied in vaporized state, preferably *in vacuo*, in one or more coats, and is deposited by condensation.

**Electric cable coverings.** E. S. ALI-COHEN. Brit. 304,493, Dec. 13, 1928. A cable core, after insulation such as "Karetnja" has been applied, and while still somewhat heated, is drawn through a fine powder of metal or other cond. material such as C black.

## 14—WATER, SEWAGE AND SANITATION

EDWARD BARTOW

**Quality of the surface waters of North Carolina.** E. E. RANDOLPH. *J. Elisha Mitchell Sci. Soc.* 44, 70-4(1928).—Complete industrial analyses were made of about 200 samples of surface H<sub>2</sub>O collected from all the large streams of the state. The av. amts. of dissolved solids in the samples from the mountain, piedmont and coast plain sections were 25, 55 and 60 p. p. m. The waters of the entire state are slightly alk. and unusually soft. The av. Ca content is 4-6 p. p. m. and Mg content 1-3 p. p. m. They contain very little Fe.

**Iodine in North Carolina public water supplies.** J. W. PERRY. *J. Elisha Mitchell Sci. Soc.* 44, 87-9(1928).—The av. I content of the public H<sub>2</sub>O supplies of 10 cities, including most of the large ones of the state, was 1.73 p. p. b.

**The ground water of Nishinomiya and its environs.** ATSUSHI MATSUBARA. *Proc. 3rd Pan-Pacific Sci. Congr.* 1926, I, 817-37(Publ. 1928).

**The mineral waters of Rosheim. Analytical and therapeutical study.** L. LEGIN AND SCHIRARDIN. *Strasbourg méd.* 88, 277-93(1928); *Wasser u. Abwasser* 25, 293.—The water is neutral in reaction, weakly radioactive and contains large quantities of Mg, Ca and Li. The waters are particularly effective in kidney, bile, gall bladder and diabetic ailments.

**Activity of mineral springs (Wiesbaden).** K. HARPUDER. *Z. wiss. Bäderkunde* 3, 293-7(1929); *Wasser u. Abwasser* 25, 293.—Catalase, peroxidase and oxidase reactions were strong and usually went hand in hand with high heavy metal oxides and insol. hydroxides.

The peroxidase activity of mineral waters; the pumerical measurement of this activity. A. MOUGROT. *Progrès méd.* 56, 733-8(1928); *Wasser u. Abwasser* 25, 294.—The decompn. of  $H_2O_2$  is effected by Vichy and some other mineral waters. Aeration causes a loss in activity but boiling recovers it. A numerical scale is used in classifying waters as to their activity.

Analysis of mineral springs in the Upper Chechnya (Caucasus). A. P. POPOV AND V. A. KARNITZKII. *Zhur. Prikladnoi Khim.* 1, 291-9(1928).—Chem. analysis of 12 mineral springs is given.

The carbon dioxide content of the Reinerz thermal springs. W. GOETSCH. *Z. wiss. Bäderkunde* 3, 320-3(1929); *Wasser u. Abwasser* 25, 294.—The  $CO_2$  content, temp., barometric height and degree of  $CO_2$  satn. were detd. on numerous samples.

Standard methods of water analysis. Progress report of sub-committee No. 8 on standardization of water analysis. [Tentative method for determination of dissolved oxygen in boiler feedwater.] HAROLD FARMER. *Fuels and Steam Power* (A. S. M. E. Trans.) 51, No. 12, 90-3(1929); cf. C. A. 22, 2630.—A tentative method for trial and criticism by the various industries is presented.  $MnCl_2$  is used instead of  $MnSO_4$ . The chem. reactions involved are given. There are 4 photographs showing the app. and steps in the operation. Sufficient construction details are shown for making the cooling coil whereby water supplied in excess of 125° F. and above atm. pressure may be cooled to room temp.

Influence of organic matter and its removal in the determination of iron in water. G. NACHTIGALL AND M. BAYER. *Arch. Hyg.* 100, 35-9(1928); *Wasser u. Abwasser* 25, 305.—In the thiocyanate method of Fe detn. in water, a clear soln. and Fe in the tervalent condition are necessary. In clear waters, Br,  $H_2O_2$  and  $KClO_3$  are all satisfactory oxidizers, but the latter is preferred in waters contg. much org. matter. The use of 1-5 drops of  $H_2O_2$  in the reaction was favorable but larger quantities decompd. the thiocyanate pigment.

Chlorophenol tastes and odors in water supplies of Ohio River cities. H. W. STREETER. *Am. J. Pub. Health* 19, 929-34(1929).—Discussion of disposal of phenol wastes by Waring (cf. C. A. 23, 4518).

A study of the taste that develops when water containing phenol is treated with chlorine. F. DIÉNERT AND F. WANDENBULCKE. *Ann. hyg. publ. ind. sociale* 1929, 298-301; *Rev. hyg. méd. prev.* 51, 489-92(1929).—In water contg. phenol in concns. higher than  $10^{-10}$ , Cl produces a taste like  $CHI_3$  that is attributed to the formation of an oxychlorophenol. Quant. expts. on both spring water and Seine water show that with increasing amts. of Cl the degree of taste increases to a max. and then decreases until no taste is present. The less phenol there is present, however, the higher is the Cl concn. necessary to reach the max. of taste, so that the intensity of taste is a function of the concn. of the Cl as well as of the phenol. The taste always disappears gradually in course of time; the slower the taste disappears, the stronger the taste was originally. If the free Cl is destroyed by hyposulfite the taste disappears much sooner than without this treatment. However, even if hyposulfite is added before the Cl some taste will appear and the safest way of preventing the formation of the unpleasant taste is destruction of the phenol by means of permanganate. When phenol does not get into the water until after the Cl and hyposulfite treatments no taste will form. These treatments, therefore, are effective and unobjectionable when, as is frequently the case, the only source of phenol is the tar material of the pipe system through which the water circulates after leaving the plant. On the pure compds. *o* and *p*-chlorophenol and trichlorophenol the observation was made that the gradual disappearance of the  $CHI_3$  taste is due to the decompn. of the Cl compds. *o*-PhCl gives the strongest and most persistent taste.

Antiliton. M. S. MILEANT. *Ukrainskii Khim. Zhur.* 4, No. 1, Tech. Pt., 23-9(1929).—A boiler compd. named antiliton contains 20% of solids and 12% of tannins. When a sample of water having 8° of temporary hardness and 16° of permanent hardness was treated with this compd. and evapd. at 5 kg. of pressure, a copious fluffy ppt. resulted, while in a control expt. hard scale was produced on the walls of the vessel.

Bacteriological examination of water. A. GUILLERD. *Ref. Zentr. ges. Hyg.* 17, 4(1928); *Wasser u. Abwasser* 25, 68.—The French, Belgian, English, German and American methods are described. Especial significance is attached to *B. coli* and fecal tests, to the differentiation of human and animal strains of coli and the number of coli colonies and the interpretation of results.

Supplementing the Gersbach fecal titer for the certain determination of bacteria in water. R. KOPP. *Zentr. Bakt.* 1927, II, 267-71; *Wasser u. Abwasser* 25, 69.—The

Gersbach fecal titer test after 24 hrs.' use was considered sufficient for *B. coli* without confirmatory tests. After 48 hrs. the test is not as good. For exact work it is necessary to confirm coli with dextrose fermentation at 45°.

F. P. GRIFFITHS

**Sewage treatment in Europe.** A few snapshots from an engineer's collection. SAMUEL A. GREELEY. *Sewage Works J.* 1, 228-30(1928).—A discussion. E. HURWITZ

**A chemical study of the sewage of the city of Prague.** J. HAMÁČKOVÁ. *Chem. Listy* 23, 98-104, 162-7, 185-8, 251-6, 277-83, 305-9(1929).—H. made weekly analyses at the city sewage plant in Bubeneč throughout the year 1927 for  $\text{HNO}_3$ ,  $\text{HNO}_2$ , Cl,  $\text{NH}_3$ , org. N,  $\text{H}_2\text{S}$ , alky. and org. matter by the action of  $\text{KMnO}_4$  upon samples after 4 hrs. and after 5 days of incubation. From graphs for the year, the sediment and sol. matter vary between wide ranges. The mineral content shows slight variations.  $\text{H}_2\text{S}$  appears very irregularly. The addn. of Cl to the sewage has no effect upon sedimentation, i. e., pptg. the colloids; a large dose (20 mg. per l.) bleaches the soln. Lime water ppts. the colloids and increases the sediment. The solns. are much decolorized by the addns. of  $\text{CaO}$ . An addn. of 200 mg.  $\text{Al}_2\text{O}_3$  per l. removes 92% of the suspended matter and leaves clear solns. The addn. of 100 mg.  $\text{SO}_2$  per l. increases the sediment measured in the lab., but no visible pptn. of the colloids occurs; the solns. are slightly bleached. The sediment shows  $\text{P}_2\text{O}_5$  2.26%,  $\text{K}_2\text{O}$  0.16%, N 3.01% on a dry basis; this compn. is the same as that found in 1910, 1914 and 1916. After settling in basins for 2 months, the  $\text{H}_2\text{O}$  content of the sediment dropped from 90 to 70%. The fresh sediment was used in various compost mixts. Tables of the mixts. and analyses are given. The gas from the sediment contained 41%  $\text{CO}_2$  and 59%  $\text{CH}_4$ . The effect of the sedimentation plant upon the river water was studied. Complete tables and graphs are given.

FRANK MARESH

**Operation of trickling filters.** E. SHERMAN CHASE. *Sewage Works J.* 1, 223-7 (1929).—Successful operation of trickling filters calls for thorough preliminary treatment for removal of suspended solids, fresh sewage, good distribution over the filter, clean nozzles, proper filter media, freedom from excessive pooling, and faithful, intelligent personnel.

E. HURWITZ

**The operation of Imhoff tanks.** H. M. BEAUMONT. *Sewage Works J.* 1, 211-7 (1929).—Possible causes of foaming of Imhoff tanks and measures taken to prevent or overcome foaming at the Philadelphia plant are discussed.

E. HURWITZ

**Separate sludge digestion studies.** ANTHONY J. FISCHER. *Sewage Works J.* 1, 236-41(1929); cf. *C. A.* 23, 1707.—Lab. research showed that the best and most economical digestion is secured when (1) the tank temp. is kept at about 80° F; (2) the amt. of fresh ripe sludge is equal to 20 times the weight of raw sludge added daily on the dry solids basis; (3) the  $p_H$  is kept between 7.3 and 7.6; (4) the raw sludge is added in the freshest possible condition and has a solid concn. of about 15%; (5) provision is made for mixing or stirring. Plant scale operations cited bear out these facts. E. H.

**Hydrogen-ion control in the digestion of sewage sludge on a practical scale.** FRANK BACHMAN. *Sewage Works J.* 1, 218-22(1929).—Answers to a questionnaire reveal that in nearly all cases liming was beneficial to digestion. Adjustment of  $p_H$  was generally practiced but varied among the operators from 6.4-6.8 to 7.2-8.4. The value of  $p_H$  adjustment to control foaming is indefinite.

E. HURWITZ

**Sludge and sludge disposal.** C. A. EMERSON, JR. *Sewage Works J.* 1, 231-5 (1929).—A brief discussion.

E. HURWITZ

**The Nidus (Nest) Rack, a modern development of the Travis Colloider.** A. M. BUSWELL AND E. L. PEARSON. *Sewage Works J.* 1, 187-95(1929).—The racks differ from the original Travis Colloider in that (1) more contact surface is afforded, (2) provision is made for removal of the pptd. material and (3) aerobic conditions are maintained in the tank. Expts. show that when ratio of contact surface to vol. of sewage is 20:1, 30% of the colloidal org. matter is removed. The efficiency of this process over plain sedimentation is given as 20 to 50%. Notes on the construction of the Nidus racks and veneer mats and ests. of costs are given.

E. HURWITZ

**Mechanical aerator at Des Plaines River Treatment Works.** M. B. TARK. *Sewage Works J.* 1, 206-10(1929).—Aeration was accomplished by a ribbon conveyor pitched both ways to give approx. the same spiral motion as the Manchester tank. Results of 6 months of operation indicate that a stable effluent was obtained with a 6 hr. detention period and a power consumption of 20 h. p. per million gallons.

E. HURWITZ

**Effect of industrial wastes on sewerage systems.** GEORGE S. RUSSELL. *Sewage Works J.* 1, 242-3(1929).—Wastes which affect sewerage systems by increasing the load on the plant or by causing disintegration and lessening of capacity of sewer systems should either be excluded from the system by ordinance or should receive preliminary treatment at the factory, sufficient to remove causes for objection.

E. HURWITZ

**Smokes and dusts of the big cities.** H. CARRION. *Rev. prat. biol.* **22**, 135-41 (1929).—A general discussion of the causes of and remedies for the pollution of the city atm. A characteristic analysis of dust collected during one month (February) on the terrace of the Palais Royal in Paris is given: C 2.659 g. hydrocarbons 1.824 g.,  $\text{H}_2\text{SO}_4$  2.432 g., Cl 0.253 g.,  $\text{NH}_3$  0.021 g. each per sq. m. G. TOENNIES

**Bacteriological investigation into the state of pollution of the Clyde at Port Glasgow, Greenock and Gourock.** D. ELLIS. *J. Roy. Tech. Coll. (Glasgow)* **2**, 129-42 (1929).—The study of pollution of the River Clyde showed, in general, that the swift running tide in the channel effectively scoured and purified the deeper waters. The quiet, shallow, shore waters were but little affected by the tide and contained numerous saprophytic organisms such as *Cladothrix*, *S-bacteria*, *Beggiatoa* and *Eumycetous* fungi. Black mud contg.  $\text{H}_2\text{S}$  underlaid the shore waters while white sand was found in the deeper waters. No corrective measures are considered. C. R. F.

**Some biochemical relationships in a polluted stream.** H. HEUKELEKIAN. *U. S. Pub. Health Repts.* **44**, 1544-55 (1929).—A survey of the Raritan River extending over a yr. shows pollution. The process of self-purification is evidenced by (a) the reduction of the nos. of *B. coli* and pollutional forms of plankton by a dam, (b) the lowering of O satn. (due to bacterial activities), and (c) the zone of max. pollution moving farther upstream in summer. Diln. with sea  $\text{H}_2\text{O}$  is a major factor in the improvement of the river below New Brunswick. The zone of max. diln. and the zone of bacterial reduction coincide. The max. amt. of Cl present is below the toxic limit of *B. coli*, and therefore, probably, is not a factor in the bacterial reduction at the point of max. diln. There is a direct relationship between the nos. of bacteria, biochem. O demand and the  $\text{NH}_3$  nitrogen. As long as the river is not overloaded nitrification is not impaired. But a heavy pollution, causing a large depletion of O, causes a decrease in  $\text{NO}_3$ . Of the tests employed in the survey the following gave an accurate picture of pollution with domestic sewage: (a) bacteria—*B. coli* and total nos., (b) biochem. O demand, (c)  $\text{NH}_3$  nitrogen, and (d)  $\text{NO}_3$  and  $\text{NO}_2$  nitrogen. J. A. KENNEDY

**Current malaria studies, with special reference to control measures.** I. J. WILLIAMS, JR. *U. S. Pub. Health Repts.* **44**, 2001-4 (1929). J. A. KENNEDY

**Paris green as an anopheline larvicide.** S. N. SUR AND HARIPADA SARKAR. *Indian Med. Gaz.* **64**, 376-8 (1929).—The advantages of cupric aceto-arsenite as a larvicide are stressed, and its effect upon anopheline larvae was discussed. F. G. G.

**The disposal of oil-field brines (a preliminary study).** LUDWIG SCHMIDT AND JOHN M. DEVINE. *Bur. Mines, Repts. of Investigations* No. 2945, 17 pp. (1929).—The successful use of ponds for evapn. in the district studied is limited to properties producing very small quantities of brine; however, ponds are of great value for temporary storage of brine. Plants for recovering the common salts from oil-field brines are uneconomical except in special cases. Further investigation of the brines produced with petroleum may disclose that the rarer salts can be economically obtained. The diversion of oil-field brines into selected streams offers possibilities. Detailed surveys covering all seasons of the year should be made of the various streams. A complete analysis to insure absence of poisonous salts should be made of all brines that are to be allowed to enter streams. The delivery of brine from a field to the selected stream can be accomplished by pipe lines, or a small tributary stream, if available, could be set aside for that purpose, providing fresh  $\text{H}_2\text{O}$  can otherwise be supplied to those obtaining their  $\text{H}_2\text{O}$  for human or stock consumption from the tributary stream. The disposal of oil-field brines by returning them to a subsurface formation appears to be feasible in isolated instances. Great care must be used in attempting this method. Not only is there danger that the  $\text{H}_2\text{O}$  will migrate to fresh-water sands and pollute a potable  $\text{H}_2\text{O}$  supply but also there is an ever-present possibility that this  $\text{H}_2\text{O}$  may endanger present or future oil production. Also in *Petroleum Times* **22**, 207-8 (1929). J. A. KENNEDY

**Disposal of phenol wastes from by-product coke plants.** F. W. SPERR, JR. *Am. J. Pub. Health* **19**, 901-7 (1929).—All phenol-bearing wastes, with the exception of  $\text{NH}_3$  still waste, may be handled by installing suitable recirculating and intercepting systems so that no phenol from these sources need reach any public water supply. The cheapest and most satisfactory for  $\text{NH}_3$  still waste disposal consists in mixing the waste with ordinary city sewage, provided a sufficient amt. of sewage is available. In cities having no sewage disposal systems simple mixt. with raw sewage will suffice to a certain extent, provided sufficient diln. or time of contact can be had. In these cases, it would be well to consider the installation of a sewage aeration system, as this would greatly facilitate the destruction of phenol. In cities using the activated sludge system of sewage disposal, a vol. of still waste equiv. to 50 parts of phenol per million parts of sewage can be treated with certainty, and it is probable that a much larger proportion can be safely

treated. In cities equipped with Imhoff tank systems of sewage disposal,  $\text{NH}_3$  still waste properly clarified can be added either to the raw sewage or to the tank effluent, and if the effluent is suitably aerated, the phenols will be destroyed. There is not sufficient data as to the proportion of still waste that can be handled in this way, but it is probable that a proportion of 1 part still waste to 10 parts sewage may be safely handled. Where the required amt. of sewage is not available, the  $\text{NH}_3$  liquor should be treated for the removal of the bulk of the phenols; this treatment should be followed, if necessary, by mixing the still waste, with its small remaining phenol content, with sewage, or treating it on bacterial filters. In most cases, the removal of the bulk of the phenol from the  $\text{NH}_3$  liquor will be sufficient without further treatment of the still waste. The disposal of  $\text{NH}_3$  still waste by using it for coke quenching is available as an emergency method except for plants producing domestic coke, but although it offers adequate protection to  $\text{H}_2\text{O}$  supplies, it is unsatisfactory for many technical reasons and will doubtless be superseded by other methods.

## 15—SOILS, FERTILIZERS AND AGRICULTURAL POISONS

J. J. SKINNER

The soil reaction profile. E. A. NORTON AND R. H. BRAY. *J. Am. Soc. Agron.* 21, 834-44 (1929).—Early in the process of soil formation, the  $p_{\text{H}}$  of the  $A_2$  horizon of the soils in Illinois becomes 5.7, which seems to be a position of equil. between the accumulation of bases from the decay of org. matter and the loss of bases by leaching. This  $p_{\text{H}}$  is maintained as long as the soil is able to support a good vegetative growth. The highest acidity which might be expected in the muck soils of this region under present environment is a  $p_{\text{H}}$  of about 4.8. Soils developed on rolling well-drained topography were more acid throughout the profile than those developed on flat topography under poorly drained conditions. A significant difference was observed in the amt. of leaching in 2 profiles of the same soil type differing only in the length of time they had been

subjected to weathering. The  $p_H$  of the Slick Spot profiles shows a good correlation with the texture, structure and consistence characteristics as observed in the field and with replaceable Na as detd. in the lab. The reaction profile is a relatively stable soil character, and can be considered as an aid to the sepn. of soil types. E. F. S.

**The nature of acidity of mineral soils.** SHIGERU OSUGI. *Proc. 3rd Pan-Pacific Sci. Congr.* 1926, II, 1960-71 (Publ. 1928).—Mineral acid soils invert cane sugar to a high degree; this is due not to the presence of large amts. of any sol. acid in the soil, but to the surface action of soil particles, as proved by expts. with soil ext. Although the  $p_H$  of the water ext. of the soil is not enough to explain the inverting action, the higher the proportion of soil to water the higher the  $p_H$  of the ext. The ext. from the clay portion of the soil has a higher  $p_H$  than that from the coarser parts. A higher  $p_H$  exists in the adsorbed water film of the soil. Existence of an insol. acid substance in acid soil is proved by changes in cond. of  $NH_4OH$  after contact with the soil. The substance causing soil to invert cane sugar is closely related to the colloidal substance in the soil. E. M. SYMMES

**Studies on the decomposition of genge (*Astragalus sinicus*) in the soil and its relation to the growth of paddy rice.** ISENOSUKE ONODERA. *Proc. 3rd Pan-Pacific Sci. Congr.* 1926, II, 1973-88 (Publ. 1928).—When a large amt. of genge is used as green manure in certain soils it retards growth of paddy rice, not because of the presence of free org. acids but because of the  $CH_4$ ,  $CO_2$ , etc., formed, which displace the necessary O in the soil. E. M. SYMMES

**The role of a cellulose fermenter in soil fertility.** ARAO ITANO. *Proc. 3rd Pan-Pacific Sci. Congr.* 1926, II, 1989-93 (Publ. 1928).—The thermophilic cellular fermenter acts vigorously on cellulose during composting. A specially built zymotic chamber aids in producing desirable compost from waste in a short time without the aid of cattle. This may be used on a large scale to dispose of city or farm waste. Human excreta can be used with comparative safety because the high temp. produced in the process destroys most of the pathogenic organisms. E. M. SYMMES

**The maximum amount of combined nitrogen that can be absorbed by soils from the atmosphere.** TSUNEJIRO IMASEKI. *Proc. 3rd Pan-Pacific Sci. Congr.* 1926, II, 1994-6 (Publ. 1928).—By using a 5%  $H_2SO_4$  soln. to absorb  $NH_3$ , and a 5%  $K_2CO_3$  soln. to absorb  $HNO_3$  and  $HNO_2$ , it was found that at Nishigahara about 22.6 kg. per hectare of combined N may be absorbed. E. M. SYMMES

**Relation between the phosphatic requirement and the phosphatic content of soil for paddy rice.** MICHI IMAI. *Proc. 3rd Pan-Pacific Sci. Congr.* 1926, II, 1996-8 (Publ. 1928).—The ratio  $Al_2O_3 + Fe_2O_3 : P_2O_5$  in a soil sol. in concd. HCl may be used to indicate its phosphatic requirement. The P content in a soil sol. in 0.2 N HCl also gives reliable information. E. M. SYMMES

**Several observations on the soils with a close gley horizon.** A. A. ZAVALISHIN. *Memorial Vol. to K. D. Glinka*, Leningrad Agricultural Inst. pp. 45-90 (1928).—Several soil profile cuts are described. (1) Peat or mud-marshy soil which lies immediately below a vegetative surface layer horizon; (2) podzolized-gley soil, where the profile has the typical podzol morphological characters. The gley horizon appears as a light gray, or gray with a slightly bluish, sandy or clay parent material. The gley horizons have no structure, are more or less compact, plastic and smeary. A suspension of the soil material from the gley horizon is stable and it is highly dispersed. The consecutive stages of the gley process are: At first there is formed a more or less compact, cemented, dark-brown horizon; the next step is a yellowish green loose gley, rich in sol. org. substances and ferrous iron. In the third stage a light-gray bluish gley is formed. In K the humus content in the gley is small; its soly. increases with the advance of the gleying process. The reaction of the gley horizon becomes more alk. with its depth, the  $p_H$  varying from 6.0 to 7.5. The gley horizon is poor in exchangeable Ca due to the decompn. of the complex by the ground waters. There is some exchangeable Mg equal in amount to Ca. The horizons above the gley horizon contain appreciable exchangeable Ca and Mg; upon treating the gley horizon with 0.05 N HCl appreciable amounts of  $SiO_2$  (av. 0.25%) are extd.  $Al_2O_3$  is found in the B and gley horizons. The specific property of the gley is the presence of ferrous iron. In general the compn. of the gley horizon differs but little from the parent material. The dynamics of the formation of the marshy condition is discussed. In gley soils the marshy condition is caused by the ground waters in distinction of the marshy soils produced by the imperviousness to the surface waters whereby a surface marsh is formed. J. S. JOFFE

**Measurement of suction forces in soil.** C. F. SHAW. *Soil Science* 27, 111-5 (1929). E. J. C.

The determination of the number of microbes in arable soils. A. J. J. VAN DE VELDE AND ALFRED VERBELEN. *Naturw. Tijdschr.* 11, 108-14(1929).—The  $pH$  and the no. of microbes of 30 different Belgian soils have been detd. In order to do the microbe counting without difficulty, the sample of soil is shaken with sterilized milk, and the counting is then done in the milk by the Skar method: flocculation of the dye is thus prevented. In order to stop the multiplication of the soil microbes during the shaking with milk, 1 cc. of 40% formol is added per 1 l. of milk. Very consistent results have been obtained.

Soil alkali as a scientific problem in Pacific regions. FRANKLIN S. HARRIS. *Proc. 3rd Pan-Pacific Sci. Congr.* 1926, II, 1923-32(Publ. 1928).—A review. E. M. S.

Determination of the fineness of marl. E. P. DEATRICK AND C. DORMAN. *Soil Science* 27, 121-2(1929).

Chernozem and forest loam. M. A. EGOROV AND M. M. STRELNIKOVA. *Ukrain-skii Khim. Zhurnal* 4, No. 1, Tech. Pt., 65-82(1929).—Of the 2 soils located under similar climatic conditions the loam is more productive, and in order to det. the cause both soils were subjected to various analyses and treatments. The chernozem contains more of the particles of the size 0.05 to 0.25 mm.; it contains more N,  $P_2O_5$ , CaO and humus; and in it  $Al_2O_3$ , CaO and, in part,  $Fe_2O_3$  move faster as shown from data on a 10% HCl ext. Treatment of the soil with  $NH_4Cl$  soln. dissolves the Ca ion; in the presence of Ca ion there is little org. matter,  $P_2O_5$  or  $Fe_2O_3$  in soln. Treatment with  $(NH_4)_2CO_3$  or  $(NH_4)_2C_2O_4$  seps. the Ca from soln.; in this case the org. matter, the  $P_2O_5$  and the  $Fe_2O_3$  appear in soln. In this respect both soils behave alike. Loam decomposes cellulose faster than chernozem and is more efficient in decomp.  $H_2O_2$ . More org. matter goes in soln. from chernozem upon treating the soils with  $Na_3PO_4$ . The loam soil contains more "crenic and aprocronic acids" of humus. Reversion of phosphates goes on faster in a chernozem soil. Treating the soils with  $Na_2CO_3$  and  $NaHCO_3$  gave the same results as treating with the phosphates of Na. In the loam the elements of fertility—N and P—are more active and move faster, while the chernozem contains more of the so-called preserving elements like Ca,  $Fe_2O_3$  and  $P_2O_5$ , which in turn hold the org. matter.

Distribution of volcanic ash loams in Japan proper and their characteristics and agricultural value. TOYOTARO SEKI. *Proc. 3rd Pan-Pacific Sci. Congr.* 1926, II, 1936-41(Publ. 1928).—To promote the productivity of ash loams attention should be given to the application of sol. phosphate after addn. of lime, addn. of K salts to ash loams deficient in K, and application of leguminous green manure to those deficient in org. substances. Land supposed to be infertile can be raised to moderate productivity.

Volcanic ashes in Hokkaido and their agricultural value. KOJI MIYAKE. *Proc. 3rd Pan-Pacific Sci. Congr.* 1926, II, 1941-54(Publ. 1928).—Volcanic ash soils are not naturally fertile. Improvement in water conditions makes them fertile and use of large amts. of fertilizers is more profitable. Selection of crops is necessary. E. M. S.

The new fertilizers. W. S. LANDIS. *Am. Fertilizer* 70, No. 12, 31-3, 55-6, 58, 60, 62(1929).—A review and discussion of the scientific basis for modern fertilizer practice and of the problems to be encountered in the use of the synthetic fertilizer salts.

Developments in fertilizer production. HARRY A. CURTIS. *Am. Fertilizer* 71, No. 1, 54, 56, 58, 60(1929).—A review with special reference to new developments in the synthetic  $NH_3$  industry.

Changes in fertilizer manufacture. H. R. SMALLEY. *Am. Fertilizer* 70, No. 7, 33, 55-6, 58(1929).—A discussion of the present tendency in fertilizer manuf. towards increasing the plant food content of fertilizer mixts. and the use of inorg. materials from chem. sources.

High analysis phosphates. F. L. LARISON. *Am. Fertilizer* 70, No. 13, 54-63(1929).—A review of the present method of producing treble superphosphate in the western field with a discussion of the economic advantages attending the use of high-grade phosphates.

Chemistry and economics of superphosphate. K. D. JACOB. *Am. Fertilizer* 70, No. 13, 48-54(1929).—Superphosphate is discussed with respect to its present economic aspects, future prospects, chem. compn. and the technical aspects of the industry. The reactions involved in the neutralization of the free acids in superphosphate are outlined and statistics are given on the possible production of F compds. as by-products in the superphosphate industry.

By-products of furnace-made phosphoric acid. K. D. JACOB AND D. S. REYNOLDS. *Am. Fertilizer* 70, No. 6, 19-23(1929).—An outline is given of a no. of processes that are

in use or have been proposed for the direct or indirect production of by-products in the manuf. of  $\text{H}_3\text{PO}_4$  by the volatilization method. The by-products listed include such materials as H, fused cement, CO, ferrophos, F compds.,  $\text{K}_2\text{O}$  salts, active C and slag wool. Several of the processes seem to offer interesting possibilities and their possible economic value is discussed in connection with the production of  $\text{H}_3\text{PO}_4$  for use in fertilizers.

W. H. ROSS

**Certain experiments for the utilization of natural aluminum phosphate on the Pacific Coast.** YOSHISABURO KIDA. *Proc. 3rd Pan-Pacific Sci. Congr.* 1926, II, 1999-2000 (Publ. 1928).—(1) Al phosphate was decompd. by  $\text{H}_2\text{SO}_4$ , extd. by alc. or acetone, and  $\text{NH}_3$  blown into the sepd. solvent to combine with the phosphoric acid, sepg.  $\text{NH}_4$  phosphate. (2) Al phosphate was decomposed by  $\text{H}_2\text{SO}_4$ , mixed with an equiv. sulfate to form alum, which was sepd. and lime or  $\text{Ca}_3(\text{PO}_4)_2$  added to convert to monocalcium phosphate. (3) Al phosphate was treated with hot  $\text{NaOH}$  soln., decanted, and Na phosphate formed at 80% yield. From the waste, alumina was prepd. (4) Finely ground Al phosphate was mixed with a small amt. of warm, dil.  $\text{NaOH}$  and allowed to stand. Fertilizers made as above were almost equiv. to superphosphate.

R. M. SYMMES

**An analysis of the effects of potash fertilizers on apple trees at East Malling.** N. H. GRUBB. *J. Pomology Hort. Sci.* 7, 32-58 (1928).—The application of  $\text{K}_2\text{SO}_4$  to a number of varieties of apple trees largely prevented leaf scorch, increased the quantity and size of fruit and promoted more vigorous growth. No consistent tendency towards more highly colored fruit was observed but in some cases the reverse was shown, probably due to denser foliage where K was applied.

A. L. MEHRING

**The effects of fertilizer treatments on the chemical composition of gooseberry bushes.** I. Effects on dry matter, ash and ash constituents of leaves and stems of terminal shoots and of fruits, and on total nitrogen of fruits. T. WALLACE. *J. Pomology Hort. Sci.* 7, 130-45 (1928); cf. *C. A.* 22, 839.—Deficiency of K is clearly shown in the compn. of the ash of leaves, stems and berries, especially of the first two. Low amts. of  $\text{K}_2\text{O}$  are accompanied by high values for  $\text{CaO}$ ,  $\text{MgO}$ ,  $\text{Na}_2\text{O}$  and  $\text{P}_2\text{O}_5$ . The moisture content is low in leaves and stem and ash is low in stems and berries where K is deficient. When K was applied, deficiency of P was reflected in low  $\text{P}_2\text{O}_5$  in the ash and deficiency of N in the total N detns. When K was not applied, its influence masked other results. The ash of material from plots treated with fertilizer was low in  $\text{P}_2\text{O}_5$ .

A. L. MEHRING

**The influence of increasing amounts of calcium sulfite and calcium sulfate on the germination and the young development of grain plants.** K. SCHARER and W. SCHROPP. *Landw. Vers. Sta.* 108, 217-51 (1929).—The action of  $\text{CaSO}_3$  on quaternary loam soils shows with wheat, rye and barley injury of no kind on germination and no decrease of the yield in green wt.; with the smaller amts. a small increase in yield is obtained. With oats a slight depression in yield was produced by the increasing amts. of  $\text{CaSO}_3$ , likewise a slight arresting of germination. The expts. with  $\text{CaSO}_4$  on the quaternary loam show a tendency toward a decrease in yield for the different amts. of  $\text{CaSO}_4$ . The decline in yield was the most distinct with the high amts. of  $\text{CaSO}_4$  on winter rye, winter barley and oats, the least on winter wheat. The small amts. produced changeable influences. On low moor soils  $\text{CaSO}_3$  and  $\text{CaSO}_4$  had, with all crops, an unfavorable influence on the yield and green wt. On low-terraced gravelly soil both  $\text{CaSO}_3$  and  $\text{CaSO}_4$  diminished yields of all cultivated plants. If one considers the  $p_{\text{H}}$  values of the individual soils with different fertilizing and different crops, a uniform picture is not obtained. With the low moor soils the differences in the reaction nos. are mostly small and for the most part lie within the limits of exptl. error. With the low-terraced soils finally the differences are the slightest and lie entirely within the limits of exptl. error.

E. F. SNYDER

**Increasing the protein content of pasture grasses by frequent light applications of nitrogen.** C. R. ENLOW and J. M. COLEMAN. *J. Am. Soc. Agron.* 21, 845-53 (1929). The protein content of the grasses mowed frequently averaged much higher than when the grasses were cut only at the end of the growing season. This held true on both fertilized and unfertilized areas. The protein content of pasture grass in a grazed condition can be increased and maintained at a somewhat higher level than ordinary by frequent light applications of a N fertilizer. The pasture grasses used in this expt. gave much higher forage yields from the N applications as shown by yield records obtained and as indicated from results obtained in the pasture expt. Rainfall (rather than available soil N) is a limiting factor in forage production, as the ratio between the total N content of the grass and the lb. of forage produced is flexible. E. F. S.

Chemical and microbiological principles underlying the transformation of organic

**matter in stable manure in the soil.** SELMAN A. WAKSMAN AND ROBERT A. DIEHM. *J. Am. Soc. Agron.* **21**, 795-809(1929).—The digestion of the complex org. materials in feeds involves a diminution of sugars, starches, fats, pentosans and celluloses and an increase of the lignins. The N is excreted by the animal partly in a sol. form, as urea and  $(\text{NH}_4)_2\text{CO}_3$  and partly in a complex org. form. In the decompn. of manure, the pentosans and celluloses are reduced much more rapidly than the total org. matter, while the lignins are decompd. less rapidly; hence there is a rapid reduction of the polysaccharides and an accumulation of the lignins. Only the sol. N undergoes rapid nitrification in the soil. Both forms of org. N, namely, that present originally in the manure and that synthesized by the microorganisms in the composting of the manure, become only slowly available. The role of microorganisms in the transformation of manure can be summarized under the processes of decompn. and synthesis, both of which take place side by side. E. F. S.

**Fermentation of soy-bean meal.** K. SHIMO AND T. HARADA. *J. Soc. Chem. Ind. Japan* **32**, 125-30(1929); Suppl. Binding **32**, 40-2B(1929).—Soy-bean meal was mixed with 30% of water and allowed to ferment in an incubator at 37°. At an early stage of fermentation the meal became more and more acid, reaching the max. acidity; its acidity then gradually fell, finally to an alk. reaction at the end of the fermentation. Unless the fermentation was stopped just when the fermenting meal showed neutrality, there would be a large loss of N as  $\text{NH}_3$ . Fats and carbohydrates are largely destroyed by fermentation whereas the total N, proteins, fibrous matter and ashes do not decrease, when the fermentation was stopped at the right time. The amide N increased markedly while the monoamino N greatly decreased and humin- and diamino-N decreased to a less extent. These facts indicate that the fermented meal when used as fertilizer should be more easily utilizable by plants than the unfermented. Y. T.

**Weight of plant tops and roots.** CLAUSEN. *Fortschr. Landw.* **4**, 277-80(1929).—The relative wt. of roots and tops is influenced by the kind of soil and the fertilization. The addn. of N increases the wt. of tops to a greater degree than that of roots.

LAWRENCE P. MILLER

**The farm as a consumer of chemicals.** C. H. MACDOWELL. *Am. Fertilizer* **70**, No. 12, 19-20, 52(1929).—The consumption of chemicals on the farm is discussed with special reference to their use in fertilizers, insecticides, sprays and mineral feeds.

W. H. ROSS

**Organic insecticides.** F. J. RUSSELL. *Chemist and Druggist* **108**, 427(1928).—A review chiefly on some recently introduced insecticides (*C. A.* **19**, 1750; **20**, 2556, 3769).

S. WALDBOTT

**The effect of copper carbonate on covered smut, *Ustilago hordei*, of hull-less barley.** R. H. PORTER. *Proc. 3rd Pan-Pacific Sci. Congr.* **1926**, II, 2098-2102(Publ. 1928).— $\text{CuCO}_3$ , dry and liquid Tillantin, dry and liquid  $\text{CuSO}_4$  and hot and cold  $\text{HCHO}$  all practically eliminated smut from infected barley seed and produced a clean crop.

E. M. SYMMES

**Seed disinfectants for the control of kernel smut of foxtail millet.** R. H. PORTER. *Proc. 3rd. Pan-Pacific Sci. Congr.* **1926**, II, 2103-7(Publ. 1928).—Dry Tillantin, cold  $\text{HCHO}$ , dry Uspulun and  $\text{CuCO}_3$  reduced smut to below 5% and increased the yield 3.1-4.6 bushels per acre.

E. M. SYMMES

**Exterminators for beet parasites.** B. TESI. *L'industria saccarifera ital.* **22**, 1(1929); *Listy Cukrovar. Rozhledy* **47**, 26.—The following prepn. were effective especially against cockchafer: (1) tobacco dust 40%, flowers of S 30%, finely ground naphthalene 30%; (2) tobacco dust 50%, dried "šama" 50%; (3) fine naphthalene 50%, dried "šama" 50%. Because of high costs, only the latter prepn. was used. Several applications were given during the summer. Solns. were more effective than dry powders, but their cost prevents a wide use. A successful prepn. was: soap 2.5 kg., cresol 1 kg.,  $\text{H}_2\text{O}$  6 l.; the mixt. is stirred till well dissolved, and then diluted to 9 l.

FRANK MARESH

**The ecology of growing beets and its relation to plant diseases.** V. STEHLIK AND FR. NEUWIRTH. *Listy Cukrovar. Rozhledy* **47**, 639-44(1929); cf. *C. A.* **23**, 1665.—The peeling of beet seeds is not effective. The main source of infection does not lie in the seed but is *Rythium de Baryanum* which attacks the growing plant. *Rythium de Baryanum* is found in blighty soils and is not carried by seeds; the treatment of seeds with germicides is useless in this case. The main causes of blight are due to soil deficiencies. The peeling of beets improved their germination and sprouting (primarily for seeds with thick shells). For ordinary com. seeds this improvement is small. FRANK MARESH

**Studies of the spring scarabee.** FLACHS. *Z. angew. Entomologie* **14**, 514(1929); *Listy Cukrovar. Rozhledy* **47**, 38.—The larvae are able to avoid poisoned baits; petro-

leum,  $\text{CS}_2$ ,  $\text{C}_6\text{H}_6$ ,  $\text{CCl}_4$ , phenols, cresols, gas plant solns. and CN mixts. kill insects and the larvae directly in lab. expts.; their practical use is very restricted. The larvae are able to live for a few days submerged in  $\text{H}_2\text{O}$ ; flooding the helds is ineffective. Drought and sunlight were very destructive to the larvae; rolling the fields 3-4 times was detrimental to the larvae. Larvae were indifferent to soil rich or deficient in Ca, or an acid or alk. one. They sought soils with the highest moisture content. K salts and manure water contg. 1-2%  $\text{FeSO}_4$  or  $\text{Ca}(\text{NO}_3)_2$  removed larvae from the upper soil layer. Powd.  $\text{FeSO}_4$  was equally effective.

FRANK MARESH

International aspects of the phosphate rock industry (GRACE) 18. Oil content of sunflower seeds and factors controlling it (USPENSKII) 27. Phosphate progress (BURROWS) 18. Value of Ca salts in poultry feeding (AUTON) 11E. Treating sewage sludge for fertilizer (Brit. pat. 305,346) 14.

BEAR, FIRMAN E.: *Theory and Practice in the Use of Fertilizers*. London: Chapman & Hall. 348 pp. 20s., net.

RENDU, A.: *Fertilité de la terre et engrais chimiques*. PARIS: Garnier frères. 192 pp. F. 8.

**Fertilizers.** SOC. L'AIR LIQUIDE, SOC. ANON. POUR L'ÉTUDE ET L'EXPLOITATION DES PROCÉDÉS G. CLAUDE AND E. URBAIN. Brit. 305,132, Jan. 31, 1928. A mixt. of  $\text{KCl}$  and  $\text{NH}_4\text{Cl}$  which may be formed as described in Brit. 210,399 is treated, at temps. up to  $260^\circ$ , with  $\text{H}_3\text{PO}_4$  in such proportion that for each atom of the total alkali contents of the mixt. there is present more than 1 (suitably 2) atoms of P, and the product is then treated, at about  $150^\circ$ , with  $\text{NH}_3$  until at least one-third of the H of the  $\text{H}_3\text{PO}_4$  used has been replaced.

**Artificial fertilizer.** NILS K. E. MALMSTEN. Ger. 477,954, Oct. 24, 1922. A device for powdering and mixing artificial fertilizer is described.

**Superphosphate.** CHEMISCHE INDUSTRIE A.-G. and H. MEYER. Brit. 304,697, Jan. 24, 1928. Superphosphate is stored until its  $\text{CaSO}_4$  content has sepd as  $\text{CaSO}_4 \cdot 2\text{H}_2\text{O}$  and then dried at a temp. below that at which the water-sol. phosphate is rendered water-insol. A single drying may reduce the water content to 5-6%.

**Insecticides.** CALIFORNIA FRUIT GROWERS' EXCHANGE. Ger. 479,192, Sept. 17, 1926. Comps. to be sprayed on plants and comprising an aq. emulsion of an oil or other insecticide are prepd. with the use of pectin or a pectic substance as the emulsifying agent.

**Liquid insecticide containing an effective ingredient of the Derris species.** SANKICHI TAKEI (to Zaidan Hojin Rikagaku Kenkyujo). U. S. 1,724,626, Aug. 13. Raw material such as *Derris* root is extracted with a volatile org. solvent for the effective ingredient, such as with ether or gasoline, the ext. is mixed with lard and chrysalic oil or other suitable anhyd. alkali-free org. preservative for the ingredient, the solvent is evapd. from the mixt. and the resulting product is mixed with an org. colloidal material in an aq. medium, e. g., with soap and water.

**Seed-separating and germination-stimulating solution.** H. R. WARREN (to Warrenteed Seed Co.). Brit. 304,649, Jan. 23, 1928. See U. S. 1,708,435 (C. A. 23, 2541).

## 16—THE FERMENTATION INDUSTRIES

C. N. FREY

**Lactic fermentation.** P. SIMONART. *Bull. trimestr. assoc. élèves école sup. brasserie univ. Louvain* 29, 75-81 (1929).—An address. A. PAFINEAU-COUTURE

**Evolution of the Saladin system in pneumatic malting.** ANTH. VISEZ. *Bull. trimestr. assoc. élèves école sup. brasserie univ. Louvain* 29, 70-4 (1929).—The evolution of the system is outlined. A. PAFINEAU-COUTURE

**Controlling the drying of malt.** V. CIHAK. *Kvas*, Jan. 16, 1929; *Brasserie & malterie* 19, 73-7 (1929).—An address. A. PAFINEAU-COUTURE

**Analyses of 1928 malts.** J. DE CLERCK. *Bull. trimestr. assoc. élèves école sup. brasserie univ. Louvain* 29, 67-70 (1929).—Analyses of 129 malts of the 1928 crop confirmed the conclusions drawn from analyses of malts from the 1927 crops (C. A. 22, 3258). A. PAFINEAU-COUTURE

**Starch, amylase and amylolysis.** H. COLIN. *Bull. trimestr. assoc. élèves école sup. brasserie univ. Louvain* 29, 49-60(1929).—A crit. review. A. PAPINEAU-COUTURE

**Use of metal filtering surfaces instead of wort filters.** J. RAUX. *Brasserie & malterie* 19, 53-61, 69-73, 86-92, 97-101(1929); cf. *C. A.* 22, 1431.—Tests with a wire cloth having a rep weave showed that it could be used instead of textile filtering cloth without appreciable modification in the working conditions of the filter, that a finer flour must be used (which results in a higher degree of extn. in mashing), and that filtration is as rapid as with a coarse textile cloth and more rapid than with a fine cloth. Preliminary tests with slotted metal plates indicated that they are not as advantageous as the wire cloth filters. A. PAPINEAU-COUTURE

**General effect of very cold temperature on the chemical composition of wine.** ASTRUC AND CASTEL. *Ann. fals.* 22, 272-5(1929).—A brief discussion of the effects on the compn. of wine of the exceptionally cold weather experienced in Southern France during the winter of 1928-29, more particularly from the standpoint of the interpretation of the results of analysis in judging of the genuineness of the wine. A.P.-C.

**Wines of Gard and of Ardèche from the 1928 vintage.** AUBOUV. *Ann. fals.* 22, 278-87(1929).—Analyses of 84 wines of Gard and 28 of Ardèche are tabulated and briefly commented. A. PAPINEAU-COUTURE

**The use of alkali sulfites in wine making.** J. HENRI FABRE AND E. BRÉMOND. *Ann. fals.* 22, 262-71(1929).—After a brief discussion of the French regulations as regards the use of free SO<sub>2</sub>, bisulfites and NH<sub>4</sub> phosphates in wine making, it is shown that NH<sub>4</sub> sulfite has no unfavorable effect either on the yeast or on the quality of the finished wine, and that sol. phosphates added to the wine must pass entirely into the finished wine and do not seem to be utilized by the yeast during fermentation. A. PAPINEAU-COUTURE

**The use of potassium ferrocyanide in wine making.** E. COUERRÉ. *Ann. fals.* 22, 354-62(1929).—Polemical with Musso (*C. A.* 23, 2530), defending the use of K<sub>4</sub>Fe(CN)<sub>6</sub>. A. PAPINEAU-COUTURE

**Contribution to the study of raisin wine.** L. CHAUVEAU AND A. VASSEUR. *Ann. fals.* 22, 340-51(1929).—A review of the rather meager literature on the subject, together with a very detailed analysis and description of the phys. and organoleptic characteristics of a sample prepd. in the lab. A. PAPINEAU-COUTURE

**A new method of estimating the acids of wine.** G. BONIFAZI. *Mitt. Lebensm. Hyg.* 20, 122-47(1929).—A comprehensive review of the methods for detg. fruit acids is presented. Lactic, tartaric, malic and succinic acids are detd. from the same sample. Acetic acid is detd. by distn. in the usual way with a sep. sample. C. R. F.

**Determination of alcohol in wines by chromic oxidation.** LUCIEN SEMICHON AND MICHEL FLANZY. *Ann. chim. anal. chim. appl.* 11, 195-9(1929).—See *C. A.* 23, 3537. W. T. H.

**Detection of cider and other fruit juices in wine.** J. WERDER. *Ann. fals.* 22, 260-1(1929).—See *C. A.* 23, 4296. A. PAPINEAU-COUTURE

**Conversion of dibenzalsorbite into hexaacetylsorbite.** C. ZACH. *Ann. fals.* 22, 261-2(1929).—See *C. A.* 23, 4296. A. PAPINEAU-COUTURE

**"Lambic" beers.** ALBERT VOSSEN. *Bull. assoc. élèves inst. sup. fermentation Gand* 30, 192-201(1929).—An address discussing the precautions to be taken to obtain good lambics. A. PAPINEAU-COUTURE

**Container for pasteurizing apparatus** (Ger. pat. 478,539) 1. **Fermenting cacao beans** (Brit. pat. 305,236) 12. **Separating alcoholic mixtures by distillation** (Brit. pat. 304,756) 13.

FABRE, J. HENRI: *Traité encyclopédique des vins: procédés modernes de vinification*. Vol. I. 4th ed. Paris: Dujardin frères. F. 40. Reviewed in *Ann. fals.* 22, 370(1929).

FEHR, J. H., AND NORRENBERG, HEINRICH: *Likörfabrikation auf kaltem Wege*. 4th ed., revised. Eberswalde: R Müller. 94 pp. M. 2.80.

HESSE, ALBERT: *Die Technologie der Fermente*. 1 Halbband. *Enzymatische Technologie der Gärungsindustrien*. Leipzig: Georg Thieme. 357 pp. M. 36. Reviewed in *Cereal Chemistry* 6, 372; *Ind. Eng. Chem.* 21, 889(1929).

**Simultaneous production of carbonic acid, alcohol and lactic acid.** PAUL LINDER. Ger. 478,558, Aug. 17, 1927. CO<sub>2</sub>, alc. and lactic acid are produced simultaneously from cane sugar, glucose, fructose or mixts. by fermentation with the bacteria from the American aloe at 25-35°.

**Butyl and isopropyl alcohols.** ALEXANDER IZSAK (to Eastern Alcohol Corp.). U. S. 1,725,083, Aug. 20. BuOH and iso-Pr alc. are obtained by the fermentation of carbohydrate material such as molasses by the action of a bacillus which is described and which is obtained by saccharifying the starches of barley malt and incubating the maltose.

**Fusel oil by fermentation.** FRANK A. McDERMOTT (to Eastern Alcohol Corp.). U. S. 1,725,084, Aug. 20. An acid molasses or other carbohydrate-protein mash is sterilized, cooled to optimum temp. (suitably about 30°), inoculated with a culture of *Willia anomala*, cultures of regular distillery yeast are added to the medium and it is aerated and permitted to ferment.

**Glycerol by fermentation.** FRANK A. McDERMOTT (to E. I. Du Pont de Nemours & Co.). U. S. 1,725,363, Aug. 20. During the fermentation of materials such as molasses solns., by the action of yeast, for glycerol production, relatively small vols. of concd. soln. of mash materials are added in successive portions.

**Apparatus for distilling alcoholic liquors.** MICHAEL KONTER. U. S. 1,725,528, Aug. 20. Structural features.

**Mash tub and rotary stirrer.** A. ROLZ. Brit. 304,182, Jan. 16, 1928.

**Stabilizing cereal beverages.** HERMAN HEUSER (to U. S. Process Corp.). U. S. 1,724,021, Aug. 13. Fermented cereal beverages of legal alc. content are treated with catechu tannic acid in at least sufficient quantity to ppt. the readily precipitable protein compds.

**Drying hops.** L. WEBER. Brit. 305,076, Oct. 27, 1927. Hops are drawn by suction into a space between perforate grids in a still and are dried, prior to extraction with air or alcoholized air, at a temp. of about 32° or somewhat lower and preferably under less than atm. pressure. An app. is described.

**Oils and resins from hops.** L. WEBER. Brit. 305,066, Oct. 27, 1927. Hops are dried (preferably at a temp. of not higher than 32° and at a pressure below atm. pressure); the dried hops are treated with water vapor at less than atm. pressure and the vapor and assocd. oil are condensed; the material is dried by warm or alcoholized air, treated with 96% alc. to ext. resins, alc. is recovered by circulating warm air through the hops and the latter are then treated with warm water to ext. residual oil, resin and alc. An app. is described, including a still with jacketed ends for cooling or heating purposes.

**Yeast.** LEWELLYN J. HOWELLS. U. S. 1,725,583, Aug. 20. A quantity of yeast-fermentable wort is divided into 2 sep. parts and each part is separately washed to produce 2 sep. worts "A" and "B," "A" having a high ratio of yeast-fermentable carbohydrate to yeast-assimilable N, and "B" having a low ratio of yeast-fermentable carbohydrate to yeast-assimilable N; yeast propagation is conducted in "B" and such quantities of "A" are added as are just sufficient to supply the yeast-fermentable carbohydrate required to maintain unrestricted growth; intense aeration is maintained during the propagation, which is conducted at a temp. of about 30°.

**Pasteurizing beer or other liquids without loss of dissolved gases.** FREDERIK LASSEN (to Aktieselskabet de Forenede Bryggerier). U. S. 1,724,291, Aug. 13. Pasteurization in a confined space is followed by cooling under pressure to effect re-dissolving of liberated gases. An app. is described.

**Yeast.** EJNAR A. MEYER (to The Fleischmann Co.). U. S. 1,724,952, Aug. 20. In an aeration process of yeast production extending over some time, yeast propagation is initiated with aeration in a soln. comprizing molasses, propagation is continued for a period in excess of 10 hrs., a portion of the yeast-contg. liquid is withdrawn, and to the remainder there is added at least an equiv. quantity of an ext. of cereal material, and the propagation with aeration is continued. Cf. C. A. 22, 3485.

**Ergosterol from yeast.** ROBERT GRIESSBACH and OTTO AMBROS (to Winthrop Chemical Co.). U. S. 1,724,706, Aug. 13. Yeast is first subjected to autolysis and ergosterol is then extd. to obtain a larger yield than is obtained without the preliminary autolysis.

**Antiseptic, from beer yeast, suitable for use in autolyzing operations.** MAURICE KAHN, ELIANE LEBRETON and GEORGES SCHAEFFER (to Soc. française des produits alimentaires azotes). U. S. 1,724,027, Aug. 13. The yeast is autolyzed for 3-20 days at a temp. of 36-44°, without addn. of an antiseptic, the mass is agitated, autolyzate is sepd. from non-liquid substances, and an antiseptic substance is obtained from the autolyzate.

## 17—PHARMACEUTICAL CHEMISTRY

W. O. EMERY

**Glycerophosphates and inositolphosphates.** G. LOCATELLI. *Boll. chim. farm.* **66**, 737-8(1927).—Ca Mg inositolphosphate,  $C_6H_8O_{24}P_4Ca_3Mg_3$ , is contained in the husk of cereals to the extent of about 8%, and is easily extd. by dil. acid; for pharmaceutical purposes it can advantageously replace Ca glycerophosphate. B. C. A.

**Evaluation of folia belladonnae.** E. I. VAN ITALLIE. *Pharm. Weekblad* **66**, 657-60 (1929).—Slight modifications in technic are described which make it possible to det. the alkaloid in a 10-g. sample of dried leaves instead of the 15-g. sample specified in the Dutch Pharm. A. W. DOX

**History of pharmacy in old Roumania.** JULIUS ORIENT. *Pharm. Post* **62**, 351-6 (1929). W. O. E.

**Macrochemical and microchemical methods for evaluation of caffeine in drugs.** GYULA V. MIKÓ. *Pharm. Monatsh.* **10**, 133-7(1929).—A critical review of the methods at present in common use, in connection with an exptl. study of a shortened macrochem. method based on the U. S. Pharm. procedure, but using only 2-g. samples (of tea) and a far shorter period for extn. (5 min. digestion in aq. media and 5 min. treatment with  $CHCl_3$ ). The caffeine values obtained were quite satisfactory. A microchem. procedure involving 0.5 g. samples and extn. as in the macrochem. method was developed, the crude caffeine being thereupon treated with  $H_2SO_4$ , and the resulting acid soln. examd. refractometrically. The results obtained in a series of samples are presented in tabulated form. Recourse should be had to the original for the rather involved details of the procedures studied. W. O. E.

**Chemistry and pharmacology of digitalis.** II. RUNNE. *Pharm. Zentralhalle* **70**, 453-60, 469-75(1929).—An address giving a review of our present knowledge of the essential ingredients of *Digitalis purpurea* L. W. O. E.

**Evaluation of cresol-rosin soap solutions.** GREGOR KOGAN. *Pharm. Zentralhalle* **70**, 488-90(1929).—An account of the examn. of certain "kreolins" of Russian and foreign manuf. from the standpoint of the Russian Pharm. W. O. E.

**Use of gold, silver, copper, iron, tin and sulfur in ancient therapy.** F. KAISER. *Pharm. Zentralhalle* **70**, 490-1(1929).—Certain observations are made on the early use of these elements in disease. W. O. E.

**Yeast products used in the manufacture of drugs.** F. GRAF. *Pharm. Ztg.* **74**, 946-9(1929).—A discussion of the use of yeast and its exts. (Zyma brand) in large-scale production of pills, the formulas of which (some 30) are given. W. O. E.

**Pine-needle extracts and pine-needle bath extracts.** C. A. ROJAHN. *Pharm. Ztg.* **74**, 978-80(1929).—A compilation of results obtained in the examn. of some 22 samples. W. O. E.

**Practical pharmacy. Barium sulfate containing barium carbonate and other "non-toxic" mixtures.** HERMANN KUNZ-KRAUSE. *Apoth. Ztg.* **44**, 924-6, 937-9(1929).—A discussion of the problems presented in the examn. and control of substances like  $BaSO_4$  (+  $BaCO_3$ ), K tartrate (+ K Sb tartrate),  $MgSO_4$  (+  $ZnSO_4$ ),  $PhNHAc$  (+  $H_3BO_3$ ), etc., notably when made to develop fluorescence. W. O. E.

**The alkaloid content of some plants.** M. STULNIKOV. *Ber. Saratower Naturforscherges.* (Russia) **2**, 8-14; *Chem. Zentr.* **1928**, I, 1294.—*Atropa belladonna* contained 0.38-0.75% in the leaves, 0.29-0.35% in the roots and 0.86% in the seeds. The normal mature leaves contained more than the tender, immature ones. The leaves of *Datura stramonium* contained 0.32%, and the seeds 0.38% atropine. The leaves and seeds of *Hyoscyamus niger* had 0.17 and 0.34% atropine, resp. *H. alba* had 0.35% of atropine in the leaves. All the plants examd. were obtained near Saratov. C. R. F.

**Extractum filicis maris.** Z. CSIPKE. *Magyar Gyógy Társaság Értesítője* **5**, 143-60 (1929).—Active components of this drug are the so-called "crude filicine," filicic acid and filmaron. The rhizome of filix mas contains about 6% fatty oil, acting as solvent to the above active components. In making an ext., this oil should always be extd. The odor of the ext. is due to the presence of about 0.04-0.06% ethereal oils. Rhizoma filicis maris should always be examd. as its content of crude filicin varies considerably, i. e., from 0.81 to 4.50%. S. S. DE FINÁLY

**Growing and production of Rheum in Szeged.** S. TUKATS. *Magyar Gyógy. Társaság Értesítője* **5**, 161-71(1929).—*Rheum palmatum* L. was grown at Szeged in different soils. Detns. were made of exts., ash, free and bound anthraquinone, emodin and chrysophanic acid. *Rheum* rhizomes of Szeged contain 26.4% less anthraquinone than Chinese rhizomes. The anthraquinone content of the roots is about 4.4%.

Anthraquinones of the roots consist for the most part of emodin. The roots proved to be more valuable than the rhizomes. The production of *Rheum* in Hungary is recommended.

S. S. DE FINÁLY

Evaluation of rhizoma and radix rhei. S. TUKATS. *Magyar Gyógy. Társaság. Értesítője* 5, 172-80(1929).—Anthranols are oxidized to anthraquinone by  $H_2O_2$ . The glucosides are hydrolyzed with alc. HCl, and the aglucones extd. with  $CHCl_3$ . This treating should be repeated. The  $CHCl_3$  ext. is evapd. and the dry matter boiled with benzene-gasoline mixt. (2:1). The benzene-gasoline ext. is shaken out with 5% KOH. To this alk. soln. a gasoline- $CHCl_3$  mixt. is added, the mixt. is acidified with HCl and shaken out in a separatory funnel. The gasoline- $CHCl_3$  mixt. is washed with acid water, evapd. and weighed as anthraquinone.

S. S. DE FINÁLY

Some notes on digitalis G. FRITZ. *Magyar Gyógy. Társaság. Értesítője* 5, 205-17 (1929).—There are given a summary of the history of digitalis in medical science and a critical review of methods of evaluation, especially that of the German D. A. B. 6.

S. S. DE FINÁLY

Value of formaldehyde and its preparations as antiseptics. V. ANDRISKA. *Magyar Gyógy. Társaság. Értesítője* 5, 242-56(1929).—Various antiseptics were compared with 0.1%  $HgCl_2$  soln. "New-lysoform" was the best of those examd. Its chem. compn. is not known. It contains  $CH_2O$ , active Cl and Cr compds. Liquor formaldehydi saponatus is next in value.

S. S. DE FINÁLY

Assay of digitalis. A. STASIAK AND B. ZBORAV. *Magyar Gyógy. Társaság. Értesítője* 5, 257-72(1929).—Since the sensitivity to digitalis of sinus parts of frog heart may change, the sinus method should be used only in comparison with a standard prepn. The g-strophanthin proposed by Mansfeld and Horn as a standard is abandoned; a standard powder of digitalis leaves is found more useful with the sinus method. The relative values shown by the sinus method are very near to the values yielded by other biol. methods.

S. S. DE FINÁLY

The copper content of drug extracts resulting from insecticide sprays. M. JANICSEK. *Magyar Gyógy. Társaság. Értesítője* 5, 317-22(1929).—A spray of 2% Bordeaux soln. and 1% Burgundy mixt. was used. Samples of plants were taken after 2, 16 and 30 days. Cu was detd. electrolytically in the 10%  $H_2SO_4$  ext. of the plant ash. By another method the dry plant powder was boiled with dil.  $HNO_3$ , evapd., concd.  $H_2SO_4$  added and the mixt. diluted. Cu was calcd to  $CuSO_4 \cdot 5H_2O$ . The Cu content of *Melissa officinalis* amounted to about 2%, that of *Mentha crispa* about 0.5%. Plants contain much Cu even after a month with ample rains. These Cu compds. are not dissolved by water and could be removed by filtering. As plant exts. are usually not filtered, toxic Cu compds. can thus get into the soln.

S. S. DE FINÁLY

The detoxification of chloroform. H. FÜHNER. *Deut. med. Wochschr.* 55, 1331 2 (1929).

ARTHUR GROLLMAN

Report of the essential oil sub-committee to the standing committee on uniformity of analytical methods. JOHN ALLAN, et al. *Analyst* 54, 335-8(1929).—Notes with respect to f.-p. and m.-p. detns., a description with cut of a standard, distg. app. and sp. directions for *oléo de rose* are given.

W. T. H.

Method for differentiating and determining the value of rhubarb, based on fluorescence. MAREU. *Ann. chim. anal. chim. appl.* 11, 165-8(1929).—A method of examg. rhubarb samples with ultra-violet light filtered through a Wood's screen is described. All the true types of Chinese rhubarb (*Rheum officinale*, *R. emodi*, *R. tanguticum*) give a velvety, brown fluorescence. *Rheum rhaponticum*, *R. undulatum*, *R. compactum* and *R. ribes* give violet fluorescence. These latter constitute the so-called *rhubarbs of Austria, England and France* but it may be said that when a rhubarb powder or tincture shows a violet fluorescence it should be rejected as not being the official drug. Such a variety has recently been sold cheaply in France as *Asiatic rhubarb*. W. T. H.

Detection and identification of primary phenylethyl alcohol in essential oils and in mixtures of perfumes. SEBASTIEN SABETAY. *Ann. chim. anal. chim. appl.* 11, 193-5 (1929).—Take the fraction (210-230°) contg. the alc. and add 1-1.5 mol. of anhyd. KOH per mol. of alc. and distil slowly and carefully. This converts the alc. into styrolene, recognizable by its odor. Shake the distillate with ether, and add  $Br_2$  in ether to form dibromostyrolene which m. 72°.

W. T. H.

Rapid method for actual quinine determination. GUSTAVE A. STICHT. *Chemist Analyst* 18, 6-7(1929).—Quinine can be sepd. from many other alkaloids by pptn. as the acid quinine citrate. Detailed directions are given for detg. quinine in cinchona bark.

W. T. H.

Detection of isopropyl alcohol in the presence of acetone. WALTER MEYER. *Chem.-Ztg.* 53, 410-1(1929).—Cf. C. A. 23, 2246.—There is some danger of isopropyl

alc. being used in cosmetics and pharmaceutical preps. Its detn. is usually accomplished by the Peyer method of oxidizing the distillate of the liquid in question with dichromate and  $\text{H}_2\text{SO}_4$  under a reflux condenser and detg. the resulting acetone by the Lagal, Déniges or Ellram method. It has generally been conceded that the method is useless if acetone is already present and most com. isopropyl alc. contains some acetone. Since, however acetone b.  $56-8^\circ$ , MeOH at  $65-67^\circ$  and isopropyl alc. at  $82^\circ$ , the problem of sepg. is not difficult. Take 50 g. of sample and distil carefully. Collect the first 5 cc. and test by the well-known methods for MeOH and acetone. Then, in a well-cooled Erlenmeyer flask, collect the next 20 cc. of distillate. Use the residue in the distg. flask for the pyridine test after acidifying and distg. some more. Take the 20 cc. and mix well, using half for each of the following tests: to one portion, add  $\text{H}_2\text{SO}_4$  and  $\text{K}_2\text{Cr}_2\text{O}_7$  and subject the oxidation product to the usual detn. If the oxidized part shows a stronger color in the acetone test than the unoxidized portion, then acetone and isopropyl alc. are both present. The difference in color or of the degree of turbidity with  $\text{HgSO}_4$  will, with practice, give a good idea of the relative amts. When acetone or isopropyl alc. is present, obviously the tables used for detg. EtOH will give erroneous results. W. T. H.

**Industrial uses of essential oils, their isolates and allied synthetics.** ANON. *Perfumery and Essential Oil Record* 20, 292-300(1929). E. H.

**Researches on the acids of tobacco.** A. SHMUK. State Inst. for Tobacco Investigations (Russia), *Bull.* 50, 1-10(1929).—The org. acids from tobacco were extd. with 3% HCl, made alk. with  $\text{NH}_4\text{OH}$  and acidified with AcOH, Ca acetate was added and the soln. heated on the water bath for 2-3 hrs. The Ca ppt. obtained was filtered, washed and dissolved in 10%  $\text{H}_2\text{SO}_4$ . The soln. was extd. with ether, the latter distd. off and a cryst. ppt. of  $\text{H}_2\text{C}_2\text{O}_4$  obtained. To the residue 1.5 l. of EtOH, made up to 2% chloric acid was added, and heated on a water bath for 20 hrs. The EtOH was driven off and the residue extd. with ether. This was fractionated by vacuum distn. The presence of malic, succinic, fumaric, acetic and formic acids was demonstrated. Other acids were obtained but their identity could not be established. J. S. JOFFE

**The acids of tobacco as a means of determining the quality of tobacco and its products.** M. PYATNITZKII. State Inst. for Tobacco Investigations (Russia), *Bull.* 51, 1-11(1929).—Tobacco (0.25 g.) moistened with 0.25 cc. 40%  $\text{H}_2\text{SO}_4$  was ground with pumice (about 0.75 g.) in a porcelain mortar. The contents were transferred into a 250-cc. glass-stoppered flask, 100 cc. of moisture-free ether was added, shaken and allowed to stand overnight. 25 cc. or 50 cc. of the ext. was pipetted off, transferred into a flask connected with a Liebig cooler and the ether distd. off at  $60^\circ$ .  $\text{H}_2\text{O}$  (15-20 cc.) was added to the residue and titrated with 0.025 N NaOH with phenolphthalein as an indicator. A subtraction of the alkali used in a blank gave the alkali used by the acids extd. The poorer grades of tobacco contain more org. acids. J. S. JOFFE

**Relation of bulk density, size, and color of mustard seeds to their oil content.** V. MILASHEVSKII. *Maslobaino-Zhirovoe Delo* 1928, No. 9, 10-2.—Exptl. work was done with *Brassica juncea* var *lutea* Bl. Bulk density of mustard seeds is not a measure of their oil content. Large seeds yield oil and cake of higher quality than small seeds. Presence of unripe seeds affects the quality of oil and cake. V. KALICHEVSKY

**The colorimetric determination of the strophanthins.** ALBERT LEULIER AND HENRI GRIFFON. *Bull. sci. pharmacol.* 36, 408-14(1929).—Strophanthins from *Strophanthus kombé* and *S. hispidus* give the reaction of Liebermann: mix a trace of the substance with 2 cc.  $\text{Ac}_2\text{O}$ , 2 cc.  $\text{CHCl}_3$  and 2 drops  $\text{H}_2\text{SO}_4$ . A green color is developed after  $\frac{1}{2}$  hr. Hydrolyze the glucoside previously by heating to  $80^\circ$  with 1%  $\text{H}_2\text{SO}_4$ . Ouabain gives a yellow color turning into orange; it should not be hydrolyzed. For amts. of 1-2 mg. this method can be used for colorimetric detn. Differences of 10-20% may occur. For tinctures, evap. 20 cc., dissolve in 18 cc.  $\text{H}_2\text{O}$  and 2 cc. Courtonne's liquid. Filter and add 1.5 g.  $\text{Na}_2\text{SO}_4$ . Filter again. Take 10 cc. and add 10 cc. dil.  $\text{H}_2\text{SO}_4$  (1:10), heat to  $80^\circ$  for 45 min. Shake out first with 5 cc.  $\text{CHCl}_3$  and twice with 2.5 cc. Use 2 cc. of the  $\text{CHCl}_3$  soln. and compare after 30 min. Strophanthin gives Pettenkofer's furfurole reaction. A. E. MEYER

**Detection of  $\alpha$ -bromoisovalerylurea.** R. SAKAI. *J. Pharm. Soc. Japan* 48, 1114-8(1928).—Soly. of  $\alpha$ -bromoisovalerylurea (I) was studied by Meyer's and Reinboldt's methods (*Ber.* 8, 999 and Houben, *Die Methoden der organischen Chemie.* 1, 787, resp.). I is most sol. in  $\text{Me}_2\text{CO}$  and alc., but insol. in petr. ether. It is nonvolatile. I gives characteristic reactions with Mandelin, Nessler and  $\text{KMnO}_4$  solns., but does not react with  $\text{AgNO}_3$  soln. In order to est. I in animals, rabbits and dogs were fed with the food contg. I and they were killed the next day. The estn. shows that most of I was distributed in stomach, intestine, blood and urine. I is stable in dead body

and it can be detected after 2 months in summer and 3 in winter. Liebig's method of estn. (*Ber.* 38, 1163) was employed throughout the expts. F. I. NAKAMURA

**Report on the analysis of drugs.** ARTHUR E. PAUL. *J. Assoc. Official Agr. Chem.* 12, 255-61(1929); cf. *C. A.* 22, 3955.—A brief discussion of the reports of the associate referees on various drugs (see following abstrs.). A. PAPINEAU-COUTURE

**Report on (the determination of) alcohol in drugs.** E. M. BAILEY. *J. Assoc. Official Agr. Chem.* 12, 261-4(1929); cf. Howard, *C. A.* 22, 3955.—Collaborative colorimetric detns. of small quantities of MeOH (1.0-2.5%) in the presence of EtOH gave very satisfactory results. A. PAPINEAU-COUTURE

**Report on (the determination of) chloroform and carbon tetrachloride.** W. F. KUNKE. *J. Assoc. Official Agr. Chem.* 12, 264-76(1929); cf. *C. A.* 22, 3956.—Any quant. method for the sepn. of  $\text{CHCl}_3$  in mixts. by distn. is considered to give inaccurate results, and a new method without distn. was developed. If the sample is a prepn. like  $\text{CHCl}_3$  Liniment, U. S. P. X, almost the same procedure is used as for  $\text{CHCl}_3$ ; if the  $\text{CHCl}_3$  mixt. is sirupy, like compd. sirup of white pine, N. F., the reaction mixt., after sapon. of the  $\text{CHCl}_3$ , is evapd. and the residue charred before detg. the chloride. Weighing of  $\text{CHCl}_3$  or  $\text{CCl}_4$ , or their mixts., directly under the reagent in a 60-70 cc. pressure bottle is a simple, satisfactory and accurate procedure. Pressure and heat are required for complete sapon. of  $\text{CHCl}_3$  and  $\text{CCl}_4$ . Non-aq. alc. KOH is a more active sapon. reagent than alc. KOH contg. 30%  $\text{H}_2\text{O}$  by vol.  $\text{CHCl}_3$  and  $\text{CCl}_4$  cannot be completely sapond. by alc. KOH (either aq. or non-aq.) at room temp. within a reasonable length of time. Shaking  $\text{CHCl}_3$  or  $\text{CCl}_4$  with the reagent is not necessary; in case foreign material is present, as would be the case when  $\text{CHCl}_3$  or  $\text{CCl}_4$  is detd. in a mixt., gentle swirling of the mixt. with the reagent is advisable. Addnl. alc. to insure complete soln. of either  $\text{CHCl}_3$  or  $\text{CCl}_4$  is not necessary. Cooling of the sapon. reagent- $\text{CHCl}_3$  mixt. materially reduces the rate of sapon.  $\text{CHCl}_3$  is more readily sapond. than  $\text{CCl}_4$  by alc. KOH. KOH is considerably more sol. than NaOH in MeOH.  $\text{CHCl}_3$  contg. 0.5% alc. by wt. does not deteriorate when kept in an amber glass bottle, closed with a cork stopper and stored in a cupboard at room temp. for 2 yr. A. P.-C.

**Report on (the analysis of) laxatives and bitter tonics.** E. O. EATON. *J. Assoc. Official Agr. Chem.* 12, 276-8(1929).—In the method proposed (which is described in detail) for *cascara prepns.* an attempt is made to liberate the acidic principles combined as salts, to ext. by  $\text{CHCl}_3$ , with a min. of heat, from a soln. of low H-ion concn. both the free and salt-occurring hydroxyanthraquinones, and to sep. the possibly non-therapeutic substances from those thought to be therapeutically active. In the second portion of the method the use of a mineral acid in essential concn., aided by heat, hydrolyzes the glucoside present; it also reacts with any resinous-like substances present to liberate  $\text{CHCl}_3$ -sol. substances. Treatment with Caro's reagent shows the resinous substances to be of hydroxyanthraquinone origin. The procedure employed removes the acidic hydroxyanthraquinones, as liberated, from further contact with the more concd. mineral acid, which under certain conditions appears to induce the destruction of the anthraquinones. The method is considered encouraging, the variation of results among collaborators being believed to be largely a matter of interpretation, as they check closely. A. PAPINEAU-COUTURE

**Report on (the analysis of) mercurials.** R. S. ROE. *J. Assoc. Official Agr. Chem.* 12, 280-2(1929); cf. *C. A.* 22, 3957.—The modified U. S. P. I method previously tentatively adopted for the detn. of  $\text{Hg}_2\text{Cl}_2$  in tablets gave very good collaborative results for  $\text{Hg}_2\text{I}_2$  tablets. The use of an asbestos mat on a Caldwell crucible, with a precaution to use a few drops of alumina cream when necessary, is an improvement over the use of filter paper. A. PAPINEAU-COUTURE

**Report on microchemical methods for alkaloids.** C. K. GLYCART. *J. Assoc. Official Agr. Chem.* 12, 282-4(1929); cf. *C. A.* 22, 3957.—Collaborative work showed the reliability of microchem. tests for the identification of quinine, quinidine, cinchonine and cinchonidine. A. PAPINEAU-COUTURE

**Report on (the determination of) santonin.** H. M. BURLAGE. *J. Assoc. Official Agr. Chem.* 12, 284-8(1929).—Collaborative results by the German Pharm., Hagar, Kropat and modified Eder-Schneider methods were disappointing, which is attributed to the impracticability and inaccuracy of the existing methods. A. P.-C.

**Report on (the analysis of) ephedra.** A. E. PAUL and C. K. GLYCART. *J. Assoc. Official Agr. Chem.* 12, 290-4(1929).—The method tried out was as follows: to 10 g. of ephedra in fine powder in an Erlenmeyer flask add exactly 100 cc. of a 3:1  $\text{Et}_2\text{O}$ - $\text{CHCl}_3$  mixt., shake, let stand at least 5 min., add 5 cc. of 10%  $\text{NH}_4\text{OH}$  and 0.5 g. anhyd.  $\text{Na}_2\text{CO}_3$ , shake intermittently for 2 hrs., let macerate 4 hrs., decant or filter rapidly a

50-cc. aliquot, ext. with 15, 10 and 10 cc. dild.  $\text{H}_2\text{SO}_4$ , neutralize with concd.  $\text{NH}_4\text{OH}$ , add about 5 g. anhyd.  $\text{Na}_2\text{CO}_3$ , ext. with 35, 30, 25, 20 and 15 cc.  $\text{Et}_2\text{O}$  and titrate by 1 of the 2 following procedures: (1) evap. the  $\text{Et}_2\text{O}$  on a steam bath with the aid of a fan to about 5 cc., finish evapn. at room temp., dissolve the alkaloids in 2 cc. neutral alc. dild. with about 40 cc.  $\text{CO}_2$ -free water, titrate with 0.02  $N$   $\text{H}_2\text{SO}_4$  in presence of bromothymol blue, comparing with a standard adjusted to a  $p_{\text{H}}$  value of 6.0; (2) evap. the  $\text{Et}_2\text{O}$  to 5 cc. as above, add the indicator and a measured excess of 0.02  $N$   $\text{H}_2\text{SO}_4$ , warm to dissolve the alkaloid and evap. the  $\text{Et}_2\text{O}$ , titrate the excess acid with 0.02  $N$  alkali. 1 cc. 0.02  $N$  acid = 0.0033 g. ephedrine alkaloids. A collaborative test showed that the method is readily workable and that the results are within acceptable limits of accuracy considering the marked chem. properties of the alkaloid ephedrine.

A. PAPINEAU-COUTURE

**Report on (the determination of) pilocarpine in tablets.** T. F. PAPPE. *J. Assoc. Official Agr. Chem.* 12, 294-6(1929).—In the absence of other alkaloids, pilocarpine can be satisfactorily detd. in simple tablet masses by dissolving in  $\text{H}_2\text{O}$ , adding slight excess  $\text{NH}_4\text{OH}$ , extd. with  $\text{CHCl}_3$ , evapg. the solvent to 5 cc., adding a measured excess of 0.02  $N$   $\text{H}_2\text{SO}_4$ , evapg. the remainder of the  $\text{CHCl}_3$  and titrating the excess of acid. 1 cc. 0.02  $N$  acid = 0.004893 g. of  $\text{C}_{11}\text{H}_{16}\text{O}_2\text{N}_2 \cdot \text{HCl}$ . Methyl red is preferable to bromophenol blue as indicator.

A. PAPINEAU-COUTURE

**Report on (the determination of) thymol.** LESLIE HART. *J. Assoc. Official Agr. Chem.* 12, 296-300(1929).—In Messinger and Vortmann's I method for the detn. of thymol (*Ber.* 23, 2753 (1890)) comparatively slight variations in the quantity of alkali and of I used in excess of that required by theory (4 I per mol. of thymol) gave wide differences in the results; in the Koppeschaar Br method (*Z. anal. Chem.* 15, 233(1876)) the quantity of Br soln. present in excess of that required for the formation of dibromothymol and the time allowed before titrating the excess Br materially affects the results. Two volumetric methods were subjected to collaborative study, both based on the reaction that occurs when nascent Br, furnished by a standard bromide-bromate soln., reacts with thymol in the presence of hot, strong  $\text{HCl}$  according to the reaction  $\text{C}_6\text{H}_5\text{CH}_2\text{CH}(\text{CH}_3)_2\text{OH} + 4\text{Br} = \text{C}_6\text{HBr}_2\text{CH}_2\text{CH}(\text{CH}_3)_2\text{OH} + 2\text{HBr}$ ; in method A the end point is observed by destruction of the red color of methyl orange indicator by slight excess of Br; method B was carried out by back titration, the starch-I end point being used. If method B is used independently of method A, the preliminary titration in hot soln. with 0.1  $N$  Br and methyl orange as an indicator should be made, so as to regulate the quantity of excess Br for the back titration, and the  $\text{Na}_2\text{S}_2\text{O}_4$  titration should be carried out immediately after the addn. of the Br soln. Both methods gave concordant results, well within 1% of theoretical; but A is considered to be inherently the better as it eliminates the effect of excess Br and the consequent time factor.

A. PAPINEAU-COUTURE

**Report on (the determination of) menthol.** F. L. ELLIOTT. *J. Assoc. Official Agr. Chem.* 12, 300 2(1929).—The U. S. P. method for menthol, slightly modified, gave fairly satisfactory collaborative results; but difficulty was apparently experienced in removing the whole of the  $\text{Ac}_2\text{O}$  from the acetylated oil.

A. PAPINEAU-COUTURE

**Report on (the determination of) ascaridole in) chenopodium oil.** E. K. NELSON. *J. Assoc. Official Agr. Chem.* 12, 303-4(1929).—Paget's contention (*C. A.* 20, 2722) that the present U. S. P. method, while useful in the assay of authentic oils of chenopodium, may give misleading results with adulterated oils, was confirmed.

A. P.-C.

**Report on (the analysis of) sabadilla.** F. C. SYKOVICH. *J. Assoc. Official Agr. Chem.* 12, 305-8(1929).—A method (described in detail), which is essentially the U. S. P. X type process A for alkaloidal assays, was studied collaboratively and yielded consistent results.

A. PAPINEAU-COUTURE

**The identification of atropine with Wagner's reagent.** CHARLES C. FULTON. *J. Assoc. Official Agr. Chem.* 12, 312-7(1929).—Atropine gives at least 4 different types of useful crystals with Wagner's reagent, depending on the relative proportions of atropine, I and KI in the test drop: (1) small, red-brown rods, (2) small, yellow plates, (3) bicolored ppt., yellow and dark-red crystals, (4) orange-red, hexagonal, elongated plates, the most characteristic and usually the most numerous form, also dark-red, diamond-shaped or triangular grains and a smaller no. of yellow cubes. The crystals generally increase in size in the order given, but all are small and usually require high power for their microscopic examn. An increase in the proportion of atropine changes the crystals from one type to another in the order given, as does an increase in the proportion of KI. A reagent may be prepd. to obtain a particular crystal type in atropine solns. of suitable concn. between 1:500 and 1:5000; when 1 g. I and 100 cc.  $\text{H}_2\text{O}$  are used, these reagents required KI as follows: (1) 2.75, (2) 8, (3) 35, (4) 50 g. Reagent

(1) is best used with solns. of 1:5000 to 1:50,000 concn.; (2) with 1:800 to 1:5000; (3) with 1:650 to 1:2000 and (4) with 1:200 to 1:800. Care should be taken not to make the test on a soln. too concd. for good results with the reagent used. Reagents that have the highest I:KI ratio are the most sensitive. With reagent (1) characteristic crystals can be obtained from a 1:200,000 atropine soln. Even reagent (4) is sufficiently sensitive to atropine to be used on a fragment of a 0.01-grain tablet dissolved in a drop of water. Atropine can be identified beyond any doubt by means of the different types of crystals described.

A. PAPINEAU-COUTURE

**The assay of jalap.** L. E. WARREN. *J. Assoc. Official Agr. Chem.* 12, 324-32 (1929).—Six methods for the assay of jalap were studied. The U. S. P. X and the Jenkins methods (C. A. 8, 3218) gave high results and were discarded. The methods of the Dutch, French and German Pharmacopeias are "aliquot-part" procedures, and therefore they were rejected. The Dale method (C. A. 22, 2032) requires total extn. and therefore it is accurate, but is tedious in execution. A modification of the U. S. P. X extn. process combined with the method of the French Pharm. for the washing and purification of the extd. resin was devised and is described in detail. It is more expeditious than the published procedures and gives equally good results.

A. P.-C.

**Absolute (flower) extracts obtained by means of volatile solvents.** D'AURIBEAU. *Parfumerie moderne* 22, 397-413 (1929).—In French, English and Spanish.—A brief discussion of the merits of abs. concrete exts. over steam-distd. oils and synthetic products.

A. PAPINEAU-COUTURE

**Toilet soap perfumes.** ARTHUR I. EWINSON. *Parfumerie moderne* 22, 431-7, 479-87 (1929).—A brief review of the chemism of the reactions which do or can take place between a neutral soap and the various radicals present in natural essential oils and synthetic perfumes.

A. PAPINEAU-COUTURE

**Analysis of liquor cresoli saponatus.** HANS KAISER. *Süddeut. Apoth.-Ztg.* 68, 626-7 (1928); *Chem. Zentr.* 1928, II, 2047.—The proposed simple method is based on the direct distn. of liquor cresoli saponatus from a fractionating flask at up to 205-6° into a tube graduated into cc./10, which is the direct receiver. The aq. portion mixed with a small part of the cresol distils between 100° and 125°. Then the temp. suddenly rises to 195-200°, at which temp., with a good prepn., only small amts. distil, thus indicating that PhOH (b. p. 178-82°) and *o*-MeC<sub>6</sub>H<sub>4</sub>OH (b. 188°) are only present in traces. The other cresols present distil almost quant. at 205-6°. The mixt. should not be heated above 210°. The no. of cc. of the total distillate is read in the graduated tube. The cresol layer seps. after the salting out. By deducting its quantity in cc. from the total distillate the water content can be calcd. The water content should not amount to more than 10-13 cc. and the cresol layer should amount to at least 44-45 cc. (per 100 cc. of liquor cresoli saponatus). For the detn. of the hydrocarbons 5 cc. of the oily distillate is shaken with 50 cc. of 8% NaOH and 5 cc. petr. ether. The increase in vol. of the petr. ether due to the hydrocarbons should not amount to more than 0.25 cc. The cresols are distd. off and the hot portion contg. the soap is transferred from the tared fractionating flask into a tared dish and weighed. The total fatty acids may be detd. in the known amt. of the soap residue, *e. g.*, this may be done with the aid of the "Standard methods of the fat industries."

**The cultivation and production of medicinal plants in Japan.** TARUO KARIYONE. *Proc. 3rd Pan-Pacific Sci. Congr.* 1926, II, 2169-70 (Publ. 1928).—E. M. SYMMES

**Madagascar cloves.** V. H. KIRKMAN. *Chemist and Druggist* 109, 527 (1928).—Notes on the cultivation of cloves and the distn. of oil from cloves, leaves and stems in 1928; cf. *Bull. Imperial Inst.* 26, 323 (1928). Zanzibar Clove Industry in 1927. ANON. *Ibid* 110, 103-4 (1929).

S. WALDBOTT

**Essential oils from Kenya Colony.** GEORGE FERGUSON AND ERNEST J. PARRY. *Chemist and Druggist* 108, 604 (1928).—"Mawah oil" distd. from "geranium" (12 tons in 1928) had an odor intermediate between that of geranium and that of palmarosa oils;  $d_{15.5}$  0.894, optical rotation  $-16.7^\circ$ ,  $n_D^{20}$  1.4690, total alcs. (as geraniol) 71%, citronellol 20%, esters (as geranyl tiglate) 12.5%. *Vetiveri* oil of high-grade odor had  $d_{15.5}$  0.9923,  $n_D^{20}$  1.5237, acid no. 10.2, ester no. 4.6, alcs. (as vetiverol) 50%. The plants grow at 7000 feet altitude, and the climatic conditions are similar to those in Java. *True geranium oil*, of typical high grade, was distd. from plants imported from Grasse in 1925, yield about 0.1%  $d_{15.5}$  0.892,  $n_D^{20}$  1.4649, optical rotation  $-9^\circ 40'$ , esters (as geranyl tiglate) 30.7%.

S. WALDBOTT

**The preparation of ampoules.** H. A. HURLSTONE. *Chemist and Druggist* 108, 813-4 (1928).—A general review of the manuf. and filling of ampoules. Three types of filling app. are illustrated and described. W. A. N. MARKWELL. *Ibid* 109, 65 (1928).

—Addnl. precautions are given as to cleaning the glass before filling, and sterilization of the finished ampoules. S. WALDBOTT

**Assay of belladonna and hyoscyamus leaves.** W. A. N. MARKWELL AND L. J. WALKER. *Chemist and Druggist* 109, 525-6(1928).—Discrepancies exist in official and other methods of assay, as the volatile bases are not always included in the results. Thus, e. g., the assay processes of the Brit. Pharm. for leaves and preps. of leaves of belladonna, on which the assay of henbane is based, do not give comparable results, because in the assay of the preps., heating of the extd. alkaloids on the water bath for 30 min. is directed, which is omitted in the assay of the leaves. On assaying *Hyoscyamus niger* leaves, no volatile bases were noted; with *H. muticus*, a slight loss upon heat occurred; with *Japanese henbane*, a dark brown sample having an odor of  $\text{NH}_3$ , over 50% of the alkaloids present escaped upon heating. No loss resulted from heating atropine and hyoscyamine on a water bath for 30 min., nor from washing the final  $\text{CHCl}_3$  solns. with  $\text{H}_2\text{O}$ . In titrating back the acid solns. of the alkaloids, the borax method of Rasmussen and Christensen (C. A. 21, 215) was used. S. W.

**Menthol from Mexico.** E. M. HOLMES. *Chemist and Druggist* 109, 649(1928); 110, 203(1929).—The plants *Calamintha macrostema*, Benth. or *tabaquillo* (A) and *Hedeoma piperita*, Benth. or *tabaquillo oloroso* (B) are possible sources of com. menthol. Dried specimens from the Kew Herbarium are photographed, and the plants are described in detail. The fresh plant of A yields 0.1-0.3% of essential oil, B 0.3-0.5% contg. 2-3% of menthol. S. WALDBOTT

**Citral in lemon oil.** G. FERGUSON AND E. J. PARRY. *Chemist and Druggist* 109, 762(1928).—With fresh unoxidized lemon oils, results of detn. of citral by the cold process (A) (Bennett and Salamon, C. A. 22, 1825) and the hot process (B) (Brit. Pharm.) are nearly identical; oxidized samples show differences of 0.3 to 0.5%. A seems to indicate pure citral only, while in B, the hot alkali may restore aldehydes or ketones in the oxidized oil, which then will react with  $\text{NH}_2\text{OH}$ , as if no alteration had taken place. S. WALDBOTT

**The varying characters of certain galenicals.** J. H. FRANKLIN. *Chemist and Druggist* 110, 11-2(1929); cf. C. A. 23, 4534.—A protest against the prepn. of "Brit. Pharm." tinctures from solid alc. exts. since the resulting products are not of Brit. Pharm. character. The variable colors of certain tinctures (belladonna, digitalis and henbane) are caused by the use of foreign or old faded English leaves. Variation in the color of compd. tincture of lavender may be caused by slight deficiency of EtOH content, affecting the  $\text{H}_2\text{O}$ -insol. color of the constituting red sanders wood. Contact with metals, Fe, Zn or Cu, also affects the color of this tincture, and of compd. tincture of cardamoms (cf. C. A. 17, 3749). Finally color variations in liquid exts. of ergot and of licorice are discussed. S. WALDBOTT

**Materia medica and pharmacy.** WILLIAM WHITLA. *Chemist and Druggist* 110, 19-21(1929).—A review of the progress of pharmacy in Great Britain since the 1st pharmacopoeia, 1618; with personal reminiscences, and portrait of W. S. W.

**The citral value of lemon oil.** ERNEST J. PARRY. *Chemist and Druggist* 110, 360(1929).—A protest against certifying to citral content on the basis of arbitrary methods of detn. Since the  $\text{NH}_2\text{OH}$  method of Brit. Pharm. is universally accepted, it should alone be recognized in com. testing; the  $\text{PhNHNH}_2$  method gives higher, but faulty results. S. WALDBOTT

**A further note on mercury ointment.** G. G. HAMMOND. *Chemist and Druggist* 110, 594(1929); cf. Franklin, C. A. 23, 480.—The previous conclusions are fully confirmed. The ointments recommended by F. for inclusion into the new Brit. Pharm. are not adversely affected by severe frosty weather. S. WALDBOTT

**The new remedies of 1928.** THOMAS STEPHENSON. *Pharm. J.* 122, 116-8(1929).—Progress in the prepn. of liver exts. in the treatment of pernicious anemia (cf. C. A. 22, 1186, 2012; 23, 195) is reviewed, also the use of salts of *o*-iodobenzoic acid in arthritis (C. A. 22, 1396); *arthrytin* is the  $\text{NH}_4$  salt. Other new remedies discussed are: *Salyrgan*, a mercurial diuretic (C. A. 22, 1394), also called *neptal* or "440-B" (France) and *mersalyl* (U. S.); *synthalin*, and *glukhorment* (C. A. 22, 2004, 2970), *ephetonine* (C. A. 22, 4656) and a new *synthetic ephedrine substitute* (phenylaminoethanol sulfate) (C. A. 23, 239) prepd. in U. S. in 1915. Miscellaneous remedies referred to are: *Ca gluconate* (Calcium-Sandoz) (C. A. 23, 2534), *cardiazole* (C. A. 22, 2789), *parosan* contg. As, an antispasmodic, *sandoptal*, a hypnotic (C. A. 22, 1397), and *staniform*,  $\text{SnMe}_2$ , used in ointment form (2%) or as a dusting powder (5%) in local inflammation. S. W.

**Alkaline citrates and acetylsalicylic acid in mixtures.** THOMAS WILSON. *Pharm. J.* 122, 196-7, 204; *Chemist and Druggist* 110, 266-7(1929); THOMAS STEPHENSON. *Pharm. J.* 122, 251(1929).—A prescription soln. contg.  $\text{HO}_2\text{CC}_6\text{H}_4\text{OAc}$  (A) 3, K citrate

(B) 6 drachms, H<sub>2</sub>O to make 6 ounces, remained clear for 12 hrs.; then a ppt. of large crystals was formed within 12 hrs. Later, re-soln. took place. Soly. expts. showed that a ratio of A:B:H<sub>2</sub>O, 2:4:6 cold-prepd., or 2.5:5:6 prepd. with gentle heat, will result in a permanent soln. In more concd. solns., complete hydrolysis will take place with time, e. g., 50% in 4 days (C. A. 16, 1486). In the unaltered soln., the therapeutic effect of A seems to be enhanced by the mixt. with B. (S.). The chem. nature of the cryst. ppt. formed on standing was not detd. Na citrate is only half as sol. as B, but the soln. of A in it also kept clear for 12 hrs.; the ppt. subsequently forming was more abundant than with B. S. H. Stroud (*Australasian J. pharm.* 5, 827, 833(1924)) states that a cryst. ppt. is formed in certain concns. of soln. of A in B, and the same substance is pptd. when an alc. soln. of A is mixed with sufficient alc. KOH to neutralize half of the acid. Its mol. formula is C<sub>18</sub>H<sub>16</sub>O<sub>8</sub>K, m. 170.5°. It is probably *acetyl-salicylyloxoniumacetylsalicylate*. S. WALDBOTT

**Acetylsalicylic acid; decomposition in aqueous solution of sodium salt.** D. B. DORT. *Pharm. J.* 122, 302, 311-3; *Chemist and Druggist* 110, 395-6(1929).—"Soln. of acetylsalicylic acid (A) may be effected by addn. of NaHCO<sub>3</sub>, but as the resulting soln. is merely a mixt. of Na acetate and Na salicylate, this method is not admissible" (*Prescriber*, quoted by Stephenson, cf. preceding abstr.). D., on treating A with a soln. of Na<sub>2</sub>CO<sub>3</sub>.10H<sub>2</sub>O or of NaHCO<sub>3</sub>, then neutralizing with HCl, extg. with Et<sub>2</sub>O-CHCl<sub>3</sub> and evapg., effected a *quant.* recovery of pure A, m. 137° (Wood, 137-138°; Brit. Pharm. 135-136°); with FeCl<sub>3</sub> no trace of salicylic acid (B) was noted. When the soln. was allowed to stand for 2 hrs., 3.5% of A was hydrolyzed, and a distinct trace of B was observed. **Supplementary note.** *Pharm. J.* 122, 355.—After 4 hrs. standing, 5.27% B was formed; after 24 hrs. 14.14% B was formed. If the soln. is used within a short time, the degree of decompn. is quite negligible. S. WALDBOTT

**Diffusion of arsenious oxide in combination with iron pill.** EDWARD ARTHUR. *Pharm. J.* 122, 197, 204-5; *Chemist and Druggist* 110, 267-8(1929).—The query arose: Can homogeneous distribution of 2.1 mg. of As<sub>2</sub>O<sub>3</sub> in the mass of 12 iron pills of 3.84 g. total wt. be proved by detg. the As content of each pill? As the detn. of such traces of As<sub>2</sub>O<sub>3</sub> seemed futile, detn. of the same quantity of MnCO<sub>3</sub> was substituted, the Mn in each pill being detd. colorimetrically after oxidation by the persulfate method. Results, although not very sharp, indicated that there was little or no variation in the Mn content of the different pills. S. WALDBOTT

**What is adhesive plaster?** ISABELLA A. PURDIE. *Pharm. J.* 122, 198, 205; *Chemist and Druggist* 110, 268(1929).—The lack of uniformity in the compn. and make-up of official adhesive plaster in the Brit. Pharm., the U. S. P. and the English Drug Tariff is pointed out. S. WALDBOTT

**Enzymes in pharmaceutical preparations.** HENRY DRYERRE. *Pharm. J.* 122, 279-82; *Chemist and Druggist* 110, 172-3(1929).—An address on the nature of enzymes and their functions in digestion, with special reference to pepsin and liquor pancreatis of the Brit. Pharm. S. WALDBOTT

**Variation in the contents of active principles in tablets and gelatin capsules made on a manufacturing scale.** P. C. *Schweiz. Apoth. Ztg.* 66, 489-91(1928).—Tables published by the official Swedish Pharmaceutical Control Lab. show considerable pos. or neg. deviations from the declared quantity of active principle present. Cf. C. A. 22, 4203. S. WALDBOTT

**The effect of methods of cultivation upon the contents of active principles in medicinal plants.** K. BOSCHART. *Schweiz. Apoth. Ztg.* 66, 649-52, 661-4(1928).—See C. A. 22, 1651. S. WALDBOTT

Light Bi carbonate (STICKINGS, COUPLAND) 18. I determination in organic compounds which readily split off I (VAN ITALLIE) 7. The action of peroxidase on glycerophosphates (RAE) 11A. Technical and medicinal petrolatums from Grozny mixed-base fuel oil (TARASOV) 22. The reaction between phenol and Pb subacetate (Gould's extract) (LUM) 10. Preparing petrolatums (CHERNOZHUKOV) 22. Condensation products of the benzodiazine [intermediates for manufacture of pharmaceutical products] (U. S. pat. 1,724,086) 25. [Therapeutic] triazine derivatives (Ger. pat. 479,349) 10.

CROLAS, F., AND MOREAU, B. **Précis de pharmacie chimique.** 6th ed., revised by A. Leulier. Paris: N. Maloine. 897 pp. F. 65.

**Medicinal preparations.** SOC. ANON. POUR L'IND. CHIM. A BALG. Ger. 479,332, Dec. 9, 1924. See Brit. 244,055 (C. A. 21, 158).

**Therapeutic composition comprising iron and yeast.** MATRO GES. Brit. 304,895, Dec. 24, 1927. See U. S. pat. No. 1,710,584 (C. A. 23, 2786).

**Therapeutic products from hemoglobin compounds.** SCHERING-KAHLBAUM A.-G. Brit. 304,731, Jan. 25, 1928. Compds. of hemoglobins with heavy metals of 2 or more stages of oxidation, such as Fe-porphyrin compds., are reduced by an agent such as hyposulfite or cysteine, and then combined with bases such as arginine, histamine or nicotine. The products may be adsorbed on an org. or inorg. carrier such as starch, animal charcoal or silica.

**Synthetic drugs (acridine derivatives).** I. G. FARBENIND. A.-G. Brit. 304,280, Jan. 18, 1928. The process described in Brit. 283,510 (C. A. 22, 4205) in which nitro-9-aminoacridine derivs. are obtained by condensing a nitro-9-chloro- or 9-alkoxyacridine with a base contg. at least 2 N atoms of which one is a primary one is modified by condensing first with an amino acid or an ester or nitrile thereof and then converting the nitroacridylamino acid thus obtained into a basic amide by means of a primary or secondary amine which also contains at least one tertiary basic N atom. The products are strong *bactericides*. Examples are given. Cf. C. A. 23, 4536.

**Chlorinized and ozonized topical remedy.** BRUCE E. CLARKE. U. S. 1,724,562. Aug. 13. A compn. suitable for supplying Cl and ozone for inhalation comprises a vehicle such as olive oil or petrolatum together with Cl and a gas such as ozone capable of producing nascent O. An arrangement of app. for prepg. the product is described.

**Anesthetic compounds.** ROGER ADAMS and OTIS A. BARNES (to Abbott Laboratories). U. S. 1,724,248, Aug. 13. Details are given of the production of  $\beta$ -( $\beta$ -carbomethoxypiperidyl)ethyl *p*-aminobenzoate-HCl and  $\gamma$ -( $\beta$ -carbomethoxypiperidyl)-propyl *p*-aminobenzoate-HCl, *m.* about 197° and about 207°, resp.

**Alkali metal tetra-bismuth tartrates.** D. H. SEARLE & Co. Brit. 304,956, April 2, 1928. Compds. such as (COOBiO.CHOBiO.CHOBiO.COOBiO)NaOH are obtained by adding Bi hydroxide to a soln. of alkali metal tartrate, contg. excess alkali metal hydroxide, without heating, and shaking the mixt. until no more Bi hydroxide dissolves. The products may be used therapeutically, *e. g.*, as *anti-syphilitics*, and are stated to be less toxic than other known alkali bismuth tartrates.

**Iodophenolphthalein compounds for x-ray examination.** E. F. ILLZEY (to National Aniline & Chemical Co.). Brit. 304,589, Jan. 21, 1928. Monoalkali metal salts of tetraiodophenolphthalein are prepd. in colloidal form for administration to a patient prior to gall-bladder examn. by Röntgen rays. Various details of mixts. for administration of these compds. are given.

**Amines.** OSCAR HINSBERG. Ger. 478,949, Dec. 21, 1926. Addn. to 360,607. Mono- and dihydroxyarylcboxylic acid ethanolamines or the corresponding bisarylethylamines and their derivs. are prepd. by the action of aminoacetal or its *N*-alkyl derivs. on mono- or dihydroxycarboxylic acids in the presence of HClO<sub>4</sub>. Examples are given. The products are *used in therapy*.

**Amino fatty acid derivatives.** VLADIMIR M. RODIONOW. Ger. 479,228, Sept. 17, 1926.  $\beta$ -Aryl- $\beta$ -amino fatty acids and their *N*-alkyl derivs. are prepd. by treating an equimol. mixt. of an aromatic aldehyde and malonic acid with an alc. soln. of NH<sub>3</sub> or of a primary or secondary aliphatic amine. The reaction is carefully controlled so that only 1 COOH group is split off. The reaction product is dissolved in water and acidified to ppt. the cinnamic acid always obtained as a by-product, and the hydrochloride of the  $\beta$ -aryl- $\beta$ -amino fatty acid is then crystd. out from the filtrate. Examples described the prepn. of the hydrochlorides of  $\beta$ -piperonyl- $\beta$ -aminopropionic acid, *m.* 232–234°,  $\beta$ -phenyl- $\beta$ -aminopropionic acid, *m.* 216–217°,  $\beta$ -piperonyl- $\beta$ - $\beta$ -methylaminopropionic acid, *m.* 207–207.5°,  $\beta$ -*m*-nitrophenyl- $\beta$ -aminopropionic acid, *m.* 202–204°, and  $\beta$ -phenyl- $\beta$ -dimethylaminopropionic acid (*m. p.* not stated). The products are *intermediates for drugs*.

**Phenol aminoalkyl ethers.** I. G. FARBENIND. A.-G. Brit. 304,732, Jan. 25, 1928. In forming *therapeutic products* such as the monoethylaminoethyl ether of 6-allyl-2-methoxy-1-phenol, a phenol contg. an unsatd. group in *o*-position to the OH group (but which is not a deriv. of an *N*-acetylaminophenol) is treated with an alkylene dihalide in the presence of an alk. agent and the resulting halogen compd. is then combined with a monoalkylamine. Cf. C. A. 23, 669.

**4-Methyl-2-phenoxyquinoline-4'-carboxylic acid.** I. G. FARBENIND. A.-G. Brit. 305,589, Feb. 7, 1928. This compd., a *therapeutic substance*, is made by heating 2-chloroquinoline with the Me ester of *p*-hydroxybenzoic acid in PhNO<sub>2</sub>, boiling the product with NaOH and acidifying.

**Urethans of  $\alpha$ -phenylcinchoninic acid.** R. WOLFFENSTEIN. Brit. 304,655, Jan. 23, 1928. These compds. (which are *therapeutic agents*) are prepd. by treating  $\alpha$ -

phenylcinchoninic acid chloride with a urethan or by reaction of  $\alpha$ -phenylcinchoninic acid amide with a chlorocarbonic ester. Examples are given of the prepn. of the ethyl- and methyl-urethans.

**Tannates.** LABORATORIUM REUMELLA ADOLF BOAS. Ger. 479,229, April 7, 1926. Tannates of Cu, Zn and Mg are prepd. by adding an aq. soln. of tannin to a soln. of the metal hydroxide in an excess of  $\text{NH}_4\text{OH}$  and an  $\text{NH}_4$  salt. The tannate ppts. and is sepd. off. The products are intended for *therapeutic use*.

**Diaminoisopropanol derivatives.** I. G. FARBENIND. A.-G. (Heinrich Jensch, inventor). Ger. 479,354, Aug. 14, 1926. Products of the formula  $\text{H}_2\text{NCH}_2\text{CH}(\text{OH})\text{CH}_2\text{N}-$ , where N— is tertiary, are prepd. (1) by treating 3-halo-2-hydroxypropylphthalimide with secondary bases and splitting off the phthalic acid residue or (2) by treating 3-halo-2-hydroxypropylamine with secondary bases. Examples are given describing the prepn. of some of these compds. and also their hydrochlorides. The products are useful as *drugs* and *intermediates for drugs*. Cf. C. A. 22, 2171.

**Dipyridylamine derivatives.** SCHERING-KAHLBAUM A.-G. (Max Dohrn and Paul Diedrich, inventors). Ger. 479,282, Nov. 5, 1925. Addn. to 406,207. Ger. 406,207 describes the manuf. of a condensation product, now identified as 2,2'-dipyridylamine, by treating 2-aminopyridine or its salts with  $\text{COCl}_2$ . This method is now extended to nuclear substitution products of 2-aminopyridine. Examples are given. The products are *drugs* or *intermediates for drugs*.

**Halogen derivatives of dihydrocodeinone.** C. H. BOEHRINGER SOHN (Clemens Schöpf, inventor). Ger. 479,104, July 21, 1925. Cl and Br derivs. are prepd. from dihydrocodeinone or its salts by treatment in aq. soln. or in acid solvents with chlorinating or brominating agents, the halogen entering the  $\text{C}_6\text{H}_5$  nucleus. Examples are given. Bromodihydrocodeinone m. 205-207° and forms a hydrobromide m. 215-217°; chlorodihydrocodeinone m. 177-178°. The products are useful as *drugs* or as *intermediates for drugs*.

**Basic phenol alkyl ethers.** HANS HAHN (to Winthrop Chemical Co.). U. S. 1,725,136, Aug. 20. Compds. of the probable general formula,  $4,2,6\text{-R}(\text{XO})_2\text{C}_6\text{H}_2\text{OYNZ}_2$ , where X represents an alkyl group, Y an alkylene group, Z, *Hor* alkyl, at least one Z being alkyl, and R represents an unsatd. aliphatic radical, are obtained by causing a compd. of the general formula  $\text{HIYNZ}_2$ , where HI represents halogen, to react upon a compd. of the general formula  $4,2,6\text{-R}(\text{XO})_2\text{C}_6\text{H}_2\text{OH}$ . The products are mostly liquids possessing a basic odor and form neutral salts with acids which salts retain the therapeutic properties of the products and are sol. in water. They are substitutes for *secale cornutum*.  $4,2,6\text{-C}_3\text{H}_7(\text{MeO})_2\text{C}_6\text{H}_2\text{OCH}_2\text{CH}_2\text{NEt}_2$ , a yellow oil, b. 146-151°.

**Cardio-active substance from bulbous scillae.** WALTER KREIS (to Chemische Fabrik vorm Sandoz). U. S. 1,725,652, Aug. 20. Aq. squill material is exhaustively extd. with org. solvents not miscible with water such as  $\text{EtOAc}$  in the presence of a sufficient quantity of easily water-sol. salts such as Na phosphate to facilitate the extrn.

**Hormones.** I. G. FARBENIND. A.-G. Brit. 305,475, Feb. 4, 1928. Active substances are obtained from the fresh or dried hypophysis or from its sep. lobes by hydrolysis by use of an alkali or an acid, under such conditions of time and temp. as avoid decompn. of the active substances. Albumin degradation products are pptd. by neutralizing the hydrolyzing agent or adjusting the  $\text{pH}$  of the soln. Numerous details are given. Cf. C. A. 23, 2252.

**Immunizing preparations from carcinoma, etc.** W. SCHMIDT and W. SCHMIDT SERUMWERK A.-G. Brit. 304,155, July 11, 1927. Microorganisms causing malignant tumors, such as carcinoma, are cultivated, either *in vitro* or *in vivo*, in symbiosis with mold fungi such as *Mucor racemosus* or *Mucor mucedo* and vaccines and immunizing preps. are obtained from the cultivated organisms. Numerous details are given.

**Surgical dressing.** E. BLANK. Brit. 304,393, Oct. 28, 1927. A pad of dressing material to be treated with a liquid, e. g.,  $\text{CHCl}_3$ , is secured to a backing of larger area comprising a foil of a cellulose salt or ester, e. g., nitrocellulose, which is not sol. in the treating liquid.

**Improving various natural and synthetic perfumery ingredients by hydrogenation.** I. G. FARBENIND. A.-G. Brit. 305,555, Oct. 29, 1927. "Subsidiary odors" are destroyed by selective hydrogenation of impurities present in resins, balsams, essential oils or synthetic products such as ionone or methyl ionone.

**Cosmetic preparations.** TOKUJIRO HASHIMOTO. Ger. 478,745, April 24, 1925. Vegetable gelatin and  $\text{H}_2\text{BO}_3$  are mixed under pressure and a mixt. of  $(\text{CH}_3)_4\text{N}_4$  and  $\text{BzONa}$  or  $\text{BzOLi}$  is added. Lanolin may also be added. Cf. C. A. 22, 2440.

**Disinfectants.** SCHERING-KAHLBAUM A.-C. Brit. 305,229, Feb. 3, 1928. The

double compd. of urea and *m*-cresol (the production of which is described in Brit. 297,083, C. A. 23, 2449) is incorporated with a neutral or disinfecting powder such as talcum, kieselguhr or boric acid.

**Reduction of the nicotine content of tobacco.** THÉOPHILE SCHLOESING. Ger. 479,095, Aug. 5, 1924. The nicotine content of tobacco is reduced, without destroying the aroma, by treating the tobacco at atm. pressure with a stream of a mixt. of steam and  $\text{NH}_3$ , the compn. of which is maintained const. throughout the process.

## 18—ACIDS, ALKALIES, SALTS AND SUNDRIES

R. M. SYMMES

**The phosphoric acid industry in its relation to the manufacture of activated charcoal.** EDOUARD URBAIN. *Bull. soc. ind. Mulhouse* 95, 325-43 (1929).—An address dealing with the general principles of the absorption of vapors by activated charcoal and with the effects of impurities in activated and decolorizing charcoals, showing how attempts to prevent introduction of impurities through  $\text{H}_3\text{PO}_4$  (used in the prepn. of charcoal by the Urbain process) led to the development of a process for the production of very pure  $\text{H}_3\text{PO}_4$ , with production of pure K metaphosphate as a by-product. A. P.-C.

**The manufacture of ammonia by direct synthesis.** III. N. F. YUSHKEVICH. *J. Chem. Ind. (Russia)* 5, 353-64 (1928); *Chem. Zentr.* 1928, II, 2180.—A summary is given of some investigations carried out during the last few years by Larson, Almquist, Crittenden and others on the effect of temp., pressure and velocity of current on the quantity of  $\text{NH}_3$  formed from a mixt. of  $\text{N}_2$  and  $\text{H}_2$ . Other expts. were concerned with mode of action of catalysts and influence of their compn., and with influence of activators and catalyzer poisons ( $\text{O}_2$ ) on the efficiency on these catalysts. G. S.

**The utilization of natural gases for the ammonia process.** H. LIANDER. *Trans. Faraday Soc.* 25, 462-72 (1929).—Possible reactions of  $\text{CH}_4$  with  $\text{O}_2$ ,  $\text{H}_2\text{O}$  and  $\text{CO}_2$  were calcd. from the Nernst heat theorem. Expts. were made by heating  $\text{CH}_4$  and  $\text{O}_2$ , with and without Ni catalysts, to 550-850°. With no catalyst the products are  $\text{CO}_2$  and  $\text{H}_2\text{O}$ ; with catalyst  $\text{H}_2$ , CO and  $\text{CO}_2$ . Conclusion: Natural gas, air and steam passed over a suitable catalyst at 1000° would yield gas that could be used as a source of  $\text{H}_2$  and  $\text{N}_2$  for  $\text{NH}_3$  synthesis. G. B. TAYLOR

**Light bismuth carbonate.** R. W. F. STICKINGS AND H. C. COUPLAND. *Chemist and Druggist* 108, 605 (1928); cf. C. A. 20, 95, 800.—Formation of the light carbonate takes place at the expense of purity;  $\text{Na}_2\text{CO}_3$  is held by adsorption, and is replaced by  $\text{CaCO}_3$  when the salt is washed with tap water. The Brit. Pharm. permits a max. of 1.06%  $\text{Na}_2\text{CO}_3$  and 0.40%  $\text{HNO}_3$ ;  $\text{CaCO}_3$  is excluded. S. and C. succeeded in removing the adsorbed alkali while preserving the lightness of the salts and adhering nitrates were reduced to 0.08%  $\text{HNO}_3$ . Details are not given. S. WALDBOTT

**The deterioration of iodized salt.** M. STARR NICHOLS. *Am. J. Pub. Health* 19, 923-5 (1929).—The results show considerable loss during the first period (about 9 months) of storage and a corresponding decrease thereafter. No definite relationship was established between added antihardeners and keeping qualities. The 2nd period of storage covered about 35 months. J. A. KENNEDY

**Sodium silicate.** ALBERT DEBECQ. *Bull. fédération ind. chim. Belg.* 8, 255-7 (1929).—This is a general article to emphasize the growing importance of sodium silicate in the industry. ALBERT L. HENNE

**The dry grinding of calcite tailings from the Kingdon lead mine, Galetta, Ontario.** R. K. CARNOCHAN. Investigations in Ore Dressing and Metallurgy, Canada Dept. of Mines, Mines Branch, *Rept. No. 695*, 123-4 (1929).—Elimination of iron from sand samples. *Ibid* 124-5.—The concentration of a garnet rock from Langlade, Quebec. *Ibid* 125-9.—The rock consisted of garnet crystals in a gang of quartz, hornblende, pyroxene and black mica. A flow sheet is given for a process which produces about 28% of the rock in an 80% garnet concentrate. The drying of epsom salts. *Ibid* 129-30.—The possibility of removing economically the 51% of  $\text{H}_2\text{O}$  from epsom salts to save freight was investigated. A gas-fired rotary drier with a screw feeder and a scraper at the top produced a product contg. 10%  $\text{H}_2\text{O}$ . The flotation of graphite tailings from Dominion Mine, Buckingham, Quebec. *Ibid* 130-1.—A tailing contg. 2.55% C in impure flakes was floated, but because of the impurities the concn. was not satisfactory. The wet milling of asbestos rock from Danville, Quebec. *Ibid* 131-4.—Typical coarse fiber asbestos rock was tested by a wet-concn. process. The rock was ground in a Hardinge mill with as much  $\text{H}_2\text{O}$  as possible to float the fiber

out of the mill as soon as freed. The balls were large in order to crack rather than to grind the rock. The mill discharge was screened on  $1/32$ -in. round-holed sieve, the oversize being the product and the undersized raw material being used for further treatment, which is outlined. The elimination of iron from sandstone from East Templeton, Quebec. *Ibid* 134-6.—The stone consisted of rounded quartz particles smaller than 10 mesh with pyrite between the grains. The  $\text{Fe}_2\text{O}_3$  content was 0.15-0.3%. Roasting and magnetic sepn. reduced the Fe content below 0.07%, the limit for glass sand. Tabling reduced the Fe but not sufficiently.

ALDEN H. EMERY

**Fluorspar and cryolite in 1928.** HUBERT W. DAVIS. Bur. Mines. *Mineral Resources of U. S.* 1928, Pt. II, 13-30 (preprint No. 2, published July 12, 1929). E. H.

**Phosphate progress.** JOHN T. BURROWS. *Am. Fertilizer* 70, No. 13, 40-2(1929). — A review is given of recent developments in the mining, washing, drying and grinding of phosphate rock. Brief reference is made to the successful application of a new flotation process for sepgg. finely divided phosphate from its assocd. siliceous material.

W. H. ROSS

**International aspects of the phosphate rock industry.** MORGAN H. GRACE. *Am. Fertilizer* 70, No. 13, 45-7(1929).—A statistical review of the production and consumption of phosphate rock in different countries throughout the world. W. H. R.

**Losses in Florida land-pebble phosphate.** H. M. LAWRENCE. *Am. Fertilizer* 70, No. 11, 42, 44, 54, 57-8(1929).—A study was made of the debris bank sands now accumulating in the land-pebble phosphate district of Florida. The greater portion of the phosphate discarded by the washers is in the finer sizes below 16 to 24 mesh. These fractions analyze considerably less than 31%  $\text{P}_2\text{O}_5$ . Recovery of the phosphate in these sizes is not possible by simple washing methods. A portion of the material now rejected by the washing plants is coarser than 16 to 20 mesh and contains upwards of 31%  $\text{P}_2\text{O}_5$ . The relation of the phosphate so lost to the present washer production is discussed. Methods and estd. costs for reclaiming the comm. fractions are considered.

W. H. ROSS

**Phosphate resources of the Philippine Islands.** V. ELICANO. *Proc. 3rd Pan-Pacific Sci. Congr.* 1926, II, 1740-3(Publ. 1928). E. M. SYMMES

**Sulfur resources of the Philippine Islands.** LEOPOLDO A. FAUSTINO. *Proc. 3rd Pan-Pacific Sci. Congr.* 1926, II, 1744-5(Publ. 1928). E. M. SYMMES

**The industrial production of hydrogen.** FERD. MORAVEC. *Chem. Listy* 23, 168-72 (1929).—Eight of the processes in use at the present time are reviewed. F. M.

**Activation of charcoal by steam.** P. P. KOSAKEVICH and N. A. ISMAILOV. *Kolloid-Z.* 48, 241-6(1929).—When charcoal is activated by steam the activity increases continuously with time between 700° and 800°. At 800° 28% activation is obtained. Lowering of the rate at which steam is passed over charcoal decreases the activity and increases the yield. At 850° the activation reaches a max. after 15 min.; at 900° in half the time. Activation and graphitization are concurrent. The velocity of the latter increases very rapidly between 800° and 850°.  $\text{EtNH}_2$  and phenol are adsorbed equally well. The normal ash constituents of charcoal have a negligible influence on the activity.

FRANK URBAN

**A suggested method for the utilization of seaweed.** T. DILLON and E. F. LAVELLE. *Econ. Proc. Roy. Dublin Soc.* 2, 407-13(1928).—Kelp cannot be dried and burned in winter, but if collected then and stored in a tub decompn. occurs. After 17 weeks 31 kg. of kelp gave a clarified ext. contg. total solids 1373, ash 684, 121.5. Of the original solids 29% had disappeared. Distn. of the ext. with  $\text{H}_2\text{SO}_4$  gave  $\text{AcOH}$  and other acids not identified.

E. M. SYMMES

**Japanese agar-agar.** U. S. Commerce Rept. *Chemist and Druggist* 108, 668 (1928).—The primitive but effective methods of prepg. agar-agar, both in mfg. and home production, are described.

S. WALDBOTT

**Modern washing and cleansing materials.** AUGUST NOLL. *Seide* 34, 166-9 (1929).—The newer types of washing and cleansing materials are discussed. Trade names, composition, properties, etc., are covered.

H. W. STIEGLER

By-products of furnace-made  $\text{H}_3\text{PO}_4$  (JACOB, REYNOLDS) 15. Developments in fertilizer production (CURTIS) 15.  $\text{H}_2\text{O}_2$ (Brit. pat. 305,472) 25. Gas purification (Brit. pat. 304,345) 21. Evaporator for treating sugar or salt solutions, etc. (Brit. pat. 304,670) 1.

**Les réserves mondiales en phosphates.** Vols. I and II. Issued by 14th International Geological Congress. In 4 languages: French, Spanish, English and Ger-

man. Madrid: Graficas reunidas, S. A. 890 pp. Reviewed in *Eng. Mining J.* **128**, 24(1929).

**Volatile acids.** HERMANN FRISCHER. Ger. 479,212, Aug. 10, 1920. Addn. to 421,319. Ger. 421,319 describes an app. for the manuf. of HCl and Na<sub>2</sub>SO<sub>4</sub> from NaCl and H<sub>2</sub>SO<sub>4</sub> comprising a heated drum fitted with stirrers and contg. balls or the like which are lifted and dropped by the rotation of the drum or of the stirrers. This app. is now applied to the decompn. of salts of other volatile acids, such as formates, acetates and fluorides.

**Nitric acid by oxidation of ammonia.** FRANS G. LILJENROTH. U. S. 1,725,462, Aug. 20. A gas mixt. consisting essentially of NH<sub>3</sub>, O, NO and steam is continuously supplied to a series of NH<sub>3</sub>-oxidation furnaces; a portion of the gas mixt. formed is drawn off and condensed to HNO<sub>3</sub>; the remainder is cooled without condensing the NO and the cooled gases are utilized to dil. freshly supplied NH<sub>3</sub> and O. An arrangement of app. is described.

**Sulfuric acid.** MANSFIELD A.-G. FÜR BERGBAU UND HÜTTENBETRIEB and R. BORCHERS. Brit. 304,688, Jan. 24, 1928. Iron, steel or Fe alloys are used instead of lead in construction of app. for H<sub>2</sub>SO<sub>4</sub> manuf., especially that used in the "intensive" system. Various details are described.

**Sulfuric acid.** METALLGES. A.-G. (formerly Metallbank und Metallurgische Ges. A.-G.). Brit. 304,308, Jan. 19, 1928. The rate of oxidation of SO<sub>2</sub> in the presence of N oxides is increased by rapidly whirling the mixt. of gases while avoiding sepn. of liquid particles. Various details and alternative procedures are described.

**Titanic acid.** METALLGESELLSCHAFT A.-G. (Erich Stahl, inventor). Ger. 478,740, Jan. 17, 1928. H<sub>2</sub>TiO<sub>3</sub> or its salts are extd. from titaniferous materials, especially the so called "red slime," by treating with SO<sub>2</sub>. The SO<sub>2</sub> may be supplied by roasting pyrites.

**Purifying carbon dioxide.** I. G. FARBENIND. A.-G. (Oskar Jonas and Philipp Balz, inventors). Ger. 479,490, Mar. 21, 1928. CO<sub>2</sub> obtained by the action of Na<sub>2</sub>CO<sub>3</sub> on HNO<sub>3</sub> is freed from oxides of N by mixing it with sufficient H to convert the oxides of N to NH<sub>3</sub> and passing the mixt. over a Pt or Pd catalyst heated to at least 70°. The NH<sub>3</sub> is washed out from the product and the CO<sub>2</sub> is liquefied. The CO<sub>2</sub> is sufficiently pure for use in the manuf. of mineral waters.

**Apparatus for producing solid carbon dioxide from the liquid.** E. DUBOIS. Brit. 304,958, April 3, 1928. Structural features.

**Ammonia synthesis, etc.** SOC. L'AIR LIQUIDE, SOC. ANON. POUR L'ÉTUDE ET L'EXPLOITATION DES PROCÉDÉS G. CLAUDE. Brit. 305,534, Feb. 6, 1928. A catalytic system as described in Brit. 268,721, (C. A. 22, 1444) is modified by heating the gas after passage through the jacket of the app. and before entry to the reaction chamber.

**Purifying gases for ammonia synthesis.** NORSK HYDRO-ELEKTRISK KVAELSTOFKATIESELSKAB. Ger. 479,474, Jan. 25, 1927. See Brit. 266,689 (C. A. 22, 669).

**Purifying ammonia liquors, etc.** H. W. ROBINSON and D. W. PARKES. Brit. 305,494, Aug. 5, 1927. The liquor is treated with a reagent such as Pb salts to ppt. catechols, after a preliminary purification by distn. or acid treatment depending on the character of the liquor, and recovery of catechols from the ppt. Various details and modifications of the process are described. Cf. C. A. 22, 862.

**Apparatus for liquefying ammonia.** WALTER HAMLIN KNISKERN. Ger. 478,540, Aug. 30, 1924. App. for liquefying synthetic NH<sub>3</sub> gas from mixts. by the cooling action of a volatile liquid is described.

**Crystallizing salts from brine.** GEORGE B. BURNHAM (to Burnham Chemical Co.). U. S. 1,724,558, Aug. 13. In heating brine, it is caused to flow beneath a salt crust subject to the action of the sun.

**Earth metal halides.** F. KRUPP GRUSONWERK A.-G. Brit. 304,135, Jan. 14, 1928. A rotary tubular furnace is used for producing halogen or double halogen compds. of earth metals such as Al compds. by treatment of raw materials mixed with fuel with halogen-contg. substances such as CaCl<sub>2</sub>, fluorides or free halogens. The halogen compds. formed are volatilized and condensed.

**Colloidal metal hydroxides.** RICHARD LORENZ and HEINRICH HEINZ. Ger. 478,994, July 23, 1924. Colloidal metal hydroxides are prepd. by pptn. from solns. of the metal salt and alkali in the presence of an albuminous protective colloid such as size, gelatin or casein, dissolving the ppt. in caustic alkali or alkali carbonate soln. and evapng. Cu, Ag and Pb hydroxides are mentioned in the examples.

**Alkali cyanides.** STRICKSTOFFWERKE G. M. B. H. (H. Heinrich Franck and Hugo

Heimann, inventors.) Ger. 478,946, Jan. 11, 1925. Addn. to 417,018. Alkali cyanides are prepd. by treating a mixt. of  $\text{Ca}(\text{CN})_2$  and alkali carbonate between  $500^\circ$  and  $700^\circ$  with a mixt. of H and CO. The reaction gives a 90% yield.

**Alkali silicate.** NATHANIEL M. ELIAS. U. S. 1,724,185, Aug. 13. An alkali silicate such as that of Na is heated in the form of a glassy solid to  $200$ – $500^\circ$ , and coated, in the form of a foam-like mass with a waterproofing substance such as paraffin. The material may be used as a *heat- and sound-insulation*.

**Alkali sulfates.** FERDINAND STEIN. Ger. 478,988, Oct. 21, 1924. Addn. to 453,118. A variation in the method of the com. prepn. of  $\text{NH}_4$  and alkali sulfates or double salts thereof described in 453,118 consists in treating the starting material with alkali chloride before treating with  $\text{CO}_2$ . Thus, gypsum is treated with an aq. soln. of  $\text{NH}_3$  and NaCl. The liquid is heated and  $\text{CO}_2$  led in. The product  $\text{NH}_4\text{NaSO}_4 \cdot 2\text{H}_2\text{O}$  is obtained by crystn.

**Reduction of alkaline earth sulfates.** SALZWERK HEILBRONN A.-G., THEODOR LICHTENBERGER and KONRAD FLOR. Ger. 479,346, Sept. 26, 1925. Addn. to 478,310. The method of Ger. 478,310 (C. A. 23, 4305) is modified by adding  $\text{MgCl}_2$  to the melt before or after the reduction with coke. A copious evolution of  $\text{H}_2\text{S}$ , which is collected or worked up, is so obtained, while  $\text{MgO}$  is produced in the melt and is sep'd. therefrom by decantation. The residue comprising alkali and alk. earth chlorides may be used again. The process may be accelerated by passing steam into the melt.

**Reduction of alkaline earth sulfates.** SALZWERK HEILBRONN A.-G., THEODOR LICHTENBERGER and KONRAD FLOR. Ger. 479,347, Dec. 22, 1925. Addn. to 478,310. The method of Ger. 478,310 (C. A. 23, 4305) is modified by using other suitable alkali or alk. earth salts instead of NaCl. Salts or mixts. of salts which liberate acid when the melt is treated with steam are preferred. Alkali sulfates and alkali and alk. earth fluorides are mentioned as suitable salts. Cf. preceding abstract.

**Sulfides from sulfur.** I. G. FARBEIND. A.-G. (Paul Koppe and Paul Herold, inventors). Ger. 478,986, July 21, 1926.  $\text{H}_2\text{S}$  and other sulfides are prepd. from S or S-yielding compds. such as polysulfides and thiosulfates by the action of H, etc., under pressure and at high temps. The H may be replaced by CO,  $\text{CH}_2\text{Cl}_2$  or formates. A catalyzer may also be used. Examples are given.

**Double fluorides.** I. G. FARBEIND. A.-G. (Julius Soll and Robert Bilsinger, inventors). Ger. 479,400, Sept. 9, 1922. Addn. to 443,007 and 461,136. According to Ger. 443,007 and 461,136, double compds. of  $\text{AlF}_3$  with alkali fluorides are manuf'd. from an impure soln. of an Al salt such as is obtained by treating clay with acid. The soln. is treated with an alkali salt and HF, the latter being added in an amt. less than that theoretically necessary, in order to avoid contamination of the product with Fe. It is now found that any desired amt. of HF can be used, without contaminating the product with Fe, if the Fe in the soln. is first reduced to the ferrous state.

**"Semimechanical" phosphate den.** DARBY L. BAKER. U. S. 1,725,604, Aug. 20. Various structural features are described.

**Alumina, etc.** N. J. GAREAU. Brit. 305,599, Aug. 3, 1927. Calcined clay briquets are passed downwardly through a tower with water, countercurrent to gases from a furnace carrying S oxides and N oxides.  $\text{H}_2\text{SO}_4$  formed reacts with the clay and forms Al sulfate and the silica is dehydrated. The briquets are lixiviated with water contg.  $\text{H}_2\text{SO}_4$  to form a soln. of Al sulfate and this is dried and calcined to form a product of the compn.  $\text{Al}_2\text{O}_3 \cdot \text{SO}_3$ . This is ground with NaCl and coal and heated to about  $300^\circ$  and treated with steam to produce HCl and further heated to redness to produce Na sulfide. The briquets are also utilized to form Na aluminate from which alumina is produced. An app. is described. Cf. C. A. 23, 674.

**Aluminum oxide.** G. A. BLANC. Brit. 304,289, Jan. 18, 1928. Alumina is obtained in granular form by decomposing the hydrated chloride or nitrate in an app. in which the material is not subjected to friction, shock, pressure or other mech. stresses during its decompn. Muffle or rotary furnaces may be used.

**Aluminum chloride.** I. G. FARBEIND. A.-G. Brit. 305,578, Feb. 7, 1928. Production of anhyd.  $\text{AlCl}_3$  from raw materials such as clay, contg. both alumina and silica, in the presence of a reducing agent such as C (which may be in the form of brown coal) or CO is carried out with Cl charged with  $\text{SiCl}_4$  vapor in such quantity that no simultaneous formation of  $\text{SiCl}_4$  from the silica present can take place. Various details are given. Cf. C. A. 23, 938.

**Ammonium chloride crystals.** JOSEPH W. MOORE and WILFRID G. POLACK (to Imperial Chemical Industries, Ltd.). U. S. 1,725,292, Aug. 20. See C. A. 22, 3497.

**Ammonium nitrate.** APPAREILS ET ÉVAPORATEURS KESTNER. Brit. 305,121, Jan. 31, 1928. In effecting neutralization of  $\text{HNO}_3$  by  $\text{NH}_3$ , excessive heating is prevented

by carrying out the reaction in the presence of excess  $\text{NH}_4\text{NO}_3$ ; the soln. is kept at a temp. below  $35^\circ$ . A circulating system including a tower and cooler is described.

**Cobalt carbonyl.** BADISCHE ANILIN & SODA-FABRIK. Fr. 33,951, Aug. 1, 1927. Addn. to 607,134. In the prepn. of Co carbonyl by the action of CO on Co under pressure, the carbonyl is sepd. from the reaction gases by cooling before expansion.

**Iron carbonyl.** MARTIN MÜLLER-CUNRADI (to I. G. Farbenind. A.-G.) U. S. 1,725,619, Aug. 20. CO is passed under pressure, downwardly, through a vertical reaction vessel contg. coarse grained iron. Cf. C. A. 23, 4540.

**Chromic hydroxide.** I. G. FARBEIND. A.-G. Brit. 305,588, Feb. 7, 1928. Chromium green and alkali or alk. earth metal formates are simultaneously formed by reduction in soln., with CO or gases contg. it, of an alkali or alk. earth chromate (suitably at  $150\text{--}350^\circ$  under pressure).

**Phosphorus oxides.** GEWERKSCHAFT DER STEINKOHLENZECHHE MONT CENIS. Ger. 478,843, June 16, 1926. Oxides of P, particularly  $\text{P}_2\text{O}_5$ , are condensed by contact with steam at high temps., forming a cloud of the corresponding acid.

**Separation of sodium and potassium hydroxides.** SOC. ANON. POUR L'IND. CHIM. A BALE. Ger. 477,952, Apr. 25, 1925. KOH and NaOH in lye mixts. are sepd. by cong. at  $40\text{--}100^\circ$ , when the KOH crystals sep., and then diluting and cooling, when the NaOH separates out. Thus, a lye mixt. is evapd. at  $60^\circ$  in a crystn. drum until the deposit of crystals ceases. These are practically pure KOH. They are sepd. and the liquor is diluted and cooled. NaOH crystals then deposited contain 8–10% KOH. These can be redissolved and the process repeated.

**Sodium hydrosulfide, nitrite and nitrate.** FRIEDRICH JOST. Ger. 479,475, Aug. 25, 1926.  $\text{Na}_2\text{S}$  is treated with not more than an equimol. amt. of nitrous gases, whereby a mixt. of NaHS,  $\text{NaNO}_2$  and  $\text{NaNO}_3$  is obtained. Suitably, the gases ascend a tower against a stream of  $\text{Na}_2\text{S}$  soln. and the salts are sepd. from the product by crystn.

**Granulating sodium sulfide, etc.** RHENANIA-KUNHEIM VEREIN CHEMISCHER FABRIKEN A.-G. (to Kali-Chemie A.-G.). Brit. 305,645, Feb. 10, 1928. See Ger. 476,218 (C. A. 23, 3781).

**Continuous preparation of sodium sulfate.** WALDEMAR RECHA. Ger. 478,987, Oct. 4, 1924. A process for the continuous prepn. of water-free  $\text{Na}_2\text{SO}_4$  from Glauber's salt consists in heating the salt to over  $32.40^\circ$  in the trough of a rotary filter and leading the filtered-off anhyd.  $\text{Na}_2\text{SO}_4$  into a drying drum.

**Stannic chloride, etc.** J. GORIANY (to G. A. Favre). Brit. 304,282, Jan. 18, 1928. Material such as alloys contg. Sn are treated while molten and suitably at a temp. of  $900^\circ$ , with Cl, with or without pressure. Volatilized chlorides such as those of Fe, Al and Sb are fractionally condensed before the  $\text{SnCl}_4$  is condensed. Unvolatilized chlorides such as those of Pb and Cu are run off from the surface of the melt. Materials contg. Ag, Au, Mo and Ni may also be treated and an app. is described.

**Titanium sulfates.** I. G. FARBEIND. A.-G. (Friedrich Raspe and Paul Weise, inventors). Ger. 479,491, Apr. 4, 1928. Solid water-sol. titanyl and titanate sulfates are prepd. from concd. solns. by evapg. the solns. in finely divided form, e. g., by spraying into heated air, preferably after addn. of a binding or solidifying agent. Suitable solidifying agents are porous substances such as kieselguhr,  $\text{TiO}_2$  or  $\text{BaSO}_4$ , water-sol. org. substances such as starch, anhyd. inorg. salts capable of taking up water of crystn., or oxides forming water-sol. sulfates. Examples are given. Cf. Brit. 309,047.

**Borax refining.** CHARLES F. RITCHIE and WM. A. GALE (to American Potash & Chemical Corp.). U. S. 1,724,420, Aug. 13. Liquors (such as Searles Lake brine) contg. borates together with phosphates are treated with reagents such as  $\text{H}_2\text{SO}_4$  to reduce the  $p_H$  to increase substantially the soly. of the phosphates and thus facilitate the crystn. of the borax substantially free from phosphates.

**Water glass.** KALI-CHEMIE A.-G. and HANS BRENEK. Ger. 477,974, Feb. 20, 1924. Rock contg. alkali and alumina is subjected to smelting or sintering and the smelt treated with acid after chilling. The resulting  $\text{H}_2\text{SiO}_3$  is dissolved in NaOH.

**Oxygen.** DEUTSCHE GOLD-UND SILBER-SCHNEIDANSTALT VORM. ROESSLER. Brit. 305,101, Jan. 30, 1928. The process described in Brit. 280,554 (C. A. 22, 3244) is modified by using a larger quantity of water for hydration of the alkali metal peroxides or their mixts. (10–15% water being suitably employed). The hydration may be followed by milling and the preps. may be stabilized by heating. Various details and modifications are described.

**Colloidal sulfur.** I. G. FARBEIND. A.-G. Brit. 304,498, Feb. 20, 1928. See Ger. 472,913 (C. A. 23, 3059).

**Gas strong in sulfur dioxide.** GEORGE A. RICHTER (to Brown Co.). U. S. 1,724,421, Aug. 13. Sulfur-burner gases are passed through a confined space in contact

with a surface material such as spiral brick filling and with water so that the water progressively absorbs  $\text{SO}_2$  and the gas becomes progressively weaker in  $\text{SO}_2$ ; the acidulated water is heated and passed through a confined space in contact with inert surface material such as spiral brick filling; gases from the first treatment are passed in contact with the acidulated water countercurrent-wise to take up  $\text{SO}_2$  from the water and to produce a gas rich in  $\text{SO}_2$  and suitable for making an acid cooking liquor.

**Carbon.** I. G. FARBENIND. A.-G. Brit. 304,791, Jan. 26, 1928. In producing finely divided C by catalytic decompn. of CO or gases contg. it, metals of the 8th group of the periodic system, such as Fe, Ni or Co, in a "carefully reduced" and finely divided form, are used as catalysts. Temps. of 350–450° (or of 250–350°, if the activity of the catalyst is increased by adding  $\text{Al}_2\text{O}_3$  or MgO) are suitable and by adding hydrocarbons such as  $\text{CH}_4$ , a C of increased activity and deep black luster is obtained (without necessary participation of the hydrocarbons in the reaction). Various details are given Cf. C. A. 23, 488.

**Active carbon.** FIRMA E. MERCK (Hermann Wieters, inventor). Ger. 478,945, June 24, 1926. Active C is prepd. by carbonizing sulfonic acids or sulfonates of all kinds, except ligninsulfonic acid, or their mixts. with such substances as molasses, cellulose, wood or straw, at high temps. with a protective alkali such as KOH.

**Finely divided carbon of high purity.** ANTON LEDERER. U. S. 1,725,359, Aug. 20, 1928. The vapor of  $\text{CS}_2$  or other suitable simple volatile compd. of C with an element of an atomic wt. of 32 or higher is passed into a heated zone where it is heated to at least 700°; C is collected on plates in a cooler zone.

**Porous clay product for carrying catalysts, filtering agents, etc.** COMPAGNIE INTERNATIONALE POUR LA FABRICATION DES ESSENCES ET PETROLES. Brit. 304,654, Jan. 23, 1928. Clay is mixed with a combustible substance such as sawdust and a binder such as mazut (naphtha residue), and the material is then baked to eliminate the sawdust. The mixt. may be molded into short hollow cylinders and baked successively in a reducing and in an oxidizing flame.

**Condensation products from acrylic acid, etc.** RÖHM & HAAS A.-G. Brit. 304,681, Jan. 24, 1928. Acrylic acid or its derivs. or mixts. contg. them are subjected to the action of O or of an oxidizing agent such as org. peroxides; heat, pressure and org. solvents such as acetone may be used.

**Molding resinous condensation products.** GILBERT MOMBACH. U. S. 1,724,501, Aug. 13, 1928. A plastic material such as plaster of Paris contg. Zn or other suitable heat-conductive metal powder is used for making a die and counterdie about a model of the article to be molded; the resinous condensation product to be molded is inserted within the dies thus formed and is subjected to a pressure of several tons per sq. in. The method is suitable for use in making artificial dentures.

**Colored molded products from blood.** FELIX HOMBERG and MAX LANDECKER (to American Nuplax Corp.). U. S. 1,724,088, Aug. 13, 1928. A water-sol. blood powder is mixed with a basic color lake prepd. with the so-called basic aniline dyes; the mixt. is pressed into shape while heated, and the color of the lake is then developed by immersing the formed body in a  $\text{CH}_2\text{O}$  soln., which develops the color on the surface and into the interior as far as the  $\text{CH}_2\text{O}$  soln. penetrates.

**Protein-containing adhesives.** GLENN DAVIDSON (to I. F. LAUCKS, INC.). U. S. 1,724,695, Aug. 13, 1928. The dispersability of vegetable protein-contg. material such as soy-bean cake in aq. alk. media is increased by subdividing the material, after the greater portion of the natural oil has been removed, to such an extent that 95% of the particles is smaller than a screen opening of 0.074 mm.

**Adhesives for uniting parts of shoes.** BRITISH UNITED SHOE MACHINERY CO., LTD., F. RICKS and R. A. LINEHAM. Brit. 304,823, Oct. 27, 1927. Rubber latex and glue are used together. Various details of prepn. and use of the compn. are given.

**Elastic composition.** W. T. GALBRAITH and A. E. MILLS. Brit. 305,249, Feb. 29, 1928. Paper or synthetic, natural or reclaimed rubber 50, heated vegetable oil 50, "synothin" 5, gluten 20, glue 20, gum such as arabin or cerasin 40, asbestos 5 and casein 2 lb., admixed with waterglass 3 qt., are immersed in  $\text{H}_2\text{SO}_4$  or paraffin, washed with ammonia, digested with  $\text{NH}_4\text{Cl}$  and alc. and dried, and may be further treated with S fumes and shellac. Washing with alc., acetone and water makes the product transparent, and addn. of a small proportion of tannic acid stabilizes its elasticity.

**Putty.** GEBRÜDERS KRAMER. Ger. 479,084, Feb. 8, 1927. A putty for the windows of forcing frames, etc., is prepd. by mixing a soln. of bitumen in a volatile solvent such as benzine with a lubricant such as petroleum jelly and a mineral filler such as chalk or  $\text{Al}_2\text{O}_3$ . The putty is repulsive to birds.

**Annular kiln for burning lime or tile ware.** EDMUND JEENICKE. Ger. 478,631, Sept. 14, 1927. Details are given. Cf. C. A. 23, 2541.

**Cleansing composition.** IRA W. LANHAM. U. S. 1,724,289, Aug. 13. A compn. suitable for cleaning clothes or woodwork, etc., is formed of soap 18–28 lb.,  $\text{Na}_2\text{CO}_3$  5–9 lb., borax 5–12 lb., a "mild abrasive" such as fuller's earth 2–8 lb. and "double-strength ammonia" 4 oz. to 1 qt.

**Cleaning and polishing composition for use on glassware, metals or other materials.** ROBERT BATES. U. S. 1,725,245, Aug. 20. Three gills of a soln. in water of the gum of chicken-grape vine (*Vitis cordifolia*) of a sp. gr. of 1.0006 at 20° is used with neutral soap 5 oz., salt 1 teaspoonful and  $\text{NaHCO}_3$  1 teaspoonful.

**Composition for cleaning and polishing varnished surfaces, etc.** A. F. WOODWARD. Brit. 305,384, March 29, 1928. Whiting 1 lb. or similar mild abrasive is mixed with copal or similar varnish  $\frac{1}{2}$  pint; "methylated spirit" and paraffin oil 1 pint each are added, as is also a soln. of borax 1 oz. in water 1 pint.

**Impregnated mops and polishing cloths.** E. A. VIAL. Brit. 305,078, Sept. 26, 1927. The material is impregnated with paraffin oil, which may be emulsified with an equal quantity of MeOH, and is further treated with a detergent mixt. such as "Bon-Ami" 25, "Old Dutch Cleanser" 50 and powdered Na hyposulfite 25%, and afterward treated also with fine dental pumice.

**Dust preventing.** HERMANN KRÜGER, WACHSMELZE (Theodor Schoenheit, inventor). Ger. 478,677, Dec. 30, 1927. A dust-preventing preservative for wood or linoleum floors consists of wool fat (95%), perfume and dye (5%).

**Composition for cleaning cylinders of internal combustion engines.** J. W. MELLORES. Brit. 304,923, Feb. 2, 1928. Naphthalene 1–7 oz. and  $\text{Na}_2\text{CO}_3$  0.5–3.5 oz. are used with "petrol" 1 qt., with or without addn. of 1% of "Castrol."

**Detergents.** E. N. QUANCE and L. C. BURCHELL. Brit. 305,273, June 29, 1928. Compds. especially suitable for cleaning the inside of enameled ovens are formed of dispersions of "com." NaOH and finely divided Fe oxide in water or other suitable liquid or pasty vehicle.

**Ornamental surfaces imitating worked metals.** SOC. LUMIFER. Brit. 305,591, Feb. 7, 1928. A compn. of plaster of Paris, glue and metallic oxide such as Pb oxide is applied to wood, cardboard or other material, and finished with a varnish in imitation of metals such as iron, Ag or bronze.

**Imitating marble or other surfaces.** OXFORD VARNISH CORP. Brit. 304,509, March 12, 1928. See U. S. 1,682,067 (C. A. 22, 3971).

**Reproducing designs of material such as wood or marble.** O. A. BERIAU. Brit. 304,524, April 10, 1928. The softer portions of the surface of a material such as wood or marble are etched out of a slab or cylinder of the material and the surface thus prepd. is used as a relief or intaglio printing-surface for direct or offset printing. HCl or  $\text{HNO}_3$  may be used for etching marble and the high portions then rolled up with a resist, and the operations repeated to secure the desired depth of etching.  $\text{H}_2\text{SO}_4$  or  $\text{NH}_3$  soln. may be used for treating wood, followed by treatment with water to expand the harder portions of the surface. The surface is polished and glossed with beeswax.

**Etching printing surfaces.** BEKK & KAULEN CHEMISCHE FABRIK GES. Brit. 304,685, Jan. 24, 1928. Intaglio, planographic or other printing plates are coated with a mixt. of Fe chloride and  $\text{HNO}_3$ . A soln. of I in KI may be used as an addnl. ingredient to clean the metal and to increase its capacity for taking fatty colors. The plates may be prepd. for etching either photographically or by use of a varnish resist.

**Composite sheet material.** H. C. ROHLFS (to British Thomson-Houston Co., Ltd.). Brit. 305,671, Feb. 9, 1928. Sheets such as paper, cotton or linen are cemented together by coating them with a condensation product such as glycerol phthalate or the like in the "B-stage," pressing the coated sheets together under a pressure of at least 1000 lb. per sq. in. at a temp. of 125–40° and thus converting the resin into the "C-stage."

**Sheet material for boxes, etc.** L. RADO. Brit. 305,571, Feb. 7, 1928. Cellulose foil is coated on one side with a metal foil such as Al and on the other side with a cellulose varnish or the like.

**Composite sheet material for making boxes, cartons, etc.** L. RADO. Brit. 305,098, Jan. 30, 1928. Pasteboard is coated with a pellicle of cellulose hydrate, cellulose acetate or the like, which is coated with a water-repellant material such as celluloid and which may be pasted to a thin sheet of paper before being attached to the pasteboard.

**Shoe-stiffening material.** HENRY P. SHOPNECK. U. S. 1,725,598, Aug. 20. A felted material of the water-laid type is formed of a short fibrous pulp mixed with longer fibers, and is impregnated with celluloid.

**Projection screen.** J. E. PALLEMAERTS. Brit. 304,875, May 18, 1928. A base is coated on the back with lead paint and convex lenses are secured to the front by adhesive.

**Projection screens.** J. E. PALLEMAERTS. Brit. 304,913, Jan. 21, 1928. A base material is coated on the back with lead paint and glass pyramids are secured to the front by adhesive.

**Projection screens of tracing cloth treated with paraffin.** SIEMENS-SCHUCKERT-WERKE A.-G. Brit. 304,656, Jan. 23, 1928. Paraffin oil may be used with the paraffin.

**Whalebone bristles for brushes.** GIMMY & DIEPOLD GES. Brit. 305,484, Feb. 4, 1928. To prevent absorption of moisture, whalebone bristles are treated with a varnish, which may be formed by introducing pinic acid resin, silvinic acid and colophony into MeOH and adding vesuvium, or which may comprise MeOH and ruby shellac.

**Brake-shoe filling and lining composition.** JACOB LAEUFER. U. S. 1,724,718, Aug. 13. Finely divided fibrous material such as sawdust or ground straw is used with hydraulic cement, a heat-resisting agent composed of asbestos and a Na compd. such as Na benzoate, blood and casein.

**Vermin-destroying compositions.** I. G. FARBERNIND, A.-G. (Karl Marx and Karl Brodersen, inventors). Ger. 479,409, Dec 22, 1922. Addn. to 430,712. According to Ger. 430,712, water-insol., vermin-destroying compns. are prepd. in a readily dispersible form by pptg. them from suitable solns. together with the org. acids obtainable from fossil fuels by oxidation, etc. This method is now modified by treating the products with alk. reagents, whereby water-sol. products are obtained. Thus, the insol. products may be dissolved in alkali and the solns. evapd., or the necessary amt. of alkali may be added during the process of Ger. 430,712, or the insol. products may be mixed with solid alkali. Examples are given. Cf. C. A. 23, 1730.

## 19—GLASS, CLAY PRODUCTS, REFRACTORIES AND ENAMELED METALS

G. E. BARTON, C. H. KERR

**Economic problems of glass technology.** OTAKAR WEBER. *Chem. Listy* 23, 146 8 (1929).—A discussion.

FRANK MARESH

**The shrinking of glass threads on heating.** IKUTARO SAWAI AND YOSHIHIRO UEDA. *Z. anorg. allgem. Chem.* 180, 287-303 (1929).—Glass threads of the compn 75.00 SiO<sub>2</sub>, 2.83 R<sub>2</sub>O, 6.43 CaO and 15.40% Na<sub>2</sub>O and varying in diam. from 0.316 to 0.031 mm. were heated at various temps. and under various loads. From observations of the rate of elongation or shrinking, viscosity and surface tension could be calcd. by the formula  $-\ln(l_0/l) = [l/(\pi r_m^2 \lambda)] [2\pi r_m \alpha - (m + (M_0/2))]$ , where  $l_0$  is the original length,  $l$  the final length,  $t$  the time,  $r_m$  the mean radius of the thread,  $\lambda$  the coeff. of viscous traction (cf. F. L. TROUTON, *Proc. Roy. Soc.* 77, 426 (1906)),  $\alpha$  the surface tension,  $M$  the weight of the thread and  $m$  the load on the thread. The surface tension varied from about 15 mg./mm. at 600° to about 11 at 800° and  $\lambda$  from  $1.5 \times 10^6$  to  $7.4 \times 10^2$ .

A. C. HIGGINS

**The rational analysis of clays.** A. F. FIOLETOVA. *Keram. Rundschau* 35, 187-9 (1927).—Ignite the clay at about 550° to const. wt., treat the ignited sample (about 0.75 g.) with 50 cc. of 10% HCl over a steam bath in a closed vessel for 10 hrs., filter, wash and treat the residue with 50 cc. of 10% Na<sub>2</sub>CO<sub>3</sub> soln. in a covered Pt vessel over a steam bath for 1/2 hr. The ignition loss is considered as combined H<sub>2</sub>O and is calcd. to kaolin. K<sub>2</sub>O taken into soln. in HCl is calcd. to muscovite mica. The rest of the K<sub>2</sub>O (known from a complete chem. analysis) is calcd. to K feldspar. The difference between SiO<sub>2</sub> found by anal. and SiO<sub>2</sub> required to satisfy H<sub>2</sub>O for kaolin, K<sub>2</sub>O for muscovite mica and K<sub>2</sub>O for feldspar is considered as quartz. Results of control treatments of quartz, muscovite mica and feldspar with HCl and Na<sub>2</sub>CO<sub>3</sub> solns. are given.

H. INSLEY

**Brick and tile clays from the Sudan.** ANON. *Bull. Imp. Inst.* 27, 161-9 (1929).—The results are given of brick and tile-making tests carried out on 11 samples of clays from Sudan.

A. PAPINEAU-COUTURE

**X-ray study of the zonal structure of silica brick from the roof of a basic open-hearth furnace.** G. L. CLARK AND H. V. ANDERSON. *Ind. Eng. Chem.* 21, 781-5 (1929).—The presence of both quartz and cristobalite in unused, burned silica brick was definitely established by means of x-ray studies. After service in an open-hearth furnace silica brick still retained the quartz formation, although there is a greater

tendency toward the cristobalite state in the hotter zones than in the cooler zones.

K. D. JACOB

**Electric selection of kaolin.** SACHIO SAITO. *Bull. Elec. Research Inst., Communications Dept.* (Japan) 220, 1-15(1928).—S. made a suspension of kaolin in an electrolytic soln. and tried to sep. and collect by cataphoresis the kaolin of different dispersities. Korean kaolin was taken and NaOH used as an electrolyte. The charge on the particle depends upon the quantity of the electrolyte in the suspension and the size of the particle, the best condition of the charge being obtained when 10-40% of kaolin is contained in 0.01-0.02 *N* NaOH. The quantity of kaolin collected by the same quantity of electricity depends upon the concn. of the mud and the current density, the current efficiency increasing with the concn. of the mud and decreasing with the current density. A current density of 10-60 ma./sq. cm. was used. With a. c. superposed on d. c. the efficiency increases markedly. Temp. variations between 15° and 30° do not change efficiency. Some expts. on a semi-industrial scale are described.

K. SOMBYA

**Heat requirement and heat distribution in a periodic or a single chambered ceramic oven.** CARL LÖRER. *Sprechsaal* 62, 76-8(1929).

C. H. LORIG

**Rapid methods of analysis in the ceramic industry.** K. PFEFFERKORN. *Sprechsaal* 62, 1-4(1929).—Rapid methods for detg. loss by ignition, loss by evapn.,  $\text{Al}_2\text{O}_3$ ,  $\text{Al}_2\text{O}_3$  and  $\text{Fe}_2\text{O}_3$ , total  $\text{SiO}_2$  and alkalies of ceramic materials are thoroughly described.  $\text{Al}_2\text{O}_3$  is detd. by titrating with 20%  $\text{Na}_2\text{S}_2\text{O}_4$  a weakly acid soln. contg. the sample to which an excess of a mixt. of equal parts of 25% KI and satd. KIO<sub>3</sub> has been added. The  $\text{Al}(\text{OH})_3$  quickly settles and is readily filtered, ignited and weighed.  $\text{Fe}_2\text{O}_3$  and  $\text{Al}_2\text{O}_3$  are detd. by electroanalysis;  $\text{SiO}_2$  is detd. by means of an ultra-filtration method, and the alkalies are detd. by Hildebrand's method, using a Hg cathode and titrating the hydroxide formed.

C. H. LORIG

**The determination of the water solubility of solid material of ceramic earths and products.** OTAKAR KALLAUNER. *Sprechsaal* 62, 19-21, 35-7, 53-6(1929).—The existing qual. and quant. methods of detg. the sol. material of ceramic earths and products are considered from a theoretical as well as from a practical standpoint. Quant. methods which require the sedimentation of suspended particles are time consuming and give, as a rule, high values. Sedimentation is accelerated by addns. of electrolytes, but in this case clear liquids are obtained only after a long time. Methods which provide for the filtration of the soln. through Puhall or Berkefeld ceramic filters give quick and accurate results.

C. H. LORIG

**Causes of fissure formation in pressed porcelain.** C. DORNEDDEN. *Sprechsaal* 62, 409-13(1929).

C. H. LORIG

**The effect on colored melts of additions of zinc oxide, rutile and fluorspar.** ANON. *Keram. Rundschau* 35, 253-5(1927).—To 4 basic glazes, the comps. of which are given, was added 2% of  $\text{CuO}$ ,  $\text{Cr}_2\text{O}_3$ ,  $\text{Fe}_2\text{O}_3$ ,  $\text{CoO}$ ,  $\text{MnO}_2$  or  $\text{Ni}_2\text{O}_3$ . To a second series of the same compn. and with the same coloring oxides was added 2%  $\text{ZnO}$ , to a 3rd 2%  $\text{TiO}_2$  and to a 4th 4% fluorspar. The glazes were applied to an earthenware biscuit and fired under oxidizing conditions. The colors and appearance of the 96 samples thus obtained are described.

H. INSLEY

**The solubility of refractory soda-lime-silicate glazes in hot water as a function of the chemical composition.** W. MÖLLER AND E. ZSCHIMMER. *Sprechsaal* 62, 38-9, 57-60, 78-82, 94-5, 115-6, 133-4, 150-4(1929).—Fifteen melts from the system  $\text{Na}_2\text{O}-\text{CaO}-\text{SiO}_2$  were prepd. and their solubilities in  $\text{H}_2\text{O}$  at 98° detd. Three series of glazes of 5, 10, and 15%  $\text{CaO}$  and varying amts. of  $\text{Na}_2\text{O}$  were used in the expt. Threads of the melt of about 1 mm. diam. were cut into 12 cm. lengths, their ends rounded in a Bunsen burner and the surface area was detd. by measurement. Bundles of 30 to 40 pieces were immersed in  $\text{H}_2\text{O}$  for 3 periods each of 3 hrs'. duration. The  $\text{Na}_2\text{O}$  dissolved was expressed in mg. per 1000 mg.  $\text{Na}_2\text{O}$  per 100 sq. cm. surface. Increasing  $\text{Na}_2\text{O}$  content with const.  $\text{CaO}$  materially increases the soly. of the glaze. The soly. decreases with an increase of  $\text{CaO}$  from 5 to 10%, but with high  $\text{Na}_2\text{O}$  content, the soly. is greater for glazes of 15%  $\text{CaO}$  content than for glazes of 10%  $\text{CaO}$  content. The effect of 1%  $\text{Al}_2\text{O}_3$  on its soly. was detd. for several series of  $\text{Na}_2\text{O}-\text{CaO}-\text{SiO}_2$  glazes.

C. H. LORIG

**Methods of investigating the resistance of refractory silica and grog to the attack of slags or glass fluxes.** OSKAR LECHER. *Sprechsaal* 62, 3(0-2)(1929).—Small cubes of 6 samples of grog were made and burnt at Seger cones 10, 12 and 14. The absorption of  $\text{H}_2\text{O}$  and the slag attack, as a rule, decrease with increased burning temp. Chem. compn., especially the  $\text{Al}_2\text{O}_3$  content, is of little value in judging the resistance of grog to slag and flux attack. As long as the material is refractory, its m. p. has little

influence on the resistance to attack. A mathematical relation between the slag attack,  $H_2O$  absorption and burning temp. is not possible. C. H. LORIG

**Coöperative tests on the determination of reversible and permanent thermal expansion of refractories.** W. MIEHR. *Tonind.-Ztg.* 53, 871 (1929).—Samples of standard brick were sent to four different laboratories employing somewhat different methods. Silica, quartzite and flint clay brick were used. There was very little deviation in the results for the reversible thermal expansion. In the detn. of permanent linear change at  $1400^\circ$  and  $1500^\circ$  the results were very erratic with high results ten times the low results. R. F. FERGUSON

**The use of antimony-bearing opacifiers in the enamel industry.** H. HAUPT AND G. POPP. *Keram. Rundschau* 35, 221-3 (1927).—Expts. are described in which 2 opacifiers contg. Sb (trade names "Leukonin" and "Timonox") were treated with boiling solns. of tartaric acid, AcOH and hard  $H_2O$  to det. the amts. of quinquevalent and of tervalent Sb dissolved. The quantities of tervalent Sb dissolved from enameled vessels using "Leukonin" are too small to be dangerous to health while the amts. of tervalent Sb dissolved from enameled vessels using "Timonox" are so great that such vessels are unsafe. H. INSLEY

Carrying out investigations at high temperatures (COHN) 2. Industrial gas in the United States—growth and trends [ceramics] (LOBELL, *et al.*) 21. A cooling drum for annealing (Ger. pat. 478,937) 1. Annealing (Ger. pat 478,990) 13. Annular kiln for burning tile ware (Ger. pat 478,631) 18.

**Schleifindustrie-Kalender, 1929.** Edited by BERNHARD KLEINSCHMIDT. Düsseldorf: Verlag des Schleifindustrie-Kalenders. 345 pp. Bound, M. 4 50. Reviewed in *Eng. Progress* 10, 224 (1929).

**Glass.** SIEMENS-SCHUCKERTWERKE A.-G. (Karl Donat, inventor). Ger. 478,746, Oct. 18, 1925. A method is described for fusing glass or quartz with metals by the aid of a device delivering a hot reducing or indifferent gas current.

**Apparatus for feeding mold charges of molten glass.** KARL E. PEILER (to Hartford-Empire Co.). U. S. 1,724,678, Aug. 13.

**Method of drawing hollow glass bodies from the molten mass.** LEONHARD BOCK (Ger. 478,583, Feb. 20, 1926).

**Apparatus for drawing sheet glass.** A. BOUFFIOUX Brit. 305,575 6, Feb. 7, 1928. Structural features

**Heat-exchange roll suitable for making plate glass.** CLAUD MOXLEY (to Pittsburgh Plate Glass Co.). U. S. 1,724,676, Aug. 13. Structural features

**Drum for glass working.** SOC. ANON. DES ATELIERS DE CONSTRUCTION ET FONDERIES DE JEUMONT (Anciens établissements Th. Haut). Ger. 478,888, April 20, 1926. Details are given.

**Glass tubing.** P. A. FAVRE. Brit. 304,664, Jan. 23, 1928. Mech. features

**Endless conveyor for glass-annealing leers, etc.** CANNING TOWN GLASS WORKS, LTD., and J. J. PARNABY. Brit. 304,381, April 18, 1928. Structural features.

**Uniting metals to glass.** RUDOLF ENGELS (to C. H. F. Muller Rontgen-Rohren-fabrik). U. S. 1,724,465, Aug. 13. Metals such as Fe, Cu or Mo which are to be fused to glass are preliminarily coated with a lacquer contg. Al and heated to form a thin Al layer on the other metal or the latter may be otherwise coated with Al.

**Porous glass filter.** JENAER GLASWERK SCHOTT & GEN. Ger. 478,560, July 18, 1926.

**Sealing the edges of composite glass sheets, etc.** J. A. WATT. Brit. 305,404, March 30, 1928. A compn. of Pb oxide and glycerol is used.

**Composite sheets of glass and celluloid, etc.** J. A. WATT. Brit. 304,530, May 2, 1928. The surface of glass which is to be joined to celluloid or the like is preliminarily roughened by treatment with dil. HCl or a similarly acting soln. or by sand blasting or like treatment to provide a better bond for the adhesive used to join the materials (which may be an acetone soln. of nitrocellulose). A solvent such as AmOAc and a transparent oil also may be applied to the surfaces to be joined to remove air bubbles and facilitate uniting of the materials. Cf. C. A. 23, 4546.

**Nonsplintering sheets of glass and cellulose derivatives.** GEORGE E. HEYL. U. S. 1,725,454, Aug. 20. The assembled materials are treated with liquid and subjected to suction in a fluid-tight bag to remove gas bubbles before pressing the sheets together.

**Silvering and beveling small mirrors.** BERT F. KELLY. U. S. 1,724,204, Aug. 13.

The edges of silvered sheets of glass are waterproofed (suitably by waterproof paint) and the edges, with the silver thus protected, are then ground to the desired bevel.

**Glass-like opaque material.** PETRUS M. COCHIUS (to N.-V. Glasfabriek "Leerdam," voorheen Jeckel, Mijnsen & Co.). U. S. 1,724,747, Aug. 13. Shaped products such as vases or building blocks are formed from a partially melted batch contg. an excess of sand, before the sand is wholly dissolved in the fusion mass.

**Rolling mill for purifying and opening clay, loam, etc.** CHRISTIAN GIELOW. U. S. 1,725,630, Aug. 20. Structural features.

**Circular multi-chamber kiln suitable for baking bricks or ceramic ware.** OTTO BUSCH. U. S. 1,724,392, Aug. 13. Structural features.

**Tunnel kiln for firing ceramic ware in successive zones of different temperatures.** ARTHUR S. WATTS. U. S. 1,724,238, Aug. 13. Structural features.

**Drier for ceramic wares.** HALVER R. STRAIGHT (to Ethel H. Straight). U. S. 1,724,325, Aug. 13. Structural features.

**Drying ceramic goods.** OSWALD HELLER. Ger. 479,414, June 18, 1925. The goods are heated by a circulating current of hot, damp air until they have attained a suitable temp., and the moisture in the circulating air current is then condensed. App. is described.

**Ceramics.** AUGUST LIEDTKE. Ger. 478,714, May 6, 1928. In the manuf. of earthenware objects, a cooling current of air and steam is blown into the kiln.

**Coloring tiles with use of special composite stencils.** GEORGE W. KRICK. U. S. 1,724,206, Aug. 13.

**Building up fused silica articles by fusing pulverulent silica to preformed masses.** PIERRE H. C. LA BURTHE (to Soc. "Quartz et Silice"). U. S. 1,724,844, Aug. 13. Details are described of a procedure adapted for building up tubes, insulators, etc.

**Fused silica beams.** ROBERT W. CLARK and LESLIE SAMPLE (to Thermal Syndicate, Ltd.). U. S. 1,724,793, Aug. 13. Mech. features of working fused silica ingots are described as is also an app. for this purpose.

**Refractory material.** J. I. BRONN. Brit. 304,492, Feb. 10, 1928. Chromite is used with a binder of the aluminous cement known as "fused cement."

**Refractory material.** KARL F. PEILER (to Hartford-Empire Co.). U. S. 1,724,886, Aug. 13. In making refractory grog suitable for use in making glass-tank blocks, etc., powdered refractory clay contg. only sufficient moisture to serve as a binder is compacted in a mold and the compacted material is fired and ground.

**Refractory retorts.** N.-V. ELECTROCHEMISCHE INDUSTRIE. Brit. 304,694, Jan. 24, 1928. Retorts for treating corrosive mixts. such as oxygenic salts with C and halogens are lined with or made from insol. halides such as  $\text{CaF}_2$  and  $\text{AgCl}$ .

**Heat-insulating refractory materials.** METALLGES. A.-G. Brit. 304,729, Jan. 25, 1928. Mg orthosilicate is used, either as a synthetic product or as a natural product such as olivine, peredolite or dunnite. The material may be used in the form of grains, with a binder and with combustible or other gas-forming materials to increase the porosity of the product.

## 20—CEMENT AND OTHER BUILDING MATERIALS

J. C. WITT

**The fuel question in the cement industry.** O. V. MORCH. *Trans. Fuel Conference, World Power Conference, London, 1928* 2, 898-918(1929).—Efficiency of cement burning figured as the ratio of the theoretical heat needs and actual consumption is about 22%. Because of the use of waste-heat boilers, clinker coolers, etc., efficiency is actually about 67%. From 75 to 140 kw. hrs. of power per metric ton of cement are required. About 25 million tons of fuel (coal, coke, lignite, peat and oil) are used annually in cement plants.

**Manganese in cement clinker, with a discussion of the question of the constitution of cements.** A. GUTTMANN and F. GILLE. *Zement* 18, 500-6, 537-41, 570-4(1929).—In portland cement clinker Mn usually occurs as  $\text{Mn}_2\text{O}_3$  though in cements poor in  $\text{Al}_2\text{O}_3$  it may exist as  $\text{MnO}_2$  also. The soundness of clinker contg. up to 3.3%  $\text{Mn}_2\text{O}_3$  has been proved in practice.  $\text{Mn}_2\text{O}_3$  may be used to add to or replace  $\text{Fe}_2\text{O}_3$  in clinker to secure the high early strengths of special cements. In normal high-Ca clinker  $\text{Mn}_2\text{O}_3$  appears in the heavy, dark-colored constituents in combinations not fully known.

H. F. KRIEGER

**Strength relationships of cements of different binding power.** H. BURCHARTZ. *Zement* 18, 662-6, 693-7(1929).—The cements studied were a normal portland, a high-

early-strength and a special cement. The amt. of  $H_2O$ , kind and amt. of aggregate and the type of curing affected each variety of cement differently. Likewise, the relative values between compressive, tensile and transverse strengths changed. The use of a well-graded sand for cement testing would be better than the standard sand since it approaches more nearly the conditions in practice.

H. F. KRIEGER

**Cement strength and water-cement ratio.** V. PÄHRNER. *Zement* 18, 468-72 (1929).—When the logarithms of the compressive strengths were plotted as ordinates and the  $H_2O$ /cement ratios as abscissas, the lines joining the values at various ages were straight and converging at a point on the ordinate axis. The position of this point was the same for any one cement even with sands of different gradation. Each cement had its own slope though no marked differences were noted.

H. F. KRIEGER

**Lime compounds formed with the constituents of clay during the progressive heating of cement raw meal.** HANS LORENZ AND HANS KÜHL. *Zement* 18, 604-11 (1929).—

Three raw batches covering the usual range in variation of  $CaO$  and of  $SiO_2$  were heated at  $50^\circ$  stages from  $800^\circ$  to  $1500^\circ$ . The formation of lime and its combinations with  $SiO_2$  and  $R_2O_3$  were followed by the methods of White and of Emley. About half of the lime had combined by the time the last  $CO_2$  was expelled from the batch. The compds. poor in lime form first. The  $2CaO \cdot SiO_2$  is formed between  $1000^\circ$  and  $1250^\circ$ . The development of a sintering melt at about  $1250^\circ$  furthers the formation of more complex compds. *Alite* appears to be a solid soln. of  $3CaO \cdot SiO_2$  and  $2CaO \cdot Al_2O_3$  while *celite* consists of  $2CaO \cdot Al_2O_3$  and  $2CaO \cdot Fe_2O_3$ .

H. F. KRIEGER

**Waterglass powder as a cement admixture.** RICHARD GRÜN. *Zement* 18, 192-4 (1929).—Addns. of 5% powd. water glass both in the slowly set. and the quickly set. forms decreased the strength, water-tightness and the resistance to salt and dil. acid soln. in the portland cement mortars observed.

H. F. KRIEGER

**Graphic determination of all practical combinations of more than two raw materials in the preparation of hydraulic cements.** F. W. MEIER. *Zement* 18, 691-3 (1929).—See C. A. 23, 2263.

H. F. KRIEGER

**Graphic determination of the raw material components for portland cement manufacture.** HESS. *Zement* 18, 227-30 (1929).—The use of the tetrahedral system in the graphic calcn. of desired compns. from four components is discussed.

H. F. K

**"Best" composition of portland cement clinker.** ERNST JÄNECKE. *Zement* 18, 288-92 (1929).—Only slight changes have been made in the compn. of portland cement since 1910 in spite of the vast amount of information gained since that time. J. concludes that the "best" compn. is approx. 63.7  $CaO$ , 21.3  $SiO_2$ , 8.0  $Al_2O_3$ , 2  $Fe_2O_3$ , and 5% of other constituents.

H. F. KRIEGER

**Determination of silica in technical portland cement raw mixes with the aid of ultra-filtration.** H. MINDERMAN. *Zement* 18, 124-8 (1929).—The method of Hart (cf. C. A. 21, 3260) is applied to cements and raw mixes by special prepn. of the sample. After grinding the sample is formed into slender rods. These are heated to  $1300^\circ$  to insure the complete conversion of the  $SiO_2$  into silicates decomposable by acids. After cooling and regrinding the 1-g. portions are treated as follows: add 1 cc.  $H_2O$  to the sample in a small beaker, then 3-5 cc.  $HCl$  (sp. gr. 1.19) and mix thoroughly with a glass rod. Warm on the sand bath to break down the gel. Cool, bring up to 50 cc with  $H_2O$  and stir until all lumps are broken. Filter through an ultra-fine filter, washing with hot dil.  $HCl$  and  $H_2O$ . By allowing 45 min. for the filtration the whole detn., including the  $CaO$ ,  $Fe_2O_3$  and  $Al_2O_3$ , can be completed in 3.5 hrs.

H. F. KRIEGER

**Influence of sugar on the setting and hardening of portland cement.** H. W. GONELL. *Zement* 18, 372-6, 437-41, 472-4 (1929).—The normal order of crystal growths and gel formation attending the setting of cement is disrupted by the presence of sugar in the mixing  $H_2O$ . Greater gel formation occurs, giving the specimens much greater vol. changes with variable moisture contents, with the attending physical stresses within the mortar. The normal crvstn. is delayed months in some cases by the solns.  $Ca$  saccharate could not be identified as a constituent in the treated mortars.

H. F. K.

**Bauxite cements.** WALTER OBST. *Zement* 18, 98-9 (1929).—The subject is discussed generally.

H. F. KRIEGER

**Action of chemically active solutions on cement and mortar.** E. PROBST AND KARL E. DORSCH. *Zement* 18, 292-6, 338-42 (1929).—Six kinds of cements and 2 sands were used to make up the test briquets. After 7 days' curing 10 specimens of each kind were immersed in a satd. soln. of  $CaSO_4$ , and 15% solns. of  $Na_2SO_4$ ,  $(NH_4)_2SO_4$ ,  $MgCl_2$  and sugar. The resistance of a high-early-strength cement was least and of an aluminous cement the greatest in the series. Briquets of Rhine River sand (graded) showed less disruption than did those of standard briquet sand. After one year's immersion in the solns. of sugar,  $CaSO_4$  and  $MgCl_2$  practically, all the specimens were intact. The

CaO held in soln. in  $\beta$ -2CaO.SiO<sub>2</sub> is liberated during the hydration process. This CaO is most readily attacked by the salt solns. The development of CaSO<sub>4</sub> crystals was noted in every case where disruption of the test pieces occurred. It was possible to follow the CaSO<sub>4</sub> reaction chemically both in the increased SO<sub>4</sub> content of the specimens and in the alky. produced in the immersing soln. The reduction in tensile strength followed closely the degree of disintegration produced. H. F. KRIEGE

Relation between cement content and curing period in attaining desired concrete strengths. A. GESSNER. *Zement* 18, 129-31(1929).—The cement content in kg. per cu. m. loose aggregates to give desired compressive strengths at 3, 7, 21 and 42 days can be predetd. by the formula  $Z = A/\sqrt[3]{T}$ , where  $T$  is the age in days and  $A$  is a const. depending on the type and gradation of aggregates, water/cement ratio, etc. H. F. KRIEGE

The suitability and economy of a cement kiln. HARRY STEHMANN. *Zement* 18, 256-9(1929). H. F. KRIEGE

Water permeability of paper sacks. CURT PRÜSSING. *Zement* 18, 568-9(1929).—The penetration of moisture through sack paper can be followed by the decrease in fineness of cement contained therein. Also the time required by heated cement to make a phenolphthalein soln. become red through paper is a good index to the permeability of the paper to H<sub>2</sub>O. Colored paper is more pervious than is plain paper. H. F. KRIEGE

Humus and alkalinity. W. DE SHÄRENGRAD. *Zement* 18, 298-9(1929).—In general, cements high in their content of H<sub>2</sub>O-sol. alky. seemed best able to withstand the effect of humus in mortar sands. H. F. KRIEGE

Gypsum or anhydrite as set retarder. A. DAHLGREN. *Zement* 18, 411(1929).—Anhydrite is not a satisfactory substitute for gypsum. H. F. KRIEGE

Gypsum or anhydrite as a set retarder. F. KILLIG. *Zement* 18, 259-60(1929).—The substitution of anhydrite for gypsum was not successful when trials were made on a commercial scale. H. F. KRIEGE

Improved asphalt treatment for concrete piles in sea water. G. F. NICHOLSON. *Eng. News-Record* 103, 95-6(1929).—A brief description of an improved method of asphalt treatment for concrete piles developed by the Los Angeles Harbor Dept. A very dense concrete is obtained by the use of pneumatic hammers on the sides of the forms during pouring. The piles are heated, subjected to vacuum and impregnated with hot asphalt under pressure of 250-300 lb. per sq. in. R. E. THOMPSON

Comparison of the changes in mortar due to drying and rewetting with similar reactions of crystallized zeolites. LEOPOLD JESSER. *Zement* 18, 158-65(1929).—The processes of hardening and vol. change of cement with variable H<sub>2</sub>O content are discussed as colloidal phenomena. Vapor-pressure curves were found to agree well with those of some zeolites, especially heulandite. H. F. KRIEGE

Testing and judging asphalt emulsions for highways. HUGO NOVÁK. *Paliva a Topení* 11, 4-11(1929).—Asphalts made by the cold process have been successful in lab. tests, but the application of the cold process for building use has not begun. The emulsions have been used for repair work primarily and for penetrating macadam. The tests which have been carried out in routine work are: moisture, stability of the emulsion, size and uniformity of the dispersed oil particle, speed of coagulation, adhesiveness, penetrating qualities, org. addn. products and phys. properties of the emulsified resins. FRANK MARESH

Testing of parquet asphalt. HUGO NOVÁK. *Paliva a Topení* 11, 17-20(1929).—Parquet asphalt is a mixt. of resin with finely ground mineral matter, chiefly limestone, which is used as a base for parquet floors in residences. These floors cannot be laid directly upon cement floors but have to be sepd. by the asphalt. An excess of resin is to be avoided; an ideal quantity would just fill all of the air spaces between the ground mineral; this vol. may be computed from the sp. gr. The amt. of resin should not exceed this ideal quantity by more than 10-12%. The m. p. of the mixt. should not be below 50°. An asphalt beam is suspended between 2 supports, and the amt. of deflection is measured for increments of temp. and plotted. A good grade shows no deflection below 35° and a complete bend does not occur below 45°. The deflection test is very simple to make and gives the best criterion by which a suitable asphalt for parquet work may be recognized. FRANK MARESH

Zinc metaarsenite, a (proposed) new American wood preservative. KARL H. WOLMAN AND HANS PFUG. *Ind. Eng. Chem.* 21, 705-7(1929).—The authors investigated the claims of Curtin, *et al.*, with reference to Zn metaarsenite as a wood preservative (*C. A.* 22, 857-8) and were unable to substantiate the claim that the resulting

compd. left in the wood was wholly insol.  $\text{Zn}(\text{AsO}_2)_2$ . Hot and cold water leaching tests of wood treated both in their lab. and by the Curtin-Howe Corp. in U. S. A. showed that the greater part of the compds. remaining in the wood were sol., the results differing little from those obtained with wood treated with sol. Zn and As salts separately. Evapn. of the preservative soln. at room temp. showed that the AcOH concn. increased to the end.  $\text{Zn}(\text{AsO}_2)_2$  was not pptd. even approx. quantitatively; arsenic acid formed which is difficult to sep. by washing. Toxicity test with purified  $\text{Zn}(\text{AsO}_2)_2$  showed no inhibition to growth of *Fomes annosus* even up to 1.0% concn. Reply. LEO P. CURTIN. *Ibid* 707-9.—W. and P. in their tests did not take into account the humidity of the air nor of the water content of the wood before treatment, factors which materially affect the AcOH evapn. and the efficiency of the reaction resulting in the pptn. of  $\text{Zn}(\text{AsO}_2)_2$ . Their failure to get inhibition to *Fomes annosus* even at 1% concn. was no doubt due to not obtaining the proper degree of dispersion of the  $\text{Zn}(\text{AsO}_2)_2$  in the agar gel. An analysis of commercially treated, kiln-dried lumber showed that 50% of the Zn had been changed to  $\text{Zn}(\text{AsO}_2)_2$ . That the reaction will continue with water absorption was shown by adding dry  $\text{As}_2\text{O}_3$  and Zn acetate to water. After 1 month 76% of the Zn was changed to  $\text{Zn}(\text{AsO}_2)_2$ . The soly. of  $\text{Zn}(\text{AsO}_2)_2$  was 25 p. p. m. Even after long soaking in water, crystals of  $\text{Zn}(\text{AsO}_2)_2$  can be seen covering the cell walls of the treated wood fibers. After an exposure of 1 yr. in the Panama Canal Zone "Z-M-A"-treated wood showed neither decay nor termite attack. ALFRED L. KAMMERER

Effect of distillation conditions on the consistence of road tars (CONDURP, SPIERS)  
21. The gasification of fuels by liquid slag producers (DESSEMOND) 21. Cement and bore-hole waters (DEMETYEV) 22. Aqueous medium for cements (Brit. pat 304,355) 26.

**Handbuch für Eisenbeton. Band I. Geschichtliche Entwicklung, Versuche, Theorie.** Lfg. 1. 4th ed., revised. Edited by FRITZ EDLER v. EMPERGER. Berlin: W. Ernst & Sohn. 96 pp. M. 6.80.

**Meddelelser fra Vejlaboratoriet. Nr. 1. Emulsionsbeton** 32 pp. Kr. 1. Nr. 2. **Gebalit.** Copenhagen: Gad. 26 pp. Kr. 1.

**Cement.** RENÉ DECOLLAND. Ger. 479,007, Feb. 10, 1924. See Brit. 211,197 (C. A. 18, 1892).

**Cement.** THOMAS RIGBY. Ger. 478,632, July 24, 1925. A method of mfg cement by spraying wet, crude cement into the chamber of a rotary furnace through a belt of furnace gas is described.

**Cement.** L. PERRIN and B. TUSCHER (to Soc pour l'exploitation des procédés Petrus). Brit. 305,170, Feb. 1, 1928. Finely ground pozzolana or blast-furnace scoria 60-80, portland cement 5-27 and lime 2-22% are mixed to form a cement.  $\text{Na}_2\text{CO}_3$ ,  $\text{K}_2\text{SO}_4$  or  $\text{BaCl}_2$  may be added to adjust the compn. of the pozzolana and "plaster" 1-10% may be added to control the setting.

**Sorel cement composition.** HIRAM S. LUKENS (to Solidon Products, Inc.) U. S. 1,724,945, Aug. 20. Sand and "silex" or other aggregate is mixed with a binder of the Sorel cement type and an emulsion of a material such as an oil is added to and cracked in the cement mixt. (suitably by the action of the  $\text{MgCl}_2$  present).

**Device for preventing the baking-on of cement during burning in a shaft furnace.** LUDWIG SAUER. Ger. 478,531, June 6, 1926.

**Lining cement pipes with bituminous material.** B. E. MONTEUX and P. L. DUK-AND. Brit. 304,288, Jan. 18, 1928. Mech. features.

**Porous concrete.** G. RICHTER. Brit. 305,415, April 25, 1928. Al powder activated by heating with  $\text{HgCl}_2$  so as to decompose water readily is used in concrete mixts. to give porosity.

**Bituminous concrete.** "PRODOR" FABRIQUE DE PRODUITS ORGANIQUES S. A. and MARCEL LEVY. Ger. 479,219, Feb. 13, 1923. See U. S. 1,699,705 (C. A. 23, 1240).

**Special heating and mixing system for preparing bituminous concrete for paving, etc.** WM. H. STANSBURY. U. S. 1,724,687, Aug. 13. An app. and various details of operation are described.

**Bituminous paving compositions, etc.** N. V. KONINKLIJKE STEARINE KAARSEN-FABRIEK GOUDA. Brit. 304,114, Jan. 14, 1928. Mineral aggregate is first treated with linseed oil, petroleum, a petroleum residuum or similar fatty or mineral oil, resin oil, oily acid or similar fatty acid or a solvent such as alc. or xylene, and then treated with a bituminous emulsion.

**Bituminous compositions for roads.** AMESITE ASPHALT CO. OF AMERICA. Brit. 304,226, Oct. 14, 1927. Crushed limestone or other suitable mineral aggregate is coated

with a bitumen-liquefier such as kerosene, naphtha or gasoline, contg. a partly neutralized oil-sol. org. acid such as oleic acid or sulfonated oil partly neutralized with  $\text{NH}_3$ , and the cold aggregate is treated with a heated, normally solid binder such as asphalt, and with lime. Various details are given.

**Gypsum wallboard.** SEWELL L. AVERY, JR., and MORRIS H. BASQUIN (to U. S. Gypsum Co.). U. S. 1,725,243, Aug. 20. In restoring the bond of paper surfacing to a partially calcined or burned gypsum board core layer at its marginal edges, warm boards assembled in piles have their margins moistened to sat. them and to rehydrate the plaster of Paris, and excess moisture is evapd. by the heat retained in the material.

**Multi-ply felted waterproof material.** LESTER KIRSCHBRAUN. U. S. 1,725,645, Aug. 20. Plies of fiber of different characters carry a coalesced film of bituminous material such as asphalt contg. also an emulsifying agent, e. g., clay, extending through each ply, and are united and simultaneously felted during the forming operation. U. S. 1,725,646 specifies a floor-covering material of similar character with an outer ply substantially free from pitchy satg. material but satd. with china-wood oil or other suitable oily material and provided with coloring material and with a design. U. S. 1,725,647 relates to generally similar products made of felted fibrous material which has been treated while in an aq. dispersion with a waterproofing binder such as asphalt which forms a continuous film coating on the fibers.

**Preserving wood.** HANS NEUBAUER. Ger. 479,270, Feb. 20, 1924. Concrete or cement is prepd. with a germicidal aq. soln. and applied in a thin layer to the wood.

**Immunizing wood, grain or other materials against fungi.** I. G. FARBENIND. A.-G. Brit. 304,741, Jan. 25, 1928. The materials are treated with As compds. of dihydroxy-benzenes such as pyrocatechol arsenoxide, pyrogallol As chloride and the corresponding compds. of pyrocatecholcarboxylic acid and pyrogallolsulfonic acid. The prepn. of various of these compds. is described.

## 21—FUELS, GAS, TAR AND COKE

A. C. FIELDNER

Points of importance for an economical comparison of the value of the heat unit in gaseous and solid fuels. HR. ELVERS. *Trans. Fuel Conference, World Power Conference, London, 1928* 2, 81-99 (1929).—The most important factor in any use of fuel is not its calorific value or the quantity of heat required for any process, but the intensity of the heat, or heat d., which is the net calorific value divided by the vol. of waste gases. The flame temp. depends on the speed of combustion, which in turn is dependent on the properties of the different fuels and also on the furnace and burner construction. This rate is much higher for gaseous than solid fuels.  $\text{H}_2$  gives an intense heat because of high speed of combustion and high sp. heat of  $\text{H}_2\text{O}$  vapor from its combustion. A gas with high CO content gives an even heat distribution in the furnace because of slow flame propagation and low sp. heat of the resulting  $\text{CO}_2$ . Temp. is more closely controllable and furnace efficiency is usually higher with gaseous than solid fuels. Other factors are also considered.

ALDEN H. EMERY

The use of gross and net calorific values for the purpose of guarantee tests. N. F. NISSEN. *Trans. Fuel Conference, World Power Conference, London, 1928* 2, 69-80 (1929).—Power plant efficiencies when calcd. on gross and net heating value are compared.

ALDEN H. EMERY

New methods for fuel analysis. BUNTE. *Trans. Fuel Conference, World Power Conference, London, 1928* 2, 467-81 (in German), 481-93 (in English) (1929).—B. believes the ordinary methods of coal analysis do not give enough data. He suggests several addnl. detns. which should be made. Ash m.-p. curves are detd. by heating a cylindrical test piece at a uniform rate in a reducing atm. in an elec. furnace. The subsidence of the sample is graphically recorded by a graphite rod in contact with the upper surface of the sample (cf. C. A. 22, 1457). The results are consistent within 5-8° and provide information not given by cones (cf. C. A. 13, 370; *Gas J.* 1913, 1160; *Glückauf* 1925, 179), rods (cf. C. A. 17, 2947, 3085; 19, 884) or the micropyrometer method (cf. C. A. 7, 1430; *Bur. Standards, Scientific Paper* 198).  $\text{H}_2\text{O}$  should be detd. by the xylene method (cf. C. A. 8, 1656) to avoid loss of bitumen and danger of oxidation. Coke vol. should be detd. by Lessing's swelling test (cf. *J. Gas Lighting* 118, 815, 855) which B. regards as more practical than other tests (cf. C. A. 15, 2172; 16, 2400; *Stahl u. Eisen* 1920, 1278). Kattwinkel's method of detg. coking power (cf. C. A. 20, 1510, 3344) is recommended. Heat of carbonization should be detd. (cf. C. A. 23,

1457, 3035). The coking constituents of coal should be isolated either by extrn. (cf. C. A. 11, 1739; 14, 1424; 16, 622; 21, 2780; *Fuel* 1927, 532) or by sepn. of vitrain, clarain, durain and fusain by sp. gr. (cf. C. A. 22, 3761; 23, 3791). For gas coals, the gas yield and its calorific value can be detd. by Geipert's method (cf. C. A. 21, 106, 813) which will also give data on tar and coke yields. The results are more reproducible than those by Bauer's method (cf. *J. Gasbeleuchtung* 1913, 389). Low-temp. distn. tests should be made (cf. C. A. 14, 3149). The reactivity of carbonized fuels is important. B. favors Koppers method for its detn. (cf. C. A. 19, 2122).

ALDEN H. EMERY

The detection and determination of sulfur in fuels. ŠTANISLAV LANDA. *Chem. Listy* 23, 287(1929).—An aq. soln. of ammoniacal  $\text{AgNO}_3$  detects sulfides, mercaptans and thio acids but is not specific for thiophene in benzene. The Heusler-Engler method gave good results in petroleum but is not satisfactory for detg S in  $\text{C}_6\text{H}_6$ . Soot deposits formed even in great dilns. with  $\text{C}_2\text{H}_5\text{OH}$ . The Lomax modification gave accurate results. The method was shortened by a titrimetric detn.

FRANK MARESH

The testing of gaseous fuels. I. Contribution on technical gas analysis. H. LÖFFLER. *Trans. Fuel Conference, World Power Conference, London, 1928* 2, 284-7 (1929).—App. planned to be simple and inexpensive is described. Strache's "Siccus" is used to det.  $\text{CO}_2$  by which absorption of  $\text{CO}_2$  from a known vol. of air is registered on a manometer calibrated in %. Temp. is measured with a "Thermoscope." The "Gasoscope" is used to locate leaks. It is a small cell, one side of which is a porous diaphragm and the other a metal diaphragm attached to an indicating device. Calorific value is detd. with a "Caloriscope." (Cf. C. A. 22, 1460; 23, 3329.) II. Review of the methods employed for investigation of fuels, firing and gas lighting in the Technical High School, Vienna. W. J. MÜLLER. *Ibid* 288-90.—For works' tests, Bunte and Orsat app. are used; for lab. tests, Hempel's app. is preferred. Absorption pipets used with the Orsat are constructed on Friedrich's spiral principle. The usual absorbents are used—KOH for  $\text{CO}_2$ ,  $\text{Br}_2$  for hydrocarbons (or  $\text{H}_2\text{SO}_4$  in Hempel and Orsat), pyrogallol for  $\text{O}_2$  and ammoniacal  $\text{CuCl}$  for CO. H,  $\text{CH}_4$  and N are detd by fractional combustion (explosion methods give incorrect results).

ALDEN H. EMERY

Domestic fuels other than anthracite. I. Processed coals. F. G. TRVON. *Trans. Fuel Conference, World Power Conference, London, 1928* 2, 319-35(1929).—The briquetting of anthracite culm and bituminous screenings is important only in certain sections of the U. S. Low-temp. carbonization in the U. S. is still insignificant in amt. The quantity of high-temp. coke sold for domestic uses is increasing. Gas heating is expanding. The av. value of by-product coke and its by-products from 1913 to 1926, the gross value of several by-products per ton of coke produced, and the price trends of solid fuels are shown graphically. II. Domestic heating from coals below the rank of anthracite. F. M. SHORE. *Ibid* 335-8.—A brief discussion of the occurrence and properties of the different ranks of fuels below anthracite is given. III. Heating with oil. E. B. SWANSON. *Ibid* 338-47.—In 1927, 26,350,000 bbls. or 5.3% of the fuel-oil production, was used for heating, 43% in the north Atlantic states, 38% in the central states, 17% on the Pacific Coast and the balance in the south Atlantic region. A brief history of the introduction of oil heating and the mechanics of the process are given.

ALDEN H. EMERY

Utilization of liquid fuels for the generation of steam. A. L. P. MARK-WARDLAW. *Trans. Fuel Conference, World Power Conference, London, 1928* 2, 668-91(1929).—M.-W. considers the use of oil for marine fuel. Oil for this purpose should have a flash point of more than 175°F., or 200°F. with low-viscosity oils; less than 0.75% S, 0.5%  $\text{H}_2\text{O}$ , 0.05% acid; viscosity less than 1000 sec. at 32°F. (for ships without heater tanks), 1000 sec. at 70°F. (for ships with heaters); and be free from solid impurities. Methods of burning are discussed.

ALDEN H. EMERY

Alcohol fuels for use in internal-combustion engines. J. C. KING and A. B. MANNING. *J. Inst. Petroleum Tech.* 15, 350-68(1929).—Efficiency with the use of alc. alone as a fuel for internal-combustion engines would require much higher compression ratios than engines are now designed to have. Studies were for this reason undertaken to det. the miscibility of alc. with other fuels. The other fuels chosen for test included representative gasolines and light distillates from coal distn. From test-tube tests the soly. of the gasolines in 95% alc. at  $-10^\circ$  to  $13^\circ$  ranged from very low for Mexican naphtha to very high for gasoline from Borneo oil. Not more than 41% of  $\text{C}_6\text{H}_6$  would combine in stable mixt. with alc. at  $-10^\circ$ ; but any probable com. mixt. would be stable at  $-15^\circ$ . The possible ternary mixts. contg. 50% of alc. and the balance gasoline and  $\text{C}_6\text{H}_6$  are given. Mixts. contg. 50% of  $\text{C}_6\text{H}_6$  were stable in any combination with the other 2 fuels at  $5^\circ$  so far as the  $\text{C}_6\text{H}_6$  was concerned but not as regards the sepn.

of  $H_2O$  from the alc. if the percentage of  $H_2O$  became high. No ternary mixt. contg. 50% of gasoline was practicable. From engine tests it was seen that blended fuels composed of alc.,  $C_2H_6$  and gasoline can be used successfully and efficiently in the present internal-combustion engine merely by enlarging the carburetor jets. Gasoline-alc. mixts. cannot be so used because of the limited and uneconomical mixt. strengths over which smooth running is possible. Thermal efficiency with the blended fuels is not very different from that obtained with gasoline.

EMMA E. CRANDAL

The gasification of fuels by liquid slag producers. A. DESSEMOND. *Trans. Fuel Conference, World Power Conference, London, 1928* 2, 506-17(1929).—A slagging gas producer is fed with a mixt. of shale or screenings and coke-breeze, high in ash, plus limestone and a certain amt. of scrap cast iron. It produces 180-270,000 cu. m. of gas, 60 tons of ingots and 40 tons of slag per 24 hrs. The gas analyzes  $CO_2$  3-4,  $CO$  28-31,  $H_2$  3-5,  $CH_4$  1.5-2.5,  $N_2$  55-60% and heating value 1150-1200 cal./cu. m. The granulated slag, dried by waste heat to 0.5% moisture, is used in making cement. A. H. E.

The bearing of high- and low-temperature carbonization and synthetic fuel processes on Canada's fuel problems. B. F. HAANEL. *Trans. Fuel Conference, World Power Conference, London, 1928* 2, 1-26(1929).—H. discusses Canada's fuel situation with her consuming centers remote from production; the present requirements and how they are met, including the production of coal gas, carbureted water gas, vaporized oil gas, acetylene, coke-oven gas, natural gas and refinery still gas; the production, importation and refining of crude petroleum, gasoline, etc.; and the conditions necessary for the establishment of high- and low-temp. carbonization plants. The profitable operation of plants for low-temp. carbonization depends on a market for the coke residue and the primary tar oils. The compn. of the latter is shown by tables of analyses. Results of the high- and low-temp. carbonization of 6 Canadian coals are compared, the data including analyses of coal and coke; yields of coke, tar,  $NH_3$  and gas; sp. gr. of tar fractions; and heating value of coke and gas. Low-temp. carbonization data are given for hardwood, peat, lignite, sub-bituminous coal and bituminous coal.

ALDEN H. EMERY

The fundamental aspects of combustion. W. A. BONE, G. I. FINCH and D. T. A. TOWNEND. *Trans. Fuel Conference, World Power Conference, London, 1928* 2, 143-85(1929); cf. *C. A.* 21, 2058.—Hea's of combustion, combustion temp. as affected by dissoen. and sp. heats and radiation from flames are discussed. The combustion of C, CO and hydrocarbons is considered (cf. *C. A.* 20, 2414). In the combustion of C there are 3 steps, a "fixation" of O at the C surface, the evolution of oxides of C, and the adjustment of mobile equil. in the reversible system  $2CO \rightleftharpoons C + CO_2$  in consonance with the temp. Presence of steam is not essential to ignition and explosion of  $CO-O_2$  mixts. When undried CO burns, both direct and indirect oxidations proceed simultaneously and independently. The presence of  $H_2$  and steam favors the indirect oxidation. The slow oxidation of hydrocarbons involves successive hydroxylation stages with evolution of heat accompanied by the decompn. of unstable hydroxylated mols. into simpler products which may undergo further oxidation in the same manner (cf. *C. A.* 22, 4236). In flames similar reactions occur. Ignition temps., limits of inflammability, propagation of flame, explosions in closed vessels and the problem of "knock" in gasoline engines are discussed. A homogeneous explosive mixt. of gas and air in proper proportion for complete combustion burns without flame in contact with a granular incandescent solid by a system devised by Bone and McCourt (cf. *C. A.* 21, 522, 1745). Such a system accelerates combustion, concentrates the heat, gives perfect combustion with a min. of air, produces high temp. without regeneration, and gives rapid transmission of heat (on account of a large amt. of radiant heat). Steam-raising efficiencies as high as 92-93% of the net calorific value of the gas have been obtained.

Determination of total sulfur in coal. O. HACKL. *Chem.-Ztg.* 52, 933-4(1928).—In view of the low results given by the Eschka method, especially with coals very rich in S, due to (a) loss of S during the heating up process and (b) incomplete oxidation, the following method is suggested: 1 g. of finely powd. coal, after drying at  $100^\circ$ , is mixed in an Fe crucible with 8 g. of a mixt. of equal parts of Na carbonate and  $KMnO_4$ .

and the whole covered with a further 2-3 g. of the mixt. The crucible is very carefully heated to redness and maintained there for  $\frac{1}{2}$  hr. After cooling, the crucible contents are extd. with 100-150 cc. of hot water, contg. a small quantity of Na carbonate, until free from sulfate. The filtrate is then pptd. with  $\text{BaCl}_2$  after making slightly acid with  $\text{HCl}$ . With coals very rich in S only  $\frac{1}{2}$  g. of coal is taken. B. C. A.

An accurate and rapid method for determining the total sulfur in coal. O. HACKL. *Chem.-Ztg.* 53, 366(1929); F. HUNDESHAGEN. *Ibid.*—Replying to a criticism of Hundeshagen (*Chem.-Ztg.* 52, 1018) Hackl cites considerable literature concerning the manner of carrying out the Eschka method and Hundeshagen repeats his criticism, which Hackl grants, that the latter did not carry out his procedure in precisely the way in which the former recommended. Cf. preceding abstr. W. T. H.

The plasticity of coal: its measurement and its value in the selection of coals for carbonization. J. A. JACKSON. *Gas J.* 186, 863-5(1929).—J. made expts. in specially designed app. M. p. and plastic range are characteristic of the coal. Standard conditions, particularly as regards rate of heating, must be used for comparable results. Oxidation, if carried sufficiently far, renders coal infusible. Partial oxidation by exposure to air does not appear to affect the m. p. but does reduce the plastic range and the expansion. Coals of low plasticity range and small expansion are easily carbonized in vertical retorts, those of high plasticity range and expansion being more suitable for coke ovens. Three stages in the coking of coal are: preliminary period of water elimination, plastic period of fusion, rapid decompn. and solidification, final period of shrinkage of mass, and elimination of gases contg. increasing amounts of H. Also in *Gas World* 90, 715(1929). J. B. CARPENTER, JR.

The present state and significance of the distillation of coal at low temperatures. R. VONDRÁČEK. *Chem. Listy* 23, 283-7, 310-2(1929).—Most of the tars are liberated below  $450^\circ$  in brown coal and below  $500^\circ$  in black coal. The gases are removed as rapidly as possible and contact with heated walls is reduced to maintain the original compn. of the gases. A contact with heated walls brings about pyrogenic changes. Raising the temp. very gradually, a long distn. period and a decreased pressure were not effective in improving the process. FRANK MARESH

Development and condition of the (low-temperature) coal-distillation industry in Germany. R. HEINZE. *Chem. Fabrik* 1929, 249-53, 288 90, 287 8, 306 9, 315 8, 345-7, 352-5.—An illustrated review. J. H. MOORE

Bussey Coal Distillation Company, Ltd. ANON. *Ind. Chemist* 5, 327-31(1929). E. H.

Hydrogenation of Eocene coal. J. VARGA. *Chem. Folyóirat* 34, 65-76(1928).—A dried and pulverized Hungarian Eocene coal of Tata was hydrogenated without addition of tar.  $\text{Fe}_2\text{O}_3$  (15%) was mixed with the coal both to catalyze the hydrogenation and to produce gases free of  $\text{H}_2\text{S}$  and oil low in S (0.22-0.28%). There was obtained a yield of 16.8-57.9% on the pure coal of an oil of d. 1.002-1.066. Best oil production was attained by heating for 1 minute only. Relative quantity of H, temp. and time of heating influenced both the quantity and the quality of the oil. The largest oil yield (57.9%) was obtained from 300 g. coal at 100 atm. and  $470^\circ$ . S. S. DE FINÁLY

Low-volatile coals. E. K. REGAN. *Power Eng.* (London) 24, 276-7, E. I. S. No. 29-22694(1929).—R. discusses the advantages of sized low-volatile coal with special reference to smoke prevention and efficiency. H. C. PARISH

Low-grade coal for blast-furnace coke. TSURUO NODA AND TAIZO KURODA. *Trans. Fuel Conference, World Power Conference, London, 1928* 2, 1131-50(1929).—Japanese coals are of low grade, producing a porous, friable coke. Low or medium volatile coal is usually mixed with high volatile coal, which reduces the porosity but increases the strength. About 12% ash in the coal after washing (resulting in 18% ash coke) is the most economical. Rapid coking seems to be most profitable. Froth flotation is being used to recover coal from slurry. The developments in blast-furnace design (enlargement in hearth, increase in bosh angle, etc.) have caused an enormous

increase in pig-iron production per unit vol. of furnace. Analyses of 5 Japanese, 4 Chinese and 1 Russian coals carbonized in Japan show the following ranges in compn.: ash 5.44-20.54, volatile matter 17.52-50.36, fixed C 42.11-67.85, S 0.143-3.92, N 0.59-1.63, C 62.73-75.64, H 3.79-5.5, O 6.42-15.54 and heating value 5942-7290 cal. Analyses of various coal mixts. usually charged show a rather const. compn.: ash 10.2-11.49, volatile matter 31.1-32.74, fixed C 51.92-56.44, S 0.52-0.73 and N 0.92-1.18. Results of washing tests are given.

**Methods for making preparations from fossil coals and bituminous shales for the purpose of their examination by microscope.** M. ZALESKII. *Izvestiya teplotekh. Inst* 1926, No. 10, 58-61; *Chem. Zentr.* 1929, I, 333.—Two methods are described. Bituminous coals and anthracites are treated with MeOH shellac soln. and dried. One side is polished with Carborundum, washed and dried. The polished side is glued to the slide by means of Canada balsam, which may be mixed with copal, if necessary. Then the other side is polished with Carborundum and finally with PbO. According to a 2nd method the coals or slates are first treated with 70% alc. KOH or NaOH, then with HF or PhOH. The coals become so soft that they can be easily cut on the microtome. The softened coal is enclosed in celloidin and is cut therein. G. S.

**Use of the Berthelot-Mahler calorimeter.** V. KOSTJEJEV. *Arhiv. Hem. Fum.* 3, 27-9 (1929).—Powd. fuels such as coke, coal, and charcoal may, when not compressible into tablets, be burned in starch capsules, the heat of combustion of which is about 3600 g.-cal./g. A supply of these capsules may be kept in hermetically closed jars.

**The properties of gases defining their combustion.** W. BERTELSMANN and F. SCHUSTER. *Trans. Fuel Conference, World Power Conference, London, 1928* 2, 291-309 (1929).—A presentation of data (mostly tabular) on calorific values of 8 important gaseous fuels, their air requirements for combustion, the vol. and compn. of their combustion products, flame temps., ignition temps., and rate of ignition. A. H. E.

**Determination of the specific gravity of gas with the Bunsen-Schilling apparatus.** L. ZIPPERER. *Gas Wasserfach* 72, 690-2 (1929).—The errors in gas density measurement with the Bunsen-Schilling app. due to moisture in the gas are calcd. and found to be normally less than the exptl. error in such detns. Changes in design of the app. to permit more accurate readings are suggested. These are: constricting the inner

glass cylinder at the calibration marks and the use of a pointer instead of the usual etched ring.

R. W. RYAN

A systematic classification of technical gases. GESELLSCHAFT FÜR WÄRMES-  
WIRTSCHAFT, WIEN. *Trans. Fuel Conference, World Power Conference, London, 1928 2*,  
269-73(1929).—A table is given classifying and giving data on gases under the follow-  
ing headings: source (from solid or liquid combustibles, natural gas or non-combustible),  
process, general nature of gas, particular nature of gas ( $H_2O$ , producer, blast-furnace,  
etc.), calorific value, and remarks on methods of production. ALDEN H. EMERY

Atmospheric-pressure burners for natural gas. T. NIEMCZYŃSKI. *Trans.*  
*Fuel Conference, World Power Conference, London, 1928 2*, 1122-30(1929).—The fac-  
tors influencing the behavior of air-pressure gas burners are discussed and formulas  
developed. The effects of the dimensions on the firing rate, the air feed and the ve-  
locity of flow of the mixt. from the burner are considered. The agreement between  
the plotted curves and exptl. results is good. ALDEN H. EMERY

Estimation of heat losses when employing natural gas as boiler fuel. WIKTOR  
WIŚNIEWSKI. *Trans. Fuel Conference, World Power Conference, London, 1928 2*, 705-  
11(1929).—W. discusses equations for measuring heat losses in flue gases. A. H. E.

Contents of nitrogen in natural gas. O. HACKL. *Neftyanoe Khozyaistvo* 16,  
274(1929); *Intern. Z. Bohrtech.* 1928, 65.—The N content of natural gas was found in  
some cases to be as high as 99.9%. The presence of elementary N is explained by de-  
compn. of nitric compds. The Dumas method gave quant. results, the Kjeldahl  
method is not recommended. A. A. BOEHLINGK

Gas from brown coal. FRITZ FRANK. *Z. angew. Chem.* 42, 773 6(1929).—  
Elaborate arrangements of app. for the study of coal distn. under most varying con-  
ditions are described, and the nature of investigations undertaken is explained. That  
the ash contains finely divided materials active as catalysts is pointed out, thus lead-  
ing to the formation of different types of compds. with alterations of pressure and temp.

W. C. EBAUGH

Coke-oven gas. (Detection and determination of nitric oxide and nitrogen peroxide  
in coke-oven gas.) P. SCHUFTAN. *Z. angew. Chem.* 42, 757-60(1929).—In s.p.g. coke-  
oven gas into its components by the Linde (low temp.) process oxides of N were found.  
It appears that NO gets into the coke-oven gas from bench (producer) gas when the  
vacuum is high, and that in the presence of  $O_2$  this oxidizes to  $NO_2$ . The compressed  
gas, freed from  $H_2S$ , is treated with *m*-phenylenediamine in AcOH soln., and the  $NO_2$   
detd. colorimetrically with an accuracy of 0.01-0.05 part per million. With a modifica-  
tion of the above method NO in coke-oven gas was oxidized to  $NO_2$  by adding 30-50%  
 $O_2$ , and then found in amts. from 1 to 30 parts per million. Correction curves and  
results are appended. W. C. EBAUGH

Separating coke-oven gases into their individual components and utilizing them.  
J. BRONN. *Z. angew. Chem.* 42, 760-8(1929).—Recent demands for substances con-  
tained in coke-oven gas have led to the application of the Linde process for sepg. the  
components and yielding them in a pure condition for the trade. A lay-out of the  
Concordia Bergbau A. G. at Oberhausen is described in detail, with analyses of raw  
gases, intermediate and finished products and the fundamental theories of sepn. in-  
volved. One cu. m. of raw gas contains 485 l.  $H_2$ , 240 l.  $CH_4$ , 120 l.  $N_2$ , 70 l. CO, 20 l.  
CO<sub>2</sub>, 20 l.  $H_2O$  (vapor), 11 l.  $C_2H_6$ , 11 l.  $C_3H_8$  and homologs, 10 l.  $C_4H_{10}$  and homologs,  
10 l.  $O_2$ , 0.5 l.  $C_4H_8$  (vapor) and 0.3 l.  $C_2H_2$ . The liquefaction method of treatment  
gives far more accurate results than any form of analytical procedure, since it seps.  
with certainty even small amts. of a given component; its "sample" is a billion-fold  
larger than that used for analysis. Hydrocarbons with 2 or more C atoms liquify  
above  $-103^\circ$ ; then comes an interval of  $60^\circ$ , and between  $-161^\circ$  and  $-191^\circ$  lie the  
liquefying points of  $CH_4$ , CO and  $N_2$ ; another interval of  $60^\circ$  is followed by the lique-  
fying temp. of  $H_2$ ,  $-252^\circ$ . When the partial pressure of each gas concerned is con-  
sidered it makes the conditions for sepn. even more favorable, especially if compres-  
sions of 10 atms. or more are used. W. C. EBAUGH

The utilization of coke-oven gas by the gas industry. T. P. RIDLEY. *Trans.*  
*Fuel Conference, World Power Conference, London, 1928 2*, 193-211(1929); cf. C. A.  
22, 4773.—To meet the needs of the gas industr., the supply of coke-oven gas must  
be (1) const. as to agreed calorific value, purity and pressure, (2) adequate in amt. and  
not subject to failure and (3) economical in price. The extent to which such gas can  
be absorbed by the gas industry is considered. Tables are given showing the amt.  
of coke-oven gas purchased by 25 English companies from 1920 to 1927, the gas sold  
by the 740 gas undertakings in Great Britain in 1928, and the estd. surplus gas at coke  
ovens. ALDEN H. EMERY

**The development of the illuminating gas industry considered from the chemical standpoint.** W. BERTELSMANN. *Z. angew. Chem.* 42, 753-7(1929).—A résumé.

W. C. EBAUGH

**Removal of carbon monoxide from illuminating gas.** HARALD KEMMER. *Gas Wasserfach* 72, 744-51(1929).—Although an insignificant no. of deaths are due to unintentional poisoning with illuminating gas, as compared to other causes of accidental death, the feasibility of removing CO from coal or coke-oven gas by (1) absorption, (2) catalytic processes or (3) fractional condensation, has been studied. CO may be absorbed by acid or alk. Cu<sub>2</sub>Cl<sub>2</sub>, which can be regenerated by heating under a vacuum. High pressures are required for complete removal of CO by this method. An analysis of the cost indicated that this would be about 3.91 pf. per cu. m. of gas (25¢ per M cu. ft.). The sp. gr. and B. t. u. of the gas are altered, but can be restored by adding inert gas. CO may also be absorbed by alkalies, giving formates, but there is but little market for these in Germany. Catalytic processes may be used, such as the hydrogenation of the CO by passing the gas over a catalyst, preferably one composed of active C impregnated with Ni contg. about 18% ThO<sub>2</sub>, which has an optimum temp. of 180-190°. A CO-H<sub>2</sub> ratio of 1:5 is required for quant. conversion to CH<sub>4</sub>. The active C-Ni catalyzer is relatively inert to contact poisons, but on an industrial scale these must be removed by fractional condensation, increasing the cost. This process is too expensive for practical purposes, and the finished gas also requires the addn. of a CO<sub>2</sub>-H<sub>2</sub> mixt. to restore its heating value and sp. gr. to the original values. For this reason K. suggests the oxidation of CO to CO<sub>2</sub> by passing the gas, with steam, over a catalyst such as Fe activated with Cr oxide. The remaining traces of CO are removed by the methanation process previously described, giving a gas with a density and heating value approximating the original gas more than other processes. The final process, that of liquefaction and fractionation, is well known. If the CO is used for heating purposes, a cost of 1.97 pf. per cu. m. of gas (about 12.5¢ per M cu. ft.) may be realized. The cost of the catalytic process would probably be somewhat higher, but no data are available for estg. this. In any case the cost of removing CO from gas is too high to make the process commercially feasible.

R. W. RYAN

**Industrial gas in the United States—growth and trends.** I. Economics of industrial fuel utilization. HENRY O. LOBELL. *Trans. Fuel Conference, World Power Conference, London, 1928* 2, 1181-9(1929).—The value of gas now used as industrial fuel in the U. S. is approx. 1/4 the total value of all industrial fuel. About 25% of the gas sold is for industrial uses. The advantages of gas over other fuels for this purpose are discussed. II. The trend of industrial gas utilization. **Steam generation.** H. W. BROOKS AND GEO. ORROK. *Ibid* 1189-92.—More than 50% of U. S. blast-furnace gas is used in steam raising, producing about 6 billion kw. hrs. annually at 60-70% efficiency. Natural gas used in central stations generates 3 billion kw. hrs. and in other industries an equal amt. The blast-furnace gas is equiv. to about 18 million tons of coal and the natural gas to about 45 million, a total of about 10% of the yearly coal production of the U. S. **The steel plant.** C. W. BERGHORN. *Ibid* 1192-7.—The total amt. of open-hearth steel ingots and castings made in 1926 by an important steel company was produced in the following proportions by the different fuels: producer gas 40.6, tar 10.6, coke-oven gas 3.8, fuel oil 2.7, natural gas 2.7, coke-oven gas and natural gas 13.1, coke-oven gas, tar and fuel oil 3.9, coke-oven gas and tar 16.2, coke-oven gas, natural gas, tar and fuel oil 6.2 and tar and fuel oil 0.2. **Heat treatment of ferrous metals.** N. T. SELLMAN. *Ibid* 1197-9.—The inherent qualities of gas as a fuel can be fully realized in all heat-treating operations. **Heat treatment of non-ferrous metals.** A. M. APMANN. *Ibid* 1199-1203.—Various uses of non-ferrous metals are reviewed and the application of gas heat to their production is discussed. **Food products.** H. O. ANDREW. *Ibid* 1204-5.—About 10% of the total mfd. gas is used in in-

dustrial coking, which is 80% performed by gas. **Ceramics.** HENRY L. READ. *Ibid* 1206-9.—A discussion. **Miscellaneous uses.** J. B. NEALEY. *Ibid* 1209-11. **III. Growth and future trends.** J. P. LEINROTH. *Ibid* 1211-7.—Statistics are given for the consumption of mfd., natural, coke-oven and blast-furnace gas for 1919-27. **Appendix.** *Ibid* 1218-1318.—Pictures and descriptive matter are given which show industrial uses of gas. ALDEN H. EMERY

**Secondary reactions in oxide purification (of gas).** G. W. ANDERSON. *Gas World* 91, 54-5(1929).—Imperfect removal of  $H_2S$  may be due to mech. defects, process defects, chem. reactions and bacterial action. Mech. defects include leaky valves, "channelling," etc. Removal of oil and tar from the gas entering the purifiers and frequent removal of sulfide sludge will prevent contamination of the oxide. A temp. between  $70^\circ$  and  $80^\circ F.$  is necessary for rapid absorption of  $H_2S$  but not sufficient to cause the formation of  $FeS$  and  $FeS_{n+1}$  or the decompn. of org. S compds. yielding  $H_2S$ . Excess alkyl. must be avoided as alkalis, alk. earths and  $NH_3$  also react with  $CS_2$ . The use of bog ore or pitch-pine sawdust will prevent or inhibit  $H_2S$  formation due to bacterial action.  $CuSO_4$  in 1:6000 concn. is a satisfactory bactericide. J. B. C., JR.

**Considerations for the preliminary survey of the theoretically correct gas plant.** FRANK W. STEERE. *Proc. Am. Gas Assoc.* 1928, 991-1027. E. H.

**The material and construction of inflammable gas appliances.** MATAKE KUROKAWA. *J. Soc. Chem. Ind. Japan* 32, 481-8(1929); Suppl. Building 32, 149-52B (1929).—K. investigated the effects of d. and compn. of gas on the rate of flow of gas at the burner orifice, the ratio of air and gas in the gas mixt. just before combustion and the radiant energy emitted. These effects and the speed of propagation of flame and the range of inflammability of gas-air mixt. det. the suitability of gas for a given gas burner to obtain good efficiency. K. also investigated the influence of the quality of radiants used in gas stoves on the amt. of radiant energy emitted, and found that the radiants coated with Pd, Pt, Cu, Fe and oxides of U emitted more radiant energy than those without coating. K. proposed the coating of U oxide most suitable for this purpose because it is not very expensive and so durable that only 1% decrease of radiant energy was observed after a continuous working of 500 hrs. S. OKA

**The principles of flame radiation.** T. LINDMARK. *Trans. Fuel Conference, World Power Conference, London, 1928* 2, 766-70(1929).—Transmission of heat is by convection, gas radiation and flame radiation, of which the latter is the most important. It is made up of chem. radiation and of radiation from min. C particles. With pulverized coal the flame is increased since the particles increase in vol. in burning (up to 8 times) and a porous core of coke remains. ALDEN H. EMERY

**Pressure regulation for high-pressure holders.** E. H. ENANDER. *Proc. Am. Gas Assoc.* 1928, 1473-9. E. H.

**Purification of tar and tar oils.** J. DE KÁRPÁTI. *Chem. Rundschau Mitteleuropa u. Balkan* 6, 11-4, 21-4(1929).—EtOH and MeOH do not dissolve tar or tar oils, but dissolve their impurities. Concd. EtOH dissolves more phenol but the soln. is less pure than when dil. EtOH is used. Forty % EtOH dissolves considerable quantities of phenols under pressure of 4-4.5 atm. and at  $128-130^\circ$ . The  $H_2O$ -alc. phase and the pptd. phenol phase can be sep'd after sedimentation. By simple distn 94% alc. can be sep'd. from the refined oils and 87% alc. from the phenols. The practical loss of alc. is about 0.1-0.2% of the crude oils. Phenols ppt. from the alc. soln. on slow cooling in the order of their acidity, beginning with PhOH. The quantity of extd. phenols depends on the temp. of extn.; their purity depends on the concn. of the alc. The purification of 1 kg. oil requires about 400 cal.; older methods required about 1500-2000 cal. S. S. DE FINÁLY

**Tar and bitumen from the colloid-chemical viewpoint.** H. GROHN. *Teer u. Bitumen* 27, 345-9(1929)—A review. W. A. GALLUP

**Effect of distillation conditions on the consistency of road tars.** C. O. CONDRUP AND H. M. SPIERS. *Gas J.* 186, 856(1929).—There is considerable flexibility in the prepn. of road tars by straight distn. since, with a still in which the time of contact is short, a tar of predtd. consistency may be obtained either by topping off a definite proportion and cooling the residue tar slowly, or by topping off a much larger proportion and cooling the residue tar quickly. Topping to the extent of an extra 4% calcd. on the wt. of the tar gives rise to at least a three- or four-fold increase in the consistency. Increase in primary consistency takes place very slowly below  $150^\circ$ . J. B. C., JR.

**The development of the coking industry.** E. LANGROGNE. *Trans. Fuel Conference, World Power Conference, London, 1928* 2, 494-505(1929).—The quality of coke from blended coals can be improved by compression of the charge, higher temps. and reduction of carbonizing time. High volatile coals are now being blended with

semi-coke from low-temp. carbonization. Improvements have been made in the charging, handling and conveying of coal and coke, methods of heating and fuel economy.

**Economics of coke manufacture in the coking industry.** M. MACKENZIE. *Trans. Fuel Conference, World Power Conference, London, 1928* 2, 108-19(1929); cf. C. A. 23, 264.

**The by-product coke oven as a source of industrial and domestic energy.** C. P. FINN AND R. RAY. *Trans. Fuel Conference, World Power Conference, London, 1928* 2, 100-7(1929).—Uses of coke, coke-oven gas, tar, benzene and  $\text{NH}_3$  are briefly discussed.

**Coke-oven practice and developments in bulk carbonization.** W. H. BLAUVELT. *Trans. Fuel Conference, World Power Conference, London, 1928* 2, 412-25(1929).—B. gives a description of the American coke industry. He includes an extensive statistical summary of the coke industry in 1926, including the by-products.

**Coke screening.** W. S. EDWARDS. *Trans. Fuel Conference, World Power Conference, London, 1928* 2, 229-44(1929).—A general discussion.

**Coke quenching and cooling.** W. COLQUHOUN. *Trans. Fuel Conference, World Power Conference, London, 1928* 2, 120-42(1929).—C. discusses and compares coke quenching with  $\text{H}_2\text{O}$  (wharf, car, tank and remote) and dry (Sulzer app.). He regards the latter as highly preferable because of the const. C and  $\text{H}_2\text{O}$  content which can be maintained, the larger size of coke obtained, lack of corrosion, lower costs of transportation, more regular furnace operation and the large amt. of steam raised as a by-product.

**Use of coke dust in boiler firing.** FR. REUTER. *Gas Wasserfach* 72, 692-5(1929).—Coke dust may be successfully fired as powd. fuel in a boiler burning coke breeze on a travelling grate. Exptl. data and a description of the boiler are given.

**The determination of mineral matter in coke.** K. HRADSKÝ. *Paliva a Topení* 11, 30-2(32-3, French)(1929).—In the incineration of coke the ash gains wt. by the oxidation of Fe  $\rightarrow$  FeO and  $\text{Fe}_2\text{O}_3$  and FeS  $\rightarrow$   $\text{FeSO}_4$  and loses wt. by decompn. of  $\text{CO}_2$ , volatilization of chlorides and decompn. of pyrites. The true mineral content can be detd. from the following schem: mineral matter  $\rightarrow$  (ash + CaO + FeS + FeO +  $\text{Fe}_2\text{O}_3$  +  $\text{SO}_3$ ) in the coke  $\rightarrow$  (CaO + CaS + FeS + FeO +  $\text{Fe}_2\text{O}_3$  +  $\text{SO}_3$ ) in the ash. The analysis is long and involved. The compn. of S in ash depends upon the oxidation of S to  $\text{SO}_4$ . Cokes with a small quantity of S leave an ash free of  $\text{SO}_4$  unless S is present as  $\text{SO}_4$  in the coke; high S in coke leaves an ash rich in  $\text{SO}_4$ . The sulfides in such cokes can be treated with an acid, the  $\text{H}_2\text{S}$  is evolved, and the S in the ash is reduced. The org. sulfides are not the source of  $\text{SO}_4$  in the ash in combination with metals. The increase in basicity does not increase the bound basic sulfate. By adding  $\text{CaCO}_3$  or CaO to the coke, the S in the ash was the same as when this addn. was omitted. By decompn. with HCl, the sulfur as sulfide is evolved and not converted to a sulfate and only the  $\text{SO}_4$  already present is detd. The procedure is: Coke (0.5-1.0 g.) in a porcelain boat is treated in an atm. of  $\text{CO}_2$  with 3-5 cc. dil. AcOH and after drying the coke is ashed at 700-800°. The ashing may be carried out in a porcelain or a glass tube in an atm. of air or O; with O the time for ashing is 30 min. toward the end; the boat is withdrawn and the contents are stirred with a wire and heated again until completely ashed. The ash is reduced with H (dry) from a Kipp flask at 700-800° and is cooled in a H atm. It is advisable to treat the ash again with AcOH (few drops), dry and reduce with H at 700-800°. The ash is weighed immediately. The total time for the detn. is 1½ hrs. With coke rich in FeS the error as compared with the abs. analysis was 0.20%; with coke with small quantities of S, the agreement was 0.04-0.05%. The Fe in coke occurs as elementary Fe or as FeS; the quantity of other compds. is small. The formed oxides of Fe are reduced to metallic Fe by H.

HINZ, FRITZ: Über wärmetechnische Vorgänge der Kohlenstaubfeuerung unter besonderer Berücksichtigung ihrer Verwendung für Lokomotivkessel. Berlin: J. Springer. 76 pp. M. 7.50. Reviewed in *Eng. Progress* 10, 190(1929).

ROSIN, P. AND FEHLING, R.: Das It-Diagramm der Verbrennung. Berlin. V. D. I. Verlag. 32 pp.

**Fuel.** LESTER KIRSCHBRAUN. U. S. 1,725,198, Aug. 20. Comminuted coal is mixed with an emulsion contg. an argilliferous emulsifying agent and bituminous material and the emulsion is then broken down (suitably by removal of water) to cause the adhesive agent to form with the coal an agglomerated mass suitable for making briquets.

**Composition fuel.** H. NIELSEN and B. LAING. Brit. 304,812, Oct. 26, 1927. Granular or powdered material such as coal or coke is caused to fall in a finely divided stream through a chamber in contra-flow to an atomized stream of a liquid coating or impregnating material such as heated pitch. The temp. at the lower part of the treating chamber is preferably such as to revaporize surplus liquid. Various details of app. and procedure are described.

**Agglomerating carbonaceous materials.** J. S. MORGAN. Brit. 305,051, July 29, 1927. Coke and the vapor of a high b. p. oil may be introduced into a rapidly revolving cylinder in which the materials are subjected to centrifugal force and may be removed continuously or intermittently and broken up. Various modifications of procedure also are described among which is the use of binders which polymerize or condense such as phenolic substances sprayed in an atm. contg.  $\text{CH}_2\text{O}$ , or a soln. of pitch.

**Hydrocarbon derivatives containing oxygen or sulfur.** I. G. FARBENIND. A.-G. Brit. 305,603, Oct. 6, 1927. Difficultly condensible hydrocarbon mixts., especially those of low mol. wt. up to  $\text{C}_6\text{H}_{12}$  which may be obtained by the destructive hydrogenation of carbonaceous materials, are treated with gases contg. O or S such as  $\text{CO}_2$ , steam, air or  $\text{H}_2\text{S}$ , at temps. of 500–800° and preferably in the presence of catalysts such as  $\text{MnO}_2$ , V, Mo or Cr oxides, Mn sulfide, alumina, active C or silica, elements and compds. of groups 1 and 2 of the periodic system or their mixts. with or without use of pressure. Among the compds. which may be obtained are HOAc and its homologs, ketones, acetaldehyde, alcohols, butadiene, butylene, propylene, thiophene, etc. Details are given Cf. C. A. 23, 3796.

**Destructive hydrogenation.** I. G. FARBENIND. A.-G. Brit. 304,343, Oct. 17, 1927. In effecting destructive hydrogenation of coals, tars, oils, etc., or low-temp. carbonization of coal, in the presence of gases, the gases and vapors are maintained at a higher rate of flow in the reaction space than they would have by being merely passed through the reaction chamber, e. g., by setting up a pulsating or oscillating movement of the gases by the action of a piston (in an app. which is described).

**Destructive hydrogenation.** R. T. HASLAM and R. P. RUSSEL (to Standard Oil Development Co.). Brit. 304,301, Jan. 19, 1928. Carbonaceous materials such as oils or coal suspensions are converted into hydrocarbons of low b. p. by intimate contact with H at high temps and pressures in a reaction zone to which a portion of the treated material is returned after being withdrawn and reheated. Catalysts such as metal oxides are preferably used. An arrangement of app. is described.

**Destructive hydrogenation, etc.** I. G. FARBENIND. A.-G. Brit. 304,404, Nov. 5, 1927. Oils are recovered from the oil-bearing residues of the destructive hydrogenation of coal, tars or mineral oils or the residues from the extrn. of coal under pressure by benzene. These residues are mixed with coal dust, sawdust or the like, and oils from the residues are obtained mixed with the oils from the powdered fuels and are suitable as a "pasting medium" for destructive hydrogenation. Coke ash or clinker may be added catalytically to promote the formation of low b. p. hydrocarbons or to loosen the starting material. Cf. C. A. 23, 4050.

**Hydrogenation of coal, etc.** I. G. FARBENIND. A.-G. Fr. 34,048, Sept. 13, 1927. Addn. to 617,504. Gases contg. hydrocarbons are partially decomposed by  $\text{CO}_2$  with or without steam or gases other than O. and used for the hydrogenation of coal, tars, mineral oils, etc. Thus a gas contg. 30–40%  $\text{CH}_4$  obtained by treating coal, tars or mineral oils with H at a high temp. and under pressure is mixed with  $\text{CO}_2$  and passed through a heated vertical furnace contg. a Ni catalyst. The resulting gas contains CO 31.4, H 66.2,  $\text{CO}_2$  1.1 and N 1.3%. The CO content of this may be converted by steam to H and  $\text{CO}_2$  before use for hydrogenating.

**Sifting and washing device for coal and other fuel.** HEAD, WRIGHTSON & Co., LTD., ROBERT S. BENSON and HENRY CLARK. Ger. 478,943, July 8, 1928. Addn. to 422,594.

**Drying or destructive distillation apparatus.** LUDWIG HONIGMANN. Ger. 469,503,

Apr. 5, 1927. Addn. to 466,925. The app. of Ger. 466,925 (C. A. 23, 3131) is modified by securing the conductive plates directly to the drum, which is rotated. Cf. Ger. 472,032 (C. A. 23, 3832).

**Apparatus for withdrawal of smoke and fumes from intermittent carbonizing-apparatus.** N. J. BOWATER, A. H. LYMN AND CHAMBER OVENS, LTD. Brit. 304,859, Nov. 7, 1927. Structural features.

**Oven and associated apparatus for carbonized briquets.** W. E. TRENT (to Trent Process Corp.). Brit. 304,284, Jan. 18, 1928. Structural features.

**Binder suitable for use with fuels in making briquets, etc.** STANLEY W. CARPENTER and GERALD N. WHITE (to Pulp Binders Development Co., Ltd.). U. S. 1,724,393, Aug. 13. Soft vegetable tissue such as grass is subjected to the action of a natural aerobic fermentation agent until fully rotted (the material being moistened during the fermentation) and the mass, contg. the fermentation products other than gases, is treated with 1-5% of an alkali such as  $\text{Na}_2\text{CO}_3$  to produce a structureless slime having strong agglomerative properties.

**Briquetting porous materials.** JULIEN PETITPAS. Ger. 479,157, Nov. 10, 1925. Materials such as sawdust, shavings, charcoal and coal are briquetted by means of a mixt. of a binder and a gel, the mixt. being ground with the material so that the particles of the latter become surrounded by the gel. The gel may be prepd. from albuminous, cellulosic or starchy material, vegetable mucilages, etc. Numerous details are given. Cf. C. A. 20, 1313, and Brit. 242,605 (C. A. 20, 3786).

**Apparatus for removing oil and fat from the hot chamber of a steam-heated coal-drying device.** LOTHAR WOLF AND KARL KUNZE. Ger. 478,637, July 1, 1927.

**Method of and means for cooling and after-drying dried lignite.** GOTTHILF SEITZ. Ger. 479,158, Sept. 15, 1926.

**Metallurgical carbon.** CARBONISATION SOC. GÉNÉRALE D'EXPLOITATION DES CARBONES. Brit. 304,676, Jan. 24, 1928. The process of producing metallurgical C described in Brit. 288,551 (C. A. 23, 676-7) is modified by starting with coked or uncoked lignite, peat or other carbonaceous material; this is crushed to small pieces, treated with a bath of  $\text{NaOH}$  or  $\text{KOH}$  to remove S, and distd. to drive off tars, and the dried treated mass has incorporated with it a nitrate or borate of Na, K, Ca, Ba, Sr, etc., proportionate to the S and P content of the material to be treated. The S content is converted into sulfate which is washed out. Distn. may be effected in a stream of N and water vapor to remove tarry substances without coking.

**Treating peat preparatory to expression of water.** A. TEN BOSCH. Brit. 304,329, Jan. 19, 1928. Elec. osmosis may be used to break down the colloidal condition of the peat surface by passing a c. between electrodes inserted in the material. Acid treatment of the perforated peat may be used for the same purpose, and the peat may be squeezed between steam-heated perforating plungers of a heated press.

**Montan wax.** I. G. FARBENIND. A.-G. Brit. 305,552, Sept. 5, 1927. Crude or deresinified montan wax is bleached and largely hydrolyzed by treatment at 100-130° with a compd. of high-valent Cr such as  $\text{CrO}_3$  and with at least 5 times its quantity of a 30-70% inorg. acid soln. such as  $\text{H}_2\text{SO}_4$  and  $\text{H}_3\text{PO}_4$ . Various details are given.

**Gasifying bituminous coal.** JOHN M. RUSHY (to U. G. I. Contracting Co.). U. S. 1,725,739, Aug. 20. In effecting complete gasification in a single vessel, a descending fuel bed is maintained with uncarbonized coal at its top and with a supporting layer of coke at its bottom; the coke layer is air-blasted upwardly to establish a bottom hot zone across the entire horizontal area of the coke, and a second air-blast is used to establish a second and upper hot zone in the coke immediately supporting the uncarbonized coal; the blast gas is excluded from the uncarbonized coal; and blue water gas is then generated by steam-blasting the coke at the lower hot zone; the blue water gas thus formed is forced upwardly through the upper hot zone where it is highly heated and is then passed upwardly through the superposed coal to effect its carbonization. An app. is described.

**Rich gas from bituminous fuel.** METALLGES. A.-G. Brit. 304,760, Jan. 26, 1928. The fuel is distd. and the residue is gasified with a gas mixt. contg. O and such a high proportion of steam that most of the C in the fuel is converted into  $\text{CO}_2$  and the H content of the resulting gas exceeds the CO content.  $\text{CO}_2$  is removed from the gas before use. The O used may be sprayed with hot water used for cooling the rich gas, or steam for further use in the process may be generated from this cooling water in a vacuum app. and superheated by the semi-coke.

**Gas manufacture.** KARL KOLLER. Ger. 479,030, Sept. 1, 1925. The gasification of caking fuels takes place in a rotary-grate producer having a rotary distn. retort in the producer shaft, the retort being traversed by the producer gases. The improve-

ment consists in operating the plant, in accordance with observations of the temp. in the upper part of the producer shaft, so that the distn. process is completed in the distn. retort. For instance, the rate of rotation of the grate may be varied.

**Gas producer.** HARRY F. SMITH (to Gas Research Co.). U. S. 1,724,525, Aug. 13.

**Gas producer (for heating steam generators, etc.).** T. R. WOLLASTON. Brit. 305,288, Nov. 8, 1927.

**Gas producer.** BAMAG-MEQUIN A.-G. Ger. 479,028, Dec. 2, 1925. In a plant in which coal is distd. and the coke is used for the manuf. of water gas, means is provided for introducing a cooling gas at the bottom of the distn. portion to avoid too high a temp. in the tar separator to which the mixed gases are passed.

**Gas producer.** FRANKFURTER GASGES. and ERNST SCHUMACHER. Ger. 479,029, Jan. 3, 1925. Plant for the manuf. of carbureted water gas is described comprising a gas-producer shaft with means for introducing steam and oil vapor at an intermediate point.

**Gas producer.** NICOLA LENGERSDORFF. Ger. 479,031, Feb. 21, 1926. A fuel distn. chamber coaxially superposed on the gas-producer shaft is heated both internally and externally.

**Gas producer (with improved rotating grate).** GES. FÜR INDUSTRIE-OFFENBAU M. B. H. Ger. 479,033, Apr. 16, 1922.

**Gas producer (with means for upper heating).** NICOLA LENGERSDORFF. Ger. 479,032, Nov. 11, 1924.

**Revolving grate construction for gas producers.** GASTON DIENNE (to Soc. anon. les ateliers mechaniques). U. S. 1,724,461, Aug. 13.

**Gas-producing and oil-recovery plant construction and operation.** F. L. DUFFIELD. Brit. 305,253, Nov. 1, 1927. Pulverized fuel is preheated in air to 200-250° to prevent the particles from sticking together on further heating, and is then distd. in the presence of a combustible gas and is gasified by partial combustion in air and steam. Volatiles from the distn. zone are recovered by condensation and the hot gases are passed through heat exchangers for preheating the air, gas and steam used. Various details of construction are described.

**Apparatus for feeding fuel to gas generators.** THOMAS F. HOLDEN (one third each to Robert D. Weaver and Calvin Vos). U. S. 1,724,402, Aug. 13. Various structural details of a portable sealed magazine-feeding device are described.

**Gas retort.** HEINRICH KOPPERS (to Koppers Development Corp.). U. S. 1,725,148-9, Aug. 20.

**Treating fuel gases.** C. COOPER, D. M. HENSHAW and W. C. HOLMES & Co. Brit. 304,333, July 15, 1927. Crude fuel gas is dehydrated, purified and cooled by contact with concd. solns. of salts such as  $\text{NH}_4$  salts, which absorb water without correspondingly taking up free  $\text{NH}_3$ . An arrangement of app. is described.

**Gas purification.** IMPERIAL CHEMICAL INDUSTRIES, LTD., K. GORDON and J. HUGHES. Brit. 304,345, Oct. 17, 1927. Coal-distn. gases are washed with water and scrubbed with oil to remove tar,  $\text{NH}_3$  and  $\text{C}_2\text{H}_4$  and the clean gas is compressed to, preferably, 250 atm.  $\text{CO}_2$ ,  $\text{H}_2\text{S}$  and S compds. are removed by ammonia liquor and the gas is then treated in a tower with an ammoniacal cuprous salt to effect absorption of CO and  $\text{C}_2\text{H}_4$  and other unsatd. hydrocarbons. The gas is then washed with a high b. p. solvent such as kerosene to remove most of the  $\text{CH}_4$  as described in Brit. 293,138 (C. A. 23, 1479), and, after addn. of gases to adjust the ratio of H to N to 3:1, the mixt is used for  $\text{NH}_3$  synthesis. Numerous details and auxiliary treatments are described.

**Gas purification.** O. W. LUSBY (to W. J. Huff). Brit. 305,026, Jan. 28, 1928.  $\text{H}_2\text{S}$  and org. S compds. are removed from combustible gases by passage at a high temp. (suitably about 450°) over metals or metal compds. such as combinations of Cu, Ag, Fe, Ni, Co, Pb, Sn and Sb or their oxides with metals (or their oxides) of the sixth and seventh groups of the periodic system. Examples are given of the use of Cu with a smaller proportion of Cr or U or both, and various details of prep. the purifying materials are given.

**Revivifying materials used in gas purification.** METALLGES. A.-G. Brit. 304,239, Jan. 17, 1928. Revivification of catalytic or other purifying materials is effected before the material is fully spent. An arrangement of app. is described in which gas purifying material may be revivified with air or O.

**Desulfurizing gas.** ROBERT M. CRAWFORD. U. S. 1,724,909, Aug. 20. The gas is washed with a soln. contg. an alkali metal carbonate obtained from the decomposition of phenolates.

**Catalysts for removing sulfur compounds from gases.** O. W. LUSBY. Brit. 305,027, Jan. 28, 1928. Catalysts are used consisting of metals of the sixth group or

their oxides or hydroxides together with metals of the first to fifth groups or of the eighth group or their oxides or hydroxides; *e. g.*, U may be used with Ce, Cu or Sb; Cr with Ce, Cu or Th; and W or Mo with metals of other groups. A temp. of 200–600° may be used.

**Coal-gas purification.** GEWERKSCHAFT M. STINNES. Brit. 305,545, Feb. 6, 1928. The gas is bubbled through naphthalene oil, tar oil or steam-volatile portions of washing oil at about 100°, cooled to about 0° to effect drying, and the condensed solvent is reused, preferably after sepn. of naphthalene by cooling or distn.

**Purifying coal gas.** GEWERKSCHAFT MATHIAS STINNES. Brit. 304,145, Jan. 14, 1928. After a usual preliminary purification, coal gas is charged with vapors of an oil which is an absorbent of naphthalene and is then cooled to effect condensation of the vapors as a rain which washes the naphthalene out of the gas. Other details also are described.

**Coal-gas plant.** C. OTTO & Co. G. M. B. H. Ger. 477,915, May 3, 1928. App. for utilizing the heat of the distd. gas in a coking furnace for heating water is described.

**Apparatus for saturating coal gas with vapor of xylene or for similar purposes.** R. MEZGER. Brit. 305,089, Jan. 30, 1928.

**Water gas.** BAMAG-MEQUIN A.-G. and O. HELLER. Brit. 304,139, Jan. 12, 1928. An app. is described in which powdered fuel is brought into contact with superheated steam and the heat of the gases generated is recovered for use in the process.

**Water gas.** HUMPHREYS & GLASGOW, LTD. Ger. 478,742, Oct. 9, 1925. A plant for producing carbureted water gas is described.

**Liquefaction system for separation of constituents of complex gaseous mixtures such as water gas, coke-oven gas, etc.** GEORGES CLAUDE (to La societe l'air liquide, Soc. anon. pour l'etude et l'exploitation des procédés Georges Claude). U. S. 1,724,004, Aug. 13.

**Dip-pipes for gas plants.** GAS LIGHT & COKE CO., W. J. B. LEECH, S. HAY and A. E. BURTON. Brit. 304,266, Oct. 18, 1927. Various structural features are described.

**Method for regulating furnaces.** SIEMENS-SCHUCKERTWERKE A.-G. (Wilhelm Gumz, inventor). Ger. 478,955, Nov. 5, 1927. A method of regulating the furnace of a steam plant by adding O to the blast gas is described.

**Device for registering simultaneously both the benzene and gas obtained in a benzene-extracting plant.** RHEIN. ARMATUREN UND MASCHINENFABRIK UND EISENGIESSEREI ALBERT SEMPELL. Ger. 478,686, July 12, 1925. Details are given.

**Distilling oils, tars or other carbonaceous liquids.** A. L. RISPLER. Brit. 305,263, Nov. 3, 1927. The material is passed through a rotary still contg. iron balls or similar crushing material which powders the residue and assists in distn. Steam may be used to facilitate the distn. Various details of the app. used are described.

**Recovering tars from aqueous emulsions.** RUSSELL R. RIPLEY and SIGMUND C. SCHWARZ. U. S. 1,724,222, Aug. 13. A relatively small proportion of a demulsifying agent such as NaOH is added to the emulsion and the mixt. is rapidly heated to the b. p. under atm. pressure; the heating is then continued at a higher temp. under increasing pressure, while preventing vaporization, but without heating to cause substantial cracking of the tar; water coalescence is effected and the tar is sepd. by gravity. An app. is described.

**Coking.** C. OTTO & Co. G. M. B. H. Ger. 478,860, Jan. 1, 1928. A method is described for operating a group of regenerative coke furnaces for varying the heating of the gases. Cf. C. A. 23, 1498.

**Coking.** METALLGESELLSCHAFT A.-G. Ger. 478,982, May 26, 1925. A method is described for producing gas, semi-coke and by-products from bituminous fuel by using O or gases rich in O.

**Vertical coke-oven battery.** J. VAN ACKEREN (to Koppers Co.). Brit. 304,743, Jan. 26, 1928.

## 22—PETROLEUM, LUBRICANTS, ASPHALT AND WOOD PRODUCTS

W. F. PARAGHER

**Petroleum resources of the Philippine Islands.** LEOPOLDO A. FAUSTINO. *Proc. 3rd. Pan-Pacific Sci. Congr.* 1926, II, 1745–8 (Publ. 1928). E. M. SYMMES

**Chemical reactions involved in the refining of petroleum.** S. F. BIRCH and W. S. NORRIS. *Trans. Fuel Conference, World Power Conference, London, 1928* 1, 641–68

(1929).—Washing with soda,  $\text{Na}_2\text{S}$  and  $\text{Na}_2\text{CO}_3$ , the plumbite process, PbS refining, the hypochlorite process, acid washing, cuprammonium sulfate,  $\text{SO}_2$  (Edeleanu process), the Frasch process, anhyd.  $\text{AlCl}_3$  and  $\text{ZnCl}_2$ , bauxite,  $\text{SiO}_2$  gel, fuller's earth and floridin are discussed and the use of each is outlined.

ALDEN H. EMERY

**The composition and chemical properties of Russian oils.** J. ELIN. *Trans. Fuel Conference, World Power Conference, London, 1928* 1, 669-79 (1929).—The oils from the Baku-Grozny field (97% of the total Russian production) are mixed-base oils with low content of S (less than a few tenths of 1%), slight acidity (max. of 0.22 g. per 100 cc. of petroleum), few unsatd. hydrocarbons, extremely low % of aromatic hydrocarbons, and high content of gummy substances. They contain less gasoline than American oils (6.5-17%, final b.  $170^\circ$ , 30% below  $100^\circ$ ).

ALDEN H. EMERY

**Flow of oil through sands.** A. D. ARKHANGELSKII AND M. A. ZHIRKEVICH. *Neftyanoe Khozyaistvo* 16, 163-73 (1929).—A thorough lab. investigation of the extn. of oil from various sands, sand-kaolin mixts. as well as oil sands being used. shows that coarse-grain sand absorbs smaller quantities of crude oil than sand of fine grain. The addn. of 10% kaolin improves by 50% the absorptive properties for oil. Similar oil sands from various fields behave quite similarly. The following conditions exist in the extn. of oil from sands by salt  $\text{H}_2\text{O}$ : (1) The oil flows from the sand; (2) oil and water flow in small quantities, each separately, at certain intervals, (3) water comes off intermingled with a few drops of oil, sometimes with oil layers. The highest recovery of oil was attained when displacing it from sand with a 1% soln. of  $\text{Na}_2\text{CO}_3$ ; blowing with air gave decidedly unsatisfactory results. Not more than 50% of oil can be recovered commercially from sand.

A. A. BOEHLINGK

**Shale and the production of oil from shale.** H. H. HILL. *Trans. Fuel Conference, World Power Conference, London, 1928* 1, 753-62 (1929).—Oil shale is found in Colo., Utah., Ky., Ind., Calif., Wyo., Mont., Nev. and Ore.; it yields 1-90 gals. of oil per ton of shale. Shale oil contains more unsatd. hydrocarbons, less gasoline, more wax and a higher % of N than crude petroleum. The crude oil has a heating value of 18,400 B. t. u. per lb. The Bureau of Mines exptl. plant is described. Oil produced from a Pumpherson retort and oil from an N-T-U retort have the following characteristics, resp.: sp. gr. 0.89, 0.92; A. P. I. gravity  $27.5^\circ$ ,  $22.3^\circ$ ; S 0.66, 0.85%; pour point  $55^\circ\text{F}$ .,  $75^\circ\text{F}$ .; Saybolt viscosity at  $70^\circ\text{F}$ ., 65 sec., solid; at  $100^\circ\text{F}$ ., 47 sec., 112 sec.; gasoline and naphtha 15.9, 8.5; gas oil 30.1, 32.1; nonviscous lubricating distillate 17.1, 10.7; medium—, 8.7; viscous—, 11.3; residuum 10.9, 36.9; C residue of residuum 7.1, 7.1; C residue of crude 0.8, 2.6%

ALDEN H. EMERY

**Investigations in distilling processes of Swedish oil shales.** B. HOLMBERG. *Trans. Fuel Conference, World Power Conference, London, 1928* 1, 680-92 (1929).—A large no. of expts. were made to ascertain the influence on thermal decompn. of rate of heating, final temp., and the size of shale particles. The shale has an approx. compn. of moisture 1.5, C 23, H 2.5, S 6, N 0.5 and ash 67%. The org. compds. in the shale are bituminous and humic substances, the former giving on heating a gas rich in hydrocarbons and  $\text{H}_2\text{S}$ , together with a large amt. of oil, and the latter a gas rich in  $\text{H}_2$  but no oil. The hydrocarbons in the shale oil are a definite class of substances intermediate between the terpenes and the benzene hydrocarbons plus small quantities of satd. aliphatic and purely aromatic hydrocarbons. Considerable amts. of org. S compds. are also present. Results are given of a detailed examn. of a shale oil contg. C 86, H 10, S 2 and phenols 0.2% and with  $d_4^{25}$  0.97, viscosity (Engler) at  $20^\circ$  4.34, at  $50^\circ$  1.75, flashpoint  $21^\circ$  and heating value 10,100 kg. cal. When distd. it gave the following fractions: up to  $150^\circ$  5.3,  $150-200^\circ$  9.9,  $200-300^\circ$  27.4,  $300-365^\circ$  21.0, residue 32.9 and loss 3.5%. The compds. of the aviation gasoline (b. up to  $90^\circ$ ), light shale gasoline (b.  $90-150^\circ$ ), heavy shale gasoline (b.  $150-200^\circ$ ) and shale gas oil (b.  $200-300^\circ$ ) are carefully considered.

ALDEN H. EMERY

**Sakhalin crude oil from Katangli.** S. S. NAMEYKIN AND L. N. ABAKUMOVSKAYA. *Neftyanoe Khozyaistvo* 16, 527-9 (1929).—Three samples of the above oil had the following characteristics: sp. gr. 0.943;  $E_{50}$  viscosity 6.7; excise resins 34%; flash (Martens-Pensky)  $102-126^\circ$ ; cold test below  $-20^\circ$  and S (Eschka) 0.42-0.44%. The Engler distn. gave: initial b. p.  $225^\circ$ , 3-4.5% below  $250^\circ$ , 8-9% below  $275^\circ$ , 19-20% below  $300^\circ$ . A vacuum (20 mm.) distn. of the bottoms gave the following cuts:

144- $204^\circ$  17.53% by weight, 0.8925 sp. gr.,  $E_{50}$  viscosity, 1.14  
204- $250^\circ$  17.71% by weight, 0.9168 sp. gr.,  $E_{50}$  viscosity, 1.70  
250- $322^\circ$  24.26% by weight, 0.9485 sp. gr.,  $E_{50}$  viscosity, 10.62  
Bottoms, 31.11% by weight.

The cuts have a cold test below  $-29^\circ$ . These crude oils do not contain any gasoline

and only the heavier part of the kerosene fraction. They are crude lubricating oils.

**Specific-heat determination of crude oil products at elevated temperatures.** V. I. TRKHOMIROV AND V. P. ZHUSE. *Neftyanoe Khozyaistvo* 16, 74-9(1929).—A calorimeter was placed in a container supplied with liquid of constant boiling point, the hot vapor of which surrounded the calorimeter. An accurately weighed amt. of oil was placed in a Cu vessel, stirred by a helical glass stirrer and heated by an elec. resistance wire. The temp. was measured with a Pt resistance wire. The sp. heat of kerosene distillate was found for the range 26.84° to 144.10° to be 0.4418-0.5936; that for gas oil of sp. gr. 0.8649 from 29.67° to 204.00° to be 0.434-0.6293; that for gas oil of sp. gr. 0.8845 from 24.41° to 196.32° to be 0.4226-0.6367; and that for gas oil of sp. gr. 0.8916 from 24.13° to 221.94° to be 0.4307-0.6603. Complete tables as well as a drawing of the app. are given.

**Bumping of hot crude-oil products containing water.** A. O. YURKOV. *Neftyanoe Khozyaistvo* 16, 362-3(1929).—The bumping of hot crude-oil products in the presence of H<sub>2</sub>O is due to the superheating of the H<sub>2</sub>O phase below the oil. This superheating depends on the wt. of the oil column and its viscosity; it is also influenced by weak soap solns. Superheating can be avoided by the creation of an evapg. surface inside the H<sub>2</sub>O itself; e. g., by introducing porous material that occludes air. A theoretical explanation of this phenomenon is given.

**Carbon monoxide the main factor in crude oil synthesis.** I. M. GARFINKEL. *Neftyanoe Khozyaistvo* 15, 556-8(1928).—A review of various synthetic crude-oil processes.

**Rectification of gaseous products from crude oil cracked in the vapor phase.** M. B. MARKOVICH. *Neftyanoe Khozyaistvo* 16, 67-73(1929).—In the "Blau Gas" process crude oil is cracked in Pintsch retorts in the presence of permanent gases. The cracked gasoline obtained has a sp. gr. of 0.725 and absorbs up to 60% by vol. of gas; it has an av. of 2% C<sub>3</sub>H<sub>6</sub>, 19% C<sub>4</sub>H<sub>8</sub>, some divinyl and butanes, 28% hydrocarbons with 5 C atoms (up to 90% of unsatd. hydrocarbons), 22% hydrocarbons with 6 C atoms (contg. not less than 85% unsatd. hydrocarbons), 17% C<sub>6</sub>H<sub>6</sub> and 12% higher polymers. The gases held by this gasoline are composed of 25% of iso-C<sub>4</sub>H<sub>8</sub> and vapors of higher unsatd. hydrocarbons, 22% divinyl, 45% C<sub>3</sub>H<sub>6</sub> + *n*-butylenes, 4% C<sub>2</sub>H<sub>4</sub> and 2% satd. hydrocarbons. The permanent gases contain 24% unsatd. hydrocarbons, 52% satd. hydrocarbons and 24% H<sub>2</sub> (all by vol.). The Blau gas contained 53.6% unsatd. hydrocarbons, 42.7% satd. hydrocarbons and 3.7 H<sub>2</sub>. It was liquefied and sepd. from the permanent gases.

**Recent advances in cracking.** A. E. DUNSTAN AND R. PITKETHLY. *Fuel Conference, World Power Conference, London, 1928* 1, 693-718(1929); cf. *C. A.* 23, 1498, 3799.—After a general review of cracking, the following processes are described (with sketches): Cross, Dubbs, Holmes-Manley, Jenkins, Tube and Tank, McAfee, Blümner, Bergius, Gyro, Knox and Leamon.

**Cracking.** A. N. SAKHANOV AND M. D. TILICH'EV. *Neftyanoe Khozyaistvo* 16, 223-9(1929); cf. *C. A.* 23, 4559.—When cracking Grozny mixed-base fuel oil at 425° for a short period (about 33 min.) the amt. of gasoline and kerosene formed is not changed materially with increase of pressure up to 40 atm. The production of gas increases and that of heavier distillate decreases with increased pressure. By heavy cracking of Surakhany fuel oil (425° for about 94 min.) approx. 4% more gasoline is obtained at a pressure of 10 atm. than at 20 to 80 atm. When Baku gas oil is cracked at 450° for about 50 min., 2% more gasoline is obtained at 10 atm. than at higher pressures. Grozny paraffin wax with a m. p. of 57° when cracked at 450° for about 65 min. gave a const. yield of gasoline independent of the pressure. The yield of kerosene decreased rapidly between pressures of 10 and 20 atm., but remained stationary at higher pressures. The following totals of fractions boiling below 300° were obtained at the pressures named: 10 atm., 73.7%, 20 atm., 62.5%, 30 atm., 65.4%, 40 atm., 61.3%. The I nos. of cracked gasolines decreased rapidly with the increase in pressure. The aniline points changed in the reverse manner. Cracked gasolines after the removal of unsatd. and aromatic hydrocarbons with 98% H<sub>2</sub>SO<sub>4</sub> gave a lower aniline point in cases where according to the I nos. considerable decrease in unsatd. compds. had been effected. In other cases the aniline point remained more or less stable regardless of the decreasing I no. This indicates that the amt. of naphthenes did not change. Therefore the unsatd. hydrocarbons in gasolines are only partly converted into naphthenes by increasing the pressure. The remainder are evidently transformed into polymerization products. **Recycling.**—Grozny mixed-base gas oil of 0.833 sp. gr. was cracked once, the cracked gasoline taken off and the residue recycled. In the 2 following recycling operations only the gas-oil fraction

was used. The total yield of gasoline, which declined gradually with each recycling, amounted to 55.2% on the original charging stock. Emba gas oil of sp. gr. 0.872 and  $E_{20}$  viscosity 2.23 produced 47.5% gasoline after recycling the gas oil fractions 6 times. The sp. gr. of the distillate increased gradually to 1.135 after the 6th recycling. The duration of cracking had to be increased for both oils for each recycling from 30 up to 95 min. for the Grozny gas oil and from 42 to 160 min. for Emba gas oil. All yields are given in percentage by wt. The proportion of gases formed increases with each recycling operation. The first cracking gave 40–150 l. per kg. gasoline; the 6th recycling produced 1500 l. per kg. gasoline. The sp. gr. of the crude oil products, decreasing after the first cracking, increases in the later operations, which indicates the prevalence of condensation processes in the latter. In the mild first cracking of straight-run products paraffins are broken up and the side chains attached to the aromatic and hydroaromatic hydrocarbons are split off, giving comparatively little gas and practically no coke. In heavier cracking or recycling decompn. of the newly formed simpler aromatic and hydroaromatic hydrocarbons takes place simultaneously with that of the original oils, so that the first ones become dehydrogenated. This reaction is accompanied by the splitting off of side chains at a much lower rate. The high gas yields are, therefore, due to the liberation of  $H_2$  and to the formation of higher hydrocarbons from the sepd. side chains. The accumulation of aromatic hydrocarbons causes the coke formation, which takes place in the condensation processes following. The amt. of unsatd. hydrocarbons decreases with each recycling of gas oil. That of aromatics increases rapidly, finally reaching 100% of the last charge, after the 6th recycling operation. This is proved by the aniline points (below  $-17^\circ$ ). The cracked kerosene fractions when chilled to  $-25^\circ$  solidify into a solid mass consisting evidently for the most part of lower naphthalene homologs. It appears that only 3 recycling operations are justified when working for high yields of gasoline; the 4th, 5th and 6th recycling are of more value for the production of aromatic compds. for other purposes. An independent cracking of gas oil collected from the several recycling operations is recommended, because with increase in the no. of the recycling operations higher cracking temp. and longer period of cracking are required for each following cracking. This could not be effected when using fresh stock with the addn. of the recycled product and the result is lower yields of cracked gasoline.

A. A. BOEHLING

**The cracking process—a universal source of motor fuel.** GUSTAV EGLOFF. *Trans. Fuel Conference, World Power Conference, London, 1928* 1, 763–820(1929); cf. C. A. 23, 963, 1499, 3330, 3335, 3568, 3793.—A comprehensive paper giving in tabular form the results of cracking petroleum oils, coal tars, shale oils, bituminous tars and asphalts, wood tars, vegetable oils, fish oils and peat oils. Data are given for 56 countries on crude-oil production, motor vehicle registration, population per motor vehicle, gasoline consumption, gasoline and kerosene prices and price of fuel oil at the nearest port. Other tabular data given and discussed include crude-oil resources; results of residual oil cracking of 8 typical oils; results of cracking and coking in one operation for 5 oils, summary of cracking results on 20 representative stocks (including sp. gr., yields of different products, pressure and temp.); chem. analyses of 6 cracked motor fuels and comparison with straight-run fuels; properties of furnace or Diesel oil from cracking 8 typical oils; comparison of 5 charging stocks with residual oils from their cracking; yields of gasoline and coke from cracking 3 crude oils, 20 topped crude oils, 29 fuel oils and 15 gas oils; analyses of 11 cokes from cracking; compn. of gas from cracking 21 oils; coal production and resources (by countries); oil shale and shale oil resources; etc.

ALDEN H. EMERY

**New cracking equipment.** ANON. *Azerbejdanskoe Neftyanoe Khozyaistvo* 1929, No. 5, 101.—The Vickers Company intends to improve its cracking equipment in Grozny and Baku by the following modification: The fuel oil is moderately heated in the first coil whereby the gas-oil fraction and a part of the lubricating-oil cut are distd.; a second coil, which is the cracking coil, cracks the bottoms together with the gas-oil fraction, which was also sent through the rectification column for the cracked gasoline. This is the first installation of its kind which is to be built by Vickers. A. A. B.

**Cracking-coil thermal calculations.** S. OBYADCHIKOV. *Neftyanoe Khozyaistvo* 16, 357–61(1929).—By using Sakhanov (Sachanen) and Tilich'ev's data "Cracking in the Liquid Phase," Moscow, 1928 (Russian), the amt. of heat required to crack a given oil at a given temp. for a predtd. yield of gasoline is calcd. The amt. of heat absorbed by the cracking reaction per m. of tube (velocity 1 m./sec.) is expressed by the

$$500G_2 P_{400} 2^{\frac{t-400}{10}}$$

equation:  $Q_{\text{req.}} = \frac{500G_2 P_{400} 2^{\frac{t-400}{10}}}{100}$ , where  $G_2$  is the wt. of stock sent through the

tubes;  $P_{400}$  percentage of cracked gasoline formed at  $400^\circ$  during the passage through one m. of tube;  $t$  the temp. of the liquid in this section of the tube.  $Q_{\text{reac}}$  is plotted against  $P_{400}$  as a function of the velocity of the flow of the liquid in the tubes in m./sec. for 1 sq. cm. of the useful tube surface. The mean temp., etc., difference, can be detd. by using these data and the method of subdividing the temp. curve into  $10^\circ$  sections. In a typical example the formation of 2.6% gasoline on stock subjected to cracking is calcd. When the oil is heated above  $400\text{--}420^\circ$  a much greater quantity of heat is required to effect cracking than in the ordinary stills. This is attained by the increase of the heating surface. Lower heating temps. require larger tubes; higher temps. require smaller tubes.

A. A. BOEHLINGK

The Voltol oil treating process. A. G. ZAKHARENKO. *Neftyanoe Khozyaistvo* 16, 544-7(1929).—A description of the Voltol process and a bibliography are given.

A. A. BOEHLINGK

Treating of light-oil distillates. S. F. BIRCH AND W. S. NORRIS. *Oil and Gas J.* 28, No. 8, 46, 162, 164, 166, 168(1929).—The action of  $\text{H}_2\text{SO}_4$  in removing S compds. from light-oil distillates and in preventing gum formation is described. The special refining uses of cuprammonium sulfate,  $\text{SO}_2$ ,  $\text{CuO}$ ,  $\text{AlCl}_3$ , bauxite, alumina gel, fuller's earth and floridin are stated.

EMMA E. CRANDAL

Improving yields with old stills. YU. AND N. BOGOSLOVSKII. *Azerbeidzanskoe Neftyanoe Khozyaistvo* 1928, No. 10, 49-55.—The throughput of an old gasoline or kerosene stripping battery can be increased 50% and better fractionation obtained either by replacing the first shell still with a tube still connected to a crude oil preheater or by atomizing crude oil preheated by a fuel oil heat exchanger into the first shell still. Similar improvements are recommended for the kerosene distg. unit. Bubble towers must also be provided to insure sharp sepn. of cuts.

A. A. BOEHLINGK

Vacuum distillation of the typical Baku fuel oils. V. GURVICH AND B. KAMINER. *Azerbeidzanskoe Neftyanoe Khozyaistvo* 1929, No. 5, 64-70.—Paraffin-base Surakhany, naphthene-base Balakhany, Sabunchi and Ramany lubricating oil, asphalt-base Binagady and heavy Balakhany and the mixed-base light Bibi-Eibat crudes were stripped of fractions below  $300^\circ$  and vacuum-distd. on a lab. scale at 2.5 mm.  $\pm 0.5$ -mm. abs. pressure. The fuel oil was heated below  $340\text{--}350^\circ$ , corresponding to vapor temps. of about  $300^\circ$  to avoid cracking. The fractions below  $140^\circ$ ,  $140\text{--}180^\circ$ ,  $180\text{--}220^\circ$ ,  $220\text{--}260^\circ$  and  $260\text{--}300^\circ$  were sepd. into gas-oil, solar-oil, spindle-oil, machine-oil and cylinder-oil cuts, making an av., very close for all the oils, of 68% of the fuel oil used. Spindle oil, etc., from a naphthene-base crude required a higher distn. temp. than corresponding fractions from asphalt-base crudes. Practically the same amt. of heat was required for the complete distn. of fuel oils independent of their origin. From 12 to 20% of asphalts suitable for road work could be recovered from the bottoms. A high vacuum is recommended when working for high-quality lubricating oils. Very complete distn. data are given.

A. A. BOEHLINGK

Fluidity of mixed-base fuel oil. N. I. CHERNOZHUKOV. *Izvestiya Teplotekhn. Inst.* 1927, No. 4, 28-32.—The viscosity of mixed-base fuel oil at low temp. was detd. in an app. consisting of a brass container immersed in a thermostat and having a glass discharge tube 300 mm. long and 12 mm. in diam. attached on the side near the bottom. This tube was closed and opened by a plug operated from the inside. The fuel oil was first heated to  $100^\circ$ , chilled, heated again, charged hot into the viscometer and stirred until the thermostat temp. was reached. The time required to discharge 200 cc. was read. Since the movement of the fluid through the tube is such as to come under Poiseuille's law, it may be accepted that the ratio of the abs. viscosity of the material under test at a certain temp. to that at another temp. is equal to the ratio of the 2 times of discharge. The difference in viscosity due to the diminishing pressure of the oil column can be disregarded. This assumption corresponds very closely with the practical results obtained. The following conclusions are based upon the results obtained with Grozny mixed-base fuel oil "V": The viscosity of fuel oil stirred in the viscometer depends on the preliminary heat treatment. Treatment that gave the max. pour point gave also the max. viscosity. The viscosity of heat-treated fuel oil stirred in the viscometer as it approaches the thermostat temp. increases with the fall of temp. considerably faster than that of a fuel oil which was not previously heat-treated. The pour point of a fuel oil which was previously heat-treated from  $40^\circ$  to  $70^\circ$  is between  $17^\circ$  and  $18^\circ$  and its viscosity approaches infinity at  $15^\circ$ , whereas lower and higher heat treatments produce a pour point below  $15^\circ$  and a low viscosity at  $15^\circ$ . The viscosity is also low at  $10^\circ$  for a fuel oil heat-treated at  $20^\circ$  and lower. The freezing curve of a stirred fuel oil indicates its fluidity.

A. A. BOEHLINGK

Fluidity determinations. L. A. SELSKII. *Neftyanoe Khozyaistvo* 16, 552-3

(1929).—Fluidity of Grozny mixed-base crude oil and its products by the Prussian Railroad Method was 15 mm. at 5° for the non-heat-treated and 9 mm. for the oil which was previously heat-treated to 50°. The fluidity of fuel oil at 27° was 9 mm. and 5 mm., resp. At 29° it was 20 mm. and 13 mm., resp. The fluidity of Diesel fuel at -10° and -19° was below zero for heat-treated and non-heat-treated oils in spite of the fact that the Diesel oil had a sp. gr. of 0.862 and that of the crude oil was 0.854. This is due to the absence of paraffin wax in the crude. This method is of primary importance when calcg. oil transmission through pipe lines.

A. A. BOEHTLINGK

Standards for Diesel fuel. N. I. CHERNOZHUKOV. *Izvestiya Teplotekh. Inst.* 1927, No. 9, 78-87.—The Russian standard for Diesel fuel accepted by the Commission for Diesel fuels are as follows: sp. gr. at 15°, 0.855-0.900; flash pt. recommended, 65-110° by Martens-Pensky and limits tolerated, 45-120°; H<sub>2</sub>O not over 1%; mech. admixtures not over 0.3%; S not over 0.5%; recommended limit 0.05% toleration not over 0.10%; acidity (mineral acid) 0.0%; viscosity E<sub>80</sub> not over 5; pour test not over 5°; coke formation not over 2% Conradson, toleration not over 3% Conradson; fractional compn. (Engler distn.) not more than 15% over below 250° and not less than 40% over between 250 and 350°; permissible residue above 350° not more than 45%.

Standards for Gt. Britain, United States, Italy, Roumania and Germany are also given.

A. A. BOEHTLINGK

Cylinder oils from heavy bottoms. L. GUKHMAN. *Azerbeidzyanskoe Neftyanoe Khozyaistvo* 1929, No. 5, 70-2.—When acid-treating heavy lubricating oil bottoms at a temp. of 25-35°, excessive polymerization is avoided by dilg. with gasoil and the polymerization products formed remain mostly in the acid sludge. Light diluents such as gasoline or kerosene dissolve more of the acid sludge and are therefore not recommended. Thus, when Binagady heavy bottoms of 0.979 sp. gr., 280° flash (Brenken), dild. with a dark gas oil of 0.881 sp. gr. and E<sub>80</sub> viscosity 1.63 in the proportion 1:1, giving a product of 0.9296 sp. gr. and E<sub>100</sub> viscosity 2.00, are treated at 20-23° with 15% (3% + 12%) of 92.5% H<sub>2</sub>SO<sub>4</sub> calcd. on the bottoms, 36% of the mixt. acid is acid sludge. After distg. off 55.8% from the sepd. oil layer a heavy greenish oil of E<sub>100</sub> viscosity 7.55 and flash (Brenken) 263° is obtained, which in its properties is close to "Viskozin 7" except for the flash, which is 300° for the latter. The comparatively high viscosity is due to the asphaltic character of this oil product. To obtain a better cylinder stock the bottoms were dild. with gas oil in the proportion 3:2 and treated with 20% (3% + 17%) of a 97.5% H<sub>2</sub>SO<sub>4</sub>. The loss amounted to 51%. When 45.9% of light fractions was distd. off, the concentrate was of a greenish color, sp. gr. 0.9402, E<sub>100</sub> viscosity 5.92, flash 260°, excise resins 32%, C 2.8% and pour test 0°. It amounted to 46% of the bottoms. When only 36.6% of concentrate was left it had the following properties: color greenish, sp. gr. 0.9433, E<sub>100</sub> viscosity 8.02, flash 298°, excise resins 38%, C 3.4% and pour test 6°. When heavy bottoms from Bibi-Eibat crude, sp. gr. 0.959 and 292° flash, were dild. with gas oil 1:1, a mixt. of 0.921 sp. gr. and 214° flash was obtained, which after treatment with 20% (3% + 17%) of a 96% H<sub>2</sub>SO<sub>4</sub> produced a conc. of the following properties depending on the amt. of light fractions taken off: sp. gr. 0.9261-0.9301, E<sub>100</sub> viscosity 4.87-7.35, flash 254-298°, excise resins 22-20%, C 2.7-3.3% and pour test 8-12°. The yield of the concentrate varies between 57.8 and 39.2% of the original bottoms. These oils, while not free from excise resins, are still of superior quality and are the equal of foreign cylinder stocks. With a lower pour test than "Viskozin 5" and flash and viscosity up to the standard, they are suitable for compounding automobile oils. The acid sludge obtained in treating after dissolving in the "solvent," washing out the acid with H<sub>2</sub>O, distg. off the solvent and blowing the org. part of the sludge with air, produced asphalts with the following properties: from the Binagady acid-sludge mixt., softening point Kraemer-Sarnow 41° and 43°, penetration 35-27, ductility above 110; from Bibi-Eibat mixture softening point 45°, penetration 43 and ductility above 100.

A. A. BOEHTLINGK

Utilization of acid sludge from lubricating-oil bottoms. S. N. OBRVADCHIKOV. *Neftyanoe Khozyaistvo* 16, 80-2(1929).—Fifty% of Grozny lubricating-oil acid sludge can be converted into an oil-sol. product suitable for fuel by first sepg. the H<sub>2</sub>SO<sub>4</sub>, partly from the sludge by settling, neutralizing the remaining acid and the sulfonic acids with lime and extg. the oil-sol. part with gasoline at 50-80°. From 17 to 20% of lime, calcd. on the acid sludge, was required. Another method, i. e., conversion of acid sludge into a solid pulverizable product, consists in blowing the acid sludge with air 15 min. at 185-218°, whereby a solid and very brittle product with a softening point of 113° is obtained. The yield is 73%. This product can be used as pulverized fuel or it can be added in any proportion to a fuel to be pulverized.

A. A. BOEHTLINGK

Synthetic gasoline. FERD. MORAVEC. *Chem. Listy* 23, 288(1929).—Synthetic

gasoline is mixed with  $\text{CH}_3\text{OH}$  and a small quantity of  $\text{Fe}(\text{CO})_5$ ; it withstands a high compression and is not self-igniting at high pressures. The antidetonating property is conferred by the  $\text{Fe}(\text{CO})_5$ .

**Gaging and sampling natural gasoline.** P. W. HILL, A. C. LYLES AND P. S. MAGRUDER. *Oil and Gas J.* 28, No. 7, 105-6, 110, 114(1929)

HENNA E. CRANDAL

**Antiknock gasoline by cracking various products at atmospheric pressure.** V. F. GERR. *Neftyanoe Khozyaistvo* 15, 343-51(1928).—The following products were cracked on the lab. scale and at atm. pressure: (1) a mixt. contg. mainly di- and trimethyl benzene and ethyl benzene, (2) the same with Cu turnings as catalyst, (3) Surakhany fuel oil, (4) Baku kerosene distillate, (5) naphthalene fooms, (6) green oil, (7) Surakhany crude oil, (8) gasoline of 0.7736 sp. gr., (9) paraffin wax m.  $60^\circ$ , (10) cracked kerosene ( $150-300^\circ$ ), (11) black gas oil of sp. gr. 0.8705, (12) toluene (grade No. 1). Nos. 4, 7 and 11 were also cracked on the mfg. scale, 3 and 11 in Kvitko's cracking still. No. 1 produced good results when a fraction b.  $122-200^\circ$  and contg. benzenes with 2 or more side chains was used. Toluene was more resistant and formed C on cracking. No. 2 produced more tar than No. 1, forming coke in small plates. No. 6 gave a low yield when recycled. Nos. 3 and 7 behaved similarly to kerosene distillate. No. 9 gave a low yield, explained by the splitting of ozocerite-like hydrocarbons, which form easily cracked paraffin and unsatd. hydrocarbons. No. 10 gave slightly lower yields than normal kerosene; the unsatd. hydrocarbons were readily converted into aromatic compds. Pintsch, Pickering and Krussel app. were used for large-scale production of aromatic compds. The temp. range  $670-700^\circ$  gave the highest yields of aromatic compds, provided the charging rate of oils was kept within certain limits. The gasolines obtained were of high-antiknock quality, contg. up to 25% of aromatic hydrocarbons. About 3 times more gas was obtained in the course of this process than when cracking under super-atm. pressure.

A. A. BOEHTLINGK

**Amyl acetate from aviation gasoline.** A. DOBRYANSKII AND E. GUREVICH. *Neftyanoe Khozyaistvo* 15, 532-59(1928).—The  $\text{C}_5\text{H}_{12}$  cut (about 20%) was sepd from Krasnodar aviation gasoline by an elaborate fractionating app. and redistd. between  $31^\circ$  and  $38^\circ$ , yielding 11.5-12.5% (on the gasoline used) of a product of mol. wt. 69-70.5 and sp. gr. 0.6332. It was then chlorinated in the gas phase in artificial light. The highest yield (35%) of the monochloride, sp. gr. 0.790-0.800, was obtained by heating to  $60-70^\circ$ . Wet Cl increases the formation of polychlorides. The reaction is then exothermic and is accompanied by explosion and sepg. of C. Up to 56-59 parts of monochloride can be obtained from 100 parts of  $\text{C}_5\text{H}_{12}$ . Chlorination of  $\text{C}_5\text{H}_{12}$  in the liquid phase and in the presence of activated C produced only 20% of monochloride. The monochloropentane was esterified with dry Na acetate by heating to  $230^\circ$  in sealed tubes for 4-8 hrs. Yield, about 90% of crude Am. acetate.

**Exploitation of a new kerosene battery of the regenerative type (Konstantinovskii refinery).** V. B. PARKHOMENKO. *Neftyanoe Khozyaistvo* 16, 365-76(1929).—Various minor changes were made in the equipment without noticeable improvement in the operation. A detailed description of the plant was given by Zadolin (C. A. 21, 3735).

A. A. BOEHTLINGK

**Action of sulfuric acid on gas from cracked kerosene.** V. F. GERR AND M. M. TIKHOMIROVA. *Neftyanoe Khozyaistvo* 16, 411-4(1929).—Gas from cracking kerosene containing 33.6% of heavy hydrocarbons, 17.4%  $\text{H}_2$  and 49%  $\text{CH}_4$  was led at varying rates (from 9 to 22 min. per 1350 l. of gas), which do not affect the reaction quant., through  $\text{H}_2\text{SO}_4$  in 3 Tishchenko gas-washing bottles cooled in ice water. The gas after this treatment contained 24% of heavy hydrocarbons, 20% of  $\text{H}_2$  and 56% of  $\text{CH}_4$ , the  $\text{H}_2$  to  $\text{CH}_4$  ratio remaining unchanged, while that of  $\text{CH}_4 + \text{H}_2$  to heavy hydrocarbons indicated a lower proportion of the latter after treatment, as the result of the polymerizing action of the  $\text{H}_2\text{SO}_4$ . The  $\text{H}_2\text{SO}_4$  gained 0.3 g. in wt. for each l. of gas conducted through. An oil layer was formed on the acid amounting to 0.0476 g. per l. of gas and having the following characteristics: sulfur 0.03%,  $\text{O}_2$  no. 1.077, I no. 4.3, ash 0.19%, composed mostly of NaCl and  $\text{CaCl}_2$ ,  $E_{20}$  viscosity 2.68, cold test below  $-20^\circ$ , initial b. p.  $135^\circ$ ,  $n$  1.473 and mol. wt. 243. The elementary compn. was C 85.68%,  $\text{H}_2$  13.76%. Technical  $\text{H}_2\text{SO}_4$  recovered from acid sludge was more active than C. P. acid. The oil layer was distd. at a vacuum of 2 mm. and sepd. into 12 fractions. The residue of 15% was composed of 82.9% C and 10.3%  $\text{H}_2$  and formed a film when dried. The  $128.6-158.5^\circ$  fraction (2 mm. abs. pressure) crystd. immediately after distn. The  $68.5-98.5^\circ$  and the  $98.5-128.5^\circ$  fractions also produced crystals after cooling to  $5^\circ$ . The  $99-130^\circ$  fraction (2 mm. abs. pressure) yielded odorless crystals m.  $73-74^\circ$ , d. 0.8626, C 87.96%,  $\text{H}_2$  11.77%, mol. wt. 196 and the empirical formula  $\text{C}_{14}\text{H}_{24}$ . Crystals obtained from the  $115-154^\circ$  cut (2 mm. abs. pressure) m.  $213^\circ$ , elementary compn. C 86.04%,  $\text{H}_2$

11.4%, and a mol. wt. of 289. The 115–206° fraction (2 mm. abs. pressure) is a viscous oil of the character of lubricating oils.

A. A. BOEHLINGK

**Preparing petrolatums.** N. I. CHERNOZHUKOV. *Neftyanoe Khozyaistvo* 16, 240–1(1929).—Low-viscosity petrolatums are prepd. from distillates by a freezing out of the higher m. p. wax, followed by a sepn. whereby the low-melting paraffin becomes more concd. in the distillate. High-viscosity petrolatums can be obtained by dissolving paraffin bottoms in naphtha, freezing out high-melting paraffins, sepg. them and concg. the low-melting paraffins by cold. To obtain a medicinal petrolatum, only the high-melting paraffins must be removed, leaving 25% of paraffin in the petrolatum.

A. A. BOEHLINGK

**Technical and medicinal petrolatums from Grozny mixed-base fuel oil.** B. K. TARASOV. *Neftyanoe Khozyaistvo* 16, 236–9(1929).—Fuel oil (69% from crude oil), of sp. gr. 0.892–0.898,  $E_{50}$  viscosity 3.4–4.0, pour point 28°, was treated with 5% com.  $H_2SO_4$  and neutralized while hot with a strong soln. of water glass. Allowed to settle and filtered through silica gel, it yielded 75% of "green oil" of 0.878 sp. gr.,  $E_{50}$  viscosity 2.49 and  $E_{60}$  viscosity 1.94. It was steam-distd. and 50, 40 and 30% cuts from the fuel oil were investigated. Medicinal petrolatums were prepd. by dissolving technical petrolatums in gasoline (initial b. p. 80–110°) in the proportion 1:4, treating twice with 10% fuming  $H_2SO_4$ , sepg. from the sludge, neutralizing the soln., washing, drying and treating with fuller's earth (5–20% portions). This gave a yield of 60–65% calcd. on technical petrolatum. Medicinal petrolatums from technical petrolatums. The 1st acid treatment (of fuel oils) does not affect the qualities of the final product, the medicinal petrolatum, appreciably. The 2nd acid treatment (of the technical petrolatum) yields a very satisfactory medicinal petrolatum when 20% of com.  $H_2SO_4$  is used instead of fuming acid. Russian petrolatums are higher in sp. gr. (0.866) than American (0.832). They contain not more than 18.9% of paraffin wax as against about 30% in American, the m. p. of the latter being lower, 56–69.5° against 58.5–62°.

A. A. BOEHLINGK

**Oxygen numbers of asphaltenes and resins in crude oils.** S. S. NAMETKIN AND V. G. PUTZILLO. *Neftyanoe Khozyaistvo* 16, 230–5(1929).—The discrepancies in the coeff. of unsatn. detd. by the I and the O numbers, particularly in the heavier oil fractions, are due to asphaltenes, which are absent in gasoline but are contained in crude oils and in the heavier fractions. Perbenzoic acid reacts with the resins and asphaltenes but I does not. The S compds., which are present in small quantities in the oil, do not affect the results appreciably.

A. A. BOEHLINGK

**Asphalt tar from Grozny mixed-base crude oil.** A. I. VORONOV AND V. S. TVERTZIN. *Neftyanoe Khozyaistvo* 16, 242–6(1929).—Heavy residues from Grozny mixed-base fuel oil of sp. gr. 0.964,  $E_{100}$  viscosity 6.80, flash (Cleveland) 250°, drop test (Ubbelohde) 45°, solidification point (Jolde-Sakhanov) 45°, asphaltenes 4.8%, resins 10.5% and oil 83%, were agitated with steam superheated to about 320° and heated to 350–375°. Asphalt of high elasticity and sp. gr. 1.003 at 20° was obtained when a limited amt. of oil was distd. off. Lower and higher sp. gravities indicated an inferior asphalt. Its m. p. was 40°; it contained about 20% of resins and 60% of oil; the penetration test decreased from 85 to 70.5 after heating; the losses amounted to 0.08% (which is below the A.S.T.M. standard). The following products were recovered by steam distn.: 4% paraffin wax m. 72° and 6% m. 62°; 63% of oil with a pour test of 21.5°,  $E_{60}$  viscosity 5.82; 10% of vaseline m. 35°; and an abs. viscosity at 60° of 0.3289. The oil with high pour test can be used as a cracking stock.

A. A. BOEHLINGK

**Preparing varnish asphalt from Emba lubricating-oil acid sludge.** N. N. KARSKII AND S. V. KAPATZINSKII. *Neftyanoe Khozyaistvo* 16, 548–51(1929).—Up to 60% of an asphalt suitable for varnish was obtained by blowing a mixt. of 2 parts acid sludge from Emba lubricating oil, 1 part of turpentine and 1 part of needle-wood tar at 280–300° for 18–20 hrs. The turpentine vapors were condensed and the sulfurous acid was absorbed in a tower sprayed with water. The yield of asphalt depends greatly upon the size of the fraction of turpentine boiling close to 180°.

A. A. BOEHLINGK

**Asphalt emulsion has many-uses in the chemical plant.** LESTER KIRSCHBRAUN. *Chem. & Met. Eng.* 36, 477–9(1929).

**Determination of paraffin hydrocarbons in commercial benzene and motor fuel.** WAWRZINICK. *Chem.-Ztg.* 53, 557(1929).—Polemical against Heilingötter (*C. A.* 23, 2287). Reply. R. HEILINGÖTTER. *Ibid* 557.

E. M. SYMMES

**Thermal decomposition of paraffin wax in the presence and in the absence of hydrogen under high pressure.** H. I. WATERMAN, T. W. TE NUYL AND J. N. J. PERQUIN. *J. Inst. Petroleum Tech.* 15, 369–71(1929).—Paraffin wax was subjected to berginization and to cracking. The portion of the products boiling above 150° was fractionally distd. in cathodic vacuum. The vapors were cooled by liquid air and the condensate was col-

lected in 10° fractions. The aniline point of the fractions from the berginized oil was about 20° higher than that of the fractions from the cracked oil. The  $\eta$  and sp. gr. of the cracked products were higher and the Br no. was much higher. Substitution was more marked in the cracked oils. These facts indicate the more unsatd. and more cyclic character of the cracked products. A comparison of the common phys. consts. of the normal satd. aliphatic hydrocarbons from  $C_9H_{20}$  to  $C_{16}H_{34}$  with those of the oils produced by berginizing shows much similarity, though the latter probably contain a small percentage of unsatd. compds. The differences noted in previous work upon the gasoline fraction between berginizing and cracking products are still more apparent in the higher fractions.

EMMA E. CRANDAL

**Exploitation of the Grozny paraffin wax plant.** A. ABLOVATZKII. *Neftyanoe Khozyaistvo* 16, 530-43 (1929); cf. C. A. 23, 2561.—The process of obtaining paraffin wax from Grozny fuel oil comprises the following operations: (1) distn. of fuel oil, (2) redistn. of cuts contg. paraffin wax, (3) settling of the distillate, (4) refrigeration, (5) crystn., (6) filtration, (7) repeated pressing of slack wax, (8) treatment of slack wax, (9) sweating, (10) bleaching and (11) packing. The fuel oil contg. paraffin wax is steam distd. in a battery of 14 shell stills, each still having 4 dephlegmators. The first 6 stills deliver cuts below 0.870 sp. gr., which are combined and do not need redistn. Cuts from the 2nd part of the battery must be redistd., leaving a petrolatum-like residue. A wax of very fine cryst. structure or of colloidal character is obtained from the machine-oil fraction, which is very difficult to handle. Up to 44% of paraffin distillate was recovered from the fuel oil and 21.82% of gas- and spindle-oil fractions was lost in the recovery of the paraffin-wax as the result of faulty equipment. This can be eliminated by the use of pipe stills now in the process of construction and of better fractionating equipment. Gas oil contg. paraffin from other stills was added to the fuel oil to improve the paraffin yield. The paraffin distillate should be free from  $H_2O$  or emulsifying agents. The crystn. temp. is kept within  $-2^\circ$  to  $+2^\circ$ . A pressure of 32 atm. produces plates of a higher wax content than lower pressures. The temp. to be used during the process depends on the character of the slack wax. Thin cakes are higher in wax than thick ones, the latter being as a rule obtained through less compression. Various lubricating oil fractions could be sepd. from repeatedly pressed slack wax. Impurities contained in slack wax are removed either through treatment with  $H_2SO_4$  (up to 4-5%) at 70-75°, followed by neutralization and washing, or by treatment with live steam, the sludge being withdrawn from the bottom. A final treatment with fuming  $H_2SO_4$ , followed by neutralization and fuller's earth treatment, produces a good com. wax, which is shipped in plates or in shavings packed in barrels.

A. A. BOEHTLINGK

**Cement and bore-hole waters.** G. DEMETIEV. *Azerbaidzhanskoe Neftyanoe Khozyaistvo* 1928, No. 8/9, 38-46.—An addn. of 4 to 7% of "Konset," which consists of 78.10% of  $CaO$  and sol. compds., 5.65% of fatty acids, 2.58% of  $NH_3$ , 10.07% of  $Mg$  silicate and 3% of volatile compds., improved the setting qualities of a poor-setting cement. This mixt. increased the accelerating action of bore-hole  $H_2O$  upon setting by 15 to 50%. As compared with pure  $H_2O$ , the bore-hole  $N_2O$  accelerated the setting of cement in the presence of this mixt. 60 to 200% when naphthenic acids were absent. The chlorides always present in bore-hole waters are probably the accelerators.

A. A. BOEHTLINGK

**Turpentine oil from larch turpentine.** SCHIMMEL & Co. *Ber. Schimmel* 1928, 101; *Chem. Zentr.* 1928, II, 1827.—Larch turpentine (*Larix decidua* Miller) yielded 14.6% oil with steam distn. The oil had the following properties:  $d_{15}^0$  0.8661,  $[\alpha]_D^{20} = -9^\circ 32'$ ,  $n_D^{20} = 1.47220$ , acid no. 0, ester no. 7.5, sol. in about 5 vols. of 90% alc. with a slight turbidity. A larch turpentine oil from Tirol had the following consts.:  $d_{15}^0$  0.8637,  $[\alpha]_D^{20} = -12^\circ 3'$ ,  $n_D^{20} = 1.46717$ , acid no. 0, ester no. 1.9, sol. in about 6 vols. of 90% alc. with a slight turbidity; the odor is more pronounced than with ordinary turpentine.

**Cracking petroleum oils.** MILON J. TRUMBLE. U. S. 1,724,982, Aug. 20. Successive portions of a device such as a metal rotor are moved through a heating chamber where they are heated by a flame and then through an oil-heating and vaporizing chamber where the same portions of the device heated by flame contact come into contact with the oil under treatment. Various details of this and assocd. app. are described. Cf. C. A. 23, 968.

**Treating petroleum distillates with sulfuric acid, etc.** JOHN C. CLARK, WIRT D. RIAL and JOHN R. MCCONNELL (to Pan American Petroleum Co.). U. S. 1,725,611, Aug. 20. After treating a distillate with  $H_2SO_4$  and sepg. from the acid sludge, the sepd. oil is treated with a pitch such as petroleum pitch in order to sep. "peppery sludge" remaining in the oil. U. S. 1,725,612 specifies the use of a coal-tar pitch as a pptg. agent for the same purpose.

**Apparatus for dehydrating petroleum emulsions by electrical treatment.** WM. O. EDDY. U. S. 1,724,263, Aug. 13. Structural features.

**Fractional distillation of hydrocarbons.** LESTER W. SNELL. U. S. 1,725,219, Aug. 20. In order to obtain fractional liquid products having desired end b. p., predetd. vapor temps. are maintained at each end of one of the condensing zones from which liquid products are withdrawn, by cooling the withdrawn liquid products, discharging portions of one of the cooled liquid products into the vapors entering the last-mentioned zone and discharging portions of another of the cooled liquid products into the vapors leaving the last-mentioned zone, and varying the flow of these portions in accord with prevailing temps. of the vapors into which they are discharged, so as to predet. the initial and end point of the product condensed in this zone. An arrangement of app. is described.

**Conversion of hydrocarbon oils.** LOUIS J. WALSH (to Standard Oil Development Co.). U. S. 1,725,434, Aug. 20. In effecting withdrawal of converted hydrocarbon material from a reaction drum (in an app. which is described), tarry material which settles during the conversion is withdrawn from near the bottom of the drum and is combined as a single stream with vapors which are withdrawn from near the top of the drum; this stream is subjected to a reduction of pressure.

**Cracking hydrocarbon oils.** GEORGE W. GRAY (to Texas Co.). U. S. 1,724,760, Aug. 13. Oil is subjected to a cracking temp and pressure in a pressure zone, fractions of high b. p. are condensed from the resulting vapors, and the condensate while still hot is subjected to increased cracking temp. and pressure. Simultaneously, another body of oil is distd., evolved vapors are sepd. according to their b. ps. and the condensate thus formed is commingled with the oil in one of the pressure zones. An arrangement of app. is described. Cf. C. A. 23, 509.

**Catalytic cracking of hydrocarbon vapors.** SILICA GEL CORP. Brit. 304,251, July 12, 1927. A finely divided absorbent silica or similar gel (preferably contg. an active catalytic material such as Fe oxide) is mixed with the gas and carried through the reaction chamber in suspension, and then sepd., revived and reused. An app. is described.

**Treating cracked hydrocarbon products containing sulfur compounds.** GUSTAV EGLOFF and JACQUE C. MORRELL (to Universal Oil Products Co.). U. S. 1,725,068, Aug. 20. The oil is agitated in the presence of  $CuSO_4$  in  $H_2SO_4$  soln. in order to remove S compds.

**Purifying hydrocarbon-oil distillates.** IMPERIAL OIL, LTD. Brit. 305,108, Aug. 30, 1927. Vapors such as those of naphtha or gasoline produced by cracking processes are passed in countercurrent to a stream of liquid carrying a finely divided adsorbent or absorbent such as clay at such a temp. that the desired vapors pass on after contact and momentary condensation on the clay (which may carry a substance such as a metal oxide or sulfide, of Cu, Pb or Fe to reduce the S content of the oil). An app. is described.

**Revivifying spent decolorizing clay from hydrocarbon-oil refining.** WM. M. STRATFORD (to Texas Co.). U. S. 1,724,531, Aug. 13. The material is treated with a solvent such as gasoline at a temp. above the normal b. p. of the latter and under sufficient pressure to maintain the solvent in substantially liquid condition. Cf. C. A. 23, 2820.

**Mineral and tar oils.** I. G. FARBENIND. A.-G. Brit. 305,553, Oct. 5, 1927. Lubricating and insulating oils are obtained from coal tars, mineral oils and other carbonaceous materials by extracting or destructively hydrogenating the solid materials or cracking or destructively hydrogenating the liquids, and exposing the liquid products or their fractions, in coherent liquid phase, to the action of high-tension and preferably high-frequency elec. currents. An example is given of the treatment of brown coal and its products.

**Stabilizing clay-treated mineral oils.** GEORGE F. OLSEN (to General Petroleum

Corp. of Calif.). U. S. 1,724,510, Aug. 13. In order to remove deleterious volatile substances from lubricating oils which have been heated with clay and sepd. from the clay while hot, the sepd. oil, while still hot, is atomized by the action of a non-oxidizing fluid such as steam to promote vaporization of the volatile substances. An arrangement of app. is described.

**Cracking mineral oils.** RICHARD W. HANNA (to Standard Oil Co. of Calif.). U. S. 1,724,476, Aug. 13. The oil is heated under pressure to a temp. sufficient to form vapors, vapors and liquid oil are sepd., the pressure is separately raised on both the liquid oil and the vapors; they are recombined and subjected to pyrogenetic decompn. together. An app. is described.

**Cracking oils.** N. E. LOOMIS (to Standard Oil Development Co.). Brit. 304,798, Jan. 27, 1928. An app. is described in which oils are cracked in an installation of the oil and drum type, the cracked material is withdrawn and mixed with uncracked oil, and sepd. from tar and fractionated.

**Cracking oils.** J. C. CLANCY. Brit. 304,421, Nov. 21, 1927. Low b. p. oils are obtained from those of higher b. p. by distn. in contact with NaCN or other suitable cyanide or cyanate in molten form. Hydrogenation of the vapors is effected by  $\text{NH}_3$  formed during the reaction;  $\text{NH}_3$  and other hydrogenating gases may also be admitted from an extraneous source. Metallic catalysts such as Fe, Ni or Cu may be added. The cyanide is regenerated by heating it with the carbonaceous residues and an alkali carbonate, hydroxide or formate in the presence of nitrogenous gases. An app. is described. Cf. C. A. 22, 683, 3288.

**Cracking oils or coal-distillation products.** L. TOCCO. Brit. 304,316, Jan. 20, 1928. Vapors from oil distn. or from destructive distn. of coal, etc., are converted into low b. p. hydrocarbons suitable for fuel for internal combustion engines by freeing them from sulfurous compds. and then passing them over catalysts and fractionating the products in a series of condensers, the temp. of which is controlled by molten metal or salt baths. Incondensable gases formed are purified, treated by high tension discharges, and then passed over the surface of the condensate obtained from the first fractionation. An arrangement of app. is described.

**Cracking and hydrogenating oils.** E. M. CLARK (to Standard Oil Development Co.). Brit. 304,796, Jan. 26, 1928. A system of app. is described in which oil is heated under a pressure of at least 50 atm. in the presence of H, vapors and liquids produced are continuously withdrawn, and the liquids are continuously distd. in a plurality of distn. zones. Brit. 304,797 relates to a process in which a fraction is distd. from the oil under low pressure, the residual oil is hydrogenated under high pressure and the hydrogenated product is returned to the distn. zone.

**Apparatus for hydrogenating and cracking oils from shale, etc.** MILON J. TRUMBLE. U. S. 1,725,320, Aug. 20. A hydrogenator delivers directly to an "equil. chamber" below it, which has an outlet for lighter fractions, and provision is made for recirculation of the heavier fractions through the hydrogenator and "equil. chamber" independent of the supply of fresh material. Various details of construction are described.

**Auxiliary oil-circulating system for cooling the coils of oil-cracking apparatus.** GUSTAV EGLOFF and HARRY P. BENNER (to Universal Oil Products Co.). U. S. 1,725,067, Aug. 20.

**Pressure-relief system for use on oil stills, etc.** HOWARD G. HILL (to Texas Co.). U. S. 1,725,455, Aug. 20. Structural features.

**Recovery of oils and naphthenic acids from distillation residues.** HUMBLE OIL & REFINING Co. Brit. 304,926, Feb. 6, 1928. The residues obtained when lubricating stocks contg. naphthenic acids are redistd. with NaOH or the like, preferably while hot, are floated on gently moving water and the upper layer of oil which forms is sepd. from the lower layer of naphthenate soln. An app. is described.

**Tank and baffle system for separating oil and gas.** MILLARD F. WATERS (to Smith Separator Co.). U. S. 1,724,537, Aug. 13.

**Separating paraffin or like material from associated oil.** JOHAN F. P. SCHÖNFELD (one-half to N.-V. De Bataafsche Petroleum Maatschappij). U. S. 1,724,731, Aug. 13. Fractional solidification of the atomized material is effected in a cooling atm. An app. is described. U. S. 1,724,732 relates to the use of a cooling atm. contg. a fog of water particles in similar seps.

**Centrifugal filter and clarifier for gasoline, etc.** PETER J. CHAPPELLE. U. S. 1,725,618, Aug. 20. Structural features are described.

**Apparatus for catalytic production of "motor spirit" by use of molten lead.** M. BALS (to W. Huesy). Brit. 305,033, Jan. 28, 1928. An app. with vertical reaction tubes

is described, which is suitable for passing a mixt. of alc. and kerosene through molten Pb as described in Brit. 267,530 (C. A. 22, 1229).

**Tetraalkyl lead compositions.** WILLIAM S. CALCOTT and ALFRED E. PARMELEE (to E. I. Du Pont de Nemours & Co.). U. S. 1,724,640, Aug. 13. An aliphatic base such as dimethylamine is used with compns. such as those contg.  $\text{Et}_4\text{Pb}$  and  $\text{C}_2\text{H}_5\text{Br}_2$  in order to stabilize the compn.

**Lubricant.** J. D. RIEDEL-E. DE HAËN A.-G. Ger. 478,767, Dec. 16, 1927. A colloidal soln. of graphite in oil is employed as a lubricant.

**Lubricants containing water.** MORITZ J. HEITMANN. U. S. 1,724,653, Aug. 13. A gas such as steam, air, H, N or O is passed under pressure into a body of lubricating oil finely to divide or break up the oil; water is then added to form an emulsion of the desired compn. and the supply of gas is continued to effect a stable emulsification. An app. is described.

**Lubricant for use in tungsten wire drawing.** CHARLES V. IREDELL (to Westinghouse Lamp Co.). U. S. 1,724,134, Aug. 13. See Can. 286,472 (C. A. 23, 1502).

**Filter for lubricating oil, etc.** RENÉ AUDUBERT. U. S. 1,723,997, Aug. 13. Structural features of filters containing capillary material such as wick-like fabric.

**Distilling device (heated by the engine exhaust) for refining lubricating oil used in internal combustion engines.** WALTER B. CLIFFORD (to Clifford Corp.). U. S. 1,725,392, Aug. 20. Various structural features are described.

**Bituminous emulsion.** LESTER KIRSCHBRAUN. U. S. 1,725,648, Aug. 20. An aq dispersion comprises bitumen-pitch particles as the dispersed phase and water as the continuous phase and contains in the external phase alc. in quantity not over 1.5% and small quantities of a deflocculating electrolyte. The quantities of alc. and electrolyte are insufficient to prevent freezing of the dispersion at temps. substantially below  $0^\circ$  but prevent damage by freezing when it does occur.

## 23—CELLULOSE AND PAPER

CARLETON E. CURRAN

**Studies on esterification of cellulose and cellulose esters. III. Effect of nitration temperature upon the properties of cellulose nitrate.** KATSUMOTO ATSUKI AND MASANORI ISHIWATA. *J. Soc. Chem. Ind. Japan*, Suppl. Binding 31, 268-9B (1928); cf. C. A. 22, 4792.—As the nitration temp. rises, the viscosity of the cellulose nitrate soln. decreases rapidly at first until the temp. reaches  $35^\circ$ , then slowly, and when the temp. rises to  $55^\circ$  it decreases rapidly. The tensile strength of the film decreases with the rise of temp., but the elongation increases with the rise of temp. of nitration until the latter reaches  $35^\circ$ , and then decreases with further rise of temp. The N content does not alter until the temp. rises higher than about  $55^\circ$ ; it then begins to decrease. A. and I. explained these relations with colloidal depolymerization and chem. decompn. of the cellulose mols.

**Cellulose ethers (alkylated celluloses).** E. BERL AND H. SCHUPP. *Cellulose Chemie* 10, 41-59 (1929).—A review is given of the literature on the methods of methylation and ethylation of cellulose. Denham and Woodhouse (C. A. 8, 243; 9, 203; 11, 1953; 15, 1693) have shown that cellulose (linters) can be methylated by treating a 15% NaOH soln. of cotton cellulose with  $\text{Me}_2\text{SO}_4$  at room temp. B. and S. carried out 28 successive methylations according to this method, obtaining Me, di-Me and tri-Me derivs. after 1, 5 and 25 methylations, resp. (17.39, 33.23 and 43.91% OMe, resp.). The soly. of these products in cold  $\text{H}_2\text{O}$  and  $\text{Cu-NH}_4\text{OH}$  decreases with increase in OMe content and *vice versa* for the usual org solvents. Alkali-sol. cellulose (regenerated from 75%  $\text{H}_2\text{SO}_4$  soln.) was methylated (I) and ethylated (II), the resp. alkyl sulfate being used under various conditions of temp., concn. and time. The products purified by dialysis contained (I) 19.17-30.71% OMe and (II) 18.2-40.84% OEt. (I) proceeds well at room temp. but (II) requires an initial temp. of  $50^\circ$  for reaction to start. Mono-methylcellulose is sol. in  $\text{H}_2\text{O}$  while the di-Me deriv. is insol. The reverse is true of alc. soly. Ethylations (6) using  $\text{C}_2\text{H}_5\text{Cl}$  and NaOH yielded derivs. of varying compn. and properties, according to the temp. of reaction, heating period, presence of  $\text{H}_2\text{O}$  and concn. of  $\text{C}_2\text{H}_5\text{Cl}$ . The viscosities of the products in  $\text{CHCl}_3$  soln. vary. The original must be consulted for the soly. of the several products. By using a high concn. of  $\text{C}_2\text{H}_5\text{Cl}$  or repeated treatment at  $100$ - $115^\circ$  triethylcellulose is finally obtained. It is sol. in  $\text{CHCl}_3$ ,  $\text{C}_2\text{H}_5\text{Cl}_2$ ,  $\text{C}_6\text{H}_6$  and  $\text{AcOH}$ . Continued ethylation of  $\text{H}_2\text{O}$ -sol. ethylcellulose (18.2% OEt) with  $\text{C}_2\text{H}_5\text{Cl}$  and NaOH at  $80^\circ$  increases OEt content to 38.85%; the product is

insol. in  $H_2O$ , but sol. in alc. Denham and Woodhouse dimethylcellulose can be ethylated with  $C_2H_5Cl$  and  $NaOH$  at  $90-100^\circ$ . Cellulose cannot be ethylated in the presence of  $C_2H_5N$  or  $Mg(OH)_2$  by the  $C_2H_5Cl$  method. Dialkylcellulose is stable in hot  $NaOH$  soln. Solns. of cellulose ethers in water, alc. or  $CHCl_3$  showed no optical activity.

C. W. SONDERN

The viscosity of nitrocellulose solutions. III. OTTO MERZ. *Farben-Ztg.* 34, 2566-70(1929); cf. *C. A.* 22, 2269.—The viscosities of solns. contg. 60 parts BuOAc (85%)  $(20 - x)$  alc. and  $(20 + x)$  "C" nitrocellulose were detd. on a modified Engler app. and found to be in substantial agreement with the equation,  $t_g = 67 \times 1.57 (p/2 - 10)$ , where  $t_g$  = time in sec. for 50 cc. to flow through a 5 mm. orifice and  $p$  = % of dry nitrocellulose in soln. The no., 67, is the const. for the app. and 1.57 is the const. for the system, BuOAc (85%), alc.  $(20 - x)$ , nitrocellulose  $(20 + x)$ . The corresponding equation for the "Wasag" falling ball method is  $t_w = 8.7 \times 1.57 (p/2 - 10)$ . The viscosities of solns. of BuOAc 40, alc. plus water 20 and nitrocellulose 20 were proportional to the amt. of water within the range 0 to 4%.

G. G. SWARD

The effect of thinners on the viscosity of nitrocellulose solutions. B. M. PAM. *J. Soc. Chem. Ind.* 48, 223-6T(1929).—Irrespective of the order of addn. of solvents or non-solvents to nitrocellulose, the viscosity of the resulting soln. is the same for a definite proportion of ingredients, provided sufficient time and agitation are allowed. The reduction of viscosity on the addn. is not directly proportional to the percentage of thinner added, but rather to the log. of that value.

FREDERICK C. HAHN

Cellulose octa-acetate. N. SENDA AND Y. UYEDA. *Cellulose Ind.* 5, 29-32 (1929).—The effects of various factors such as time, the amt. of  $Ac_2O$ , etc., on the acetylation of cellulose from a tissue paper of moisture content 5.35% and ash content 0.31% have been studied. In the acetylation the removal of water- and alc.-sol. substances from the gelatinous product formed by pouring the acetylated cellulose into water is important. For the same material under controlled conditions of treatment the highest yield of the octa-acetate is given when 20 g. of  $Ac_2O$  is used for treatment of 5 g. of tissue paper in the presence of  $H_2SO_4$ ; this yield, however, is only 37.5% of the theoretical. For the treatment of different materials under standard conditions the highest yields are given by cotton wadding and tissue paper (27.8% of the theoretical) and the lowest by straw cellulose (9.7%) and sulfite pulp (11.5%).

B. C. A.

The action of the caustic soda solution upon cellulose. II. The nitration of the mercerized cotton wool. KATSUMOTO ATSUKI AND KICHIRO SHIMOVAMA. *J. Soc. Chem. Ind. Japan* 31, 1104-9(1928); Suppl. Binding 31, 261B(1928).—The viscosity of nitrate of  $NaOH$ -treated cellulose decreases with increasing concn. of  $NaOH$  up to 20%, more rapidly than the rate of increase of concn., if the duration of treatment is limited to a few hrs. When the concn. of  $NaOH$  soln. was more than 40% the viscosity of the product is higher than that of the product from the untreated cellulose. If treated for a long time with  $NaOH$  in air, the viscosity of the product decreases with the duration; the tensile strength and elongation of the film increase with the duration at first, but decrease on further treatment. The treatment with alkali soln. has no effect upon the N content of the product, as long as no appreciable oxidation of cellulose occurs, but the velocity of the nitration is greater than that of untreated cellulose.

S. OKA

Studies on viscose. XV. Increase of rigidity of the filament by means of mere rubbing at spinning. RIKIMATSU TOMIHISA. *J. Soc. Chem. Ind. Japan* 31, 429-33(1928); Suppl. Binding 31, 100-1B(1928); cf. *C. A.* 23, 3084.—By rubbing the filament at spinning, the rigidity of the filament was greatly increased without increasing the denier. Too much rubbing will break the filament.

S. OKA

Removal of dyes from cellulose acetate rayon. SCHEURER, LAUTH & CIE AND L. DISERENS. *Bull. soc. ind. Mulhouse* 95, 349-52(1929); Sealed Note 2662, June 23, 1926.—Addn. of  $Ca(CNS)_2$ , as recommended by the Brit. Dyestuffs Corp., does not give perfectly satisfactory whites. These can be obtained by printing with Na sulfoxylate to which is added a  $C_6H_5$  deriv. contg. 1 or more OH groups, e. g., resorcinol or aromatic or aliphatic acids contg. an alc. group, e. g., lactic or glycolic acids, which do not react with the reducing agent. PhOH should not be used because it exerts too strong a solvent action on the fiber. Dyes which are destroyed by reduction are unaffected by hyposulfite NF alone when fixed on acetate rayon, but are very deeply degraded by the action of colored removing pastes consisting of basic dyes dissolved in resorcinol, hyposulfite NF and tannin. Addn. of anthraquinone or its derivs. is practically without effect, showing that the effect is not due to a catalytic action of the basic dye similar to that produced by setopaline, patent blue or nitroalizarin in the removal of naphthylamine bordeaux. A large no. of the Duranol, Ionamine, Acetonine and Setacyl dyes can be removed by addn. of 5-10% resorcinol. The function of the latter is considered to be partly a cellu-

lose acetate solvent; but that cannot be its sole function as solvents such as  $\text{Me}_2\text{CO}$  and  $\text{PhOH}$  do not give a good white. It is considered highly probable that resorcinol reacts with the cellulose acetate in a manner similar to  $\text{Ac}_2\text{O}$  and phenols. Report. ANDRÉ WOLFF. *Ibid* 352-4.—Addn. of resorcinol undoubtedly gives a better white and with a larger no. of dyes than  $\text{Ca}(\text{CNS})_2$ , but the fiber is seriously impaired, unless the amt. of resorcinol is reduced to about 20 g. per kg. of color, and the results are then no better than those obtained with  $\text{Ca}(\text{CNS})_2$ . A. PAFINEAU-COUTURE

Cellulose ether rayon. SLAVKO. *Russa* 4, 1003, 1005(1929).—A brief outline of the prepn. of Et and Me celluloses and of their possibilities as textiles. A. P.-C.

Cuprammonia rayon. WILHELM A. DYES. *Kunstseide* 11, 47-52, 90-8(1929).—A review of the literature and patents in connection with the manuf. of this type of rayon. FREDERICK C. HAHN

Corrosion-resisting steels in the rayon industry. Their response to sulfuric acid. J. H. G. MONYPENNY. *Rayon Record* 2, 489-91, 631-5(1929). A. K. J.

Paper and cellulose industries in 1928. JOSEF SATOPLÉ. *Chem. Listy* 23, 265-9 (1929).—A discussion. FRANK MARESH

Cogon and rice straw as raw material for paper manufacture. F. D. REYES AND A. O. CRUZ. *Philippine J. Sci.* 38, 367-76(1929).—Cogon grass and rice straw are available in com. quantities as pulp sources. The latter has the advantage of being a waste by-product. The rice straw required  $\frac{1}{3}$  less  $\text{NaOH}$  to yield a more easily bleached pulp than the cogon grass. The cellulose contents of cogon and rice straw were 50 and 42%, resp., but the pulp yield from rice straw was 15% higher than that from cogon because of the milder digestion used. The paper made from cogon had a higher tensile strength than that from rice straw. F. A. SIMMONDS

Qualitative method for the determination of paraffin in paper. FRANK R. FILZ. *Chemist-Analyst* 18, 4(1929).—Digest the sample in  $\text{CHCl}_3$ , which dissolves the paraffin, and add an excess of  $\text{EtOH}$  to the evapd. soln. which ppts. paraffin. W. T. H.

Dull artificial silk (NEVELY) 25. Tests on paper cables [insulation] (SHERMAN) 13. Water permeability of paper sacks (PRÜSSING) 20. The determination of Cu and nitrite in solutions of cuprammonium hydroxide (BUTTERWORTH, ELKIN) 7. Gas strong in  $\text{SO}_2$  [for making an acid cooking liquor] (U. S. pat. 1,724,421) 18.

BIAGOSCH, HEINRICH: *Lexikon der Papierbearbeitung. Band 2. Arbeitsverfahren. Lfg. 3. Bog. 9-12. Begazen-Einfasser. Pp. 129-2. Berlin: Verlag d. Papier-Ztg. C. Hofmann.*

Cellulose esters. H. T. CLARKE and C. J. MALM (to Kodak, Ltd.). Brit. 304,278, Jan. 18, 1928. Cellulose aceto-esters contg. higher acyl groups are made by treating a partly deacetylated cellulose acetate (suitably an acetone-sol. cellulose acetate contg. 34.5-37.5% acetyl) with anhydrides such as stearic, propionic, butyric, valeric, heptylic, lauric, myristic, palmitic, cyclohexanecarboxylic, crotonic, cinnamic, hydrocinnamic, undecylenic, *o*-methoxybenzoic and benzoic anhydrides, or with the corresponding or similar acids in the presence of halogen-substituted anhydrides, and suitably in the presence also of chloroacetic acid and a catalyst such as Mg perchlorate. The products are suitable for making films. Brit. 304,279 relates to the production of various cellulose esters contg. halogen-substituted fatty acid groups and gives numerous details regarding the manuf. of such products. Cf. C. A. 23, 980.

Cellulose esters. I. G. FARBERIND. A.-G. Brit. 305,674, Feb. 9, 1928. Chloroacetic acid is used as a diluent at a temp. below  $50^\circ$  in effecting the acylation of cellulose such as cotton with  $\text{HOAc}$  or other carboxylic acid in the presence of a catalyst. Various details are given. Cf. C. A. 23, 4570.

Esters of cellulose, starch, etc. I. G. FARBERIND. A.-G. Brit. 305,661, Feb. 10, 1928. Higher aliphatic acid and cyclocarboxylic acid esters of cellulose, starch and the like sol. in org. solvents, are obtained in a single operation by permitting the reaction between the halide of the acid and the carbohydrate to take place with rise of temp. and heating if necessary. The products are suitable for making threads, films, lacquers, insulating compns., plastic masses, etc. Various details are given.

Cellulose ester compositions, etc. I. G. FARBERIND. A.-G. Brit. 304,814, Oct. 26, 1927. Colored cellulose deriv. compns. such as are described in Brit. 247,288 (C. A. 21, 649) are incorporated with water-repelling substances such as natural or artificial resins, waxes or oils, to produce compns. which may be dissolved in solvents in which the coloring matter is insol. to form coatings for leather or paper, etc., or lacquers, priming or filling compns. Various details and examples are given.

Plastic compositions containing cellulose esters. W. PLINATUS (to Compagnie française d'exploitation des procédés Plinatus). Brit. 305,238, Feb. 2, 1928. "Semi-moist" cellulose esters such as nitrocellulose or cellulose acetate, of low viscosity, are mixed with solid solvents or gelatinizing agents of high b. p. in the absence of volatile org. solvents. Cellulose esters of greater viscosity also may be added. Examples are given.

Composite sheets containing cellulosic derivatives. WOLFF & Co. and R. WEINGAND. Brit. 304,722, Jan. 25, 1928. Layers of material which swell in water such as cellulose, regenerated cellulose or cellulose ether are joined with layers of material such as celluloid which is resistant to water (suitably by use of an agglutinant also resistant to water).

Decorating sheet material of cellulose esters or ethers. SOC. CHIMIQUE DES USINES DU RHONE. Brit. 305,189, Feb. 3, 1928. See Fr. 648,152 (C. A. 23, 2793).

Cellulose acetates. H. L. BARTHELEMY (to Ruth-Aldo Co.). Brit. 305,096, Jan. 30, 1928. Acetylation is effected by spraying into the app. used a series of 5 acetylation mixts. each composed of glacial HOAc,  $\text{Ac}_2\text{O}$  and  $\text{H}_2\text{SO}_4$ , with the addn. of chromic acid and Br to the first and second mixt., resp., and the acetate is saponified by a 2-stage-process comprising addn. of aq. HOAc to destroy the surplus  $\text{Ac}_2\text{O}$  followed by aq. HOAc contg. HCl and HF, and the acetate is then pptd. by a dil.  $\text{NaHCO}_3$  soln., washed with water and dried. Various pretreatments of the cellulose used (including oxidation) may be employed as described in previously issued British patent specifications, several of which are referred to. Cf. C. A. 23, 4571.

Cellulose acetate, etc. I. G. FARBENIND. A.-G. Brit. 305,601, Sept. 5, 1927. Cellulose, such as cotton which is to be used for the production of cellulose acetate, is preliminarily treated with formic acid of at least 80% strength until it contains 4–10% chemically combined formic acid. Cf. C. A. 23, 4342.

Nitrocellulose solutions. W. J. JENKINS and IMPERIAL CHEMICAL INDUSTRIES, Ltd. Brit. 305,148, Aug. 26, 1927. Nitrocellulose solns. such as those contg. "petrol" or "benzol hydrocarbons" or other diluents of low flash point, and with or without other ingredients such as resins, plasticizers, pigments and drying oils, are formed with a content of  $\text{CCl}_4$  8% or less.

Apparatus for treating cellulose fibers with acetic acid and anhydride, aromatic sulfochlorides, etc. COMPAGNIE NATIONALE DE MATIÈRES COLORANTES ET MANUFACTURES DE PRODUITS CHIMIQUES DU NORD RÉUNIES ÉTABLISSEMENTS KUHLMANN. Brit. 304,227, Jan. 17, 1928.

Foodstuff containers of fibrous material. JOHN D. RUE, SIDNEY D. WELLS and FRANCIS G. RAWLING. U. S. 1,724,778, Aug. 13. A fibrous material free from objectionable odor under cold-storage conditions is made from cereal straw by mildly cooking it until it is softened, but not pulped, into ultimate fibers, with a soln. formed solely of water,  $\text{Na}_2\text{CO}_3$  and  $\text{Na}_2\text{SO}_3$ .

Seamless tubes from cellulose solutions. WOLFF & Co. and R. WEINGAND. Brit. 304,717, Jan. 25, 1928. An app. and various mech. details of treatment are described.

Forming seamless tubes from cellulose solutions by extrusion and coagulation. WOLFF & Co. and R. WEINGAND. Brit. 304,754, Jan. 26, 1928. An app. is described.

Playing cards. CELLON-WERKE A. EICHENGRÜN (to S. Klausner). Brit. 304,276, Jan. 18, 1928. Opaque, washable playing cards are formed of celluloid-like cellulose ester or ether or ester-ether compns. contg. as fillers mixts. of zinc white, lithopone or the like together with other pigments of higher sp. gr. such as titanium white, etc.

Apparatus for making transparent films of cuprammonium cellulose or viscose solutions. C. RUZICKA. Brit. 304,374, Oct. 21, 1927. Mech. features.

Artificial fibers. I. G. FARBENIND. A.-G. (Emil Hubert, Otto Leuchs and Ludwig Lock, inventors.) Ger. 479,003, July 21, 1923. In order to render cellulose acetate solns. capable of stretch spinning in salt baths, there is added to the spinning soln. a compd. which is extd. by the bath more slowly than the solvent. Thus, to an acetone soln. which is to be spun into a bath of concd.  $\text{CaCl}_2$  soln. there may be added  $\text{AcOEt}$ ,  $\text{PhNH}_2$ , pyridine,  $\text{ClC}_2\text{H}_4\text{OH}$  or  $\text{C}_6\text{H}_6$  with  $\text{EtOH}$  or chlorobenzene. Again, to an  $\text{AcOH}$  soln. to be spun into a bath of concd.  $\text{AcONa}$  soln. there may be added  $\text{ClC}_2\text{H}_4\text{OH}$  or  $\text{C}_6\text{H}_5\text{Cl}$ . Examples are given. Cf. C. A. 23, 4070.

Artificial fibers, films, etc. MELITTA KLEIN. Ger. 474,236, June 30, 1923. Artificial fibers, films, etc., are prepd. from the flour or meal obtainable from certain aroid plants such as the snake palm (*Amorphophallus rivieri*). An aq. colloidal soln. of the meal is prepd., suitably with the aid of a small addn. of acid or alkali, and this is then spun or extruded into a pptg. bath, e. g., a warm bisulfate bath, in the usual way. Solns.

of cellulose may be mixed with the soln. of the meal. An antiseptic may be added also.

**Artificial fibers, films, etc., from viscose.** N. V. NEDERLANDSCHE KUNSTZIJDE-FABRIEK. Ger. 479,149, Mar. 6, 1925. An addn. of 1% or so of a salt of Ni and (or) a salt of Co is made to pptg. baths of the kind comprising  $\text{H}_2\text{SO}_4$  with or without  $\text{Na}_2\text{SO}_4$ ,  $\text{MgSO}_4$  or  $(\text{NH}_4)_2\text{SO}_4$ . The products have an enhanced affinity for dyes.

**Films from viscose.** KALLE & Co. A.-G. Ger. 479,246, Oct. 14, 1924. Films are prepd. from comparatively ripe viscose such that the salt point is less than 3. Transparent and uniform products are so obtained.

**Films, etc., from viscose, etc.** WOLFF & Co., EMIL CZAPEK and RICHARD WEINGAND. Ger. 479,004, Sept. 14, 1926. See Brit. 277,309 (C. A. 22, 2472).

**"Viscose silk."** I. G. FARBENIND. A.-G. Brit. 304,244, Jan. 17, 1928. The process described in Brit. 303,514 (C. A. 23, 4572) is modified by employing a bath contg. a low percentage of inorg. electrolytes and a high percentage of added org. substance so that the bath is maintained satd. with the org. substance. The condensation product of naphthalenesulfonic acid and  $\text{CH}_2\text{O}$  or Na carbazolesulfonate may be used in a coagulation bath contg. 9-12%  $\text{H}_2\text{SO}_4$ .

**Apparatus for spinning artificial silk.** A. E. GULL. Brit. 304,890, Dec. 20, 1927. Structural features.

**Spinning device for artificial fibers.** RUTHALDO Co., INC. Ger. 478,579, Mar. 13, 1927. Details are given.

**Funnel-shaped spinning device for artificial fibers.** FRITZ TSCHIRCH. Ger. 478,928, Apr. 14, 1926.

**Rotating nozzles for artificial-silk manufacture.** O. SINDL. Brit. 305,280, Nov. 28, 1927. Structural features.

**Multi-nozzle cells for "dry spinning" of artificial silk.** BRITISH CELANESE, LTD., H. DREYFUS, E. KINSELLA, J. BOWER and W. I. TAYLOR. Brit. 304, 674, Oct. 24, 1927. Such cells as described in Brit. 300,998 (C. A. 23, 4072) may be made with up to 100 or more nozzles to avoid the necessity of partitioning the "meters" of the spinning plant into comparatively small cells.

**Artificial silk.** JAMES A. SINGMASTER. U. S. 1,725,742, Aug. 20. In order to produce artificial silk filaments of good opacity and covering power, a soln. to be spun has incorporated with it a small quantity of inorg. pigment-like material such as C black or  $\text{BaSO}_4$  such as will not materially impair the continuity of the filaments formed from the soln. by use of small orifices.

**Artificial silk.** COMPAGNIE DE PRODUITS CHIMIQUES ET ÉLECTROMÉTALLURGIQUES ALAIS, FROGES ET CAMARGUE. Brit. 305,468, Feb. 4, 1928. Artificial silk is made from condensation products of urea or its derivs and (or) cyanamide or its derivs. with  $\text{CH}_2\text{O}$ ; the viscous condensation products are extruded into an acid coagulating bath. Numerous details and examples are given.

**Artificial silk.** M. DUPUY (to Soc. D. O.). Brit. 305,622, Feb. 8, 1928. Artificial silk is rendered more elastic and its twist is fixed by immersion before twisting in a bath formed of white soap 300 g., olive oil 2 centiliters, 66° Bé.  $\text{H}_2\text{SO}_4$  0.5 centiliters, 36° Bé NaOH 1.5 centiliters and water 100 liters, at a temp. of 40-50°.

**Absorption chest for a paper or cellulose drying machine.** JOSEF HROCH. Ger. 478,612, Jan. 11, 1928. Details are given.

**Drying pulpy material.** ALBERT SCHLOSS. Ger. 478,855, Mar. 13, 1926. Pulpy wet goods are subjected to a kneading process and dried in two stages.

**Pulp board from corn-stalk material.** J. J. HINDE. Brit. 304,171, July 14, 1927. An app. is described.

**Hydraulic paper- and pulp-rolling machine.** WILLY SCHEU. Ger. 478,903, Sept. 15, 1926. Details are described.

**Paper manufacture.** MOISEY M. SEREBRIANOI. U. S. 1,724,522, Aug. 13. Paper and paperboard are made by a process similar to that used in rubber manuf. by drawing the pulp between hot and cold rolls until the desired thickness and d. are obtained.

**Paper-making apparatus.** ALVIN W. SMITH. U. S. 1,725,108, Aug. 20. Structural features.

**Paper-making apparatus.** HAINDL'SCHE PAPIERFABRIKEN GES. Brit. 304,671, Jan. 23, 1928.

**Paper-making apparatus.** SIEMENS-SCHUCKERTWERKE A.-G. Brit. 305,668, Feb. 10, 1928. Mech. features.

**Apparatus for applying waterproofing materials to sheets such as paper.** LESTER KIRSCHBAUM and CHESTER R. MACDONALD (MacDonald to Flintkote Co.). U. S. 1,724,137, Aug. 13. Structural features.

Coloring, sizing, impregnating or other treatments of paper. I. G. FARBERNIND. A.-G. Brit. 305,122, Jan. 31, 1928. An elastic surface such as rubber is used on rollers of app. such as described in Brit. 293,000 (C. A. 23, 1507).

Ornamental paper. JOHN MACLAURIN. U. S. 1,724,672, Aug. 13. Paper is coated with a soln. of mannitol, allowed to dry and the drying is controlled by a hydroscopic agent such as glycerol and gum tragacanth which is used in the soln., so that the greater part of the coating will be converted into flake-like crystals.

## 24—EXPLOSIVES AND EXPLOSIONS

CHARLES E. MUNROE

Charles E. Munroe. H. BRUNSWIG. *Z. ges. Schiess-Sprengstoffw.* 24, 121-4 (1929).—A review of the accomplishments of M. in chemistry and in the development of explosives, written in honor of his 80th birthday, May 24, 1929. C. G. STORM

53rd annual report H. M. Inspectors of Explosives for the year 1928. T. H. CROZIER, R. A. THOMAS, H. E. WATTS AND G. HARCOURT GIBBS. *Home Office Rept.*, June, 1929, 51 pp.—There is covered the usual field for explosives, petroleum,  $\text{CaC}_2$  and  $\text{C}_2\text{H}_2$  with records of a large no. of accidents in each field. In tests of Al, though the different samples varied widely in size of grain and some were protected by oil or vaseline, no difference could be detected in mixts. of these aluminums with  $\text{KClO}_3$  in sensitiveness to shock, or shock and friction combined but their effectiveness as ingredients of fireworks varied widely. A mixt. of  $\text{KClO}_3$  + Al + orpiment was exploded by friction of the broomstick on soft wood. Wet TNT was found to be sensitive to detonation and its transportation as a non-explosive forbidden. In making dyes the explosiveness of intermediates should be ascertained and proper precautions taken. 4,6-Dinitrophenoldiazo oxide was found a very sensitive and violent explosive. The burning of a girl's legs in an accident was attributed to her having worn stockings of artificial silk.

CHARLES E. MUNROE

The factory accidents of the chemist. LEYMAN. *Chem. Fabrik* 1929, 360-1.—Notes on explosive compds. Cf. C. A. 23, 1186. J. H. MOORE

Liquid oxygen involves an explosion hazard. ANON. *Eng. Mining J.* 128, 162-3 (1929).—An accidental explosion of LOX occurred in a mine at Chuquicamata, Chile, early in July, 1929, through which 11 men were killed. The cause of the accident is unknown but during the investigation while search was being made for "stray currents" it developed that in loading the boreholes the explosive charge acquired a static charge whose potential at the top and bottom of the explosive charge differed by a v., thus making a spark possible. A previous accident was due to an LOX cartridge being stuck in the hole and an attempt made to free it with a Cu spear dislodged rock from the walls of the hole so as to form a spark by friction.

CHARLES E. MUNROE

Explosibility of atmospheres behind stoppings. H. F. COWARD. *Iron Coal Trades Rev.* 118, 432, 468-70(1929).—See C. A. 23, 3345. LESLIE B. BRAGG

The technic of measuring coal dust. C. FÖRDERREUTHER. *Rauch Staub* 19, 1-12(1929); *Wasser Abwasser* 26, 29.—The methods of detg. dust content, humidity and inflammability of coal-mine galleries are discussed. C. R. F.

Comparative tests of the initiating ability of lead azide and mercury fulminate detonators. BÉLA CSERNÉCZKY. *Z. ges. Schiess-Sprengstoffw.* 24, 169-71(1929).—Specially loaded detonators (blasting caps) were tested by a modification of Wöhler's method (C. A. 21, 3744) in which the material to be detonated was compressed picric acid (instead of TNT) impregnated with 2-8% of paraffin oil. The explosive was pressed at 1500 kg./sq. cm. to d. 1.55 in 50 g. charges 38 mm. in diam. The explosive effect of the charges was detd. by the Pb block compression method of Hess. Tetryl was more effective than TNT as a base charge in compound detonators, while mixts. of  $\text{PbN}_3$  and Pb styphnate were more effective than  $\text{Hg}(\text{ONC})_3$  as the priming charge. The Pb styphnate increases the inflammability of the  $\text{PbN}_3$ . When the cavity in the pressed charge was provided with a metal lining in which the detonator was placed, simulating conditions under which detonators are used in ammunition, results were less consistent. The metal surrounding the detonator appeared to reduce its efficiency. After exposure to moist atm. for 7 to 21 days all tetryl and TNT detonators with 0.6 g. priming charge of  $\text{Hg}(\text{ONC})_3$  or its mixts. with  $\text{KClO}_3$  failed to function, whereas similar detonators with 0.3-0.4 g. priming charge of the  $\text{PbN}_3$  mixt. still functioned after 58 days of such exposure. C. G. STORM

Pentaerythritol tetranitrate and its nitroglycerin mixture "penthrinit" as a shell

filler. ALFRED STETTbacher. *Chem.-Ztg.* 53, 533-4, 554-6(1920); cf. C. A. 23, 516. E. M. SYMONS

Combustion and explosion processes. F. HABER. *Z. angew. Chem.* 42, 745-51 (1929).—Rutherford's concept of an atom and Planck's ideas concerning quanta to the processes of combustion result in new explanations of the mechanism involved. In the Bunsen flame there is an inner cone (about 0.1 mm. thick) of constant explosions, requiring only a few ten-thousandths of a second for gas to pass through it. The assumption that it was much hotter than other parts of the flame was not proved by expt. But its spectrum showed 3 groups of bands, due to OH, CH and CC (Swan spectrum), resp., which exist temporarily in the flame. Studies on radiation and cond. of flames from hydrocarbons support the theory that the number of ions and free atoms in the flame is high. Flames of different origins have very different conditions in the inner zones, depending upon whether CC or CH groups are present. The existence of free H is definitely established; by employing walls, dust or antiknock preps. to cause the free H atoms to combine with one another the course of combustion is regulated. That ortho-H and para-H occur in varying proportions in H at different temps. also has a bearing upon the course of the combustion. It has been established, too, that  $C_2H_4$ ,  $C_2H_2$  and  $C_2H$ , all yield the radical CC as an intermediate substance, that long aliphatic chains break down into members of low mol. wts. during combustion, and that  $C_6H_6$  likewise yields  $C_2H_2$ . Explanations for these facts are offered in terms of modern theories. W. C. EBAUGH

The role of electricity carriers during the explosion of combustible gases mixed with air. F. HABER. *Sitzb. preuss. Akad. Wiss.* 1929, 162-70.—On the basis of expts. carried out by himself in collaboration with Sasaki and Quasebarth, H. discusses the extinction of explosion flames by passage through charged condensers, and states that the cond. in the explosion zone is to be assigned chiefly to the presence of CC-, or eventually CH-radicals. The source of the energy required to bring about splitting into charged parts lies in the impact of the primary particles formed during the combustion stage. ALBERT L. HENNE

Report of Commission of Inquiry into the Holborn explosions and fires. Secy. of State for the Home Dept., *Pamphlet* 47, 1929.—This catastrophe which occurred in London, Dec. 20-21, 1928, through which a large section of the streets was blown up, was due to mixts. of coal gas and air accumulated in the Post Office duct. The continuous ventilation of underground ducts and cavities is recommended. The rept. is accompanied by many sketches, photographs and tables. CHARLES E. MUNROE

Explosive shells. O. MATTER. *Brit.* 303,975, Nov. 25, 1927. A shell is charged with compressed TNT or the like and provided with a cap contg. highly compressed pentaerythritoltetranitrate, tetranitromethylaniline or the like with a superposed igniting charge of strongly compressed Pb azide or other suitable heavy metal azide. Small caliber shells may have caps contg. merely compressed azide. Cf. C. A. 23, 517.

Blasting detonators and fuses. W. ESCHBACH. *Brit.* 304,144, Jan. 14, 1928. Pb azide in a Cu container is protected from moisture and  $CO_2$  by inserting an elec. igniter into the mouth of the container and applying a cast seal.

Gun cartridges. J. D. PEDERSEN. *Brit.* 304,948, March 20, 1928. The exterior of metal cartridges is coated with a protective and lubricating coating preferably formed of ceresin applied in soln. in  $CCl_4$ .

Cartridge wads. C. A. BURGHARDT (to Textile Fabrics Corp.). *Brit.* 304,714, Jan. 25, 1928. Wads are formed with the fibers perpendicular to the plane of the wad, to facilitate lateral expansion of the wad and good sealing effect for the gases under pressure.

Gas bomb suitable for discharge from aircraft. ARCHIE F. NAIR and ROBERT A. NAIR. U. S. 1,723,804, Aug. 6. Structural features.

Projectile for bombing practice from aircraft. F. MARIE (to État-Français). *Brit.* 304,318, Jan. 19, 1928. Structural details are given of a projectile adapted to eject a cloud of colored powder such as red ochre on impact with the ground.

Hexamethylenetetramine dinitrate. MAX ELBE. *Ger.* 479,226, Jan. 23, 1927. The dinitrate of  $(CH_2)_6N_4$  is prepd. directly by passing  $CH_2O$  into a concd. aq. or alc. soln. of  $NH_3$  and treating the product with the calcd. amt. of  $HNO_3$ , which may contain some  $H_2SO_4$ . Alternatively, a solid polymer of  $CH_2O$  may be dissolved in the  $NH_3$  soln. and the acid then added. The product is desired for use in the manuf. of an explosive compd., tentatively considered to be 1,3,5-trinitrohexahydro-s-triazine.

## 25—DYES AND TEXTILE CHEMISTRY

L. A. OLNEY

The analysis of dyestuffs, yesterday and to-day. H. E. FIERZ-DAVID. *J. Soc. Dyers Colourists* 45, 133-40(1929).—At the present time methods exist which permit the identification of any dyestuff which has once been properly described. Methods for newly developed types of dyes are not generally available but are kept unpublished by manufacturers who are unwilling to give the necessary data. Valuable examples and methods of approach are given. H. W. STIEGLER

The increasing importance of vat colors, and some methods of application. PHILLIP H. STORT. *Proc. Am. Assoc. Textile Chem. Colorists* 1929, 261-71; *Am. Dyestuff Repr.* 43, 463-73(1929).—The development of the vat dye industry and methods of dyeing and printing cotton, rayon and silk are described. Thorough reduction is important. A classification of certain vat dyes as to dyeing temp. and speed of exhaust is given. Variations in fastness of vat colors are discussed. E. W. CLARK

Dibenzodithiazinequinone, a class of vat dyestuffs. II. Derivatives. RINOSUKE SHIBATA, SHUTARO TESHIMA AND YASUYUKI ASAGI. *Tech. Repts. Tohoku Imp. Univ.* 8, 279-95(1929); cf. C. A. 22, 2842.—The dichloro and the dibromo derivs. are prepd. by condensation of  $p\text{-Cl}_2\text{C}_6\text{H}_4\text{NH}_2$  (II) with itself or bromoaniline, resp. and treating as previously described. These dyes decomp. above  $360^\circ$  and impart blue shades. Dibenzodithiazinequinone (I) with  $\text{Br}_2$  is probably both brominated and oxidized to the sulfonyl deriv. 3,6-Dichloro-2,5-diphenetinedio- $p$ -quinone, decomp. at  $263^\circ$ , is obtained in 56% yield by condensing II with  $p\text{-H}_2\text{NC}_6\text{H}_4\text{OEt}$ . This with alc.  $\text{Na}_2\text{S}$  yields a mercaptan which with  $\text{PhNO}_2$  gives a 40% yield of the diethoxy deriv., which with  $\text{HBr}$  yields 10% of the dihydroxy deriv. (III) and with  $\text{HNO}_3$  45% of the sulfonyl deriv. III has also probably been prepd. from 2,5-di-( $p$ -hydroxyanilino)-3,6-dimercaptoquinone, which is prepd. either from 2,5-di-( $p$ -hydroxyanilino)-3,6-dichloroquinone or its acetate, which are prepd. by condensing II with  $p\text{-H}_2\text{NC}_6\text{H}_4\text{OH}$  or  $\text{MeCOOC}_6\text{H}_4\text{NH}_2$ , resp. All these give blue colors from a  $\text{NaHSO}_4$  vat. The dinaphtho deriv. is prepd. directly in 88% yield by treatment of the condensation product of  $\beta\text{-C}_{10}\text{H}_7\text{NH}_2$  and II with a  $\text{Na}_2\text{Sx}$  soln. This deriv. colors fibers green, yields with  $\text{HNO}_3$  the disulfonyl and gives a violet Cu salt. I can be crystd. from  $\text{H}_2\text{SO}_4$  by exposure to  $\text{H}_2\text{O}$  vapor. V. F. HARRINGTON

The utilization of some by-products from intermediates in the aniline dye industry. G. V. KOGAN. *J. Chem. Ind. (Russia)* 4, 761(1927); *Chem. Zentr.* 1928, I, 1332-3.— $\text{Fe}_2\text{O}_3$  is present in most of the aniline waste liquors.  $p$ -Nitroaniline waste contains approx. 28-29% of  $\text{H}_2\text{SO}_4$ . By concg. this  $\text{H}_2\text{SO}_4$  and mixing with Fe chips,  $\text{FeSO}_4$  may be manufactured. In the reduction of nitrobenzene to hydrazobenzene with Zn in an alk. soln.,  $\text{ZnSO}_4$  or  $\text{ZnCl}_2$  is obtained. The Zn may be pptd. as basic carbonate and ignited to form ZnO. The ZnO may then be converted into  $\text{ZnCrO}_4$ . C. R. F.

Colloid chemistry and dyeing. I. KARIN SCHULZE. *Seide* 34, 169-73(1929).—An exposition of colloid chem. principles applied to textile fibers. H. W. STIEGLER

Dyeing methods for rayon. GEORG RUDOLPH. *Kunstseide* 11, 244-6(1929).—A general article. FREDERICK C. HAHN

Dyeing possibilities of acetate rayon alone and in mixed fabrics. GEORG RUDOLPH. *Kunstseide* 11, 261-4(1929).—General discussion. FREDERICK C. HAHN

The boiling of rayon in dyeing. GEORG RUDOLPH. *Kunstseide* 11, 278-9(1929). FREDERICK C. HAHN

Dyeing of mixed shades in rayon fabrics. GEORG RUDOLPH. *Kunstseide* 11, 23-4(1929). FREDERICK C. HAHN

Uneven colors on rayon. GEORG RUDOLPH. *Kunstseide* 11, 61-3(1929).—A discussion of dyeing conditions for avoiding uneven colors. FREDERICK C. HAHN

Dye absorption power of mercerized cellulose. N. UERB. *Z. Farbenind.* 20, 247-50(1929).—U. has endeavored to find chem. methods for distinguishing between mercerized (I) and unmercerized (II) cotton. The absorption of different dyes was studied. I absorbs a much greater quantity of dye than does II. F. C. H.

Lake formation and cotton dyeing. EMIL BAUR AND H. SCHNYDER. *Z. Elektrochem.* 35, 254-63(1929).—An attempt is made to place the question of chem. combination between fiber and dye on a more general basis. The exptl. evidence is based on the distribution of dye between adsorbing material and soln. After theoretical discussion, detailed exptl. evidence is presented in the form of curves and tables. The data cover  $\beta$ -naphthol and picric acid; pptd. alumina, Al-tannin, Cr-tannin, Cu-tannin, Sb-tannin mordants; cotton, immunized and mercerized cotton. Acid, basic and direct dyes were used. After studying a wide range of concns., the conclusion is reached that

the distribution of acid and basic dyes between dye bath and such materials as mordants and various types of cellulose fibers is governed essentially by chem. change.

H. W. STIEGLER  
Printing sulfur dyes without blackening the rolls. PIERRE HOLM. *Bull. soc. ind. Mulhouse* 95, 354-7(1929).—Sealed Note 1960, Dec. 27, 1905.  $As_2O_3$  is added to the color paste. The  $As_2S_3$  formed dissolves in the alkali, giving Na thioarsenite which, in presence of a slight excess of  $As_2O_3$  and NaOH, does not attack the Cu rolls. The paste should not be too strongly reducing, as the  $As_2S_3$  would be again liberated and would darken the rolls. A no. of formulas are given. Report. ANDRÉ WOLFF. *Ibid* 358-9.—The results claimed were confirmed. No anteriority was found. The toxicity of  $As_2O_3$  militates against the industrial application of the process, especially as there are now available dyes which are faster and easier to use than the S dyes. A. P.-C.

Aging in a print works. CARLETON C. ADAMS. *Am. Dyestuff Repr.* 43, 483-8, 508-11(1929).—A. describes the development of the ager, present ager practice and classes of colors handled. Of the many factors affecting the reactions which take place on the cloth during aging, the temp. of the steam is considered the most important with the factors of time, flow and moisture coming next. The use of a copious supply of satd. steam is recommended. Various methods of introducing moisture to the steam, which is important in the aging of vat colors, are mentioned. E. W. CLARK

Report of the Sub-Committee on Light Fastness. III. The fading of dyed textiles in daylight and in carbon arc light. WM. H. CADY AND WM. D. APPEL. *Proc. Am. Assoc. Textile Chem. Colorists* 1929, 217-56; *Am. Dyestuff Repr.* 18, 407-46.—Twelve hundred fifty-two specially prepd. dyeings on cotton, wool, silk and weighed silk were exposed to daylight in several different ways and to the light from a glass-enclosed C arc. Three hundred eighty-one different coloring matters were used. Details are given concerning the samples used, the method of exposure, the method of studying results, the results of exposure and miscellaneous observations. Results prove that the "standard sun test" of the Am. Assoc. of Textile Chemists and Colorists gives reproducible results with reference to the relative fading of dyes in the series; that the presence or absence of a glass cover over dyeings exposed to the sun has a marked effect on the fading in only 4% of the samples; and that marked divergences take place in fading, depending on the method of exposure to sunlight. Fading in the arc light is different in quality in many instances from that in the "standard sun test." T. G. HAWLEY, JR.

Preliminary report on investigations of the fastness of dyed textiles to light and washing. P. W. CUNLIFFE. *J. Soc. Dyers Colourists* 45, 215-7(1929).—A brief description is given of the results of fastness tests on wool, silk, cotton, linen, rayon and mixed fabrics, and the conditions under which they were carried on. Increased humidity generally caused more rapid fading of dyed fabrics exposed to light. Some of the methods of measuring color changes are briefly discussed and an opinion is expressed as to their relative values. T. G. HAWLEY, JR.

Notes on the effect of light on colored fabric. III. EVA HIBBERT. *J. Soc. Dyers Colourists* 45, 204-5(1929); cf. C. A. 23, 280.—Calico, wool and cellulose acetate silk were impregnated with 1,2,4-trihydroxyanthraquinone (Purpurin). After 60 hrs.' exposure to the Fade-O-Meter, a substance was extd. with  $CCl_4$  which was thought to be a mixt. of phthalic acid and phthalic anhydride. References are given to earlier work in which Purpurin has been oxidized to phthalic and oxalic acids. Impregnation with phthalic acid and phthalic anhydride, followed by exposure to the Fade-O-Meter and extn. with alc. and  $CCl_4$ , increases the affinity of calico for methylene blue. T. G. HAWLEY, JR.

Effect of light during the bleaching of some colored cellulose materials by hypochlorites. F. SCHOLEFIELD AND C. K. PATEL. *J. Soc. Dyers Colourists* 45, 175-8(1929).—If cellulose materials dyed with certain vat yellows and oranges and satd. with hypochlorite or  $H_2O_2$  solns. are exposed to light, tendering takes place, except with Indanthrene Yellow G. H. F. LEUPOLD

How much should a dyer know about wool? GEORGE RICE. *Am. Dyestuff Repr.* 43, 489-92, 502-3(1929).—Practical. H. H. MOSHER

The manufacture of staple fiber. ARTHUR FATH. *Rayon Record* 2, 537-41(1929). ARTHUR K. JOHNSON

The rotting of textiles by microorganisms. I. A laboratory test. G. O. SEARLE. *J. Textile Inst.* 20, 162-74T(1929).—The loss of strength caused by fungi and bacteria attacking textiles, more particularly heavy canvases and tent ducks, is discussed. The chief matters for investigation are the nature of the intrinsic mildew-resistant qualities of various cloths in the loom state and the proportionate effects of microbial, tendering and light tendering on textiles exposed to weathering, so as to discover the relative im-

portance of antiseptics, waterproofing and lightproofing in producing max. resistance. To compare the resistance of cloths to fungi and bacteria, strips of a size suitable for a Goodbrand cloth-testing machine are bound round filter candles which have been covered first with a thin layer of soil. The samples are kept in an incubator and the strips are tested for strength at periodic intervals. Results of several trials of heavy linen ducks are given. No appreciable difference was found between the resistance of a cotton duck and a linen duck tested by this method over a period of 6 weeks. The viscosity in cuprammonium of cloths tendered by microorganisms is the same as that of normal cellulose, and this is suggested as a basis for distinguishing between microbiol decay and light tendering, since the latter causes a considerable drop in the viscosity values.

S. B. FOSTER

The preliminary examination of raw silk before scouring and loading. KARL GUTOWSKY. *Kunstseide* 11, 24-5(1929).—Raw silk is made softer and more workable by treatment with glycerol, olive oil, soap or other textile oils before weaving and knitting. The treatment results in 10-30% increase in wt., which must be taken into account to obtain satisfactory loading and subsequent processing.

F. C. H.

The action of alkalies and other swelling agents on viscose silk (Courtauld's A quality). A. J. HALL. *J. Soc. Dyers Colourists* 45, 171-5(1929).—Viscose silk suffers much loss of luster, shrinkage in length, strength, softness of handle and elasticity when immersed in soln. of NaOH (12-70° Tw.) and afterward washed in cold water. The deleterious effect of such treatment comes when washing with plain water, since the use of aq. solns. of certain org. or inorg. substances permits the silk to retain its original properties. The effect of KOH is practically harmless above 0° and it decreases with increased temp. It is possible to mercerize cotton goods contg. viscose silk with KOH without the slightest deleterious effect on the viscose silk.

A. K. JOHNSON

Denier measurement—the microscopic method. J. M. PRESTON. *Rayon Record* 2, 543(1929).—Herzog's method measures the areas of the filament cross sections by square-ruled standardized eyepiece micrometer. The product of the mean value for a single filament, the no. of filaments in yarn, the sp. gr. of rayon and the correction factor 0.93 are the denier size of yarn. The sp. gr. and area per denier for acetate rayon are 1.26 and  $85 \times 10^{-8}$  sq. mm., resp.; for viscose, cuprammonium and nitron rayon 1.52 and  $71 \times 10^{-8}$  sq. mm.

ARTHUR K. JOHNSON

Dull artificial silk. FRANZ NEVELY. *Seide* 34, 173-5(1929).—A survey is made of patent literature on the production of artificial silk having less luster. Two general methods are given: the introduction of finely dispersed materials in the fiber during spinning; changing the fiber surface during after-treatments.

H. W. STIEGLER

Delustering rayon. WALTER OBST. *Kunstseide* 11, 279-80(1929).—A discussion of patents in this connection.

FREDERICK C. HAHN

Creping wool muslin. CAMILLE FAVRE. *Bull. soc. ind. Mulhouse* 95, 359-60(1929); cf. C. A. 16, 3001; 20, 827. Sealed Note 2284, Oct. 8, 1913.—When a large no. of pieces are creped simultaneously by the process of Sealed Note 2266, the results are somewhat uneven, and best results are obtained by treating each piece separately for about 20 min. The crepe may be reserved by printing the wool muslin with 40° Bé. water glass, drying and then treating with acid. By dissolving a direct dye in the water glass, a colored reserve is obtained. Report. ADOLPHE WOLF. *Ibid* 360.—The claims of F. were confirmed. Similar results can be obtained by printing with a soln. of albumin or of sericose, but not with British gum and BaCl<sub>2</sub>.

A. PAPINEAU-COUTURE

The sulfur content of wool. II. Distribution of sulfur along the fiber, variation with color and the effect of exposure to ultra-violet light. J. BARRITT AND A. T. KING. *J. Textile Inst.* 20, 151-8T(1929); cf. C. A. 21, 178.—In a majority of the samples examd. the highest percentage of S was found to be toward the tips. This distribution was not affected by a typical S-contg. dip. Weathering causes a diminution of S in the most exposed parts of the fiber. White wool has a higher S content than black. Cleaned samples exposed for 80-100 hrs. to the light from a quartz lamp lost from 3.7 to 5.0% of their S content. If irradiation was followed by treatment with 0.001 N NaOH, this loss was more than doubled. Microscopic examn. showed that the scales were raised up and some completely removed. It is suggested that these scales possess a higher S content than the cortex; hence a decrease in the number of scales would explain in part the loss of Sn on irradiation. This paper contains an addendum in which the authors criticize similar studies by H. R. Marston who reported (cf. C. A. 23, 2997) no inherent variation in S content. The biol. significance of variable S in wool is discussed, and the belief advanced that this property is due to variations in the incorporation of the cystine nucleus under the action of *glutathione*. III. Effects of chemical processing on sulfur content. *Ibid* 159-61T.—Certain com. processes such as scouring,

liming and chlorination as conducted by the authors have little effect on the total S content. With respect to scouring with  $\text{Na}_2\text{CO}_3$  and alk. soaps, this conclusion contradicts that of Marston.

S. B. FOSTER

The influence of laundering on some cotton and linen fabrics. MARION GRIFFITH, THELMA SPRAGUE, VERA BERG WITH RACHEL EDGAR. *Iowa State Coll. J. Sci.* 3, 215-25(1929).—Eleven fabrics were tested for thickness, weight, inorg. content, dry breaking strength and wet breaking strength after 100 washings, 150 washings and 200 washing. Dry breaking strength was measured at 7 intervals in a 100-hr. exposure to steam at  $120^\circ$ .

F. E. BROWN

The use of dispersing media to prevent precipitation by means of hard water. F. MÜNZ. *Z. angew. Chem.* 42, 734-6(1929).—Soap itself acts as a protective colloid to hold material in suspension, and therefore when textiles are washed in hard water and rinsed even in soft water there may be a deposition of flocculated substances during the rinsing. "Intrasol," a (German) proprietary product made by treating certain oils with acids, is very efficient in preventing such deposition, and is therefore recommended for use with hard water.

W. C. EBAUGH

Report of the Sub-Committee on Waterproof Standards. ANON. *Proc. Am. Assoc. Textile Chemists and Colorists* 1929, 281-3; *Am. Dyestuff Repr.* 18, 523-5 (1929).—An app. has been developed for hydrostatic pressure tests. Fabrics showing a resistance of 17 cm. are called showerproof, a resistance of 50 cm., rain resisting. A resistance of 50 cm. for 1 hr. is accepted as waterproof. The size of drops, their rate of fall and the amt. falling from 1 min. to 24 hrs. is being investigated, as is the relation of hydrostatic pressure to conditions during rainfall of various degrees. The impermeability of fabrics to air at various pressures is being studied by the comm. with the idea of measuring the fabric's resistance during very high wind pressure. STEPHEN K. FORD

Modern washing and cleansing materials (NOLL) 18. Synthetic agents [for weight-imp silk] (Brit. pat. 305,013) 29. Benzanthrone derivatives [intermediates] (Ger. pat. 479,230) 10.

MANGET, CH.: *Tableaux synoptiques pour l'examen des tissus et l'analyse des fibres textiles*. Paris: Dunod. 80 pp. F. 5.

WOODHOUSE, T. AND KILGOUR, P.: *Spinning, Weaving and Finishing of Flax and Jute*. London: Sir Isaac Pitman & Sons, Ltd. 206 pp. 10s. 6d., net. Reviewed in *J. Textile Inst.* 20, P138(1929).

Dye. A. ZINKE (to F. Bensa). Brit. 305,136, Jan. 31, 1928. A vat dye giving heliotrope shades on cotton is made by chlorinating  $\beta$ -dinaphthol in boiling glacial HOAc and treating the product with concd. or fuming  $\text{H}_2\text{SO}_4$ .

Dyes. L. CASSELLA & Co. Brit. 304,613, Jan. 21, 1928. Halogen derivs. of anthranthrone are prepd. by treating an aq. soln. of an anthranthrone-sulfonic acid with a halogenating agent, to replace the sulfonic acid group by halogen. Products are obtained which dye cotton from the vat orange shades.

Dyes. I. G. FARBENIND. A.-G. Brit. 304,263, Oct. 18, 1927. 1,2-Benzanthraquinone-3,4-dicarboxylic acid, anhydrides, imides and imidazoles are prepd. by acid condensation of 1,8-naphthalic-4-benzoyl-*o*-carboxylic acid and its derivs. (suitably by use of  $\text{H}_2\text{SO}_4$ , with or without  $\text{H}_3\text{BO}_3$ , at  $160$ - $200^\circ$ ). Examples are given including an imidazole which is an orange vat dye. 1,8-Naphthalic anhydride-4-benzoyl-*o*-carboxylic acids are pred. by oxidation of 5-acenaphthoylbenzene-*o*-carboxylic acids, and the product thus formed yields the corresponding imides and imidazole by reaction of  $\text{NH}_3$ , methylamine, arylamines or *o*-phenylenediamine. 5-Acenaphthoyl-3',6'-dichlorobenzene-*o*-carboxylic acid is obtained from acenaphthene and 3,6-dichlorophthalic anhydride by use of  $\text{AlCl}_3$  in  $\text{CS}_2$ .

Dyes. I. G. FARBENIND. A.-G. Brit. 304,326, Jan. 20, 1928. Bluish red azo dyes are formed in substance or on the fiber by coupling with an arylide of 2,3-hydroxynaphthoic acid a diazotized monoaroyl-*m*-phenylenediamine having in the *o*-position to the amino groups a halogen atom and a methyl or alkyl group or 2 halogen atoms. The amino H atom of the aroylamino group may be replaced by an alkyl or aralkyl group. Several examples are given.

Dyes. I. G. FARBENIND. A.-G. Brit. 304,794, Jan. 26, 1928. An active  $\alpha$ -deriv. of 5,6-benzo-7-chloro-3-hydroxy-1-thionaphthene is condensed, in a solvent such as glacial HOAc, with 4,5-benzo-3-hydroxy-1-thionaphthene or an active  $\alpha$ -deriv. of the latter is condensed with 5,6-benzo-7-chloro-3-hydroxy-1-thionaphthene. Dyes are thus obtained which give current tints on cotton.

**Dyes.** I. G. FARBENIND. A.-G. Brit. 304,804, Sept. 22, 1927. Dyes are formed by treating naphthazarine with monomethylamine or other suitable aliphatic amines, preferably in a closed vessel and in the presence of boric acid or condensing a reducing action such as Zn dust or  $\text{SnCl}_2$ , at a temp. not exceeding  $100^\circ$ ; the products are sepd. from the small quantity of vat dyes which are simultaneously formed (and which are less sol.) by extn. with an org. solvent. The products are suitable for dyeing cellulose esters and ethers such as "acetate silk." Examples are given.

**Dyes.** I. G. FARBENIND. A.-G. Brit. 305,082, Oct. 26, 1927. Anthraquinone vat dyes are formed by the action of  $\text{H}_2\text{SO}_4$  at a relatively low temp. (suitably about  $15\text{--}20^\circ$ ) on a 1,1'- or 2,1'-dianthraquinonylamine contg. at least one acridone ring in the 3(CO)-4 (NH)-position, and also contg. at least one acylamino group, with or without other substituents. The products may be oxidized with  $\text{HNO}_3$ . Dyes are obtained which produce olive-brown and gray shades on cotton. Examples are given.

**Dyes.** I. G. FARBENIND. A.-G. Brit. 305,174, Feb. 1, 1928. Monoazo dyes dyeing wool orange and yellow shades fast to fulling and to light are made by coupling a diazotized amine of the benzene series, such as diazotized 4-aminoacetylaniline or diazotized 2,4,6-trichloroaniline, with a sulfonic acid of 2-phenylindole or a substitution product.

**Dyes.** I. G. FARBENIND. A.-G. Brit. 305,487, Feb. 3, 1928. Azo dyes are made by use as components of compds. at least one of which contains a heterocyclic structure of the general formula  $(A.R_1)_x.R_2(B)_y$ , in which A represents nitro groups or reduction groups such as azoxy or azo or the amino group or its acylation products,  $R_1$  represents a carbocyclic ring,  $R_2$  represents a heterocyclic ring joined to  $R_1$  by a C to C linkage, x and y are 1 or 2 and B represents a halogen atom or a residue introduced in place of a halogen atom combined with  $R_2$  through a N, O or S atom. Various dyes are formed capable of use as acid wool, mordant or direct cotton dyes or cotton dyes for subsequent treatment. A very large number of examples are given.

**Dyes.** I. G. FARBENIND. A.-G. Brit. 305,488, Feb. 3, 1928. Phthaloylphenanthridones and their derivs. and substitution products are obtained by treating phenanthridone or a deriv. or substitution product with phthalic anhydride or a deriv. in the presence of a condensing agent such as  $\text{AlCl}_3$ . Yellow dyes or intermediates for dye manif. are thus obtained.

**Dyes.** I. G. FARBENIND. A.-G. Brit. 305,489, Feb. 3, 1928. Dyes and intermediates of the anthanthrone series are formed by treating a halogenated anthanthrone such as 2,7-dibromoanthanthrone with S or a S-yielding agent. A dye producing reddish violet shades on cotton may be thus formed.

**Dyes.** I. G. FARBENIND. A.-G. Brit. 305,592, Feb. 7, 1928. Indigo dyes are formed from 1-amino-3,6-dimethyl-4-halogen benzene or 1-amino-2-carboxy-3,6-dimethyl-4-halogen benzene by caustic alkali fusion of the Na amide of the corresponding phenylglycine, by condensation of the phenylglycine- $\alpha$ -carboxylic acid by use of  $\text{Ac}_2\text{O}$ , or by the phenylaminomalonic acid ester method. Various details and modifications of procedure are described.

**Dyes.** J. R. GEIGY AKT. GES. Brit. 305,648, Feb. 9, 1928. *o*-Hydroxynitroso dyes are made by nitrosating an aminonaphthol or a deriv. in which the amino group has been replaced by an alkylammonium group or by a group of the general formula  $\text{NH}\cdot\text{CO}\cdot\text{CH}_2\cdot\text{N}(\text{X})\cdot\text{B}$ , in which B is a basic residue such as pyridine or a dialkylamine, and X is an acid radical. The acid salts of the dyes and their heavy metal compds. are sol. in water and can be used directly on wool or silk, or by means of tanning mordants on vegetable fibers. Silk is dyed brown-yellow by the Cu compd. of nitrosated pyridacetyl-2,7-aminonaphthol. Other examples also are given. Cf. C. A. 23, 4347.

**Dyes.** ALFRED PONGRATZ (to Felice Bensa). U. S. 1,725,596, Aug. 20. Diacetyl dichloroperylene or other suitable halogen substituent of alkylperylene diketones having each of the 2 aliphatic acetyl groups and a halogen atom in peri position is heated with a metal cyanide such as Cu cyanide in the presence of an org. solvent such as quinoline and the product of the reaction is sepd. from the solvent and the metal constituent of the cyanide is removed (suitably by use of aq.  $\text{NH}_3$ ). The product dyes cotton red which changes to reddish violet on exposure to the air. Cf. C. A. 23, 990.

**Azo dyes.** COMPAGNIE NATIONALE DE MATIÈRES COLORANTES ET MANUFACTURES DE PRODUITS CHIMIQUES DU NORD RÉUNIES ÉTABLISSEMENTS KUELMANN. Brit. 304,298, Jan. 19, 1928. Azo dyes of mordant character capable of being converted into sol. Cr compds. are obtained by coupling diazotized *o*-aminophenols or *o*-aminonaphthols or their substitution products with pyrazoles derived from aminoarylsulfamides. Numerous examples are given.

**Azo dyes.** KARL HEUSNER and MAX SIMON (to General Aniline Works). U. S.

1,725,076 Aug. 20. By coupling diazo compds., such as those derived from aniline or the like, with  $\alpha$ -naphthylsulfaminic sulfonic acid compds., dyes are obtained which give orange to yellow shades on wool.

**Azo dye.** I. G. FARBENIND. A.-G. (Georg Kalischer and Richard Gast, inventors). Ger. 477,913, May 22, 1927. Basic azo dyes sol. in water are prepd. by heating unsulfonated azo dyes contg. one or more thiazole groups in the mol. with alkylating agents in the presence of an org. solvent. Examples are given.

**Azo dye.** I. G. FARBENIND. A.-G. (Winfrid Hentrich and Max Hardtmann, inventors). Ger. 477,914, July 17, 1926. Tetrakisazo dyes are prepd. by diazotizing aminodisazo dyes of the type  $R_1$ -azo- $R_2$ -azo- $R_3$ -NH<sub>2</sub>, (where  $R_1$  = an amine,  $R_2$  = a further diazotable middle component of the naphthalene series and  $R_3$  = a deriv. of  $\alpha$ -naphthylamine coupled to the amino group in the *p*-position and contg. a substituted or free OH group), coupling with derivs. of 2-amino-5-hydroxynaphthalene-7-sulfonic acid, diazotizing again and coupling with methyl-ketol, its analogs or substitution products, pyrazolone, derivs. of  $\beta$ -ketoninaldehyde, 1,3-dihydroxyquinoline, sulfazone or salicylic acid. Examples are given. Cf. C. A. 23, 4347-8.

**Azo dyes.** I. G. FARBENIND. A.-G. (Leopold Laska and Arthur Zitscher, inventors). Ger. 479,345, Sept. 6, 1927. Azo dyes fast to light are produced on the fiber by impregnating the goods with a bis-(2',3'-hydroxynaphthoyl)-arylene-1,4-diamine having substituents in the 2- and 5-positions, and then coupling with a diazo, tetrazo or diazoazo compd. Many examples are given. Cf. Brit. 311,194.

**Azo dyes from rubber derivatives.** HARRY L. FISHER (to B. F. Goodrich Co.). U. S. 1,724,270, Aug. 13. Rubber di(hydroxyphenyl), which may be prepd. by reaction between rubber bromide and PhOH, is coupled in alk. soln. with diazotized aromatic amines such as the diazo compds. of sulfanilic acid, aniline or benzidine. Dyes are obtained which give brown to orange shades on wool, fast to washing and to sunlight.

**Red azo dyes formed by combining aromatic diazo compounds with 2,3-hydroxynaphthoyl-2-amino-3-naphthol ethers.** LEOPOLD LASKA and ARTHUR ZITSCHER (to General Aniline Works). U. S. 1,725,087, Aug. 20. Numerous examples are given of dyes suitable for production of lakes and which give red shades of good fastness on vegetable fiber.

**Monoazo dyes.** I. G. FARBENIND. A.-G. Brit. 304,744, Jan. 26, 1928. Monoazo dyes of good fastness to Cl and to kier-boiling are formed in substance or on the fiber by coupling with arylides of 2,3-hydroxynaphthoic acid diazo compds. of amines of the general formula 1,2,3,4,5-C<sub>6</sub>HMeHlgR(NH<sub>2</sub>)R, in which Hlg is halogen, one R is H and the other is halogen and in which one of the halogens is not Cl and preferably is Br. Several examples are given of dyes giving various red colors. Cf. C. A. 23, 2301.

**Orange to brown disazo dyes.** HENRY JORDAN (to E. I. Du Pont de Nemours & Co.). U. S. 1,724,660, Aug. 13. Various dyes are formed by coupling diazo compds. not having a sulfo or carboxy group with an aminobenzoylaminobenzoyl-2-amino-5-naphthol-7-sulfonic acid, diazotizing the resulting monoazo compd. and combining it with a sulfo or carboxylarylpyrazolone compd. or a sulfo or carboxyl indole compd. As first components there may be used, for instance, aniline, *o*-, *m*- or *p*-toluidine, xyldine, *o*- or *p*-anisidine, chloroaniline,  $\alpha$ - or  $\beta$ -naphthylamine, etc. U. S. 1,724,663 relates to dyes obtained by coupling a diazo compd. of the benzene or naphthalene series without a free hydroxyl or amino group to an amino compd. of the benzene or naphthalene series contg. only one free amino group and no OH group, and having a free *p*-position to the amino group, diazotizing the aminoazo compd. and coupling it again to an amino compd. of the benzene or naphthalene series contg. only one free amino group and no OH group, and having a free *p*-position to the amino group, then condensing the aminodisazo compd. with nitrobenzoyl chloride, reducing the nitrobenzoyl compd., and finally condensing the resulting aminobenzoyl compd. with an aliphatic or aromatic acid chloride or anhydride not contg. a free OH or amino group. Several examples are given.

**Vat dye.** LEOPOLD CASSELLA & CO. G. M. B. H. (Richard Herz and Werner Zerweck, inventors). Ger. 478,738, Nov. 14, 1926. Addn. to 458,568. An orange vat dye is prepd. by the successive action of Cl and Br on anthanthrone. The order of the halogenation may be reversed. Examples are given.

**Vat dyes.** I. G. FARBENIND. A.-G. Brit. 305,679, Feb. 10, 1928. Anthraquinone vat dyes are formed by the action of an acid condensing agent such as H<sub>2</sub>SO<sub>4</sub> on a benz-anthranylaminoanthraquinone contg. at least one aroylamino group in the anthraquinone nucleus. Examples are given of dyes producing yellowish brown shades on cotton.

**Vat dyes.** I. G. FARBENIND. A.-G. (Karl Schirmacher, Wilhelm Schaich and Arthur Wolfram, inventors). Ger. 476,811, June 25, 1926. Addn. to 470,809. The

method of Ger. 470,809 (C. A. 23, 2043) is modified by conducting the oxidation throughout under moderately acid conditions. The same final products are obtained as before, and these are now identified as anthraquinoneazines. Examples are given.

**Vat dyes.** I. G. FARBENIND. A.-G. (Paul Nawiasky and Julius Müller, inventors). Ger. 479,027, May 11, 1927. Addn. to 478,047. Brown vat dyes resembling those prep'd. according to Ger. 478,047 (C. A. 23, 4348) are prep'd. by treating directly with alk. reagents the nitrobenzanthrone prep'd. according to Brit. 12,518(1906), example 2. According to the example, the nitrobenzanthrone is treated with alc. KOH at 120°. The product may be purified by treatment with oxidizing agents.

**Vat dyes.** SOC. ANON. POUR. L'IND. CHIM. A BAËLE. Brit. 304,245, Jan. 17, 1928. Dibenzanthronyl sulfonic acids are alkali-fused to form vat dyes which, on alkylation form vat dyes dyeing gray shades and similar to the products formed as described in Brit. 279,479 (C. A. 22, 2845). Examples are given.

**Violet to blue sulfur dyes from dihydroindoleindophenolic compounds.** FRITZ BALLAUF (to General Aniline Works). U. S. 1,725,046, Aug. 20. A dihydroindoleindophenolic comp'd. which in form of its leuco deriv. has most probably the formula  $p\text{-HOC}_6\text{H}_4\text{NHR}_1\text{HR}_2\text{CHR}_3\text{CHR}_4$ , where R stands for H, an alkyl, aryl or aralkyl group

and  $R_1$  stands for a benzene nucleus which may be substituted by an alkyl, aryl, aralkyl, halogen or other univalent group, such as 2-phenyldihydroindole-5-*p*-leucoindophenol, is submitted to a polysulfide fusion (suitably an alc. fusion with  $\text{Na}_2\text{S}_4$  at about 170°). Dyes of good fastness to light and boiling are thus obtained.

**Dyes.** I. G. FARBENIND. A.-G. Brit. 305,140, Jan. 31, 1928. *o*-Cyanarylsulfocyanogen compds. (as described in Brit. 306,575 (following abstract)) are first submitted to acid hydrolysis and are then condensed with chloroacetic acid in alk. soln. to give *o*-cyanarylthioglycolic acids, for the prepn. of dyes of the thioindigo series. Various details and examples are given.

**Dye intermediates.** I. G. FARBENIND. A.-G. Brit. 306,575, Nov. 18, 1927. An *o*-aminoarylthiocyano comp'd. in which the position *p*- to the amino group is occupied or forms part of a further ring (and which may be prep'd. (as described in Brit. 257,619 (C. A. 21, 3057) and Brit. 303,813 (C. A. 23, 4482)) is diazotized and subjected to Sandmeyer's reaction in order to replace the amino group by a cyano group. The thiocyanogen group is then saponified with alkali and the resulting mercapto group is coupled with chloroacetic acid in order to produce an *o*-cyanarylthioglycolic acid. Several examples are given.

**Dyes and intermediates.** I. G. FARBENIND. A.-G. (Georg Kränzlein and Fritz Roemer, inventors). Ger. 479,163, Jan. 26, 1926. 1-Amino-4-diazoanthraquinone-sulfonic acids are prep'd. by subjecting 1,4-diaminoanthraquinone-2-sulfonic acid or 1,4-diaminoanthraquinone-2,6- or 2,7-disulfonic acid to the usual diazotization process. Neither quinoneimide derivs. nor bisdiazogen compds. are produced. New dyes of the alizarine direct blue A class can be prep'd. from the diazosulfonic acids by replacing the diazo group with halogen and treating the product with arylamines. Examples of the diazotization process are given.

**Dye intermediates.** I. GUBELMANN, R. J. GOODRICH and E. T. HOWELL (to Newport Co.). Brit. 305,536, Feb. 6, 1928. Benzanthrone or a benzanthrone deriv. is obtained in a pure state from crude reaction masses such as are produced by condensing an anthranol with glycerol in the presence of  $\text{H}_2\text{SO}_4$ , by treating the mass with a solvent such as  $\text{C}_6\text{H}_6$  and its homologs, which has a selective solvent action on the benzanthrone or deriv.

**Dye intermediates.** I. G. FARBENIND. A.-G. Brit. 304,439, Dec. 15, 1927. 2,3-Aminonaphthol and its derivs. are obtained when an *O*-arylsulfonic ester of 2,3-hydroxynaphthalenecarboxamide or a nuclear substitution product is subjected to Hofmann's reaction and the *O*-arylsulfonyl-2,3-aminonaphthol or nuclear substitution product thus formed is hydrolyzed. Several examples are given. Brit. 304,441 relates to the production of naphthol ether carboxyamides by alkylation of hydroxynaphthalene carboxyamides, and to their conversion into the corresponding aminonaphthol ethers by Hofmann's reaction. Examples are given.

**Dye intermediates.** I. G. FARBENIND. A.-G. Brit. 305,593, Feb. 7, 1928. (*o*-Aminoaroyl)-benzoic acids and their inner ring anhydrides are prep'd. from specified phthalic acid arylimides by heating with a Cl-contg. acid condensing agent such as  $\text{AlCl}_3$ ,  $\text{ZnCl}_2$  or  $\text{HCl}$ . Various details and examples are given.

**Anthracene derivatives.** I. G. FARBENIND. A.-G. (Georg Kalischer and Heinrich Salkowski, inventors). Ger. 479,357, Nov. 12, 1926. A product useful as an *intermediate for dyes* is prep'd. by heating  $\text{C}_{14}\text{H}_{10}$  with S at 200–250° and extg. the desired

product from the melt with an alkali sulfide soln. The extrn. with alkali sulfide soln. seps. the desired product from the dyes which, as described in Ger. 186,990 (C. A. 2, 600), are formed at the same time. The product is believed to be a mixt. of compds.

**Benzanthrone derivatives.** I. G. FARBENIND. A.-G. (Georg Kalischer and Heinz Scheyer, inventors). Ger. 479,231, Sept. 5, 1926. Dye intermediates are prepd. by heating benzanthrone to a high temp. with aromatic hydroxy compds. (which may contain other substituents in the nucleus) in the presence of caustic alkali. An excess of caustic alkali is avoided.

**Benzanthrone derivatives.** I. G. FARBENIND. A.-G. (Eduard Holzapfel, Otto Braunsdorf and Hans Lange, inventors). Ger. 479,356, Aug. 3, 1926. *Intermediates for dyes* are prepd. by condensing a halobenzanthronyl sulfide, disulfide or mercaptan, or derivs. thereof, with compds. having a reactive H atom, particularly with  $\text{NH}_3$ , aliphatic or aromatic amines, phenols or mercaptans. Examples describe the prepn. of aminobenzanthronyl sulfide, m. above  $340^\circ$ , propylaminobenzanthronyl sulfide, bisphenoxybenzanthronyl sulfide, bis-*p*-thiocresylbenzanthronyl sulfide, phenoxy-*Bz*-1-benzanthronyl methyl sulfide, m.  $163\text{--}165^\circ$ , amino-*Bz*-1-benzanthronyl methyl sulfide, m.  $275\text{--}278^\circ$ , 1'-anthraquinonylamino-*Bz*-1-benzanthronyl-*p*-tolyl sulfide, m. about  $330^\circ$  and 1-anthraquinonylamino-*Bz*-1-benzanthronyl sulfide. Cf. Brit. 249,891 (C. A. 21, 1016) and 261,757 (C. A. 21, 3751).

**Bisaminoarylanthrone and bisaminoarylanthracenes.** KARL SCHIRMACHER, BERTHOLD STEIN and KONRAD STENGER (to General Aniline Works). U. S. 1,724,045, Aug. 13. These compds. are formed by heating an anthraquinone or substitution deriv. with a salt of an aromatic amine such as  $\text{PhNH}_2\text{--HCl}$  or *o*-toluidine- $\text{HCl}$  and may be used as *dye intermediates*. Various examples and details of procedure are given. Bisaminophenylanthrone, m.  $298^\circ$ , bis-*o*-aminotolylanthrone, m.  $255^\circ$  and bisaminophenyl-*l*-aminoanthrone decomposes on melting.

**6,6'-Dichloroisodibenzanthrone.** ARTHUR LÜTTRINGHAUS and HUGO WOLFF (to General Aniline Works). U. S. 1,725,590, Aug. 20. This compd. is made by reaction of Na anilide on 6,6'-dichlorobenzanthrone in aniline at  $100\text{--}118^\circ$  in a current of N and dyes cotton violet-blue. Other similar compds. also are described.

**Condensation products of the benzodiazine series.** WINFRID HENTRICH, MAX HARDTMANN and RUDOLF KNOCH (to General Aniline Works). U. S. 1,724,086, Aug. 13. Quinazolines, monohalogenated in a diazine nucleus and wherein the diazine nucleus may be further substituted by a hydrocarbon residue and the benzene nucleus by any substituent, are caused to react with one mol. of such compds. which possess one or more reactive H atoms attached to a N, a S atom which is attached to a C atom with one valency or an O atom in such a manner that halide is split off. The products may be used as *intermediate products in the manuf. of dyes or pharmaceutical products*.

**Metal compounds of dyes.** I. G. FARBENIND. A.-G. (Hans Krzikalla and Werner Müller, inventors). Ger. 479,373, June 16, 1926. See Brit. 272,908 (C. A. 22, 1859).

**Dyeing with vat dyes.** DURAND & HUGUENIN SOC. ANON. Ger. 479,487, Jan. 25, 1927. Addn. to 418,487. According to Ger. 418,487, the fiber is impregnated with an ester salt of a leuco vat dye and the color is then developed by oxidation. This method is now simplified by impregnating the fiber with a bath contg. the ester salt and an oxidizing agent, with or without salts such as  $\text{Na}_2\text{SO}_4$  and a protective colloid, acidifying the bath and warming to develop the color. Examples are given.

**Dyeing with vat dyes.** I. G. FARBENIND. A.-G. Brit. 305,230, Feb. 2, 1928. In dyeing piece goods, an agent promoting bleeding or running is applied in the padding process, to assist penetration of the dye. Various emulsions of fats and oils or of their free acids or water-sol. derivs. such as Turkey-red oils and cellulose derivs. such as an alkali salt of carboxymethylcellulose capable of forming neutral or alk. colloidal solns. in water may be used.

**Dyeing mixed fabrics.** I. G. FARBENIND. A.-G. Brit. 305,269, Nov. 4, 1927. A sulfonated natural resin such as colophony sulfonic acid is employed as a reserve for wool or silk in dyeing mixed fabrics in acid or neutral baths. Several examples are given, and the prepn. of colophony sulfonic acid is described.

**Dyeing vegetable fibers.** JULIUS RATH (to General Aniline Works). U. S. 1,724,108, Aug. 13. Mixts. of S dyes with "ice colors" are produced on the fiber. U. S. 1,724,109 specifies a process of dyeing with S dyes and azo dye components which are developed with diazo compds. Several examples are given.

**Dyeing material containing wool.** I. G. FARBENIND. A.-G. Brit. 304,742, Jan. 25, 1928. In dyeing material contg. wool with substantive dyes, the wool is reserved by use of sol. salts of sulfonic acids produced by condensing a natural resin with an aralkyl-halide or a deriv. and sulfonating, or by condensing one or more natural resins with a

phenol and then treating with an aralkyl halide or deriv. followed by sulfonation. Examples are given.

**Dyeing cellulose esters and ethers, etc.** I. G. FARBENIND. A.-G. Brit. 304,739, Jan. 25, 1928. "Acetate silk" and like products are dyed deep greenish yellow tints by treatment with compds. such as that obtained by interaction of the anhydride of 4-amino-1,8-naphthalic acid with  $\text{NH}_3$  or a suitable amine or similar compds. Cf. C. A. 23, 2305

**Dyeing cellulose esters and ethers.** I. G. FARBENIND. A.-G. (Paul Nawiasky, inventor). Ger. 479,225, June 9, 1926. Fast red to blue shades are produced on cellulose esters and ethers by dyeing with ethers of 1,4-diamino-2-hydroxyanthraquinone or its *N*-substituted derivs.

**Dyeing cellulose acetate.** BRITISH CELANESE, LTD., G. H. ELLIS and H. C. OLPIN. Brit. 305,560, Nov. 7, 1927. Examples of nitro compds. which can be used are given. Various dispersing methods (which are specified) may be used in applying these compds. to materials formed from or contg. cellulose acetate. Brit. 305,566 relates to the use of similar compds. for the same purpose. Cf. C. A. 23, 3110.

**Dyeing cellulose acetate.** BRITISH DYESTUFFS CORP., LTD., R. S. HORSFALL, L. G. LAWRIE and J. A. R. HENDERSON. Ger. 479,224, Apr. 23, 1926. See Brit. 257,654 (C. A. 21, 3134).

**Dyeing acetate silk.** I. G. FARBENIND. A.-G. (Gustav Reddelien and Georg Matzdorf, inventors). Ger. 479,343, July 25, 1926. See U. S. 1,673,301 (C. A. 22, 2846).

**Spot dyeing yarn in cones.** WARD N. GERE (to Eclipse Textile Devices, Inc.). U. S. 1,724,015, Aug. 13. In order to color portions of a yarn cone, a coloring liquid is projected from the interior outwardly to the exterior of the cone while the cone is revolved at sufficient speed to assist the passage of the coloring liquid by centrifugal force. An app. is described.

**Printing fabrics.** I. G. FARBENIND. A.-G. Brit. 305,476, Feb. 2, 1928. Color printing is effected by padding the fabric with an aniline-black liquor, drying, printing with a paste contg.  $\text{ZnO}$ , a large excess of caustic alkali, and a coupling component free from sulfonic and carboxylic groups, steaming and developing with a diazo soln. Numerous examples and details are given.

**Printing fabrics with vat dyes.** I. G. FARBENIND. A.-G. Brit. 304,787, Jan. 26, 1928. The material is first printed with a dye thickened with a soln. of a cellulose ester or ether, and is subsequently treated with a reducing agent and an alkali and steamed without previous drying. A hyposulfite with addn. of a wetting agent is a suitable reducing agent. Details are given.

**Perforated dyeing spindles for use with yarn "cheeses."** J. BRANDWOOD and T. BRANDWOOD. Brit. 304,800, July 28, 1927. Structural features.

**Leather-like surface on dyed textile materials.** GOTTHARDT A. SALLMANN. U. S. 1,725,675, Aug. 20. Pressure rolls of soft rubber are used for assisting in giving fabrics a suitable leather-like appearance by treatment of the material in dry condition.

**Mordants and wetting agents.** ORANIENBURGER CHEMISCHE FABRIK A.-G. Brit. 304,608, Jan. 19, 1928. Products which are mordants for basic dyes, upon vegetable materials and chrome leather, are obtained by the action of strong condensing and sulfonating agents upon fats, fatty acids, resins or fat-like substances, the high b. p. distn. products of petroleum, brown-coal tar or other bituminous material or upon mixts. of such materials with compds. capable of being condensed with them under the conditions of sulfonation. Various details are given, with examples employing as starting materials: wool fat and peanut oil fatty acid, naphthalene and the fatty acids of peanut oil and soy oil, castor oil and  $\text{Ac}_2\text{O}$ , a mineral oil and a mineral oil together with iso- $\text{PROH}$ .

**Retting fibers.** C. LIENARD-FIEVET. Brit. 304,602, Jan. 20, 1928. In the prepn. of fibers having a wooley feel from fibrous plants of the Malvaceae family, such as *Sida rhombifolia*, the sorted and moistened plants are steeped in 1%  $\text{Na}_2\text{CO}_3$  soln. followed by an alk. soln. of vegetable oil dissolved in "tetrachloride (Tetrapol)" in order to dissolve out the pectic substances. The material is then washed, drained, treated for  $1\frac{1}{2}$ -2 hrs. at ordinary temp. with a soln. of 35° Bé.  $\text{NaOH}$  to which 1 g. monopol soap per l. has been added, drained, rinsed and bleached with sulfurous gases. Brit. 304,606 relates to the use of yarns of such fiber, mixed with wool, etc., and which may be treated with natural or sulfonated oils.

**Insect-proofing textile materials, etc.** HAROLD MAXWELL-LEFROY (to Graesser Monsanto Chemical Works, Ltd.). U. S. 1,725,656, Aug. 20. Trichloronaphthalene or other suitable polyhalogenated naphthalene is used as an impregnating agent in insuffi-

cient quantity substantially to alter the phys. and mech. properties of the material treated.

**Waterproofing textile and other materials.** C. J. MORETON and PRUFIX, LTD. Brit. 305,493, Aug. 5, 1927. Gum tragacanth or a similar gum is used with soap, an animal, vegetable or mineral waxy substance and ammonia, in conjunction with metal salts such as those of Ti, Zn or Al. Various details and examples are given.

**Yarn-sizing apparatus of the "bobbin-to-bobbin" type.** WM. B. CROMPTON. U. S. 1,724,397, Aug. 13. Structural features.

**Yarn-conditioning apparatus (for treating yarn with steam).** FREDERICK E. STRUVE (to Textile Machine Works). U. S. 1,724,230, Aug. 13. Structural features.

**Mercerizing fabrics and yarns.** N.-V. J. A. CARP'S GARENFABRIEKEN. Brit. 305,664, Feb. 10, 1928. The wetting power of NaOH mercerizing lye is increased by adding a phenol such as cresol and an alc. such as benzyl alc.

**Mercerizing cotton or similar fabrics.** I. G. FARBEIND. A.-G. Brit. 305,509, Sept. 6, 1927. A mixt. of an org. sulfonic acid with the product obtained by the interaction of  $H_2SO_4$  upon oleic or ricinoleic acid is added to the mercerizing bath or used for pretreating the fabric. Alcs. or other org. solvents also may be added to increase the wetting power of the mercerizing bath. Various examples are given.

**Coating fabrics with rubber.** ANODE RUBBER CO., LTD. Brit. 304,157, Aug. 10, 1927. Materials to be coated or impregnated are subjected to a preliminary wetting with the same or a similar dispersion as that used for the impregnation or coating. Various compounding and modifying ingredients such as synthetic rubber, casein or artificial resins may be added, and various details and modification of procedure are described.

**Coating fabrics with natural or artificial rubber dispersions.** C. MACINTOSH & Co., LTD., S. A. BRAZIER and J. D. CAMPBELL. Brit. 305,264, Nov. 4, 1927. After application of the coating material, the fabric is passed in festoons through a drying chamber, further coating is applied and the material passed through another drying chamber, in a continuous operation. An arrangement of app. is described.

**Mixed linen and cotton fabric.** NORBERT VOHS. U. S. 1,724,628, Aug. 13. Features of weaving are specified.

**Apparatus for impregnating cotton-wrapping cloth, etc., with viscose or like solutions.** A. H. KILNER. Brit. 304,168, Oct. 15, 1927. The fabric is immersed in the soln. and then passed through a fine slit to force the soln. into the material. Various structural details are described. Brit. 304,341 relates to the use of similar material for *enclosing and preserving various food products*.

**Washing wool or other textile fibers, leather, feathers, etc.** H. T. BÖHME A.-G. Brit. 304,719, Jan. 25, 1928. In using oxidizing agents such as peroxides or reducing agents such as sulfurous acid or hyposulfite, hypogenated phenols such as hexahydro-cresol or aromatic or hydroaromatic oxy-compds. are added as protective agents; they may also enhance the cleaning effect. Further addns. such as soaps, Turkey-red oil or the hydrogenation products of higher sulfo acids are also preferably used.

**Centrifugal apparatus for treating wool-washing water.** J. THOMSON and C. A. THOMSON. Brit. 304,718, Jan. 25, 1928. Fat, water and dirt are separately discharged from the app. described.

**Finishing textile materials containing cellulose organic esters.** C. DREYFUS (to British Celanese, Ltd.). Brit. 304,596, Jan. 21, 1928. Yarns, threads, fabrics, garments, etc., comprising esters such as cellulose acetate, alone or with other fibers such as silk, cotton or linen, are treated with an alk. soln. of OH-ion concn. sufficient partially to saponify the cellulose ester. The permissible ironing temp. is thus raised.  $Na_2PO_4$  or an alkali metal hydroxide, carbonate or silicate may be used for the treatment.

**Artificial fibrous cellulosic material.** LEON HILLENFELD. U. S. 1,724,670, Aug. 13. Material comprising cellulose or cellulose hydrate is treated with a caustic alkali soln. contg. not more than 5% NaOH or equiv., and the material is stretched during at least a part of the treatment, in order to strengthen the material, e. g., "viscose silk."

**Treating cellulosic fabrics.** TOOTAL BROADHURST LEE CO., LTD., R. P. FOULDS and J. T. MARSH. Brit. 304,900, Jan. 9, 1928. Cellulosic fabrics have little or no tendency to crease or crumple after successive treatment with a mercerizing liquid and then, while in wet swollen condition, with a synthetic resin or components capable of forming such a resin such as  $PhOH$ ,  $CH_3O$  and  $K_2CO_3$  which are caused to react on the material.

**Apparatus for treating artificial silk on spools with liquids for bleaching or dyeing, etc.** MASCHINENFABRIK SCHWEITER A.-G. Brit. 304,310, Jan. 19, 1928.

**Centrifugal boxes for treating artificial silk with liquids.** COURTAULDS, LTD.,

E. HAZELBY and E. A. MORTON. Brit. 305,279, Nov. 7, 1927. Structural features. Treating artificial filaments with liquids. I. G. FARBENIND. A.-G. Brit. 304,667, Jan. 23, 1928. Mech. features.

Treating artificial silk with liquids on perforated tubes and drums. M. SCHOENFELD. Brit. 304,197, Jan. 16, 1928. Mech. features. Brit. 304,203 relates to spools for use in similar treatments.

Mat and luster effects on yarns or fabrics comprising viscose in the sulfur state. FRED SCHOLEFIELD and NORMAN DENNER (to Burgess Ledward & Co., Ltd.). U. S. 1,724,375, Aug. 13. A printing paste contg.  $\text{Na}_2\text{SO}_3$  and a dye is applied locally to parts of the material. Several examples are given.

Device for washing artificial silk fibers. SPINNSTOFFWERK GLAUCHAU A.-G. Ger. 478,580, Jan. 22, 1927. Details are given.

Rubber-lined vat and associated apparatus for washing or other treatments of fibrous material wound on bobbins. WALTER ALTHOFF. U. S. 1,725,045, Aug. 20. Structural features.

Degreasing, opening up, and bleaching animal and vegetable fibers. A. UHLMANN (to Aktis Patent-Verwertungs-Ges.). Brit. 304,295, Jan. 18, 1928. The material is placed in water in a glass or ceramic vessel contg. a metal plate and resting on or surrounded by a coil through which currents of 3000–5000 v. and up to 3,000,000 periods may be passed. *Soaps, oils and fats may be obtained as by-products.*

Hydrogen peroxide. N.-V. ELECTROCHEMISCHE INDUSTRIE. Brit. 305,472, Feb. 4, 1928.  $\text{H}_2\text{O}_2$  (which may be in alk. soln.) and solns. of  $\text{Na}_2\text{O}_2$  or Na perborate are stabilized by addn. of protein substances such as gelatin, glue, casein, keratin, glutenin, gliadin or albumin, which may be dissolved by alkali. The stabilized solns. may be used for bleaching or in the prepn. of compds. such as alk. earth peroxides, diacyl peroxides or perborates.

Bleaching fibers, pelts, skins, material for making hats, etc. H. GOLDARBEITER. Brit. 304,680, Jan. 24, 1928. Bleaching is effected by an alk. oxidizing process in which a catalyzer such as Co nitrate or Ni sulfate, and a bleaching agent such as  $\text{H}_2\text{O}_2$ , act successively. The materials may be subsequently treated with a reducing bleaching soln., and may be finally washed with dil. oxalic acid soln. Cf. C. A. 23, 1760.

## 26—PAINTS, VARNISHES AND RESINS

A. H. SABIN

Paint vehicles containing olive oil. ERNST TAUBER. *Farben-Ztg.* 34, 2460–1 (1929).—After 14–21 years the yellowing of white paints contg. olive oil was inversely proportional to the percent of olive oil. Softness and tackiness were directly proportional to the percent of olive oil.

Determination of chromate in paints. EDWARD J. DAVIS. *Chemist Analyst* 18, 8(192).—See C. A. 23, 2839. G. G. SWARD W. T. H.

Coloring power of white pigments and its connection with covering power. F. MUNK. *Z. angew. Chem.* 42, 737–8(1929).—In the hands of a skilled operator detns. of coloring power may be made with an accuracy of  $\pm 2\%$ , but much time and care are required; otherwise, errors of 30% or more may be made. Coloring power is not proportional to covering power, and it is doubtful if even accurate detns. of the former can be taken as approx. values for the latter. Expts. with titanium white, lithopone, zinc white and various mixed pigments are reported. W. C. EBAUGH

Pigment form. F. KLUMPP. *Farben-Ztg.* 34, 2612–4(1929); cf. C. A. 22, 3790; 23, 4086.—A study of oil absorption data leads to the conclusion that there are 3 classes of pigment particles, *vis.*, primary, secondary formed by cohesion of crystals during growth and secondary formed by primary particles cemented together with the mother liquor. The larger pore space of a mass made up of secondary particles is the sum of the space between the primary particles composing the secondary particles and the space between the secondary particles themselves. Thus, if the secondary particles of a pigment be reduced to primary ones, the oil absorption will be lowered by an amt. corresponding to the space between the secondary particles. G. G. SWARD

The chromates of lead. J. STEWART REMINGTON. *Ind. Chemist* 5, 292–4(1929).—Methods are given for making different shades of Pb chromate, also for the analysis of chromes. A no. of complete analyses of different varieties of litharge are tabulated. R.'s experience on the color fastness of chromes is given. E. G. R. ARDAGH

Colloid chemistry of coatings. RAPHAEL ED. LIESEGANG. *Farben-Ztg.* 34,

2460(1929).—The sepn. of a paint film into a pigment and a vehicle layer has often been noted. With a magnetic pigment the magnitude of the forces involved might be detd. by measuring the magnetic field necessary to overcome the sepn. Pores in coatings may sometimes be closed by treatment in a medium in which the coating swells. To det. permeability of films to  $H_2O$ , first coat the panel with a mixt. of 50 g. gelatin, 350 cc. warm  $H_2O$  and 400 cc. latex. When dry, apply the material to be tested. The primer of gelatin and latex turns white upon absorption of  $H_2O$ . G. G. SWARD

**The problem of the drying (determination of drying time) of paints and varnishes.** HANS WOLFF AND W. TOELDT. *Farben-Ztg.* 34, 2293-5(1929).—The original spreading-drop test soln. (cf. *C. A.* 23, 4086) spreads irregularly on paint films. However, satisfactory results are obtained if the soln. be diluted with an equal amt. of benzene. The dust-free drying time is 20% longer than the min. spreading time, i. e., at the dust-free stage the film is 12° dry if the dryness at min. spreading be taken as 10°. The max. increase in weight often occurs at 12° of dryness. Spreading-drop graphs should aid in the differentiation of materials which have the same final drying times but not the same intermediate rates. G. G. SWARD

**Oil absorption and particle size.** HANS WAGNER AND HANS PFANNER. *Farben-Ztg.* 34, 2513-4(1929).—The authors are unable wholly to confirm Klumpp's statement (*C. A.* 23, 4086) that the oil absorption of a pigment is decreased by a preliminary grinding. Data on several pigments confirmed Klumpp's statement only in those cases in which the pigment was already very finely divided, in which cases microscopic examn. showed the formation of secondary particles. Wherever grinding resulted in the production of smaller particles, the oil absorption was increased. G. G. SWARD

**Contribution to the theory of drying oils.** B. TYUTYUNNIKOV. *Masloboiino-Zhirovoe Delo* 1928, No. 10, 35-41; No. 11, 28-32; No. 12, 26-32.—Decrease in vol. of the oil on drying is due to coagulation of the colloidal soln. of the oxidation products of the glycerides of fatty acids. Oxidation and coagulation processes are of auto catalytic nature. Physical properties of the oily film are greatly affected by the presence of foreign substances such as driers. V. KALICHEVSKY

**The drying of oils.** R. S. MORRELL AND S. MARKS. *J. Oil & Colour. Chem. Assoc.* 12, 183-205(1929).—Recent theories of the drying of oils are discussed and the conclusion is reached that oxidation is followed by polymerization and gelation. Pure  $\beta$ -eleostearin was oxidized in the solid state and in soln. in  $C_6H_6$  and in  $CCl_4$ . The results of oxidation in the solid state were not satisfactory. Oxidation in soln. resulted in an insol. gel (I) and a sol. portion (II). I is a monoperoxydihydroxy- $\beta$ -eleostearic glyceride, while II contains a petroleum ether insol. form (F) and a sol. form (E), in which the hydroxyl groups of I have passed into the keto form and in which the peroxy group has disappeared. I yields a polymerized methyl ester (A), insol. in petroleum ether, and a simple methoxy methyl ester (C), sol. in petroleum ether. II yields corresponding products (G) and (H). The mol. wt. of A is 1107 (calcd. 1068) indicating that the oxidized gel was intramolecularly polymerized. The formation of C destroyed the polymerization, indicating that polymerization is assocd. with the hydroxyl groups. In all of the compds. mentioned, the I value indicates one remaining double bond. Sapon. nos. of I, A and C were high (over 300), indicating disruption of the mol. during sapon. I is insol. in  $C_6H_6$ ,  $CCl_4$ , EtOAc and  $Me_2CO$ . It is slowly sol. in valeraldehyde, which fact may account for the gradual softening in some cases of drying-oil films. When fresh it is sol. in glacial AcOH. On heating, it decomposes with formation of valeraldehyde. Piperidine unites with the gel to form a soln. which may be diluted with  $H_2O$ ,  $C_6H_6$  or alc. The union with piperidine decomposes with evolution of piperidine and formation of valeraldehyde. G. G. SWARD

**Drying of drying oils in an atmosphere of carbon dioxide.** N. BELYAEV. *Masloboiino-Zhirovoe Delo* 1928, No. 12, 33-4.—Linseed and hempseed oils dry in an atm. of  $CO_2$ . V. KALICHEVSKY

**Decolorization of hempseed oil for manufacturing a colorless drying oil.** A. LAPTEV. *Masloboiino-Zhirovoe Delo* 1928, No. 8, 3-5.—Blowing of the oil with a heavy blast of air for several hrs. at 125-170° is recommended. V. KALICHEVSKY

**The properties of varnishes containing natural and synthetic copals.** HANS WOLFF AND G. ZEIDLER. *Farben-Ztg.* 34, 2458-9(1929).—Short and long oil varnishes were prepd. from congo, kauri, Albertol 111L and Albertol 117R. Floor enamels were also prepd. The varnishes were subjected to an accelerated test and a sand abrasion test, while the enamels were tested for gloss, pencil hardness, sand abrasion, water resistance and a bending test. In the above tests, the products contg. congo ranked first 3 times, kauri 3 and 111L, 4. Congo ranked last 3 times, kauri 3 and 111L once. Similar tests on varnished maple panels using varnishes contg. 111L, or ester gum, compared

with a com. copal and a com. tung oil varnish were conducted. In general, the Albertol varnish was as good or better than the copal and much better than the ester gum varnish.

G. G. SWARD

**Detection of benzene in varnishes.** EDWARD H. JACKSON. *Chemist Analyst* 18, 15(1929).—Distil 200 cc., using a Hempel still head. The benzene will all distil between 65° and 100°. Wash this fraction with 4 vols. of water. To 8 cc. of concd.  $H_2SO_4$  in a 100-cc. beaker add slowly 7 cc. of concd.  $HNO_3$ , keeping the mixt. chilled by ice water. When at 25°, add 5 cc. of the fraction to be tested and allow to stand 15 min. at 25°. Cool and wash the resulting nitrobenzene in a small separatory funnel with a little water. Dissolve 0.5 cc. of the nitrated sample in 25 cc. of EtOH, add 15 cc. of concd. HCl and 2 g. of 20-mesh Zn. Boil 10 min. to reduce the nitrobenzene to aniline. Dil. with 2 vols. of water and set free aniline by adding 30% NaOH in slight excess. Filter and to 5 cc. of the clear filtrate, add 15 cc. of water and 10 cc. of a freshly prepd., satd. soln. of bleaching powder. Filter if necessary. If aniline is present, a red to purple color is formed; otherwise the NaClO soln. is yellow. This test for benzene is delicate and toluene does not interfere.

W. T. H.

**Chemical methods of thickening oils and their use by the lacquer industry.** K. DORN and I. BURDIN. *Masloboino-Zhirovoe Delo* 1928, No. 7, 29-31.— $S_2Cl_2$  is an effective agent for thickening linseed oil, which is thus rendered satisfactory for use by the lacquer industry.

V. KALICHEVSKY

**Clarification of nitrocellulose lacquers.** FRITZ KOLKE. *Farben-Ztg.* 34, 2045-8 (1929); cf. C. A. 23, 997.—Clarification by centrifuging does not give an optically clear product but the results are satisfactory and it is quicker than pressing or settling. Centrifuges operating at 5000-6000 r. p. m. are now safe. For exceedingly viscous lacquers slight warming is advantageous.

G. G. SWARD

**Influence of plasticizers on the viscosity and light sensitivity of nitrocellulose lacquers.** HANS WOLFF and B. ROSEN. *Farben-Ztg.* 34, 2564-6(1929).—The plasticizers, dibutylphthalate, tricresyl phosphate, sipalin AOM and sipalin MOM, were added in varying amts. to BuOAc solns. of nitrocellulose. The following detns. were then made: diln. ratios with toluene and with benzine, viscosity of solns. contg. the max. amt. of non-solvent, max. amts. of benzine which permitted the solns. to dry clear, and max. amts. which permitted the solns. to dry without orange peel effect. Addn. of any of these plasticizers increased the yellowing of films exposed to ultra-violet light, the effect being greatest with tricresyl phosphate, next with dibutylphthalate, next with sipalin MOM and least with sipalin AOM. In general, the diln. ratios were greater with toluene than with benzine; the viscosities were reduced most with sipalin MOM, least with sipalin AOM.

G. G. SWARD

**Rapid drying finishes for wood surfaces.** F. W. HOPKINS. *Am. Paint & Varnish Mfrs.' Assoc. Circ.* 343, 61-4(Feb., 1929).—H. ests. that of all surfaces requiring protective or decorative coatings, wood surfaces constitute 68% and metal 32%. Nitrocellulose lacquers are being used successfully on but 14% of the wood surfaces. The claim is made that rapid drying finishes not contg. nitrocellulose have been developed for use on wood surfaces that heretofore could not be successfully coated with any lacquer.

G. G. SWARD

Oil from the seeds of *Erucastrum elongatum* (semi-drying oil) (BELYAEV) 27. The determination of Co in driers, japans, etc. (HEIM) 7. Preparing varnish asphalt from Emba lubricating-oil acid sludge (KARSKII, KAPATZINSKII) 22. Radium, with special reference to luminous paint (PARSONS) 3. Benzanthrone derivatives [pigments] (Ger. pat. 479,230) 10. Coating wire with enamel, etc. (Brit. pat. 305,084) 13. Temperature-control system for enameling apparatus (Brit. pat. 305,611) 13. Cellulose ester compositions [lacquers, priming or filling compositions] (Brit. pat. 304,814) 23.

**Solvents, Cotton Solutions and Plasticizers, including specifications, technical data and general information for the lacquer manufacturer.** New York: U. S. Industrial Chemical Co., Inc. 48 pp.

**Paint.** HUGO REINHARD. Fr. 656,984, July 4, 1928. By- or waste-products in paint manuf. are emulsified or ground up with oils ordinarily used for paints, then sepd. by drying or sifting or both, giving a product of higher quality than the starting material.

**Paint suitable for use on sheet materials containing rubber.** P. SCHROEDT and D. J. BURKE. Brit. 304,334, July 16, 1927. A gum resin such as wax-free shellac or a dammar resin is dissolved in a low-viscosity soln. of nitrocellulose or cellulose acetate in a high b. p. solvent such as Et lactate or Et benzoate; the resulting soln. is mixed

with a colloidal soln. of a pigment in a non-drying oil such as castor oil or a liquid plasticizer such as tricresyl phosphate, and thinners may be added such as toluene, xylene and AmOH. AmOH may be used as a solvent for the gum resin before admixt. with the cellulose deriv.

**Aqueous medium for paints and cements.** A. G. RODWELL, W. ROPER and A. J. C. HART. Brit. 304,355, Oct. 19, 1927. Na silicate and  $\text{NaNO}_3$  are used together with water in stated proportions, with various pigments, for coating cements or concretes, or as a binder with fireclay, etc.

**Incorporating paint ingredients.** KRAUSEWERK A.-G. Brit. 305,452, Feb. 4, 1928. See Fr. 653,517 (C. A. 23, 3820).

**Chromium oxide.** I. G. FARBERIND. A.-G. Brit. 304,809, Oct. 24, 1927. Green hydrated Cr oxides for use as pigments or for other purposes are formed by heating chromic acid or its salts with water and reducing agents (other than  $\text{SO}_2$ ) such as H, hydrocarbons, CO, formates, glycerol or  $\text{Na}_2\text{S}_2\text{O}_3$  under a pressure not exceeding 150 atm. (suitably by treating a soln. of K chromate with H or a mixt. of H with CO at  $270^\circ$  under 110 atm. pressure). Cf. C. A. 23, 4306.

**Coating compositions containing drying oils, etc.** J. SCHEIBER (to Chemische Fabriken J. Wiernik & Co. A.-G. and Bakelite Ges.). Brit. 304,761, Jan. 26, 1928. The process described in Brit. 299,024 (C. A. 23, 3113) is modified by adding to the paints, etc., themselves deoxidizing materials in an initially inert form but which become active by the action of substances such as acid degradation products or water produced in the completed film. Phenolates of Pb, Zn, Ba, Mg or other metals may be used, e. g., the Pb salt of  $\alpha$ -naphthol may be used in linseed oil varnish. Amines such as diphenylamine or benzylamine may be rendered temporarily inert by employing readily hydrolyzable compds. with metal salts such as the double compds. with  $\text{ZnCl}_2$ ; in such case, water formed serves as the activator.

**Modifying drying oils.** JAMES E. BOOGE and COLE COOLIDGE (to E. I. Du Pont de Nemours & Co.). U. S. 1,725,561, Aug. 20. In order to improve paint-forming drying oils such as linseed and soy-bean oil, the oil is heated in N at a moderate temp. (suitably about  $200^\circ$ ) and blown with air or other O-contg. gas at a temp. lower than that used for the heat treatment.

**Rustproofing metal surfaces.** I. G. FARBERIND. A.-G. Brit. 305,218, Feb. 2, 1928. The surface is treated with a soln. of a cellulose ester, the acid residue of which forms with the metal a compd. insol. in water, such as esters of higher aliphatic acids such as stearic or lauric acid, in a solvent such as xylene or  $\text{C}_6\text{H}_6$ . Various pigments may be added, as may also salts such as Cu naphthenate, Cu oleate, ferric laurate or ferric resinate, and the layer may be further covered with lacquer, varnish or oil.

**Ink.** GEORGE D. KNIGHT (to Emory Winship). U. S. 1,725,649, Aug. 20. A quick drying ink for use in intaglio printing, of relatively high fluidity and sufficient homogeneity to cause it to enter and to be retained in the depressions of a hard metal intaglio printing form after wiping, and which does not excessively spread or penetrate the paper used, comprises gilsonite 22, a hydrocarbon solvent such as "M and P" thinner 51, water 22 and glue about 5 parts.

**Printing ink.** GEORGE D. KNIGHT (to Emory Winship). U. S. 1,724,603, Aug. 13. Casein, borax, carbolic acid,  $\text{CH}_3\text{O}$ , oil of citronella, glycerol and coloring matter are used in intaglio inks suitable for printing etchings or engravings.

**Ink for use for safety purposes on deeds, checks, etc.** E. BAYLE, H. GEORGE and A. MACHE. Brit. 305,028, Jan. 28, 1928. An ink is used the color of which is readily changed by various reagents. A violet, blue or red ink is prepd. by mixing together in varying proportions the chlorozincic deriv. of the bromoethylate of hexamethyl- and pentamethylmonoethyl-*p*-rosaniline, the Na salt of *o*-toluidine diazo-bi-1-naphthylamine 4-sulfonic acid,  $\text{NaH}_2\text{PO}_4$ , soda, glycerol and a thin printing-ink varnish. This ink undergoes a variety of stated color changes with different specified reagents.

**Varnish solvents.** J. G. DAVIDSON (to Carbide & Carbon Chemicals Corp.). Brit. 304,759, Jan. 27, 1928. Nitrocellulose and natural or synthetic resins are used with mixed solvents comprising an ethyl benzene or like alkyl benzene and a good solvent for nitrocellulose such as glycol mono-ethyl ether or BuOAc.

**Coatings for the fabric of airship gas containers.** K. HUERTLE (to Goodyear-Zeppelin Corp.). Brit. 304,775, Jan. 27, 1928. Solns. or varnishes contg. synthetic resins such as "bakelite" are used with softeners such as castor oil, tricresyl phosphate or triphenyl phosphate and thinners such as acetone, etc.

**Lacquers.** I. G. FARBERIND. A.-G. (Ludwig Lock and Emil Hubert, inventors). Ger. 479,083, Aug. 27, 1925. Lacquers giving mat effects are prepd. by dissolving a plastic mass comprising a cellulose ether and a high-boiling hydrocarbon, fat or oil in a

mixt. of liquids of which one is a solvent for both the cellulose ether and the hydrocarbon, etc., while the other is a solvent for the cellulose ether only. According to the example, a compn. comprising ethyl cellulose and a condensation product of  $C_{10}H_8$  with xylyl chloride is dissolved in a mixt. of  $C_6H_6$  and EtOH.

**Depositing japan-forming materials from emulsions.** HARRY CHISLET (to General Elec. Co.). U. S. 1,724,826, Aug. 13. A film of an electrolyte such as KOH or NaOH or NaCl is deposited on the surface of an article under treatment, and the coated surface is immersed in an aq. emulsion of japan-forming materials for a sufficient time to cause deposition of a portion of the materials as an adherent layer; the article is then removed and baked.

**Artificial resins.** F. SCHMIDT. Brit. 304,648, Jan. 23, 1928. Condensation products of phenols and aldehydes, which are still liquid while hot, are hardened by treatment with as small a quantity as possible of acid or an acid-reacting substance.

**Synthetic resins.** BAKELITE GES. Brit. 305,237, Feb. 3, 1928. Phenol-aldehyde resins (which may be mixed with fillers, other synthetic or natural resins, dyes, etc.), are hardened and deodorized by use of metal compds. such as Ca, Mg, Fe and Zn oxides, hydroxides or salts with acids such as fatty, oleic and resin acids, *e. g.*, Ca stearate or Zn oleate. Various details are given.

**Synthetic resins.** BAKELITE GES. Brit. 305,211, Feb. 3, 1928. In forming shaped articles, urea or a urea deriv., a solid polymerized aldehyde such as paraformaldehyde, and fillers such as lithopone and paper pulp are mixed, and the mixt. may be pressed cold and then heated to 100–120°, or may be hot pressed. Various natural or artificial resins may be added as may also other ingredients such as PhOH, *p*-toluene sulfonamide, gypsum, cements, dyes, etc.

**Synthetic resins.** H. L. Bender (to Bakelite Corp.). Brit. 304,659, Nov. 11, 1926. A phenol 2, aniline (or a homolog) 1 and  $CH_2O$  more than 2 mol. proportions are heated together (suitably in the presence of  $(CH_2)_6N_4$ ,  $Na_2CO_3$  or  $Ca(OH)_2$ ) and the aniline is expelled from the condensation product (suitably by distn. under reduced pressure).

**Synthetic resins.** I. G. FARBENIND. A.-G. Brit. 305,043, Jan. 28, 1928. Vinyl ester resins are freed from unpolymerized ester by heating to about 80–100° in water or water vapor so that the volatile material in the resin is replaced by water; the water is then removed by heating *in vacuo* at about 100° or by cooling, comminuting and subjecting to a vacuum. Various details are given.

**Synthetic resins.** I. G. FARBENIND. A.-G. (Adolf Steindorff and Gerhard Balle, inventors). Ger. 479,161, Jan. 14, 1922. Resinous products, which become insol. and infusible on heating, are prep'd. by combining (1) a permanently sol. and fusible condensation product from a phenol or a naphthol and aldol or crotonaldehyde with (2) a resin of the PhOH- $CH_2O$  type. The 2 components may be fused together or brought together in a solvent, or one can be added in the process of prepg. the other.

**Linoleum.** E. CLAXTON (to Armstrong Cork Co.). Brit. 305,656, Feb. 9, 1928. Linoleum cement contg. little unoxidized oil is made by heating a drying or semi-drying oil (such as linseed, menhaden, fish, tung or soy bean) in the presence of O and material delaying coagulation (such as rosin, gum kauri, ester gum, abietic acid, pimaric acid and neutral esters of rosin). Various details are given.

## 27—FATS, FATTY OILS, WAXES AND SOAPS

E. SCHERUBEL

**The differential halogen absorptions of oils and fats.** J. W. CROXFORD. *Analyst* 54, 445–53 (1929).—The Cl, Br and I absorbed by the following oils and fats were det'd: tung oil and eleostearic acid, linseed oil, rubber seed oil, soy-bean oil, coconut oil, maize oil, olive oil, almond oil, whale oil, cod-liver oil, castor oil and ricinoleic acid, peanut oil, fatty acids from peanut oil, oleic acid, fatty acids from parsley seeds, crotonic acid, tiglic acid, maleic acid, fumaric acid, cinnamic acid, cinnamyl alc., croton oil and the fatty acids from croton oil. From the mass of results here presented, it is claimed that the Br vapor method for detg. the degree of unsatn. compares favorably with the Wijs method, is more rapid and often more complete. Castor oil and ricinoleic acid, however, absorb considerably more Cl or Br than corresponds to the I value of the Wijs method, probably because of the halogen being substituted for H as well as absorbed at double bonds. It is suggested that the difference between the values obtained by 1 hr's. absorption by the Wijs and Br-vapor methods may help to indicate the position of the unsatd. bond in the fatty acids of the oleic series. The expts. with substances not oils or

fats showed, in general, that the Cl-vapor and Br-vapor methods gave results agreeing closely with the theory except with maleic and fumaric acids which were very inert under this treatment. Results obtained with Br in AcOH were unsatisfactory probably because of the formation of bromohydrins during absorption. With croton oil, 2 hrs. digestion by the Wijs method gave the value 109.1 whereas 14 days and 100% excess gave the value 123.4 while Margosches got the value 117.1-117.7. The Br vapor after 7 hrs. gave a value like that obtained by M.

W. T. H.  
**Terrestrial animal oils and fats from a few birds.** III. S. UENO AND KUZŌ. *J. Soc. Chem. Ind. Japan* 32, 312-9(1929); Suppl. Binding 32, 94-7B(1929).—The properties are given of (A) Japanese black bear fat from *Ursus torquatus* Schinz., var *Japonicus* Schleg., (B) Japanese weasel fat from *Putorius itatsi* Pallas, (C) "Mami-tanuki" fat from *Canis procyonoides* Schleg., (D) painted snipe fat from *Rostratula capensis* (Linn.), (E) common quail fat from *Coturnix communis*, Bonn, (F) feathered-toed scops owl fat from *Scops semitorques* (Temm. and Schl.), (G) ural owl fat from *Strix uralensis*, Pallas.

	A	B	C	D	E	F	G

m. p.	30.0°	36.5°	19.0°	31.0°	27.0°	30.5°	29.6°
sapon. value	197.2	213.1	194.6	194.0	195.4	198.5	198.6
unsaponifiable matter	0.3%				1.2%	0.3%	0.4%
$n_D^{40}$	1.4591	1.4609	1.4621	1.4601	1.4600	1.4616	1.4616
acid value	2.9	19.6	0.8		3.2	2.2	2.0
(Wijs) I value	62.8	52.2	107.2	66.4	73.8	80.5	84.6

Bird fats contained highly unsatd. fatty acids. The fats from *Scops semitorques* (Temm. and Schl.) and *Strix* gave ether-insol. bromide. The unsaponifiable matter from "Mami-tanuki" fat is a fragrant light yellow liquid, most likely to consist of hydrocarbons.

M. NAKAMURA

**Thiocyanogen number of fatty oil and its uses.** WASABURO KIMURA. *J. Soc. Chem. Ind. Japan* 32, 451-61(1929); Suppl. Binding 32, 138-41B(1929). I. Preparation of pure thiocyanogen solution and determination of thiocyanogen number.—A pure soln. of  $(CNS)_2$  is obtainable by decomp.  $Pb(CNS)_2$  in AcOH by  $Br_2$  (in  $CCl_4$  and AcOH) and filtering off the  $PbBr_2$ . For the detn. of the  $(CNS)_2$  number, an excess of 50% of soln. and duration of 24 hrs. were suitable.  $(CN)_2$  numbers of 32 different kinds (16 animal, 16 vegetable oils) of fatty oils were detd. and tabulated, and the difference between them and the I value was discussed. II. Selective action of free thiocyanogen on unsaturated fatty acids.—The actions of  $(CNS)_2$  on Me oleate, elaidic acid, Me linoleate and Me linolenate were studied. One mol. of  $(CNS)_2$  is taken up by oleic, elaidic and linoleic acids, while linolenic acid takes up between 1 and 2 mols.; this suggests the existence of some isomers which have different  $(CNS)_2$  nos.

KOSAKA

**Determination of iodine number by the rapid method of Margosches.** S. YUSHKEVICH. *Masloboino-Zhirovoe Delo* 1928, No. 9, 22-6, No. 10, 31-5; cf. *C. A.* 18, 2436, 3484; 19, 741, 904, 1503; 20, 302, 1914.—Results obtained by the method of Margosches are in good agreement with those obtained by the method of Hübl and of Hanus. At least 65% excess of  $I_2$  must be present. Periodine numbers are analytically important.

V. KALICHEVSKY

**Improvement of methods of estimation of impurities in crude camphor.** II. Determination of iodine values of camphor and camphor oil. YAMADA AND TERUJI KOSHITAKA. *J. Soc. Chem. Ind. Japan* 31, 574-83(1928); Suppl. Binding 31, 141-2B(1928).—Four methods of detg. the I value were tested concerning the influence of concn. and amt. of reagent, time of reaction and temp. The methods were: (1) Hübl's method, (2) Wijs' method, (3) a method with AcOH soln. of Br and (4) Rosenmund's method. In methods (1) and (2), the I values depended much upon the above conditions, while by methods (3) and (4), fairly const. I values were gained in a short time. The most satisfactory results were gained when method (3) or (4) was used with sufficient excess Br at 20°.

S. OKA

**Relation between the titer and the coefficient of refraction of oils.** A. MARKMAN AND M. SERGEV. *Masloboino-Zhirovoe Delo* 1928, No. 7, 27-9.—No relation was found, hence hydrogenation cannot be controlled by observing changes in refraction coeff. of oils.

V. KALICHEVSKY

**Standards in oil manufacture.** S. IVANOV. *Vestnik Standardizatsii* 1928, No. 3, 20-2; *Chem. Zentr.* 1928, II, 2417.—I. demonstrated by the example of linseed oil and its

I no., which varies with the climate, that creation of international standards for vegetable oils is not possible in all cases. The oils of tropical plants (palm oil, almond oil, etc.), which mainly contain satd. fatty acids and fatty acids with 1 double bond, possess uniform properties on account of their formation in a climate, which is everywhere uniform. However, the properties of oils contg. 2 or 3 double bonds depend on the location in which these oils originated. Therefore the oils mentioned first may be brought under an international norm, but for the other oils, each producing country has to work out its own standards corresponding to its climate.

Steam kettles in oil factories. P. TERSIKH. *Masloboino-Zhirovoe Delo* 1928, No. 6, 6-7.—A continuous system of kettles for heating oil-bearing seeds is described.

Optical methods for the rapid examination of oil. C. VAURABOURG. *Ann. chim. anal. chim. appl.* 11, 129-32(1929); cf. *C. A.* 23, 2052.—Methods are discussed, app. shown and some typical values given.

Effect of pressure on the yield of oil. A. MARKMAN AND V. BOCHKO. *Masloboino-Zhirovoe Delo* 1928, No. 8, 19-23.—The amt. of oil lost in the cake is an exponential function of the pressure.

Determination of shell in pressed cakes. N. BELYAEV. *Masloboino-Zhirovoe Delo* 1928, No. 5, 13.—Ten g. of pressed sunflower cake is boiled under reflux with a 3% NaOH soln. for 6-7 hrs. on a water bath. The sediment (shell) is washed by decantation and dried to const. wt.

Effect of temperature on the hydrogenation process. A. MARKMAN AND V. VASIL'EV. *Masloboino-Zhirovoe Delo* 1928, No. 8, 23-4.—Absorption of H by sunflower oil in the presence of Ni reaches a max. at 250-270°. Above this temp. dehydrogenation and decompn. of the oil take place.

Catalyst for hydrogenating oils. A. MOSHKIN. *Masloboino-Zhirovoe Delo* 1928, No. 10, 16-7.—S is less poisonous to Ni catalyst than As. In regenerating Ni must be cooled in the atm. of H<sub>2</sub> or CO<sub>2</sub> as contacting of hot Ni with air affects its catalytic properties.

Influence of air on the activity of catalysts used in hydrogenating oils. A. BAG. *Masloboino-Zhirovoe Delo* 1928, No. 5, 6.—Reactivated Ni does not lose its activity when kept in contact with air for one month, provided it is treated with CO<sub>2</sub> directly after exposure to H<sub>2</sub>.

The utilization of the exhausted catalysts. S. KAZARNOVSKII. *Masloboino-Zhirovoe Delo* 1928, No. 1, 12-4; *Chem. Zentr.* 1928, II, 2417.—K. gives a survey of some methods for the regeneration of Ni from Ni catalysts freed from oil by means of extn. or sapon.

Hydrogenation of linseed oil. V. VASIL'EV. *Masloboino-Zhirovoe Delo* 1928, No. 7, 9-11.—Slightly deteriorated linseed oil absorbs more H<sub>2</sub> than can be accounted for by the decrease in I no. This is explained by reduction of hydroxyl groups formed during the oxidation process.

Oil content of sunflower seeds and factors controlling it. N. USPENSKII. *Masloboino-Zhirovoe Delo* 1928, No. 6, 31-40.—Oil content of sunflower seeds decreases with the increase in N content of the soil beyond a certain limit which is required for max. growth of leaves. Other factors such as humidity of the soil, etc., must not be below the same limit. The influence of weather is important. Oil-bearing properties are hereditary but attempts to increase the oil content of the plants beyond a certain limit may lead to reverse results.

Oil from the seeds of *Erucastrum elongatum*. N. BELYAEV. *Masloboino-Zhirovoe Delo* 1928, No. 8, 26-8.—The oil is used as food by the population of the Samara and adjacent districts in the time of famine. It has brown color, pungent odor and bitter disagreeable taste. The oil has d<sub>4</sub><sup>15</sup>—0.9321; it freezes at —24°, thickens at 17°, b. 200-210° and decomposes at 230°. It is sol. in Et<sub>2</sub>O, CHCl<sub>3</sub> and probably in all common solvents. Its acid no. is 4.52, I no. 116.3, sapon. no. 176.02, glycerol content 9.35%, av. mol. wt. 318.03. It is a semi-drying oil and can be used by the industry.

Studies on soy-bean oil. IV. Changes during the formation of polymerized and air-blown oils. K. HASHI. *J. Soc. Chem. Ind. Japan* 32, 415-22(1929); Suppl. Binding 32, 121-6B(1929); cf. *C. A.* 22, 1864.—Soy-bean oil was heated 30 hrs. at 290° in H<sub>2</sub>; the coagulated substance sepd. quickly and disappeared on further heating. The  $\eta$ , sp. gr., viscosity, acid value and mol. wt. increased and the I value decreased. The product of the above heating was distd. at 10 mm. at 250°, and the properties of the distillate and residue were examd. During the polymerization process, solid and liquid fatty acids sepd. and unstable liquid fatty acids decompd. further and hydrocarbon formed. When about 10% was distd. off from the polymerized oil, the residue was

easily changed into gel when heated at 290°; this gel formation may be prevented by addn. of rape-seed oil. Heating in the presence of dry  $\text{AlCl}_3$  decreases the I value and increases the acid value to a certain degree. They then became nearly const. The viscosity of  $\text{AlCl}_3$ -contg. oil increased rapidly during heating, but that of oil sepd. from  $\text{AlCl}_3$  with  $\text{HCl}$  is nearly unchanged, which facts show, according to H., the necessity of a small quantity of  $\text{H}_2\text{O}$  for catalytic action of  $\text{AlCl}_3$ . By blowing air into the oil at above 210°, changes of characteristic values of oil were observed in quite analogous directions as in the case of heating in  $\text{H}_2$ . N. KAMEYAMA

**Alkaline refining of castor oil.** M. BAUMAN. *Masloboino-Zhirovoe Delo* 1928, No. 7, 12-4.—Emulsions formed in refining castor oil with  $\text{NaOH}$  soln. are avoided by dilg. the oil with benzene, which is later distd. off from the refined oil. 15° Bé.  $\text{NaOH}$  soln. is used, and agitation is continued for about 30 min. while the temp. rises to 50°. The oil is settled and washed with warm water until neutral. V. KALICHEVSKY

**Control of the roll setting in a crushing mill.** V. LAZDIN. *Masloboino-Zhirovoe Delo* 1928, No. 6, 3-6.—Proper crushing of seeds is shown to be important to insure high yield of oil. V. KALICHEVSKY

**Japanese fish oils, rock-fish oil and sand-eel oils.** M. HIROSE and T. SHIMOMURA. Tokyo Imp. Ind. Laboratory. *J. Soc. Chem. Ind. Japan* 32, 569-74; Suppl. Binding, 32, 176-8B(1929).—H. and S. gave characteristic values of fish oils produced in 1927-1928, including oils of sardine, herring, plaice, salmon and trout. The properties of 2 samples of oils of rock-fish (*Sebastes macrochir*) and sand-eel (*Ammodytes personatus*) were, resp.: I value Wijs 130.0, 139.4, 167.3; sapon. value 188.2, 187.6, 184.6; acid value 3.8, 1.2, 11.6;  $n_D^{20}$  1.4710, 1.4714, 1.4750;  $d_4^{20}$  0.9228, 0.9228, 0.9300; unsaponifiable matter 1.98, 1.77%, —. M. NAKAMURA

**Deodorization of cod-liver oil by silent discharge.** Y. IWAMOTO. *J. Soc. Chem. Ind. Japan* 32, 308-12(1929); Suppl. Binding 32, 93-4B(1929).—Cod-liver oil was subjected to the action of a silent discharge in  $\text{H}_2$  and  $\text{N}_2$  under normal pressure. The sp. gr. and  $n$  increased, while the I value decreased. In  $\text{H}_2$ , the oil was perfectly deodorized after 3 or 1.5 hrs. treatment, the applied elec. pressure being 1000 and 2000 v., resp. I. confirmed by animal test that vitamin A had not been destroyed during the process and that the oil retained its original nutritive value. M. NAKAMURA

**Sulfonated oils. III. Hydrolysis of ricinoleic acid sulfuric ester and its sodium salt.** K. WINOKUTI and K. NISHIZAWA. *J. Soc. Chem. Ind. Japan* 32, 141-4(1929); Suppl. Binding 32, 47-8B(1929).—Ricinoleic acid sulfuric ester is quite stable in aq. soln. towards the action of acid at ordinary temp. (25°), partially decomposed at somewhat elevated temp. and completely at 100° under certain conditions. The time of heating at 100° necessary for the complete decompn. of the ester was detd. at several concns. of  $\text{HCl}$ . At room temp. the ester is sepd. from the soln. by concd.  $\text{HCl}$ , but the ester is quite stable at least within 24 hrs. under such a condition. Alkali exerts at least no action on the ester (Na salt) at ordinary temp. (25°) either in aq. or alc. soln., but at higher temp. (say 100°) it decomposes the ester; the velocity of decompn. is small and depends on the concn. of alkali and the nature of solvents. IV. Preparation of sodium sulforicinoleate and its isolation from commercial products. *Ibid* 145-7; 48-9B.—The ethereal soln. of ricinoleic acid sulfuric ester obtained by Grün's process is washed and then neutralized with  $\text{NaOH}$  soln. The ester can be obtained by the reaction of ricinoleic acid and concd.  $\text{H}_2\text{SO}_4$  at room temp., but the yield is less than that by the chlorosulfonic acid process. The crystals of the ester salt are orthorhombic, prismatic or rather lath-shape and optically active, the axial plane being at right angles to the crystallographic elongation, but its axial angle not being so large. M. NAKAMURA

**Proposed standard method for the analysis of so-called 72% soaps.** ANON. *Ann. fals.* 22, 325-33(1929).—The method proposed by the Chambre Syndicale des Fabricants de Savons à Marseille is described in detail. A. PAPINEAU-COUTURE

**Chlorinated herring oil and its soap.** M. HIROSE and T. SHIMOMURA. *J. Soc. Chem. Ind. Japan* 32, 233-6(1929); Suppl. Binding 32, 71-2B(1929).—The properties of the chlorinated herring oil obtained by passing dry  $\text{Cl}$  through refined herring oil at 18-20° were examd. The fishy smell is eliminated by chlorination; an irritating gas ( $\text{HCl}$ ) is evolved at room temp. Chlorination does not have a remarkable effect on the drop no. of the soap. The lather of soap of the chlorinated oil is very thin and transparent and vanishes rapidly. K soap of chlorinated oil exposed in the air for a long period gave an offensive odor and became dark brown. Chlorinated oil is not suitable for soap stock. M. NAKAMURA

**Soap from polymerized fish oil.** M. HIROSE. *J. Soc. Chem. Ind. Japan* 32, 381-4(1929); Suppl. Binding 32, 115-6B(1929).—The oil was polymerized by heating

in a current of  $\text{CO}_2$ , and the drop nos. of a Na-soap soln. of polymerized herring oil were measured by means of a Hillyer's stalagmometer, the kerosene of "Chester" brand b. 150–200° being used as the medium oil. The drop no. decreased as the polymerization proceeded at the beginning, but after a certain period it began to increase to a max. and then decreased again. The max. drop no. was, however, smaller than that of the soap from the original oil. The lathering power measured with a Stiepel's flask modified by H. showed that the soap of polymerized oil was less than that of the original soap. The lathering vol. decreased in the first stage of polymerization, then increased remarkably and exceeded that of the soap from the original oil and then decreased again. Conclusion: The degree of polymerization of this oil most suited for soap manuf. corresponds to an I value of 80; the soap produced had no disagreeable smell and no apparent change after long keeping.

M. NAKAMURA

**Soap from castor oil.** N. PANTYUKHOV. *Masloboino-Zhirovoe Delo* 1928, No. 7, 11–2; cf. C. A. 22, 3794.—Greatest difficulties are encountered in the salting-out process. The curd soap from castor oil is easily sol. in alkali and salt solns. It is hard and has an appearance of a good soap, but is easily sol. in water, contains large quantities of salts, and does not lather well.

V. KALICHEVSKY

**Cold method of manufacturing soaps in presence of catalysts.** D. ZABRAMNII AND I. ITZKOVICH. *Masloboino-Zhirovoe Delo* 1928, No. 10, 18–21.—Cottonseed oil yields a soft soap by the usual method of manuf. in Middle Asia where hydrogenated oils are not available. It is recommended to use the cold process with  $\alpha$ - or  $\beta$ -naphtholsulfonic acid as catalyst. To prevent discoloration of the soap not over 0.1–0.2% of catalyst should be used. Soap of high quality is obtained but glycerol is lost in the process.

V. K.

**Studies on soap solution.** VII. Adsorption of soaps on charcoal. JIRO MIKUMO. *J. Soc. Chem. Ind. Japan* 32, 574–6(1929); Suppl. Binding 32, 178–80B(1929); cf. C. A. 23, 3118.—The adsorption of single K soaps (laurate, myristate, palmitate, stearate and oleate) in abs. alc. soln. on animal charcoal (Merck's "extra pure" purified with EtOH and Et<sub>2</sub>O) was measured. For single soaps Freundlich's adsorption isotherm holds below the concn. of aggregate formation, and Traube's rule is also applicable. In binary mixed soaps, the higher soap is always predominant on the adsorption layer, displacing the lower soap to a certain extent.

Acids, alcohols and hydrocarbons from waxes (Brit. pat. 304,150) 10. Degreasing, etc., of animal and vegetable fibers [with soaps, oils and fats as by-products] (Brit. pat. 304,295) 25.

RENAUD-SIVAN: *L'industrie des corps gras dans la région de Marseille*. Paris: Dunod. 140 pp. F. 20.

**Wool fat.** REGINALD O. HERZOG and HEINRICH OESTERMANN. Ger. 477,959, Mar. 9, 1923. A sulfonated product of wool fat is obtained by sepg. the wax-like and liquid constituents in the known way and sulfonating them separately.

**Sulfonated wool fat.** I G. FARBENIND. A.-G. Brit. 305,597, Feb. 7, 1928. In prepg. water-sol. products of high emulsifying power, from the fatty acids of wool fat, these acids are treated with O or with a gas contg. O, at a high temp., with or without a catalyst such as Co resinate, which effects volatilization of substances of low mol. wt. and decreases the acid value of the mixt. The product obtained by sulfonating the fatty acids and pptg. by Na<sub>2</sub>SO<sub>4</sub> soln. is treated with BuOH and soda lye which effects sepn. of an upper layer of the purified product. This may be used to stabilize easily pptd. solns. such as those of 2,3-hydroxynaphthoic acid arylides.

**Emulsifying margarine, chocolate pulp, tallow or other fatty materials.** V. A. T. FAURSKOV. Brit. 304,256, Oct. 12, 1927. The material is subjected to the action of rollers revolving in opposite directions, in an app. which is described.

**Phosphatides—sterols.** CHEMISCHE FABRIK PROMONTA G. M. B. H. Ger. 479,353, Aug. 8, 1926. Addn. to 463,531. According to Ger. 463,531, fats or suitable exts. of fats are run in a thin stream into hot EtOH denatured with crude MeOH and, after sepg. the fatty residue, the alc. soln. is evapd. and the phosphatides and sterols are sepd. from the evapd. product with acetone. This method is now modified by using aq. or abs. EtOH or MeOH for the initial extn. step. Examples are given.

Apparatus for heating oil-bearing seeds, etc., prior to pressing. FRIED. KRUPP GRUSONWERK A.-G. Ger. 472,211, Oct. 18, 1925. See Brit. 259,939 (C. A. 21, 3477).

Cooking cotton seeds or other oil-bearing seeds preparatory to oil extraction. JOSEPH DAVIDSON (to Davidson-Kennedy Co.). U. S. 1,724,073, Aug. 13. Steam having a temp. above 200° is passed directly through the material and the excess steam and moisture are drawn off. An app. is described.

Aqueous emulsions or solutions of tall oil. HEIN & COMP. Ger. 479,085, June 10, 1925. The dispersion is effected, in the presence of a soap, with  $\text{PhNH}_2$  or its homologs, with or without a naphthol. An example is given.

Tall oil products. OEL- UND FETT-CHEMIE G. M. B. H. Ger. 477,829, Dec. 5, 1926. Products valuable in commerce are made from tall oil by fractioning *in vacuo* at a pressure below 8 mm.

## 28—SUGAR, STARCH AND GUMS

J. K. DALE

Titrimetric determination of invert sugar. G. D'ORAZI. *L'ind. saccharifera ital.* 21, 502(1928); *Listy Cukrovar. Rozhledy* 47, 27.—During the boiling of Fehling soln. with invert sugar and  $\text{NH}_4\text{OH}$ , the  $\text{Cu}_2\text{O}$  is not redissolved. The soln. becomes clear and colorless as all of the bivalent Cu is reduced to the univalent. The detn. is carried out by adding  $\text{NH}_4\text{OH}$  to a standardized Fehling soln., and while boiling, adding a soln. of invert sugar from a buret until decolorization occurs. Sucrose has an insignificant effect upon the reduction.

FRANK MARESH

The continual filtration following the first saturation. E. SAILLARD. *Suppl. Circ. Hebdm.* No. 2079(1929); *Listy Cukrovar. Rozhledy* 47, 31.—S. describes a filtering plant consisting of a concentrator and a rotating filter which has 0.1 the capacity of the plant. Details of the process are given.

FRANK MARESH

Methods for the determination of injurious nitrogen in beets. B. A. RUBIN. *Zhur. Sakharnoi Prom.* 2, 83-8(1928).—The method of Friedl (C. A. 5, 3179), modified by Herzfeld (Z. Ver. deut. Zuckerind. 70, 307), cannot be accepted for exact detn. of injurious N in beets. Even in beets which contain a very high % of it the exptl. error of Friedl's method reaches 4%, which cannot be compared with Kjeldahl's much superior precision method. It is not possible to apply a correction, as errors are variable. Comparative tables are shown.

V. E. BAIKOW

Changes in beets during storage. I. E. DUSHKII AND P. G. GALABUTSKII. *Zhur. Sakharnoi Prom.* 2, 213-28(1928).

V. E. BAIKOW

Regeneration of Norit. S. S. KUTZEV AND M. R. KOTLYARENKO. *Zhur. Sakharnoi Prom.* 2, 236-8(1928).—The decolorizing power of used Norit cannot be raised by chem. treatment to more than 65.68% of the original. Further treatment gives a decrease in decolorizing power and an increase in ash. Exhausted Norit after 50 days of use contained 17.5% of ash and 2.03% of mineral oils. The sample treated 8 times with 2% soln. of NaOH and 2% HCl still contained some oil and 9.7% of ash. The decolorizing power increased only from 52.55 to 55.6% of the original. After extn. of the oils by ether and after washing 6 times with 2% NaOH and once with 2% HCl the decolorizing power increased to 69.16%, while the ash decreased to 6.4%; a trace of oils was left. Norit regenerated in the factory and submitted in the lab. to thermal treatment in a current of  $\text{CO}_2$ , then washed once with 2% NaOH and 2% HCl contained no longer any trace of oil, the decolorizing power increased to 88.43% and the ash decreased to 3.2%. In bone char an increasing amt. of oil decreases the decolorizing power.

V. E. BAIKOW

The chemical constitution of gums. I. The nature of gum arabic and the biochemical classification of the gums. ARTHUR G. NORMAN. *Biochem. J.* 23, 524-35 (1929).—Gum arabic is not a substance of definite empirical formula, but in its general compn. there is a nucleus-acid consisting of galactose, and a uronic acid, probably galacturonic acid, to which is linked arabinose by glucoside linkages. There is no essential difference in structure between gums and hemicelluloses. BENJAMIN HARROW

Exterminators for beet parasites (Tesi) 15. Starch, amylase and amylolysis (COLIN) 16. The ecology of growing beets and its relation to plant diseases (STREHLIK, NEUWIRTH) 15. The production of pressed foods from dried beets and molasses (SAILLARD) 12. A new series of depolymerization products of starch (PICTET, VOGL) 10. Evaporator for treating sugar solutions (Brit. pat. 304,670) 1.

**Purifying raw sugar juices.** HERMAN SCHREIBER. U. S. 1,724,376, Aug. 13. The juice is heated at a temp. somewhat below the b. p. until no further sepn. of non-sugars occurs, lime is added to the sepd. juice to adjust the  $p_H$  and the limed juice is heated until a clear liquid is produced.

**Sugar-crystallizing apparatus.** BERNARD H. VARNAU and TRUMAN B. WAYNE. U. S. 1,724,627, Aug. 13.

**Starch.** HENKEL & CIE. G. M. B. H. (Max Jacobi, inventor). Ger. 478,538, July 2, 1925. Starch for use with cold water is prepd. by grinding with KOH, water and alc. or acetone, drying and regrounding.

**Starch preparations.** HENKEL & CIE. G. M. B. H. (Guido Hedrich, inventor). Ger. 479,143, Aug. 18, 1926. See Brit. 276,340 (C. A. 22, 2482).

## 29—LEATHER AND GLUE

ALLEN ROGERS

**Work of the German research laboratory for the leather industry in Freiberg during 1928.** JOHANNES PAESSLER. *Ledertech. Rundschau* 21, 37-9, 53-7, 64-7, 75-8, 87-9 (1929).—Summary of analyses made during 1928.

**A study of enzymes in the leather industry.** PAUL I. SMITH. *Ind. Chemist* 5, 311-2, 323 (1929).—A review. I. D. CLARKE

**Committee on oils, fats and waxes [of the I. S. L. T. C.] II. Limitations of present methods used in the analysis of oils and fats in the leather industry.** D. BURTON AND G. F. ROBERTSHAW. *J. Intern. Soc. Leather Trades Chem.* 13, 285-97 (1929); cf. C. A. 23, 1764.—A discussion. E. H. H. B. MERRILL

**The significance of the  $p_H$  value in leather manufacture.** M. AUERBACH. *Leder- tech. Rundschau* 21, 93-7 (1929).—A general discussion. I. D. CLARKE

**Fat liquors with special consideration of preparations containing lecithin.** ANON. *Leder- tech. Rundschau* 21, 105-9 (1929).—Vegetable lecithin (*Leder- tech. Rundschau* 1928, 23) is an excellent material for use in fat liquors. I. D. CLARKE

**The principles of fat liquoring.** OSWALD STADLER. *Leder- tech. Rundschau* 21, 69-74, 83-7 (1929).—A discussion from the practical viewpoint of parts of a monograph by Wilh. Schindler (cf. C. A. 23, 2846). I. D. CLARKE

**Acidity of vegetable-tanned leathers.** W. R. ATKIN AND F. C. THOMPSON. *J. Intern. Soc. Leather Trades Chem.* 13, 300-9 (1929).—Vegetable-tanned leather probably still contains some free  $NH_2$  groups, and may, therefore, be treated as a protein jelly like collagen or gelatin. The  $p_H$  value of any external soln. in contact with such a jelly is lower than that of the melted jelly, but the difference disappears if the external soln. is made about 0.1 *N* in KCl or other salt. Weigh 3 different quantities of leather increasing by powers of 2 or of 3 (e. g., 1, 3 and 9 g.). Digest each sample for 24 hrs. with exactly 100 cc. of 0.1 *N* KCl, filter and det.  $p_H$  value of the ext. by any convenient method. Plot  $p_H$  value of each soln. against  $\log_{10}$  of the diln. of the  $H_2O$  in the leather (e. g., for 1 g. of leather contg. 14%  $H_2O$ , diln. is  $100.14 \div 0.14 = 716$ ). Extrapolate to zero diln. The resulting figure is the  $p_H$  value of the acid soln. in the original leather, and is called the "acid figure." Acid figures are compared with % mineral acid by the Procter-Searle method. For leathers tanned with ordinary vegetable tanning materials, the 2 detns. give concordant results. In general, when % mineral acid  $\geq 0.5$ , acid figure  $\leq 2.5$ . For leathers tanned with syntans or other substances containing sulfonic groups, the % mineral acid found by the Procter-Searle method is generally high, but the acid figures indicate low acid in such leathers, which is in accordance with the facts. H. B. MERRILL

**The evaluation of cold-soluble quebracho extracts.** M. AUERBACH. *Leder- tech. Rundschau* 21, 118-22 (1929).—An untreated settled, cold-sol. quebracho ext. was compared with a sulfated ext. The former gave better weight and penetration in tanning and less ash and soluble matter in the leather.

**Tanning materials and their estimation.** [Effect of tanning agents on properties of gelatin and hide.] G. GRASSER and SUN TAU. *J. Am. Leather Chem. Assoc.* 24, 406-27 (1929).—Strips of gelatin and of hide were treated with (a) metalloids (I, Br, S), (b) metal salts, (c) metallic dichromates, (d) coal-tar dyestuffs, (e) vegetable tanning materials, and (f) ultra-violet light. The change in m. p. of gelatin and increase in shrinking temp. and hrs. required for complete hydrolysis of hide upon boiling were detd. Some tanning agents have a much greater relative effect upon gelatin than upon hide, and *vice versa*. Results of several hundred tests are tabulated. H. B. M.

**Gelatin.** KATHLEEN PEARSON AND PAUL I. SMITH. *Food Manuf.* 2, 232-4, 287-9; 3, 427-30 (1928).—The properties, applications, technical valuation of the various grades of gelatin and a simple description of its manuf. are given. J. A. KENNEDY

**The water-resisting property of glue and casein glue.** I. TSURUO ARAKI AND TASUKE MATSUNO. *J. Soc. Chem. Ind. Japan* 32, 591-5 (1929); Suppl. Binding 32, 183-4B (1929).—This property was measured by the time of failure under const. load in water of test pieces bound together by glue. With test joints made with casein glue, fairly concordant results were obtained for various specimens of casein. With test joints made with glue, widely varying results were obtained according to the kind of glues. Glues of higher  $p_H$  values generally have inferior water-resisting property with the exception of bone glue. Good glues are more water-resistant than the com. casein glues. II. *Ibid* 32, 595-600 (1929); Suppl. Binding 32, 184B (1929).—The water-resisting properties of glues are improved by treatment with paraformaldehyde together with oxalic acid; those of casein glues are improved by mixing them with a little Cu salt. In a water bath at 45° the test joints failed much sooner than at 20°. To test the brittleness of the casein glues, the glued test pieces were examd. by a high-speed vibration testing machine for 40 hrs., after which the shearing strength of the glued portion was tested, but the decrease of the strength was not noticed. S. OKA

Contribution to the theory of vegetable tanning (BUNGENBERG DE JONG) 2. Cellulose ester compositions [for coating leather] (Brit. pat. 304,814) 23.

**Preparing skins such as those of crocodilians for tanning.** RODOLPHE A. GERMAIN. U. S. 1,725,629, Aug. 20. In order to decalcify skins with calcareous formations without detaching the latter, the skin is macerated in a 2-10% soln. of an acid, which dissolves the calcareous matter and neutral salts in sufficient quantity to give a soln. of mol. tension high enough to oppose swelling and attack of the fiber; the skin is moved about, with care, in the soln., and is afterward washed and neutralized.

**Treating hides and skins with flowing liquors for depilating, cleansing, tanning, etc.** MATTHEW M. MERRITT (to United Shoe Machinery Corp.). U. S. 1,724,954, Aug. 20. A liquor is caused to flow rapidly past both sides of hides or skins in stretched condition; the used liquor is mixed with stronger liquor to restore its strength and is reused with the stronger liquor. An app. is described.

**Drench for treating hides.** I. G. FARBENIND. A.-G. Brit. 304,214, Jan. 16, 1928. A drench is prepd. by the action of bacteria such as those of the mesenteric group on albuminous and fatty substances such as defibrinated blood and refuse from meat and fish. A dry product may be formed by drying the liquid on kieselguhr, animal charcoal, sawdust, etc.

**Treating hides and skins preparatory to tanning.** I. G. FARBENIND. A.-G. Brit. 304,204, Jan. 18, 1928. Hides and skins after being limed and unhaird are drenched with materials such as those prepd. as described in Brit. 304,214 (preceding abstract). A salt such as  $AlCl_3$  may be used to facilitate the deliming process.

**Treating hides and skins before tanning.** SOC. INDUSTRIELLE DES APPLICATIONS CHIMIQUES SOC. ANON. Brit. 305,126, Jan. 31, 1928. Depilation is effected by treatment with purified Na sulfide or thioarsenite to which, for fatty hides, a small quantity of soda soln. may be added. Desulfurizing agents such as Al acetate may be used to prevent subsequent deterioration of the hides. Cf. C. A. 23, 2066.

**Tanning agents.** LEOPOLD POLLAK. Ger. 479,162, Mar. 4, 1925. Tanning agents are prepd. by treating sulfite cellulose lye with aromatic hydroxy or sulfo compds. in the presence of a mineral acid or  $S_2Cl_2$  and in the absence (as far as possible) of water, the reaction being conducted under energetic conditions until no free hydroxy or sulfo compd. remains. The products may be purified by treatment with Zn, Al, Mg or Fe. Examples are given.

**Synthetic tanning agents.** I. G. FARBENIND. A.-G. Brit. 304,454, Jan. 9, 1928. Water-sol. synthetic tanning agents are obtained by condensing phenol alcs. (which may also contain alkylated hydroxyl groups or carboxylic groups) with resorcinol at a temp. below 50°, preferably in the presence of an acid or alk. condensing agent. Examples are given both of this process and of the prepn. of the phenol alcs. used.

**Synthetic tanning agents.** J. R. GEIGY AKT.-GES. Brit. 305,013, Jan. 28, 1928. Condensation products of sulfonated phenols with urea and  $CH_3O$ , which are sol. in alkalies and suitable for use as tanning agents and also for *weighting silk*, are produced by sulfonating a phenol and then adding urea or a substance yielding urea, and  $CH_3O$

or a  $\text{CH}_2\text{O}$  substitution product, or adding to the sulfonated phenol the condensation product of urea and  $\text{CH}_2\text{O}$ . Several examples are given.

**Tanning with iron compounds.** E. G. STIASNY and B. JALOWZER. Brit. 305,562, Nov. 7, 1927. Complex compds. of Fe are used, such as those obtained by treating a  $\text{FeCl}_3$  soln. with  $\text{Na}_2\text{CO}_3$  and Na lactate, or by treating a soln. of  $\text{FeSO}_4$  acidified with  $\text{H}_2\text{SO}_4$  with K chromate and Na lactate. Various other reacting materials suitable also for producing complex compds. include compds. of acetic, oxalic, malonic, butyric and nitric acids or naphthalene or anthracenesulfonic acids. Glucose or molasses also may be added. Cf. C. A. 23, 543.

**Plastic composition suitable for making imitation leather, etc.** MOISEY M. SEREBRIANOI. U. S. 1,724,523, Aug. 13. Leather scrap is soaked and heated in water, turpentine is added and the material is formed into sheets by compression.

**Glue.** WILHELM LEIBROCK and AUGUST KLEE. Ger. 477,783, Dec. 25, 1925. Strong glues are made by heating finely divided albuminous substances with water in the presence of such materials as  $\text{NaOH}$ ,  $\text{Na}_2\text{CO}_3$ ,  $\text{NH}_4\text{OH}$ ,  $\text{Na}_2\text{B}_4\text{O}_7$  or  $\text{Ca}(\text{OH})_2$ .

### 30—RUBBER AND ALLIED SUBSTANCES

C. C. DAVIS

**Jelutong.** C. D. V. GEORGI. *Malayan Agr. J.* 17, 101-17(1929).—Since Fe compds. have been shown to induce the oxidation of jelutong (cf. C. A. 23, 546) and since jelutong can, during its prepn., be easily contaminated with Fe, expts. were carried out to det. at what stage Fe has the greatest influence. The expts. with Cu and Mn compds. were repeated, the reputed tendency of Kedah jelutong to oxidize was investigated further, and the behavior of creped jelutong in storage was detd. In the new expts. various proportions of aq.  $(\text{NH}_4)_2\text{Fe}_2(\text{SO}_4)_3$  were added to the latex, the latter was then coagulated with  $\text{H}_2\text{SO}_4$ , let stand 4 days, squeezed and left without further treatment or refined with boiling water. The results show that very small proportions of sol. Fe salts induce rapid oxidation, without the growth of mold, even 1 part of sol. Fe in 20,000 parts of latex causing complete oxidation after 3 months, in which case only 60% of the Fe originally added was found in the oxidized product. Jelutong refined with boiling water did not oxidize nearly so rapidly (because of the smaller Fe content of the corresponding samples), though here too oxidation was well advanced after 4 months. Treatment with boiling water also increased the toughness. The same general results were obtained with  $\text{FeCl}_3$ , with  $\text{AcOH}$  as coagulant. When jelutong latex contg. Fe salts was coagulated by boiling, the product was also susceptible to oxidation in much the same way, even after refining with boiling water. Expts. with rusty coagulating app. showed that wherever spots of rust existed in the jelutong, oxidation ensued. When  $\text{Fe}_2\text{O}_3$  was mixed with latex before coagulation with  $\text{H}_2\text{SO}_4$  or coagulation by boiling, black mold developed, but there was no oxidation. There was no oxidation of jelutong prepd. by soaking the coagulum in water contg.  $\text{Fe}(\text{OH})_3$  (1-40 parts of Fe per 100,000 parts of water) and refining with boiling water after 4 days. Contact of the surface of refined jelutong with aq.  $\text{FeCl}_3$ ,  $(\text{NH}_4)_2\text{Fe}_2(\text{SO}_4)_3$ , and  $\text{Fe}(\text{OH})_3$  and rusty nails caused little or no oxidation. Addn. of  $\text{CuSO}_4$  (1 part of Cu per 2500-10,000 parts of latex) and coagulation with  $\text{AcOH}$  yielded products, which, whether or not they were refined with boiling water, showed no signs of oxidation. Similar treatment, except for coagulation with boiling  $\text{AcOH}$ , yielded products which with the higher proportions of  $\text{CuSO}_4$  were completely oxidized after 4 months. Similarly,  $\text{MnCl}_2$  and  $\text{MnSO}_4$  (1 part of Mn per 1000-4000 parts of latex) yielded products which did not oxidize, and which showed no abnormal growth of mold. The higher proportions of Mn tended to retard coagulation. In general, the res. lts agree with those of the earlier expts. (*loc. cit.*). Fe is the most dangerous metal of those tested, but it is objectionable only if in sol. form in the latex. An investigation of Kedah jelutong showed no evidence in support of the view that this jelutong is particularly prone to oxidation. Expts. also show that creped jelutong has no greater tendency to oxidize than the corresponding uncreped product. C. C. D.

**Microscopic investigations on the occurrence of resins in Hevea latex.** A. FRIG-WYSSLING. *Arch. Rubbercultuur* 13, 371-91(1929). (In English 392-412.)—A systematic study of latexes of different origins led to the discovery that there are present among the rubber particles a hitherto unsuspected kind of globule which has the same appearance as the rubber particles but which consists of resin. These colorless globules of resin carry the yellow pigment of latex, and it was because of this that they were first detected in latex from trees which yielded a yellow latex. They occur not only in the

latex of *Hevea brasiliensis*, but also in that of *H. guianensis*, *H. collina* and *H. spruceana*, in the latter in relatively great quantities. Their dimensions are about the same as those of the rubber particles. They refract light somewhat more; they are viscous and of a butter-like consistency; and they cohere far better than rubber particles. Unlike rubber particles they can be stained by fat coloring dyes, and unlike rubber particles they are sol. in EtOH, AcMe and AcOH. They contain several components, including various esters of fatty acids and at times the yellow pigment. They are unaffected by  $\text{NH}_3$ ,  $\text{Na}_2\text{CO}_3$ ,  $\text{Na}_2\text{SO}_3$ ,  $\text{NaHSO}_3$  and  $\text{Na}_2\text{S}_2\text{O}_3$ , but are liquefied by 40% aq.  $\text{HCHO}$ . No peroxidase is present. They reduce 1% osmic acid and  $\text{AgNO}_3$ , and are oxidized by  $\text{HNO}_3$  and by  $\text{KMnO}_4$ . Though the yellow pigment is absorbed in the resin there is no quant. relation between the resin content and the pigment content of the latex. If pigment formation is abundant, yellow latex results, whereas with only a slight tendency to form pigment the latex is white. Colorless resin globules also occur in branches and in very young latex next to the cambium, and in general, the formation of resin globules in latex is just as characteristic of the rubber tree as the formation of rubber particles.

C. C. DAVIS

Latices of *Euphorbia tirucalli*, *E. candelabro* and *E. abyssinica*. E. DE'CONNO, S. CAPALBI AND L. FRUITIER. *Ann. chim. applicata* 18, 540-9(1929).—All plants of the *Euphorbia* family contain some latex. The varieties found in *Tirucalli*, *Candelabro* and *Abyssinica* have been investigated. They contain, resp.,  $\text{H}_2\text{O}$  46.8, 30.05, 49.6%; gums 7.25, 8.3, 8.44%; insol. residue 10.1, 9.8, 2.02%. All also contain traces of fatty substances.

A. W. CONTIERI

The swelling of rubber. P. STAMBERGER AND C. M. BLOW. *Nature* 124, 13 (1929).—Expts. on the diminution of the vapor pressure of solvents in rubber jellies and on swelling pressures show that the vapor pressure of jellies is a const. at a given concn. of rubber, regardless of the kind of rubber and the extent to which it has been masticated (cf. S., C. A. 22, 2078). However, after mastication swelling is unlimited and up to 30% concn. a viscous liquid is obtained, which shows that the solvent is not bound by surface adsorption. The relative vapor-pressure-concn. curve differs from that calcd. by Raoult's laws, the curve bending sharply at 20-30% concn. toward the vapor-pressure axis, which suggests that the phenomenon is more complicated than ordinary soln. Though no difference was found between the vapor pressure of "liquid" jelly from masticated rubber and solid jelly from untreated rubber, the swelling pressures were far different, showing that the swelling of a structureless rubber differs greatly from that of a rubber with a well-defined structure, though both show the same diminution of vapor pressure. It is impossible, therefore, to calc. the swelling pressure from the vapor-pressure diminution on a thermodynamical basis. The expts. show that the forces which cause imbibition of solvent by jelly are not uniform, a "structure factor" taking a part when the solvent is in liquid form.

C. C. DAVIS

The influence of the amount of the surplus liquid on the swelling maximum of rubber jellies. C. M. BLOW AND P. STAMBERGER. *Rec. trav. chim.* 48, 681-94(1929); cf. C. A. 22, 4314; 23, 3144.—Rubber jellies in PhMe, petroleum ether or  $\text{C}_6\text{H}_6$  show an increasing swelling max. with an increase in the initial vol. of liquid present, up to a point beyond which a greater vol. of liquid causes no greater swelling max. The variations are due to the rubber diffusing into the solvent during the process of swelling to different extents when different proportions of liquid are present. The effect of a higher temp. during swelling is to increase the swelling max. The proportion of rubber in a gel was detd. by drying the gel and weighing. It was found that the concn. of rubber in the unabsorbed liquid was greater, the less the proportion of pure liquid present initially. The jelly swells less, the higher the concn. of rubber in the final liquid. Nearly the same final state was observed when rubber was swollen in solvents initially contg. varying proportions of rubber, and when jellies swollen to a max. were transferred to solns. contg. varying proportions of rubber. Variations in the swelling max. due to change in the concn. of the rubber in the unabsorbed liquid, can be explained qual. on the assumption of an osmotic phenomenon.

CORNELIA T. SNELL

Cold vulcanization [of rubber] (Parkes' process). P. BOURCOIS. *Bull. fédération ind. chim. Belg.* 8, 3-8(1929).—The method of vulcanization of rubber by immersion in a soln. of  $\text{S}_2\text{Cl}_2$  is reviewed, with especial reference to certain practical details and difficulties. The vulcanizing effect is attributed to nascent S formed from the  $\text{S}_2\text{Cl}_2$  by the action of natural moisture in the rubber.

B. C. A.

Topochemical reactions with racked rubber. F. KIRCHMOP. *Kautschuk* 5, 9-13 (1929).—When immersed in  $\text{H}_2\text{SO}_4$  (d. 1.8) for 4 months, thin strips of smoked sheet rubber which had been racked to 600% darkened and lost their power of contraction in warm water. A fibrous structure was, however, still evident both from visual examn.

and by the production of a distinct point diagram with x-rays. Treatment of similarly raked rubber with Br water also yielded a product with a superficially fibrous character, but x-rays revealed no sign of any structure, even the amorphous ring being absent. Apparently bromination causes a complete structural disturbance both in the amorphous component and in the crystallites, whereas with  $H_2SO_4$  the action appears to be confined chiefly to the amorphous phase.

C. C. DAVIS

The problem of vulcanization without sulfur. LEO ECK. *Gummi-Ztg.* 43, 2481-2 (1929).—A discussion of present knowledge, with particular reference to the work of Ostromislenskii (cf. following abstr.). For vulcanization without S to be successful economically: (1) the new process must be no longer nor more difficult than that with S; (2) the phys. properties of the vulcanizates, including their aging, must be at least as good as those of the corresponding vulcanizates with S; (3) the vulcanizing agent must be innocuous; and (4) if the vulcanizing agent gives no better results than does S, it must be cheaper. The fulfillment of these conditions by  $1,3,5-C_6H_3(NO_2)_3$  is open to question.

C. C. DAVIS

Vulcanization without the use of sulfur. IVAN OSTROMISLENSKII. *India Rubber World* 80, No. 3, 55-61 (1929).—Because of contradictory results obtained by other investigators on the vulcanization of rubber with  $1,3,5-C_6H_3(NO_2)_3$ , and to furnish quant. data on the methods and results obtained by O. (which were not published in complete form in the original papers of O.), the earlier expts. are reviewed and discussed and quant. data not heretofore published are given. The commonest error in using  $1,3,5-C_6H_3(NO_2)_3$  is to use too much. Over 3% should never be used, and 2% is better (based on the wt. of rubber). All mixts. should contain an agent to protect the vulcanizates against aging, e. g., relatively large proportions of oxides (PbO, ZnO, etc.) or 0.3-1.0% of aromatic amine. Rubber mixts. vulcanized with  $1,3,5-C_6H_3(NO_2)_3$  often have phys. properties superior to the corresponding mixts. with S. The aging in particular is better with the  $1,3,5-C_6H_3(NO_2)_3$  vulcanizates. A sample 13 yrs. old has shown little or no change in phys. properties. With suitable accessory ingredients, rubber mixts. can be vulcanized at 50-100° with  $1,3,5-C_6H_3(NO_2)_3$ . With the latter, overcuring is minimized, e. g., a mixt. of rubber 100,  $1,3,5-C_6H_3(NO_2)_3$  2,  $PhNH_2$  1, ZnO 150, has almost the same phys. properties whether cured for 20 min. or for 2 hrs. at 141°. Carborundum, Si and certain other uncommon ingredients accelerate the action of  $1,3,5-C_6H_3(NO_2)_3$  and impart peculiar phys. properties to the vulcanizates. Deterioration through contact with Cu or by acids is slower in vulcanizates cured with  $1,3,5-C_6H_3(NO_2)_3$  than in those cured with S. Metallic oxides, sulfides, selenides and tellurides, C black, lamp black, amorphous C, graphite, Si, SiC, red P, Al, talc, ultramarine and other substances accelerate the action of  $1,3,5-C_6H_3(NO_2)_3$ , whereas amorphous B is not an accelerator. C black, whether it is or is not satd. with air, accelerates in the same way, so it does not act as an O carrier. With a chem. and a phys. accelerator together, e. g., with a metallic oxide and C black, the effect is additive. The character of the ZnO governs to a great extent its accelerating power. Thus a mixt. of rubber 100,  $1,3,5-C_6H_3(NO_2)_3$  2, ZnO 150, cures in 20-25 min. at 141° with "Kadox", ZnO, whereas with ordinary ZnO the cure is 160 min. at 141°. C black is also an excellent accelerator with  $1,3-C_6H_4(NO_2)_2$ . With PbO and C black, 0.25-0.5% of  $1,3,5-C_6H_3(NO_2)_3$  (based on the wt. of rubber) is the min. required for satisfactory vulcanization. The presence of S (0.3-8.0%) or of ordinary accelerators does not influence the rate of vulcanization with  $1,3,5-C_6H_3(NO_2)_3$ . With 2-8% S (there is a discrepancy between these values and those above—ABSTRACTOR) or with a large proportion of aliphatic or aromatic amine, the rate of vulcanization with  $NO_2$  compds. is retarded and the phys. properties of the vulcanizates are impaired. Aromatic amines, S, metallic sulfides and above all  $Sb_2S_3$ , certain S dyes and tannic acid protect  $1,3,5-C_6H_3(NO_2)_3$  vulcanizates from oxidation and other changes occurring on storage in the open air. The proportion of these protective substances should be limited to 0.3-1.0%. A few representative factory rubber mixts. cured with  $1,3,5-C_6H_3(NO_2)_3$  had superior phys. properties for the particular uses to the corresponding mixts. cured with S.

C. C. DAVIS

Deposition of aqueous dispersions [of rubber] (Fr. pat. 657,404) 13. Coating fabrics with rubber (Brit. pat. 304,157) 25. Coating fabrics with natural or artificial rubber dispersions (Brit. pat. 305,264) 25. Heating apparatus [for vulcanizing rubber] by steam (Brit. pat. 305,577) 13. Electrophoresis [reversal of rubber latex] (Brit. pat. 305,630) 4.

Centrifugal concentration of latex. AKTIEBOLAGET SEPARATOR. Brit. 304,686, Jan. 24, 1928. Liquid to be treated is supplied from a tank of uniform cross section

in which the surface is protected from the air by a float which prevents evapn. of  $\text{NH}_3$  or other preservative. Various other app. details are described.

Composition from rubber latex and casein. WM. W. CHRISTMAS. U. S. 1,724,906, Aug. 20. Casein is dissolved in a strong  $\text{NH}_3$  soln. heated to about 70–90°, mixed with raw rubber latex, and the resulting compn. is dried and vulcanized.

Rubber. ERNST ROHLIN. Ger. 478,590, Aug. 23, 1925. A dipping app. for the prepn. of rubber goods and for the recovery of the solvent is described.

Preserving rubber. A. M. CLIFFORD (to Goodyear Tire & Rubber Co.). Brit. 305,195, Feb. 2, 1928. Aryl hydroxides such as hydroquinone and amines such as aniline are caused to react in the absence of solvents (suitably by heating with  $\text{CaCl}_2$ ) to form compds. which improve the "aging qualities" of rubber. Cf. C. A. 23, 4376.

Preserving rubber. A. M. CLIFFORD (to Goodyear Tire & Rubber Co.). Brit. 305,572, Feb. 7, 1928. The "aging qualities" of rubber are improved by adding aromatic nitrosoamines such as the nitroso derivs. of phenyl- $\beta$ -naphthylamine,  $\beta$ , $\beta$ -dinaphthylamine or the like.

Preserving rubber. A. M. CLIFFORD (to Goodyear Tire & Rubber Co.). Brit. 305,647, Feb. 9, 1928. See U. S. 1,717,093 (C. A. 23, 3828).

Retarding deterioration of rubber. WM. S. CALCOTT, WM. A. DOUGLAS and OLIVER M. HAYDEN (to E. I. Du Pont de Nemours & Co.). U. S. 1,725,564, Aug. 20. In order to retard deterioration by the action of oxidation and heat, there is incorporated with rubber 2 or more substances such as *m*-toluylenediamine and phenyl- $\alpha$ -naphthylamine, one of which primarily retards deterioration by action of heat and the other of which primarily retards deterioration by the action of O.

Rubber pastes. I. G. FARBERIND. A.-G. Brit. 305,490, Feb. 3, 1928. A paste which can be homogeneously mixed with fillers, vulcanizing agents, etc., is prepd. from natural or synthetic latexes or the like by treatment with a water-sol. cellulose ether such as the methyl ether or a soln. of the ether, heating to form a ppt. and sepgg. the ppt. from the water. Various details are given.

Extrusion method for making rubber inner tire tubes. HERMAN T. KRAFT (to Goodyear Tire & Rubber Co.). U. S. 1,724,354, Aug. 13. An app. and various details of procedure are described.

Forming rubber tire tubes by extrusion. DUNLOP RUBBER CO., LTD., and F. FELLOWES. Brit. 305,152, Oct. 31, 1927. Mech. features.

Forming seamless rubber tires, etc., by deposition on the surface of a hollow mold. J. TOWNLEY. Brit. 304,633, Oct. 21, 1927. Mech. features.

Cleaning rubber molds. G. G. ANDREWS (to Goodyear Tire & Rubber Co.). Brit. 305,531, Feb. 6, 1928. Alk. solns. are used under heat and pressure, e. g.,  $\text{NaOH}$ ,  $\text{KOH}$  or  $\text{Na}$  sulfide may be used under a steam pressure of about 80 lb. per sq. in. An app. is described.

Coloring rubber and similar materials. IMPERIAL CHEMICAL INDUSTRIES, LTD., A. J. HAILWOOD, W. J. S. NAUNTON and A. SHEPHERDSON. Brit. 304,376, Oct. 21, 1927. Materials such as rubber, balata or gutta-percha are colored by incorporating with them a pigment consisting of a vat dye and a finely divided substratum substantially insol. in water. Various details and examples are given.

Synthetic rubber. I. G. FARBERIND. A.-G. Brit. 304,207, Jan. 16, 1928. Coagulation of a synthetic latex such as may be formed from isoprene and  $\text{Na}$  oleate soln. is effected by cooling to below 0°, and after thawing the coagulum is sepd. from the aq. emulsifying and polymerizing agent. Unpolymerized diolefin present is removed by heating or reduced pressure, use of a gas current or by rolling the coagulum. Several examples are given. Cf. C. A. 23, 2324.

Synthetic rubber compositions. I. G. FARBERIND. A.-G. Brit. 304,612, Jan. 20, 1928. Sheets or other forms of material for use in the same manner as linoleum, celluloid, horn, etc., are made from synthetic rubber (such as that from isoprene) with an artificial or natural resin or other plastic material and org. or inorg. fillers or both. Fac-tis, natural rubber, cellulose esters or ethers, dyes, etc., may be included in various compns.

Rubber vulcanization accelerators. SIDNEY M. CADWELL (to Naugatuck Chemical Co.). U. S. 1,724,180, Aug. 13. Polynitrophenylbenzothiazyl sulfides (and corresponding chlorophenyl compds.), details of the production of which are given, are accelerators of the vulcanization of rubber. They all have antioxidant properties and improve the aging of rubber, and particularly is this true of the 2,4-dinitrophenylbenzothiazyl sulfide. The 2,4,6-trinitrophenylbenzothiazyl sulfide, which may be also called picrylbenzothiazyl sulfide, has the property of improving the flexing of a rubber compd.

# CHEMICAL ABSTRACTS

Vol. 23.

OCTOBER 20, 1929

No. 20

## 1—APPARATUS AND PLANT EQUIPMENT

W. L. BADGER

Time of reaction and apparatus construction. W. ALLNER. *Chem. App.* 16, 117(1929).—A. discusses the influence of the time factor and the velocity of reaction on the size of equipment. Examples showing the effects are given. A table gives the time of combustion for a no. of common fuels. M. C. ROGERS

A laboratory ozonizer. ALBERT L. HENNE. *J. Am. Chem. Soc.* 51, 2676-7(1929).—The app. of Smith (cf. *C. A.* 19, 2427) has been modified to eliminate the use of Hg electrodes and litharge joints. The new app. has the same yields of O<sub>3</sub> but is less expensive and more easily built. ALBERT L. HENNE

Late developments in continuous filtering machines for sludges. K. W. GEISLER. *Eng. Progress* 10, 36-9(1929); cf. *C. A.* 22, 3807. E. I. S.

Some modern apparatus for the artificial drying of chemical products. K. RENGW. *Chem.-Ztg.* 53, 496-7(1929).—Different types of mech. drying app. built by the Benno Schilde Machinery Co., Hersfeld, Germany, are described. G. H. VON FUCHS

New desiccator and insets. KURT THORMANN. *Chem. Fabrik* 1929, 392.—The porcelain supports touch the crucible at 3 points only. Cf. *C. A.* 23, 3377. J. H. MOORE

An all-glass evaporator. D. F. OTHMER. *Ind. Eng. Chem.* 21, 876-7(1929).—Details of construction and operation of an app. for evapn. of corrosive solns. and of delicate solns. under vacuum. J. H. MOORE

A mercury displacement volumeter. COLIN G. JACKSON. *J. Sci. Instruments* 6, 261-2(1929). E. J. C.

Simple method of distillation under greatly reduced pressure. B. STEMPEL. *Arch. Pharm.* 267, 484-6(1929).—A very compact distg. app. is described and illustrated, a set-up reminiscent of the original Anschütz arrangement of flasks, with suitable connections with manometer, drying tube, pump, notably for distn. in an atm. of H or CO<sub>2</sub>. W. O. E.

Apparatus for the automatic stopping of distillations. G. RANKOFF. *Chem. Fabrik* 1929, 401.—An improvement of R.'s app., *C. A.* 22, 892. J. H. MOORE

A new automatic apparatus for the determination of water by distillation. J. PRITZKER AND ROB. JUNGKUNZ. *Chem.-Ztg.* 53, 603(1929).—The app. described in *C. A.* 21, 719 is improved to use with substances both lighter and heavier than H<sub>2</sub>O. J. H. MOORE

A new integrating microphotometer for x-ray crystal reflections. I, II. W. T. ASTBURY. *J. Sci. Instruments* 6, 192-6, 209-13(1929). E. H.

An improved adjusting device for thermoregulators. FRITZ FRIEDRICH. *Chem.-Ztg.* 53, 480(1929).—The escaping of min. particles of Hg through the threads of the adjusting screw is prevented by the use of a ground-in piston. G. H. VON FUCHS

A new rapid counterflow mixer. O. SCHWENNINGER. *Eng. Progress* 10, 52-4(1929).—This machine consists of a revolving mixing tub and two rotary agitators. Uniform and rapid mixing of material is assured by appropriate location of agitator centers. E. I. S.

Portable detector developed for many combustible gases. J. K. MABBS AND W. B. ROWLAND. *Chem. Met. Eng.* 36, 490-2(1929).—Description of an app. which depends on the increased elec. resistance of a hot filament when the temp. is further raised by the combustion of a gas on its surface. The app. is not suitable for detecting mixts. of air with H<sub>2</sub>, C<sub>2</sub>H<sub>2</sub>, or CS<sub>2</sub>. J. H. MOORE

A modified Pirani vacuum gage. THOS. DEVRIES. *J. Optical Soc. Am.* 18, 333-5(1929).—A modified Pirani vacuum gage can be made by assembling 4 C or W bulbs in a Wheatstone bridge arrangement, and connecting to the vacuum line those which are in the opposite arms of the bridge. The other 2 bulbs serve as balancing resistances, together with a dial-decade box in series with one of these bulbs to balance

the bridge. This arrangement is a simple set-up for controlling low pressures or for detecting slight changes.

FRANK V. JOHNSON, JR.

Some vacuum recording gages. K. C. D. HICKMAN. *J. Optical Soc. Am.* 18, 305-31(1929).—There has been no satisfactory vacuum gage for recording between the limits 5 mm. and 0.01 mm. A differential Hg manometer is described which covers this range satisfactorily. The same principle has been extended to construct a moving dial instrument. These gages yield a nearly linear deflection with pressure and their use is extended to obtain abs. measurements of pressure. Certain org. liquids are recommended for lubricating the Hg meniscus. A no. of other gages and their limitations are described.

FRANK V. JOHNSON, JR.

A pressure-controlled McLeod gage. NEWTON UNDERWOOD. *J. Optical Soc. Am.* 19, 78(1929).

E. J. C.

A new apparatus for collecting and measuring gas. B. KUNISCH. *Chem. Fabrik* 1929, 372-3.

J. H. MOORE

A voltage regulator for gas discharge x-ray tubes. F. E. HAWORTH. *J. Optical Soc. Am.* 19, 79-80(1929).

E. J. C.

A spherical high-pressure ionization chamber. JAMES W. BROXON. *J. Optical Soc. Am.* 18, 403-4(1929).—Details are given for the construction of an ionization chamber to withstand pressures of 2500 lb. per sq. in. and suitable for studies of the natural ionization in gases at high pressures.

H. R. MOORE

[Apparatus for] determination of isotherms at high pressures. A. MICHELS AND R. O. GIBSON. *Ann. Physik* [4], 87, 850-76(1928).—A new app. for detg. isotherms at high pressures is fully described. In particular, the isotherms of Ne between 0° and 100° at 20-500 atm. are detd. The accuracy is estd. to be not greater than 1 in 2000.

B. C. A.

Determination of the size of rotary vacuum pumps of multiple-cell construction. M. LACKMANN. *Chem. Fabrik* 1929, 371-2, 380-1.—Practical formulas are given for calcg. capacities and the mean working grade during progressive evacuation to a detd. pressure.

J. H. MOORE

"Small gas muffle." M. MIELDS. *Chem. Fabrik* 1929, 392.—Cf. Horst, C. A. 23, 8378.

J. H. MOORE

Water, oil and sludge separator for compressed-air systems. M. BEYER. *Apparatebau* 41, 121(1929).—The compressed air undergoes purification in 3 stages: (1) Packed metal turnings remove small dust particles and other like materials. (2) Passing through a conical metal sieve it is cooled and dehumidified. (3) It next strikes against a metal plate and undergoes a change of direction, which insures thorough mixing.

M. C. ROGERS

The working of aluminum. H. KRAUSE. *Apparatebau* 41, 133(1929).—K discusses the factors to be considered.

M. C. ROGERS

The use of stoneware. FELIX SINGER. *Chem. App.* 16, 130(1929); cf. C. A. 23, 1312.—S. discusses the use of stoneware in the chem. industry.

M. C. ROGERS

Sublimation. MARTIN STRUBIN. *Chem. App.* 16, 139(1929).—S. discusses the fundamental principles of sublimation and their relation to the design of app. used for sublimation.

M. C. ROGERS

Measuring the specific heats of metallurgically important materials with the aid of 2 new types of calorimeters (ROTH, BERTRAM) 2. Practical guides for gas-analytical investigations (NEUMANN, STRÄHUBER) 7. Determination of H and CH<sub>4</sub> in the Orsat apparatus (BAHR) 7.

Filter. CHARLES H. LOEW (to Loew Filter Co.). U. S. 1,726,035, Aug. 27.

Filter. SIEMENS & HALSKE A.-G. (Nikolaus Schönfeldt and Reinhold Reichmann, inventors). Ger. 481,178, Apr. 20, 1927. See Fr. 653,033 (C. A. 23, 3603).

Drum filters. MASCHINENFABRIK BUCKAU R. WOLF A.-G. Ger. 480,894, Jan. 18, 1925. Details.

Filter for air, etc. A. JORDAHL. Brit. 306,348, June 15, 1928. Structural features are described of a filter preferably formed of knitted metal fabric and which may be coated with a viscous material.

Filter for gases. H. S. POCHIN and C. H. W. CHELTNAM. Brit. 305,693, Nov. 4, 1927. Structural features.

Filter for clarifying furnace flue gases for purposes of analysis. A. LUMB and L. LUMB. Brit. 305,874, April 10, 1928. Structural features of a filter are described, the lower half of which is filled with broken coke and the upper half with asbestos fiber

**Combined settling and filtering apparatus.** C. PICCARDO. Brit. 305,976, Feb. 13, 1928. Structural features.

**A concentrating device for a filter-press washing machine.** VULKAN-WERKE A.-G. FÜR BRAUEREIBEDARF. Ger. 480,300, Nov. 6, 1926.

**Drying apparatus.** EMIL WEISS. Ger. 479,898, Jan. 9, 1927. Details of the trough and hot gases.

**Vacuum drying apparatus.** OGDEN MINTON. Ger. 479,573, Mar. 25, 1927. Details.

**Vacuum drying apparatus with a rotary or oscillating drum.** A. E. JONSSON. Brit. 306,088, Feb. 15, 1928. Structural features.

**Cleaning device for rotary vacuum driers.** AUGUSTINUS E. JONSSON. Ger. 480,574, Nov. 24, 1927. Corresponds to Brit. 288,341.

**Vacuum container.** ROBERT LUBOWSKI. Ger. 480,021, Sept. 6, 1925. A hollow body made of materials which resist chemicals is exhausted by coating its interior with a substance which will form a stable solid compd. with the gaseous contents.

**Rotary spray disk for drying apparatus.** J. A. REAVELL. Brit. 306,009, Oct. 14, 1927. Structural features.

**Traveling-belt apparatus for drying moist solid materials.** VERNOR S. HENRY, ARTHUR WRIGHT and FRANK W. YOUNG (to Filtration Engineers, Inc.). U. S. 1,726,511, Aug. 27. Structural features.

**Device for drying grass and grain.** HEINRICH SUTER-EGGENBERGER. Swiss 132,237, May 1, 1928.

**Apparatus for drying hides, skins, enamel plates and other objects in sheet form.** ALAN W. RANDALL. Ger. 480,571, Nov. 23, 1928. Corresponds to Brit. 314,738.

**Crucible holder.** JOHANN ARNST. Ger. 481,072, Mar. 16, 1927. The holder has three adjustable arms.

**Photoelectric photometer.** CLAYTON H. SHARP, CARL KINSLEY and EDGAR D. DOYLE. U. S. 1,726,318, Aug. 27. Structural, optical and electrical features are described.

**Microscope.** R. WINKEL G. M. B. H. Ger. 467,150, Jan. 8, 1927.

**Pasteurizing apparatus.** GEBRÜDER SCHÄFFLER MASCHINENFABRIK. Ger. 480,028, June 21, 1927. Addn. to 478,539 (C. A. 23, 4600). An improvement in the water circulation of the container for the flasks is described.

**Reaction vessel.** FELD & VORSTMAN G. M. B. H. Ger. 481,320, May 15, 1928. The vessel has corrugated walls and is made of Fe with a lining of chem.-resisting metal such as Sn or Cu.

**Containers lined with rubber and similar chemical-proof coatings.** GUMMIWERK ERNST KNIEPERT. Ger. 481,283, July 23, 1925.

**Catalytic apparatus.** A. O. JAEGER (to Selden Co.). Brit. 306,442, Feb. 20, 1928. In a catalytic converter cooled by the reaction gas, all or a portion of the partly reacted gases issuing from the converter are recirculated (preferably after removal of reaction products and addn. of more reacting gases). Various details of app. and procedure are described applicable to processes such as  $\text{NH}_3$  synthesis,  $\text{SO}_2$  oxidation,  $\text{NH}_3$  oxidation, org. oxidation, reduction, dehydrogenations, polymerizations, condensations, etc Cf. C. A. 22, 4015.

**Catalytic apparatus for gas reactions.** A. O. JAEGER (to Selden Co.). Brit. 306,519, Feb. 23, 1928. A converter having a plurality of catalyst chambers immersed in a bath of normally non-boiling liquid is provided with temp. regulating elements such as rods or tubes of metal immersed in the bath so as to prevent undue rise in temp. either locally or generally. The app. is suitable for org. oxidations, reductions, hydrogenations, dehydrations, decompositions, condensations, polymerizations,  $\text{NH}_3$  synthesis and oxidation and  $\text{SO}_2$  production. Various structural details are described. Cf. C. A. 23, 3831.

**Emulsifying or mixing apparatus.** C. S. H. SNOW. Brit. 305,711, Nov. 10, 1927. Structural features.

**Apparatus for stirring and mixing fluids.** FRANZ MEYER. Ger. 481,319, Oct. 14, 1927. Details.

**Homogenizing mill of the rotating disk type.** W. EPPENBACH. Brit. 306,502, Nov. 22, 1927. Various structural features are described.

**Measuring device for liquids such as benzene.** "BREVO" A.-G. FÜR EXPLOSIONS-UND FEUERSCHUTZ. Swiss 131,783, Apr. 10, 1923.

**Apparatus for delivering measured quantities of coloring substances or other powdered or granular substances.** GUSTAV HAAS (to General Aniline Works). U. S. 1,725,913, Aug. 27. Structural features.

- Apparatus for working up coal and ores. ERNEST HODEIGE. Ger. 480,481, Oct. 22, 1924. Details are given.
- Apparatus for determining the viscosity of liquids. MARIO MICHELS and BORN & STUCKI. Swiss 130,930, Apr. 4, 1928.
- Vacuum meter. MASCHINENFABRIK OERLIKON. Swiss 131,844, May 24, 1928.
- Molding machine. BADISCHE MASCHINENFABRIK UND EISENGIESSEREI VORM. G. SEBOLD UND SEBOLD & NEFF. Ger. 480,118, Oct. 9, 1926. Details.
- Molding machines. CLIFTON D. PETTIS. Ger. 479,630 and 479,631, Jan. 16, 1925. Details of construction are given.
- Double molding machine. PHILIPP KREUZER. Ger. 479,624, Nov. 10, 1926. Details of construction are described.
- Surface condenser with a rotating internal cooling drum. KALIINDUSTRIE A.-G. Brit. 306,106, Feb. 17, 1928. Structural features.
- Gas-purification plant. METALLGES. A.-G. (Kurt von Eberhard, inventor). Ger. 480,600, Oct. 22, 1927. Small particles deposited on the electrodes of gas purifiers are removed by magnetically operated scrapers.
- Tray for gas purifiers. JULIUS SCHMITT. Ger. 480,613, June 19, 1928.
- Apparatus for removing constituents of gas mixtures. ADOLF MESSER. Ger. 479,984, Apr. 4, 1928. App. for removing constituents of gas mixts. by solidification is described.
- Gas washer with vertical baffle plates. PNEUMATIC CONVEYANCE & EXTRACTION, LTD., and W. A. SMITH. Brit. 306,058, Nov. 14, 1927. Structural features.
- Centrifugal gas-washing machine. HAROLD NIELSEN. Ger. 479,765, July 11, 1924.
- Apparatus for cooling gas-washing oil. C. OTTO & Co., G. M. B. H. Ger. 479,954, Mar. 29, 1925. Details are given.
- Recording gas calorimeter. CHARLES V. BOYS. U. S. 1,726,140, Aug. 27. Structural features.
- Pressure vessel for difficultly liquifiable gases. GES. FÜR INDUSTRIEGASVERTUNG M. B. H. Ger. 479,985, Dec. 28, 1926. Details are given.
- Acetylene generator. CLARA D. KILLIAN (to H. C. S. Samuels). U. S. 1,726,029, Aug. 27. Structural features.
- Acetylene generator. AUTOGEN ENDRESS A.-G. Swiss 131,769, Oct. 19, 1927. The  $\text{CaC}_2$  container and water tower are relatively displaced so as to ensure a sudden and continuous contact between the  $\text{CaC}_2$  and the water.
- Carbide-charging device for acetylene generator (carbide to water type). JACOB KNAPPICH. Ger. 480,347, Jan. 14, 1927.
- Furnace. CHARLES CHAPPUIS. Swiss 131,542, Mar. 16, 1927. Details are given.
- Furnace. INTERNATIONAL ENGINEERING CORP. Ger. 479,869, Jan. 13, 1926. Details of cooling tubes.
- Furnace. ROLFS KOHLEN-OXYD-VERBRENNER G. M. B. H. Ger. 479,618, Feb. 19, 1928. The blast air is pre-heated by passing it through canals in the furnace wall.
- Rotary furnace. KLÖCKNER-WERKE A.-G. Ger. 481,012, Apr. 8, 1927. Details.
- Rotary plate furnace. TROCKNUNGS-, VERSCHWELUNGS- UND VERGASUNGS-G. M. B. H. Ger. 479,730, Jan. 16, 1927. Details of unloading are described.
- Regenerative furnace. FRIEDRICH SIEMENS A.-G. Ger. 481,332, Feb. 25, 1928.
- Regenerative furnace. KARL WOLINSKI. Ger. 481,132, Dec. 24, 1926.
- Regenerative furnace plant. C. OTTO & COMP. G. M. B. H. Ger. 479,614, June 27, 1928. A device for keeping down the pressure in the gas tubes is described.
- Crucible furnace. HANS KOCH. Ger. 481,035, Apr. 24, 1927. The furnace has a jacket comprising two semi-cylindrical hinged halves.
- Annular kiln for crucibles. AUGUST HUNECKE. Ger. 481,057, Feb. 12, 1928. Details of removing smoke are given.
- Chamber furnace for the production of dry air. EGON DREVES. Ger. 480,618, Dec. 18, 1924. Details are given.
- Traveling-grate furnace for granular coal. ALLGEMEINE ELEKTRICITÄTS GES. (Nius Hilgers, inventor). Ger. 481,554, Sept. 27, 1927.
- Coal-dust furnace. CAMILLE DUQUENNE. Ger. 481,142, Oct. 7, 1925. Constructional details.
- Coal-dust furnace. BERG & Co. GES. FÜR INDUSTRIE-OFFENBAU UND FEUERUNGS-BEDARF M. B. H. Ger. 481,246, Aug. 29, 1926. Details of the fire chamber are described.

**Coal-dust furnace.** WILFRED R. WOOD. Ger. 480,578, May 9, 1926. Details of arrangement of the hearth and water tubes are described.

**Furnace for peat.** L. & C. STEINMÜLLER ROHRENDAMPFKESSEL- UND MASCHINENFABRIK. Ger. 480,346, Nov. 28, 1926. Details of the fire chamber are given.

**Gas furnace.** EUGEN BURG. Ger. 480,227, Feb. 23, 1927. Details of burner are given.

**Gas furnace.** DEUTSCHE WÄRME-AUSNUTZUNG G. M. B. H. "DEWAG." Ger. 479,615, May 5, 1927. Details of construction are given.

**Gas furnace.** G. KROMSCHRÖDER A.-G. Ger. 480,086, Jan. 26, 1926. Details of the gas-mixing app.

**Gas furnaces.** JOSEF H. REINEKE. Ger. 481,352, Nov. 25, 1924. A device is described for regulating the gas mixt.

**Gas-fired furnaces.** MAX NUSS. Ger. 479,867, Sept. 4, 1925. Addn. to 479,086 (C. A. 23, 4600).

**Gas burner.** C. H. KEMPTON and W. BISSELL. Brit. 305,786, Jan. 7, 1928. Structural features.

**Gas burner.** F. S. SCOTT. Brit. 305,795, Jan. 23, 1928. Structural features.

**Liquid-fuel burner with pressure and atomizing devices.** BARTHÉLÉMY TERRY. Ger. 479,613, May 19, 1925.

**Oil furnace.** HEINRICH DINNER. Swiss 132,183, Jan. 21, 1928.

**Furnace operated optionally by oil, gas or fuel dust.** KOHLENSCHIEDUNGS-GES. M. B. H. Ger. 479,963, Dec. 18, 1924. Details of construction are described.

**Furnace plant for producing superheated steam and distillate from impure water.** AKT.-GES. BROWN, BOVERI & CO. Swiss 132,230, Dec. 22, 1927. Addn. to 123,207. Details of arrangement are given.

**Annealing furnace.** SIEMENS-SCHUCKERTWERKE A.-G. Ger. 479,852, Sept. 3, 1925. A furnace for tubes and rods is described.

**Annealing furnace.** SIEMENS-SCHUCKERTWERKE A.-G. (Johann Schnepf, inventor). Ger. 480,038, Aug. 15, 1926. A furnace for rods and tubes is described.

**Annealing kiln.** AKT.-GES. BROWN, BOVERI & CO. Swiss 131,865, Jan. 5, 1928. Details of loading are described.

**Continuously-acting melting furnace for glass or metals.** RUDOLF SCHNEIDER. Ger. 480,619, Sept. 5, 1924. Details of the circulation of hot gases in the furnace structure are described.

**Enameling furnace.** ALLGEMEINE ELEKTRICITÄTS-GES. (Gerhard Schumann, inventor). Ger. 480,718, Mar. 22, 1927.

**Fire chamber for enameling furnace.** ALLGEMEINE ELEKTRICITÄTS-GES. Ger. 480,719, Oct. 26, 1927.

**Device for consuming the smoke in a furnace plant.** ADOLPH MESSMER. Swiss 131,985, Feb. 17, 1928.

**Delivering device for shaft furnaces, condensers and generators.** ARNO ANDREAS. Ger. 481,058, Mar. 23, 1928.

**Furnace-charging device.** THE STANDARD STOKER CO., INC. Ger. 481,333, Sept. 21, 1926.

**Air-heating plant in furnace waste-gas canal.** ELEKTROWERKE A.-G. Ger. 479,619, Oct. 11, 1927.

**Delivering device for a shaft furnace.** KARL BERGFELD. Ger. 480,764, May 16, 1926. Structural details.

**Device for cooling furnaces.** DEUTSCHE BABCOCK & WILCOX DAMPFKESSEL-WERKE A.-G. Ger. 480,876, Feb. 25, 1928.

**Automatic loading device for a rotary wheel-grate furnace.** SIEMENS-SCHUCKERTWERKE A.-G. (Wilhelm Gumz, inventor). Ger. 479,995, May 4, 1926.

**Machine for molding furnace doors.** KOMMANDIT-GES. EISENHÜTTEN & EMAILIERWERK PAULINENHÜTTE EDMUND GLÄSER. Ger. 480,779, Oct. 13, 1928. Addn. to 405,144. Details are described.

**Temperature-alarm device.** H. SCHLAICH. Brit. 305,985, Feb. 13, 1928.

**Thermostatic control device for incubators.** EUGENE C. HENRION. U. S. 1,725,799, Aug. 27. Structural features.

**Thermostatic electric switch.** B. R. WINGFIELD and B. T. WINGFIELD. Brit. 305,749, Dec. 5, 1927. Structural features.

**High-temperature thermostat.** SIEMENS-SCHUCKERTWERKE A.-G. Ger. 481,455, Sept. 7, 1926.

## 2—GENERAL AND PHYSICAL CHEMISTRY

FREDERICK L. BROWNE

**The name Berzelius. The 150th anniversary of Jöns Jakob Berzelius.** J. SVEN-  
NUNG. *Chem.-Ztg.* 53, 669 (1929). E. J. C.

**Richard Newman Brackett.** B. B. ROSS. *Ind. Eng. Chem.* 21, 885-6 (1929).—  
Biography with portrait. E. H.

**The 125th anniversary of August Bragg.** ANON. *Apparaturbau* 41, 148 (1929).—  
A biography. M. C. ROGERS

**One hundred years of chemistry in the Stuttgart Technical College.** E. SAUER.  
*Chem. App.* 16, 93-6 (1929).—A discussion of the development of the college.  
M. C. ROGERS

**Use of word "anaëric" proposed.** FRANK WILEN. *Ind. Eng. Chem., News Ed.* 7,  
No. 17, 8 (1929).—This word is proposed to express the adjectival and adverbial notion  
of mere freedom from, or performance in the absence of, free oxygen. E. J. C.

**Secondary science education.** CHAS. G. FRASER. *Can. Chem. Met.* 13, 245-8  
(1929).—The problems confronting the science teacher, and the increasing relative  
importance of the sciences in industry and every-day life are pointed out. W. H. B.

**The origin of the term "gas."** ERNST DARMSTAEDTER. *Chem.-Ztg.* 53, 565-6  
(1929).—It is suggested that Von Helmholtz coined "gas," not from the Greek "chaos"  
but from the Middle High German "gasesen" or "gesen" (to ferment, to foam).

AUSTIN M. PATTERSON

**Ortho, meta, para. I. History of the introduction of the prefixes into chemical  
nomenclature.** LEONARD DOBBIN. *Chemist and Druggist* 109, 643 (1928).—The term  
"ortho" (phosphates) was first used in 1859 by Odling, following Breithaupt's naming  
of "orthoclase" in mineralogy. "Para" (tartaric acid) was introduced "with more  
ceremony" by Berzelius in 1830, "meta" (phosphoric acid) by Graham in 1833. **II.**  
**Benzene and some of its derivatives.** *Ibid* 643-4.—This history of its discovery and  
synthesis is given; also of the discovery of  $\text{BzOH}$ ,  $\text{PhNH}_2$ ,  $\text{PhNO}_2$ ,  $\text{PhOH}$  and  $\text{PhMe}$ .  
Loschmidt (1861) contrasted a "condensed"  $\text{C}_6\text{H}_6$  group with the more open chain  
 $\text{C}_6\text{H}_4$ , and constructed graphic formulas for 121 aryl compds. **III. Kekulé; the con-  
stitution of aromatic substances.** *Ibid* 110, 38 (1929).—History of the benzene ring of  
K., 1866. **IV. Position isomerism; early views and difficulties.** *Ibid* 164.—Körner  
(1866) introduced *o*, *m* and *p*, into the special nomenclature of the benzene isomerides,  
but actual place relations were often uncertain, causing confusion, e. g. with  $\text{C}_6\text{H}_4(\text{OH})_2$ .  
**V. Position isomerism; the problems solved.** *Ibid* 225-6.—The successive steps in  
proving the location of *o*, *m* and *p*, positions are outlined, and the methods of Körner  
(1867) and Griess (1874) for detg. these positions are explained in detail. S. W.

**Bunsen flames of unusual structure.** FRANCIS A. SMITH AND S. F. PICKERING.  
*Bur. Standards J. Research* 3, 65-74 (1929)—A mixt. of air or  $\text{O}_2$  with a combustible  
gas is forced through a cylindrical burner tube, and the flame is observed in secondary  
air. Complex structures noticed in acetylene-air mixts. include the intersection of 2  
zones, 4 distinct light zones and a hollow dark core extending upward from the tip  
of the primary zone. When secondary air is excluded, the primary zones of some  
hydrocarbon-air flames become polyhedral. Photographs of flames are presented.  
J. O. C.

**Laboratory methods for the purification of metallic mercury.** EDGAR NEWBERY.  
*Ind. Chemist* 5, 289-91 (1929).—Filtration methods, treatment with various reagents,  
distn. methods and the "mercurous perchlorate" electrolytic method are described.  
Three illustrations are included. E. G. R. ARDAGH

**Tellurium thermoelements.** B. LANGE AND W. HELLER. *Physik. Z.* 30, 419-25  
(1929).—The authors, using Henning's method, were able to prep. Te-Pt thermo-  
couples which gave very exact temp. measurements from  $-75^\circ$  to  $+90^\circ$ . The thermal  
e. m. f. in this region was practically const. It increases linearly for Te from  $0^\circ$  to  $40^\circ$   
and is practically linear up to  $400^\circ$ . For the Te used in capillaries a temp. coeff. of  
0.00325 was found for the range  $20-40^\circ$ , which permits of its use as a resistance ther-  
mometer for a smaller temp. interval. LOUIS WALDBAUER

**Comparison of colors: errors and illusions.** RENÉ TOUSSAINT. *Chimie & in-  
dustrie* 21, 924-30 (1929).—A brief discussion of the difficulties inherent to matching of  
colors, and of the use and advantages of the photocolormeter for this purpose.

A. PAPINEAU-COUTURE

**The standardization of colors.** WILHELM OSTWALD. *Z. angew. Chem.* 42, 437-9

(1929).—A discussion of the classifications of others and that of O. Cf. *C. A.* 16, 1903

Iron and antiquity. T. A. RICKARD. *J. Iron Steel Inst.*, Advance copy, No. 9, Oct. 1929, 20 pp. J. G. McNALLY, E. J. C.

Surface oxidation of aluminum, tungsten and molybdenum. LEONARD C. BANISTER. *Metal Ind.* (London) 35, 27-8, 30(1929); cf. *C. A.* 23, 2086. C. L. READ

The atomic weight of arsenic. HANS KREPELKA. *Nature* 123, 944 (1929).—The internationally accepted at. wt of As is 74.96. The British sub-committee has proposed 74.934, based on the mass spectrograms of Aston. K. detd. the ratio  $\text{AsCl}_3:3\text{Ag}$  and obtained  $\text{As} = 74.937$ , in remarkable accord with the physical detns. of Aston. The measurement of the  $\text{AsBr}_3:\text{Ag}$  ratio is under way. ALBERT L. HENNE

The pseudo-components of hydrogen. A. SMITS. *Physik. Z.* 30, 425-7(1929).—The proof of the existence of para and ortho  $\text{H}_2$  is hailed as a proof of the principles on which the theory of allotropy is based. Further proofs of this nature are predicted. LOUIS WALDBAUER

Heat of dissociation of oxygen. GERHARD HERZBERG. *Z. physik. Chem.*, Abt. B, 4, 223-6(1929).—The spectroscopic value of the heat of dissoen. of normal  $\text{O}_2$  hitherto given, namely 7 volts, rests on the assumption that the mol. dissociates under the influence of light into 2 normal atoms. This transition is incompatible with the selection rules of the new theory; dissoen. must yield a normal  $^3P$  and an excited metastable  $^1D$  atom. Since the exciting energy of the  $^1D$  atom is between 1 and 2 volts, the value of the heat of dissoen. of  $\text{O}_2$  into normal atoms must lie between 5 and 6 volts. W. W.

The ability of silicon to oxidize and its solubility in hydrofluoric acid. CH. BEDEL. *Compt. rend.* 189, 180-2(1929); cf. *C. A.* 23, 4604 —B. repeated the expts. of Sanfouche without success. Si cannot be oxidized at  $150^\circ$  (cf. *C. A.* 21, 1582). E. S.

Investigations of the active forces between atoms and molecules. DANIEL AVDALIAN. *Ukrainskii Khim Zhurnal* 4, No. 1, Sci. Pt. 95-8(1929).—In the first of a series of articles A. analyzes the Lindeman equation:  $D \equiv KT_s/V^{2/3}$ , where  $T_s$  is the m. p. in the abs. scale and  $V^{2/3}$  is the square of the distance between the atomic centers at the m. p. To study the periodicity of  $D$  a curve was constructed in which the abscissas represent the at. nos. and the ordinates  $T_s/V^{2/3}$ . The minima differentiate the periods: the smallest is H-He, followed by 2 small ones, Li-Ne and Na-A; then 2 large periods with 18 elements K-Kr and Rb-Xe and finally a period with 32 elements Cs-Rd and 87-U. It is pointed out that the distribution of the maxima coincides with the even-number groups in the periodic system, with one exception: some maxima (beginning with C) decrease in value, while others (beginning with O) increase. The decreasing maxima differentiate the electropos. and electroneg. elements and coincide with the elements of the 4th group. The increasing maxima come into the 6th group and coincide with the elements the properties of which are characteristically electroneg. The min. at Mn occupies a special position; it reflects a subgroup in the 7th group (Mn, 73 and 75). It is thus logical to suppose that the elements 73 and 75 are also to be found on the minima, but their abs. value is lower than that of Mn. J. S. JOFFE

The boiling point elevation of acetone solutions as related to the interionic attraction theory. A. L. ROBINSON. *J. Phys. Chem.* 33, 1193-9(1929).—B. p. measurements of acetone solns. of NaI,  $\text{CoCl}_2$  and  $\text{La}(\text{NO}_3)_3$  were made, in the concn. range 0.001-0.3 M. Both anhyd. and hydrated salts were used. For the 3 valence types of salts the results are in accord with the interionic attraction theory of Debye and Hückel. The results obtained with hydrated salts indicate that definite ionic hydrates do not exist. H. W. LEAHY

The electronic interpretation of oxidation and reduction. WM. ALBERT NOYES. *J. Am. Chem. Soc.* 51, 2391-6(1929).—Oxidations are of 3 types: (1) transfer of an electron from one atom to another, (2) addn. of a pos. hydroxyl group,  $\text{H}:\ddot{\text{O}}^+$ , to an unshared pair of electrons in either a negative ion or an elec. neutral mol. (in the latter case a H ion seps. and a semipolar union is formed) and (3) sepn. of a semipolar O atom in an elec. neutral condition followed by its union with an unshared pair of electrons. The O atom may either remain in the semipolar condition in the new compd. or may take up a H ion and form an OH group. C. L. READ

The volume of molecules. W. HERZ. *Z. Elektrochem.* 35, 457-8(1929).—Data on 69 org. compds. are compiled to show that a proportionality exists between the values for  $b_K$  of van der Waals' equation calcd. from crit. data and for the mol. refraction, quantities which are directly related to the sp. vol. of mols. For  $1/3$  of the known cases the quotients lie between 3 and 5. Low quotient values appear for low-boiling or assoc. substances. H. W. WALKER

The heats of dissociation of the molecules CH, NH, OH and HF. DONALD S. VILLARS. *J. Am. Chem. Soc.* 51, 2374-7(1929).—Band spectra data were interpolated by Mecke's method and the heats of dissociation of the molecules, CH, NH, OH and HF were calculated to be, resp., 82.0, 108.3, 138.0 and 172 kilocal. C. L. READ

Diamagnetism and space charge distribution of atoms and ions. EDMUND C. STONER. *Proc. Leeds Phil. Lit. Soc. (Sci. Sect.)* 1, Pt. X, 484-90(1929).—From the space charge distribution values of Hartree (*C. A.* 22, 1269) and Brindley and James (*C. A.* 23, 2864) the diamagnetic susceptibilities are calculated for He 1.90;  $\text{Li}^+$  0.70;  $\text{Na}^+$  5.47;  $\text{K}^+$  17.61;  $\text{Rb}^+$  30.12;  $\text{Cl}^-$  40.39. For He the values agree within 1% and for the positive ions they agree very well with the experimental values of Ikenmeyer (*C. A.* 23, 3136), Joos (*C. A.* 18, 618; 20, 1026) and Wills and Hector (*C. A.* 18, 1232). This indicates that the space charge distribution in ions in solution does not differ widely from that calculated for the free ion. The calculated value for  $\text{Cl}^-$  ion is much greater than that determined experimentally. This indicates that the charge distribution in the ion in solution is considerably more diffuse than that calculated for the free ion. If the whole of the charge of the Cl ion were concentrated within the radius 1.57 Å, i.e., half the distance between centers of K and Cl ions in crystalline KCl, the calculated diamagnetism would be of the order of that observed. This discrepancy may be due to the difficulty in calculating "self-consistent field" for a negative ion. E. R. SCHIERZ

Molecular polarization of symmetrical, but non-rigid molecules. GERHARD JUNG AND ARTHUR SCHLEDE. *Z. physik. Chem., Abt. B.* 4, 207-16(1929).—For a molecular model consisting of 2 atoms or groups placed symmetrically with respect to a third, and capable of displacement perpendicular to the line joining them to the third, it is shown that a dipole moment may be induced by the measuring field, in virtue of a displacement of the movable atoms or group. This displacement is influenced by temperature, the higher the temperature, the greater the length of the movable arm of the molecule; an increase in temperature causes a diminution of the molecular polarization. This effect, which is given by the equation  $P_{\text{non-rigid}} = a' - b/T$ , can be distinguished from the temperature influence on the polarization of unsymmetrical rigid molecules, which is given by the Debye equation  $P_{\text{rigid}} = a + (b/T)$ . The significance of these considerations with regard to the experimentally observed moments of C compounds of the type  $\text{CR}_4$  is pointed out. W. W.

The additive nature of molecular dipole moments. A. EUCKEN AND L. MEYER. *Physik. Z.* 30, 397-402(1929).—The extent of the validity of the dipole-additivity rule is shown, a recalculation of molecular dipole moments having been made on the basis of the moments, not of individual groups, but of individual linkages. This gives important information as to the orientation of the resulting moments. On the basis of the stereochemical rotation of individual groups a hitherto unobserved case of a rotational polarization is shown, which causes the apparent moment of many  $\text{Ca}_4$  compounds. I. J. PATTON

The dipole moment as a characteristic group property. KRISTIAN HØJENDAHL. *Physik. Z.* 30, 391-97(1929); cf. *C. A.* 23, 2333.—Dipole moments were calculated from the dielectric constants of vapors and the values found to be constant for monosubstituted homologous compounds. Each polar group is thus characterized by a constant "group moment," which may be considered as a vector. Dipole moments were calculated from the dielectric constant and  $n$  of 24 aromatic compounds in  $\text{C}_6\text{H}_6$  solution and were compared with the moment obtained from the geometrical sum of the group moments. The classical plane  $\text{C}_6\text{H}_6$  formula is supported by these investigations. Agreement was obtained between calculated and experimental moments for dinitro-, chloronitro- and bromonitro-benzene, dinitronaphthalene and nitrotoluene. In the case of nitroaniline, the groups cause considerable mutual deformation. Deviations were found in the case of anisole and of nitroanisole, explained by the fact that the 2 O<sub>2</sub> bonds are not in a straight line. Three types of substituent groups are distinguished. (1) Those which have the positive pole on the outside, (2) those which have the negative pole on the outside, (3) those in which the group moment lies diagonally across the group. These form a transitional type. NO<sub>2</sub>, Cl and Br belong to one, CH<sub>3</sub> and NH<sub>2</sub> to the other of the 2 first types, but it cannot be determined which is positive and which is negative. I. J. PATTON

Magnetic researches on sorbed gases. JOSEPH AHARONI AND FRANZ SIMON. *Z. physik. Chem., Abt. B.* 4, 175-89(1929); cf. *C. A.* 23, 1550.—A simple, accurate null method for measuring magnetic susceptibility is described which does not involve a knowledge of the field strength and which is suitable for work at low temperatures. This method is used in measuring the susceptibilities of the systems chabasite-O<sub>2</sub>, charcoal-O<sub>2</sub>, and Pd-H<sub>2</sub> at various gas concentrations and temperatures. Measurements were also made on a series of NH<sub>3</sub> halides and on the oxides of Mn. The susceptibility of O<sub>2</sub> absorbed by chabasite is less than that of the free gas and shows discontinuities corresponding to integral molecular proportions. The C-O<sub>2</sub> system gives similar results. For the Pd-H<sub>2</sub> system the result

seem to indicate the presence of the weakly paramagnetic compd.  $\text{Pd}_2\text{H}_2$ .  $\text{H}_2$  in amts. less than this ratio is bound adsorptively.

W. W. STIFLER

The paramagnetic properties of the rare earths. B. CABRERA AND A. DUPERRIER. *Compt. rend.* 188, 1640–2(1929).—All the compds. of the rare earths which were tested were found to follow the Curie-Weiss law approx. Salts of Gd, Tb, Dy, Ho and Er were found to follow this law rigorously and the no. of Weiss magnetons were approx. 39, 48, 52, 52 and 47, resp. Salts of Nd and Eu followed more accurately a modification of the Curie-Weiss law which can be written  $(\chi + k)(T + \Delta) = C$ , where  $k$  is a const. for any given compd. The no. of magnetons corresponding to Nd and Eu seem to be approx. 17 and 18, resp. The paramagnetism of Sm salts is weak and possibly const. Salts of Pr, Tu and Yb, which have been considered to obey the Curie-Weiss law, satisfy more accurately the modified law. The introduction of the new const.,  $k$ , permits a latitude of 3 or 4 tenths in the no. of magnetons. Tables are given for the various compds. studied in which the values of  $k$  are so chosen as to make the no. of magnetons most nearly integral. This const.,  $k$ , represents a susceptibility, independent of the temp., which is paramagnetic for elements in the neighborhood of Sm and diamagnetic for Tu and Yb. Perhaps it may be due to a deformation of the atom.

W. W. STIFLER

Magnetic susceptibilities of some inorganic and organic electronic isomers. S. S. BHATNAGAR AND SHAM LAL LUTHER. *J. Indian Chem. Soc.* 6, 303–7(1929).—Measurements on a no. of electronic isomers, such as NaBr and SrO, and aminobenzoic acid and nitrotoluene, indicate that the mol. susceptibilities,  $\chi_m$ , and the mean radius of the mol.,  $r_1$ , are connected by the relation  $\chi_m = -2.85 \times 10^{10} k r_1^2$ , where  $k$  is a const. for each group of isomers. Two tables are given, showing the mean values of  $k$ ,  $r_1$  as computed from Bragg's data,  $\chi_m$  as found by expt. and  $\chi_m$  as calcd. by this equation, for 16 groups of isomers varying from at. no. 28 to at. no. 96. The values of  $k$  tend to increase with the no. of atoms in the mol. For groups of isomers having the same no. of atoms in the mol., the values of  $k$  increase with the atomic nos. of the groups. In the case of groups of isomers having the same at. no., the values of  $k$  increase with the no. of atoms.

W. W. S.

The dipole moment of antimony trichloride. OTTO WERNER. *Z. anorg. allgem. Chem.* 181, 154–8.—The mol. dipole moment  $\mu$  for  $\text{SbCl}_3$  is  $3.64 \times 10^{18}$ . This is larger than the value of  $0.4 \times 10^{18}$  for  $\text{SbI}_3$ . The more strongly positive character of the I atom is given as the explanation for the difference. This value for  $\text{SbCl}_3$  is also discussed from the point of view of the measurements for the series HCl, HBr, HI and  $\text{NH}_3$ ,  $\text{PH}_3$ ,  $\text{AsH}_3$ .

L. L. QUILL

Dipole moment of symmetrical trinitrobenzene. ADOLF PARTS. *Z. physik. Chem., Abt. B*, 4, 227–33(1929); cf. *C. A.* 22, 1528.—The dielec. const. of solns. of symmetrical trinitrobenzene in  $\text{C}_6\text{H}_6$  were measured to 1 unit in the 4th decimal by means of an oscillator at frequency  $10^4$ . The concn. ranged from a mol. fraction of trinitrobenzene to 0.0389, and the temp. from  $10^\circ$  to  $50^\circ$ . Within this range the total polarization is independent of concn. and temp. to within the limits of exptl. error; the dipole moment, therefore, cannot be calcd. directly. Subtraction of the electronic polarization 40 cc. as estd. from optical data by Williams and also by P., from the total polarization leaves 14 cc. for atomic and dipole polarization. If atomic polarization is absent, this corresponds to a dipole moment of  $0.8 \times 10^{-18}$ , which agrees with Williams' second value (*C. A.* 23, 559).

W. WEST

Dielectric constants of benzene solutions of oximes and ketones. The dipole moment of *o*-methylbenzaloxime, of acetophenone and of benzophenone. O. HASSEL AND E. NAESHAGEN. *Z. physik. Chem., Abt. B*, 4, 217–22.—The dielec. const. of  $\text{C}_6\text{H}_6$  is scarcely increased by addn. of the stable modification of benzaloxime or of acetoxime; since the oximes, which in single mols. must have a large dipole moment, are strongly assocd. in  $\text{C}_6\text{H}_6$ , it appears that even in small concn. the assocn. is so great as to obliterate the dipole moment. *anti-O*-Methylbenzaloxime in  $\text{C}_6\text{H}_6$ , which is slightly assocd., has a dipole moment of  $0.86 \times 10^{-18}$  e. s. u. In contrast to the observation that aliphatic ketones have the same moment of  $2.74 \times 10^{-18}$  e. s. u., it was found that acetophenone had a moment of  $2.94 \times 10^{-18}$ , and benzophenone,  $3.13 \times 10^{-18}$ , against  $2.72 \times 10^{-18}$  for acetone.

W. WEST

Microscopic study of electric double refraction in liquids. MATSUNOSUKE IWATAKE. *Tech. Repts. Tohoku Imp. Univ.* 8, No. 3, 121–32(1929).—Elec. double refraction in  $\text{PhNO}_2$  (I), *o*- $\text{MeC}_6\text{H}_4\text{NO}_2$  (II),  $\text{C}_6\text{H}_5\text{N}$  (III) and  $\text{CS}_2$  (IV) is studied. By increasing the potential above 6000 v. per mm. I and II, between crossed Nicols, show a bright layer at the anode; II shows a layer at the cathode which disappears, then reappears at the anode; III shows uniform brightness. Further increase produces a

color fringe. With Nicols not exactly crossed, at high intensity, the color fringe fills the field; rotation of the analyzer decreases the color. At  $45^\circ$  the field is uniform and at  $90^\circ$  the fringe reappears with complementary colors. These results suggest non-uniformity and are easily explained in the same way as the chromatic polarization of uniaxial crystals. IV does not show this anomaly. Eighteen photomicrographs, 50 references and a description of the app. are given. V. F. HARRINGTON

**The effect of iron on the magnetic susceptibility of aluminum.** RALPH B. MASON. *Trans. Am. Electrochem. Soc.* 56 (preprint) 8 pp.(1929).—Values published to date on the magnetic susceptibility of Al have not been considered trustworthy, because of the presence of Fe and other impurities. Accordingly, the magnetic properties of the purest Al obtainable today (99.97% Al) were investigated and compared with those of com. grades of Al and various alloys. It was found that pure Al is paramagnetic. Furthermore, the paramagnetic property of Al is only very slightly increased by the presence of Fe up to 8%, because the Fe occurs as an intermetallic compd. Upon etching the surface of the sample with NaOH soln., the Fe-Al compd. is broken up, and the liberated Fe in the surface film produces a marked increase in magnetic susceptibility. The magnetic method described is useful in the *approx. estn. of the Fe content of Al*, but is not recommended for the accurate detn. of small percentages of Fe in Al. C. G. F.

**Magnetostriction of diamagnetic substances in strong magnetic fields.** P. KAPITZA. *Nature* 124, 53(1929).—Atomic, as distinguished from classical magnetostriction is due to the action of the magnetic field on the binding forces between the atoms. A single crystal of Bi contracted when its trigonal axis was perpendicular to a very powerful field, but when its axis was parallel to the field an expansion of approx. the same amount was observed. This explains why with an extruded Bi rod only the classical magnetostriction was observed. The fields used were of the order of 300 kilogausses and were maintained for approx.  $\frac{1}{160}$  sec. The possible bearing of these results on the theory of homopolar bonds is discussed. W. W. STIFLER

**Behavior of various organic vapors under high-tension oscillatory discharges.** H. HIEDEMANN. *Ann. Physik* [5], 2, 221-32(1929).—The  $H_2$  diffused through a glowing Pd tube into a high-frequency silent discharge tube was tested for purity; it was then tested by carburetting the  $H_2$  flame with various org. vapors, but was found uncontaminated. Previous work had shown that old Pd tubes sometimes become permeable to org. vapors, leading to the formation of a brown deposit on the walls of the discharge tube; the deposit was found to be a mixt. of C and a small amt. of a highly polymerized hydrocarbon. The phenomena taking place when  $Et_2O$ ,  $EtOH$ ,  $Me_2CO$ , glacial  $AcOH$ ,  $CHCl_3$ ,  $CCl_4$  and  $PhH$  vapors were subjected to a silent discharge are described.  $PhH$  was found to give a product similar to the brown deposit previously noted; it consisted of C, and biphenyl, biphenylene and their polymers. The type of elec. discharge seems to have no influence on the nature of the products. LOUIS WALDBAUER

**Magnetic and crystallographic researches: Hydrated ferric oxide.** WERNER H. ALBRECHT. *Ber.* 62B, 1475-82(1929).—Of the 2 hydrated oxides of trivalent Fe occurring in nature, both represented chemically by the formula  $Fe_2O_3 \cdot H_2O$ , although differing in cryst. form, only one has heretofore been prepd. synthetically. A now gives full details for the prepn. of 2 hydrates,  $\alpha$ - and  $\gamma$ -, which are shown by chem. analysis, x-ray photographs and magnetic measurements to be identical with the minerals gothite and lepidocrocite, resp. The  $\alpha$ -hydrate is prepd. by oxidizing a dil. aq. soln. of  $Fe(HCO_3)_2$ . Three different methods of oxidation are outlined and tests on the different products are described which prove them to be identical. One sample, prepd. in March, 1928, contained 12.3%  $H_2O$  and had a magnetic susceptibility =  $36.47 \times 10^{-6}$ . After being stored 10 months in a stoppered flask its susceptibility was practically unaltered, although it had absorbed moisture from the air so that it now contained 19.4%  $H_2O$ . Upon dehydration in a stream of dry air at  $100^\circ$ , its  $H_2O$  content was reduced to 10.62%, corresponding accurately to the formula  $Fe_2O_3 \cdot H_2O$ , and this value remained const. until the temp. was raised. Continued heating at successively higher temps. up to  $260^\circ$  reduced the  $H_2O$  to 2.21%, and complete dehydration was obtained by heating for 4 hrs. at  $600^\circ$ . It then had a susceptibility =  $23.10 \times 10^{-6}$  and x-ray photographs showed the lines of the  $\alpha$ -oxide. The hydrate when first prepd. had a susceptibility =  $48.10 \times 10^{-6}$ . Heating for some time at  $100^\circ$  produced so great an increase in susceptibility that it could not be measured by the magnetic balance. After heating for 3 hrs. at  $250^\circ$  it contained only 1.75%  $H_2O$  and was strongly ferromagnetic. The x-ray photographs showed the broadened lines of the  $\gamma$ -oxide. Complete dehydration at  $600^\circ$  reduced the susceptibility to  $25.6 \times 10^{-6}$  and the x-ray interference pattern now corresponded to that of the  $\alpha$ -oxide. These results are not altogether in agreement with those of Herroun and Wilson on lepidocrocite (cf. C. A. 23, 3136)

X-ray analysis by A. of samples supplied by Herroun shows that the discrepancies are due to the small amts. of Mn present in the natural minerals, as noted by H. and W. The application of Haber's theory of "aggregation" and "arrangement" velocities to the synthetic prepn. of these hydrates is pointed out. It is also suggested that the production of the  $\alpha$ - or the  $\gamma$ -hydrate is detd. primarily by the H-ion concn. In both the natural and the synthetic hydrates the  $\alpha$ -form is the more stable, and both are eventually converted into the  $\alpha$ -oxide when dehydrated at sufficiently high temps. Excellent reproductions of a no. of the x-ray photographs of the different preps. are given.

W. W. STIFLER

**The magnetic anisotropy of naphthalene crystals.** S. BHAGAVANTAM. *Proc. Roy. Soc. (London)* A124, 545-54(1929).— $C_{10}H_8$ , carefully freed from Fe was recrystallized from alc. The magnetic susceptibilities along the three axes by direct detn. and by null method were  $-700$ ,  $-420$  and  $-1540 \times 10^{-7}$ . Indices of refraction for  $NaD$  were found to be:  $b$  axis 1.775,  $c$  axis 1.932 and for axis perpendicular to  $b$  and  $c$  1.442. Two magnetic axes coincide with the crystallographic axes  $b$  and  $c$ , while the third is perpendicular. The data indicate an orientation of molecules in the  $bc$  plane, rather than the  $ac$  plane as suggested by Bragg. The max. axis of the magnetic ellipsoid coincides with the min. axis of the optical ellipsoid. This leads to a simple explanation of the strong positive birefringence of aromatic liquids in a magnetic field.

ARTHUR FLEISCHER

**X-ray structure and magnetic properties of single crystals of Heusler alloy.** H. H. POTTER. *Proc. Phys. Soc. (London)* 41, 135-42(1929).—By use of single-crystal rotation method, Heusler alloy has been found to crystallize as a body-centered cube with lattice const. 2.95 Å. U. The Al atoms are distributed so as to lie on a face-centered cube of lattice const. 5.9 Å. U. Directional magnetic properties are found to be identical with those of Ni, which has a face-centered cubic structure. It is suggested that this may be interpreted as indicating that the Mn atoms (the positions of which cannot be detd. by x-ray analysis) also lie in a face-centered cubic lattice.

B. C. A.

**Röntgenographic study of the crystalline state of iron.** ROBERT BACH. *Helv. Phys. Acta* 2, 95-114(1929).—The crystal lattice of iron is investigated between  $700^\circ$  and  $1400^\circ$ . A discontinuity of the cell dimensions has been observed between  $750^\circ$  and  $850^\circ$ , corresponding to the transition of the  $\alpha$  into the  $\beta$  modification. The structure of  $\alpha$ ,  $\beta$  and  $\delta$  iron is represented by a body-centered cube.  $\gamma$  iron is face-centered. As the curve of dilatation of  $\beta$  iron on extrapolation meets the curve of the  $\delta$  modification, it is assumed that these modifications are identical.

EGON BRETSCHER

**Allotropy and the determination of densities by means of x-rays.** N. H. KOLKMEIJER. *Trans. Faraday Soc.* 25, 392-7(1929).—Ds. detd. by the x-ray method show smaller discrepancies than those obtained by the pycnometer. In both cases these variations are due to exptl. error, to "physical impurity" or coexistent allotropic modifications and to mixed crystals. The necessity for detg. const. on chemically and physically pure substances is emphasized. K. describes his special use of the spectrographic and powder methods and attributes greater accuracy to the former. A precision camera to improve the powder method and to eliminate certain sources of error which are enumerated is being constructed.

H. W. WALKER

**The crystal structure of bismuth fluoride.** O. HASSEL and SIGURD NILSSEN. *Z. anorg. allgem. Chem.* 181, 172-6(1929).— $BiF_3$ , prepd. (I) by the interaction of  $Bi(NO_3)_3$  and KF and (II) from  $Bi(NO_3)_3$ ,  $Bi_2O_3$  suspended in 40% KOH soln.,  $Cl_2$  and HF and purified to the theoretical compn., was analyzed by the Debye x-ray powder method using the  $K\alpha$  rays from Ni and Fe.  $BiF_3$  is face-centered cubic with 4  $BiF_3$  mols. in the unit cell and has a density of 8.75 as compared with 8.3-8.4 by the pycnometer method. The planes of the Bi and F atoms are given together with tables of data and a comparison with  $PbF_2$ .

H. W. WALKER

**An examination of the microcrystals of calcium carbonate in molluscan shells by means of x-rays.** III. JINZO TSUTSUMI. *Mem. Coll. Sci. Kyoto Imp. Univ.* A12, 199-202(1929); cf. C. A. 23, 2083.—By testing the shells of more than 60 species of Japanese molluscs by means of the x-ray method, it is proved that there are various fibrous arrangements of the microcrystals of  $CaCO_3$  in the molluscan shells. In the porcelaneous and the nacreous layers of the shells the  $CaCO_3$  is in the form of aragonite, while in the prismatic layer it is usually in the form of calcite but sometimes in the form of aragonite. The axis of the fibrous arrangement is always in a direction nearly perpendicular to the outer surface of the shell, and coincides with the principal axis of calcite or the orthorhombic C axis of aragonite, resp.

C. H. LORIG

**Determination of the length of the cube edge of potassium bromoplatinate.** M. MATHIEU. *Compt. rend.* 188, 1611-2(1929).—X-ray powder photographs of this

compd. and of  $K_2[PtCl_6]$  give the relation between the 2 cube edges as  $a_{Br}/a_{Cl} = 1.07$ , which gives the cube edge of  $K_2[PtBr_6]$  as  $10.35 \pm 0.05$ . From Groth's density the no. of mols. per unit cube (4) accords with this value.

GREGG M. EVANS

The lattice constants and the space groups of barium carbonate and strontium carbonate. THOMAS A. WILSON. *Phys. Rev.* 31, 305(1928).—Precision x-ray photographs were taken of Merck's  $BaCO_3$  and  $SrCO_3$  by the powder method with Mo K radiation. The crystallographic dimensions are given.

H. R. MOORE

The dependence of the number of crystallization centers on the temperature. G. TAMMANN. *Z. anorg. allgem. Chem.* 181, 408-16(1929).—This is a theoretical study dealing with the probability of the formation of sep. crystals depending on the energies involved and the temps.

HELEN G. WEIR

Factors governing the growth of zinc crystals by the Czochralski-Gomperz method. E. P. T. TYNDALL. *Phys. Rev.* 31, 313(1928).—It has been shown that the production of Zn crystals of any desired orientation can be insured by controlling the temp. gradient existing in the column of liquid Zn between the crystal and the surface of the molten metal.

H. R. MOORE

The chemistry of crystalline forms of aggregation. Investigation of basic copper compounds. TOA LABANUKROM. *Kolloidchem. Beihefte* 29, 80-121(1929).—Introductory remarks and method of investigation are given by V. KOHLSCHÜTTER. The purpose is to obtain a material suitable for studying the relationship between definite factors and conditions of formation and individual forms and forms of aggregation. The basic compds. of the following Cu salts were studied:  $CuSO_4$ ,  $Cu(NO_3)_2$ ,  $CuCl_2$ ,  $CuBr_2$ ,  $Cu(ClO_4)_2$ ,  $Cu(BrO_3)_2$ ,  $Cu(IO_3)_2$ ,  $Cu(NO_2)_2$ ,  $Cu_2S_2O_6$  and  $CuCO_3$ . Methods of prepn. (chiefly the slow hydrolytic cleaving of the normal salt) are given. Morphologically well-defined forms are obtained and described crystallographically and optically. Plates of the various cryst. forms are included. The mode of formation of the individual crystals and their type of assocn to aggregates in the case of different compds. presenting similar relations from the standpoint of crystallography and chem. constitution are decidedly different. This must be due chiefly to the properties of the compds. themselves and the kind of material and conditions concerned in the formation. The topochem. reactions of the basic Cu salts are also investigated. Remarkable individual differences are shown with respect to the type as well as the form and properties of the decompn products. These observations on the basic Cu salts show that the typical aggregation forms of cryst. substances, if not simply a result of the chem. and crystallographic structure of their individuals, are connected with their chem. nature by an ordered, complex or indirect relation.

R. I. RUSH

Mesophases (intermediate states of aggregation). IV. Some further cases of aqueous mesophases. H. ZOCHER AND V. BIRSTEIN. *Z. physik. Chem., Abt. A*, 142, 177-85(1929).—Of the soaps, only K and Na oleates form mesophases (smectic). Stearates and palmitates sep. in cryst. form from aq. soln. Na naphthenate, in aq. soln., also forms a smectic mesophase, which explains the jelly formation on the addn. of amyl alc. to the concd. aq. soln. Cetyl xanthate, in concd. aq. soln., forms at higher temps., a smectic phase with anomalous dispersion of the double refraction. The nematic phase formed by bromophenanthrenesulfonic acid in moderate concns. shows neg. double refraction and forms drops with optically pos. radii. Com. lecithin shows an aq. smectic phase, but the pure synthetic lecithin does not. The diffuse double refraction often found is attributable to gels or sols with anisotropic colloid particles. V. Influence of electric and magnetic fields. *Ibid.* 186-94.—The dielec. anisotropy of nematic substances is neg. for symmetrical mol. formulas, pos. for unsymmetrical formulas, in the cases hitherto studied. Nematic systems of the cholesterol type are orientated by the elec. field and their optical activity is diminished. Smectic compds. are also influenced by a field of sufficient strength. Their dielec. anisotropy seems to be neg. in every case investigated, even when the corresponding nematic phase is pos. The magnetic anisotropy appears always to be neg.

I. J. PATTON

Hydrocyanic acid. II. Determination of the densities of gaseous and liquid hydrocyanic acid, and some thermodynamic calculations. HEIMA SINOSAKI AND RYOSABURO HARA. *Tech. Repts. Tohoku Imp. Univ.* 8, No. 3, 19-64(1929).—The vapor d. was measured with an accuracy of  $1/1000$  to  $1/100$  at temps. from  $0^\circ$  to  $190^\circ$  and pressures of 100 to 830 mm. At  $0^\circ$ ,  $30^\circ$  and  $60^\circ$  the relation  $PV/WT = R - bP - cP^2$  holds and at  $100^\circ$  and  $189^\circ$   $PV/WT = R - bP$ .  $W$  is the wt. of the gas;  $(\log b)^2 = -2.6393 + 0.010449T$  and  $-\log c = -4.4533 + 0.029123T$ . Keyes' equation expresses the assoc. to 1 part per 1000. For the liquid,  $V_1 = V_0(1 + 0.002002t + 6.175t^2)$  holds to 2 parts per 150,000. The heat of vaporization and sublimation, the fugacity,  $C_p/C_v$ ,  $C_p - C_v$ ,  $(\partial H/\partial P)_T$ , and  $(\partial E/\partial V)_T$ , were calcd.

V. F. HARRINGTON

**Removal of dissolved gases from liquids by vacuum sublimation.** JAMES H. HIBBEN. *Bur. Standards J. Research* 3, 97-104(1929).—A method of removing and collecting dissolved gases from liquids is described. The principle of vacuum sublimation is applied to prepare gas-free liquids without appreciable loss of either liquid or dissolved gas. J. O. COLLINS

**A general method of measuring the partial pressures of mercury at room temperatures.** L. L. HIRST AND A. R. OLSON. *J. Am. Chem. Soc.* 51, 2398-2403(1929).—Hg resonance radiation was allowed to fall through absorption cells on reaction cells contg. mixts. of 93% H<sub>2</sub> and 7% C<sub>2</sub>H<sub>2</sub>, satd. with Hg vapor. These were connected to opposite sides of a differential pressure gage (cf. *C. A.* 23, 4377). From the time required to produce a given pressure change with pure Hg vapor in the absorption cells, and the free-energy equation for Hg, the vapor pressures of Hg at various temps. were calcd. The activities of Tl amalgams were calcd. by substituting them for Hg in one of the absorption cells. GREGG M. EVANS

**Osmotic vapor pressure.** II. F. A. H. SCHREINEMAKERS. *Proc. Acad. Sci. Amsterdam* 32, 392-400(1929); cf. *C. A.* 23, 3847.—Systems with volatile components are discussed. A substance *S* runs congruently through a membrane, when it diffuses from greater toward smaller O. S. V. P., and incongruently from smaller toward greater pressure. O. S. V. P. is the value of its own osmotic vapor pressure. E. SCHOTTÉ

**The dependence of surface tension and heat of vaporization on density and temperature up to the critical temperature.** W. HERZ. *Z. anorg. allgem. Chem.* 181, 280-4(1929).—A criticism of van Laar's treatment of work and data cited in the latter's article (cf. *C. A.* 23, 3622). W. E. VAUGHAN

**Diffusion of gases through metals.** V. LOMBARD. *Rev. métal.* 26, 343-50(1929); cf. *C. A.* 22, 4024; 23, 2338.—Description of app. and technic, and summary of results. A. PAPINEAU-COUTURE

**Rectification.** A. TREGUBOV. *Azerbejdjanskoe Neftyanoe Khozjaistvo* 1929, No. 4, 73-81.—A mathematical analysis of the process of rectification of a binary mixt. A. A. BORHTLINGK

**Liquid substances.** N. BĂRBULESCU. *Bul. stiintei fizice pure aplicate* 29, 22-8 (1928).—Relations between d. of liquids and d. of the elements thereof, with deductions as to d. of elements when in compds. E. M. SYMMES

**The shapes of drops and the determination of surface tension.** B. B. FREUD AND W. D. HARKINS. *J. Phys. Chem.* 33, 1217-34(1929).—The drop-wt. method for detg. surface tension is concerned with at least 3 drops: the hanging, the detaching and the detached. The profile of the hanging drop can be calcd. in terms of surface tension, diam. of tip, height of liquid column above the tip and d. of liquid. This is done by the expansion of Taylor's theorem and the interpretation of the graphs which result from plotting the data. If the head of a liquid above a tip is const. there is only one stable drop as measured by the length of the drop. There is also a crit. length of the drop greater than the length of the stable drop which corresponds to a max. vol. If a drop is smaller than the stable drop it grows until the stable drop is formed. If the drop is larger than the stable drop and shorter than the crit. length it will shrink to the stable form. If the drop is longer than the crit. length it will increase in size as a detaching drop and lose a part of itself as a detached drop. The ideal drop of Harkins and Brown is the max. drop which is stable on a tip where  $r/a$  is very small. The theory of the detaching drop and the detached drop have not been worked out without the use of guesses. The guess, that the drop breaks in such a way that the length of the profile between the curve of max. vol. and the point of inflection is bisected, is suggested and agrees with exptl. data as well as any assumption yet made. It is certain that the neck of the detaching drop is broken into several small drops. Calcs., curves, drawings of drops and 5 plates of photographs taken with a motion-picture camera are reproduced. F. E. BROWN

**Surface tension and associated phenomena.** N. E. DORSEY. *Natl. Research Council Bull.* 69, 56-118(1929).—A review of recent theory of surface tension and of methods of measuring it. W. D. LANGLEY

**Rheology.** II. The nature of plastic flow and its relation to fluid flow. EUGENE C. BINGHAM. *J. Chem. Education* 6, 1206-14(1929); cf. *C. A.* 23, 4119.—An outline of methods of measurement, with quant. definitions of *shortness*, *tackiness*, *elasticity*, etc. Photographic demonstrations are given of various types of flow and *slippage*. EUGENE C. BINGHAM

**Viscosity.** JOHN H. NORTHPROP. *Natl. Research Council Bull.* 69, 142-5(1929).—The various math. equations correlating viscosity with other properties of solns. are reviewed. W. D. LANGLEY

**Viscosity of different soap solutions.** BRUNO WALTHER. *Allgem. Öl- u. Fett-Ztg.* 25, 448-50; *Chem. Zentr.* 1928, II, 1633.—The time of outflow of aq. soap solns. (0.3% expressed as fatty acids) was detd. in the Engler viscometer; the Na and K soaps used were prepd. from fats of known compn. and were analyzed as exactly as possible. The time of outflow for H<sub>2</sub>O at 20° was 50.8 sec., while with the soap soln. the values found varied between 52 and 56.2 sec.; for K soaps the values were in most instances a little higher than for the corresponding Na soaps. The Na soaps from tallow and lard with 240.3 and 66.6 were exceptions. At 50° the solns. showed values between 47.2 and 50.8. Further expts. were made at 30° and at 40°. It is attempted to correlate the detn. of viscosity of the soaps with their value for washing purpose. G. S.

**Experiments in viscometry.** BANDTE. *Erdöl u. Teer* 5, 387-9(1929).—Oils were heated 28 days at 115-20° in O<sub>2</sub> and 50 hrs. at 200° in H<sub>2</sub> and the effect on their viscosities was detd. Exception is taken to the opinion of Rowell and Finlayson (*C. A.* 22, 3770) that changes in the viscosity of oils after heating may be due to "temp.-hysteresis." It is argued that these effects are caused chiefly by oxidation. W. A. G.

**The viscosity of sodium chloride, calcium chloride, and magnesium chloride solutions and its dependence on the temperature and concentration.** H. STAKELBECK AND R. PLANK. *Z. ges. Kälte-Ind* 36, 105-12, 133-5(1929).—The abs. viscosities of Na, Ca and Mg chloride solns. over the whole concn. range and from 20° to -25° were detd. exptly. by the Lawaczek fall method. The results are tabulated and graphed and compared with the data of other experimenters. F. D. ROSSINI

**The viscosity of binary systems containing guaiacol as one component.** N. A. PUSHIN AND T. PINTNER. *Z. physik. Chem., Abt. A*, 142, 211-26(1929).—The densities and viscosities at 30° of mixts. of guaiacol with benzene, toluene, acetone, methylaniline, dimethylaniline, phenylhydrazine, quinoline, pyridine, aniline and *o*-toluidine, were detd. with the Ostwald viscometer, by using the formula  $\eta = 0.008019 \frac{dt}{t_{H_2O}}$  in which  $d$  is density,  $t$  the time of efflux, and  $t_{H_2O}$  the time of efflux for H<sub>2</sub>O. The first 5 pairs show no evidence of compd. formation and the authors regard the shape of the viscosity curves as evidence of dissoen. The last 5 pairs give undeniable evidence of compd. formation, there being a max. in each of the curves of viscosity vs. mol. concn. However the max. usually does not occur in the mixt. which corresponds with the chem. compd. indicated by the m p. curve. EUGENE C BINGHAM

**Meaning and measurement of plasticity.** E. KARRER. *Ind. Eng. Chem.* 21, 770-3(1929).—The principles of plasticity in general and of the new plastometer of K. (cf. *C. A.* 23, 4106) in particular are discussed critically. Plasticity may be defined as the susceptibility to and the retentivity of deformation. A substance has unit plasticity when it undergoes a quant. defined deformation under a force of 1 kg. per sq. cm. acting for 1 sec. and the deformation is retained permanently. These definitions are then developed mathematically and their application to the new plastometer are shown. C. C. DAVIS

**The general laws of plastification.** OTTO MANFRED AND J. OBRIST. *Rev. gén. mat. plastiques* 5, 195-203, 251-7(1929); cf. *C. A.* 22, 4674.—A general discussion of the laws governing plastification of org. and inorg. plastics and of metals. In the light of numerical data by other investigators, it is shown that the laws enunciated in previous publications (*C. A.* 21, 2535, 2991; 22, 173) are of general application as regards the functional dependence between the degree of plastification of the raw materials and the phys. properties of the finished product. It is also shown that the products obtained in the molded plastics industry, which subsequently are shaped by the plastic method, receive in practically every case their final conformation in accordance with an operating principle of general application, viz., the "principle of conformation by assemblage." A. PAPINEAU-COUTURE

**The specific resistance of cupric sulfide and its temperature coefficient.** KURT FISCHBECK AND OSKAR DORNER. *Z. anorg. allgem. Chem.* 181, 372-8(1929).—A Cu wire spiral was converted to CuS by immersing in boiling S until its resistance became const. and its resistance was then measured at several temps. Three wires gave values for the resistivity at 0° of 36.76, 41.60 and 42.33 microhm-cm. (Cu = 1.7); and for the temp. coeff. 0.0037, 0.0037 and 0.0036, resp. T. H. CHILTON

**The electrical conductivity, the thermal expansion, and the hardness of magnesium-zinc alloys.** G. GRUBE AND A. BURKHARDT. *Z. Elektrochem.* 35, 315-32(1929).—Systematic measurements of the elec. cond. and thermal expansion from room temp. to the beginning of melting were made on Mg-Zn alloys in order completely to investigate the equil. diagram by means other than thermal analyses. Hardness tests were made on the alloys. The alloys were prepd. from Mg of 99.93% purity, and Zn of 99.99% purity. The specimens were tempered for many hrs. at 300 = 3° and

cooled very slowly to insure homogeneity and equil. conditions. The elec. cond. tests were carried out in an atm. of pure  $H_2$  with a Thomson double bridge and a sensitive galvanometer. The sp. resistance and sp. cond. of the alloys for each  $10^\circ$  rise in temp. are tabulated. Isothermal cond. lines show distinct maxima at compns. represented by the compds.  $MgZn_2$  and  $MgZn_8$ . An equil. diagram constructed from elec. cond. data agrees with the diagram of Chadwick with the exception of 2 additional transformation lines. One line appears at  $260 \pm 10^\circ$  for alloys between 3.5 and 65 wt. % Zn; the other appears at  $371^\circ$  for alloys between 68 and 83 wt. % Zn. Thermal expansion measurements of the alloys by the dilatometer method confirmed the results of the elec. cond. tests. Brinell hardness numbers when plotted against compn. of the alloys gave a curve with two minima at the compn. of the compds.  $MgZn_2$  and  $MgZn_8$ .

C. H. LORIG

**The problem of the metallic state.** J. D. BERNAL. *Trans. Faraday Soc.* **25**, 367–79(1929).—Substances in the metallic state are classified as metallic ionic, metallic homopolar, and truly metallic substances, depending on the predominating ionic, homopolar or metallic forces binding them together. The distinguishing properties of true metals such as close-packed structure, constancy of at. vol., dissolving power and elec. and thermal cond. are discussed and tables of compiled data given together with those of compds. and solid solns. A hypothesis for *super-cond.* is put forward wherein the super-conductive state is conceived as one of absolute purity and undistorted lattice. An explanation in terms of homopolar binding is given for certain diamagnetic metallic compds. which follow the Hume-Rothery rules. The chief empirical characteristics of the metallic bond are described and their possible theoretical meaning discussed.

H. W. WALKER

**Density measurements at high temperatures. IX. The density of molten gold and molten gold-copper and silver-copper alloys.** W. KRAUSE AND F. SAUERWALD. *Z. anorg. allgem. Chem.* **181**, 347–52(1929); cf. *C. A.* **20**, 3148.—The ds. were detd. by the method previously discussed. For the binary alloys Au-Cu and Ag-Cu the vol. additivity-concn. curves for the liquid state are straight lines while the sp. vol.-temp. curves are very nearly straight. The tables give the data:

Au-Cu(Parts Au per 1000)				
$^\circ C.$	1000 d.	757.7 d.	510.5 d.	0 d.
18	19.21	14.96	12.16	8.92
900	18.32	14.01	11.42	8.47
1000	18.23	13.46	10.98	8.41
1100	17.24	13.33	10.86	7.96
1200	17.12	13.21	10.73	7.81
1300	17.00	.....	10.61	....

Ag-Cu (% Cu)				
	81	55.7	28.1	0
800	....	...	8.98	...
900	....	8.62	8.88	...
1000	8.31	8.48	8.79	9.2
1100	8.16	8.34	8.68	9.17
1200	8.00	8.21	8.59	9.07

ARTHUR FLEISCHER

**The surface tension of molten metals and alloys. III. The surface tension of gold, zinc, gold-copper, silver-copper and iron alloys.** W. KRAUSE AND F. SAUERWALD (with investigations of M. MICHALKE). *Z. anorg. allgem. Chem.* **181**, 353–71(1929); cf. *C. A.* **20**, 3110.—The values for  $\sigma$  found were higher in all cases than those recorded in the literature. For alloys of Ag and Cu  $\sigma$  decreases linearly up to 64% Cu, above which  $\sigma$  increases linearly with temp.

% Ag	Temp.	$\sigma$	$\frac{d\sigma}{dt}$
100	995	923 dynes per cm.	—0.13
71.9	800	962	—0.12
44.3	911	1042	—0.07
18.0	1008	1092	+0.18

In the Au-Cu alloys a max. is found in  $\sigma$ -temp. curves, with the max. displaced to higher temps. with increasing Cu content.

Parts Au	Temp.	$\sigma$	Temp.	Max. $\sigma$	Temp.	$\sigma$	$\frac{d\sigma}{dt}$
1000	1120	1128	....	....	....	....	-0.10
810	1135	1036	1210	1098	1315	1095	....
757.7	1135	1071	1240	1122	1305	1110	....
510	1075	1032	....	....	....	....	+0.52
0	1140	1120	....	....	....	....	+0.66

The difficulty in the Cu-Au series is the closeness of the values of  $\sigma$  of the pure metals. The Cu-rich alloys have linear  $\sigma$ -temp. curves. For Zn oxidation was excluded by a special app.

Temp.	$\sigma$	$\frac{d\sigma}{dt}$
510	785	-0.19

The measurements were made from 510-640°. The Fe alloys show a great difference in  $\sigma$ .

% C	% Mn	% Si	% P	Temp.	$\sigma$	$\frac{d\sigma}{dt}$
3.32	0.56	2.76	0.49	1225	826	+0.80
3.52	2.1	0.65	1.6	1150	1054	+0.34
1.4	0.29	1.27	7.44	1245	957	+1.4

The capillaries were checked wherever possible before and after detns. The Fe alloys show positive temp. coeffs. The heats of vaporization cannot be calcd. from  $\sigma$  data of metals with the exception of Hg. The temp. coeffs. for Au, Ag and Zn do not fulfil the Eötvös rule.

ARTHUR FLEISCHER

The electrokinetic potential of gold in very dilute solutions of electrolytes. P. A. THIESSEN AND J. HEUMANN. *Z. anorg. allgem. Chem.* 181, 379-84(1929).—The displacement of a freely suspended fine Au wire under the influence of a potential applied through the soln. was taken as a measure of the electrokinetic potential or mobility. With solns. of LiCl, KCl, CsCl and K<sub>2</sub>SO<sub>4</sub>, ranging from 10<sup>-3</sup> N to 10<sup>-4</sup> N, the values passed through a max. at about 10<sup>-7</sup> N. The effect is explained on the basis of Debye's double layer.

T. H. CHILTON

The adsorption of sulfur dioxide by platinized asbestos. D. O. SHIELS. *J. Phys. Chem.* 33, 1167-74(1929).—Measurements are given of the adsorption of SO<sub>2</sub> by platinized asbestos in absence of air at 25° and up to 40-mm. pressure. The adsorption is reversible and the isotherm is represented by Langmuir's equation  $q = abp/(1 + ap)$ .

S. LENHER

The adsorption of sulfur dioxide by platinum black. D. O. SHIELS. *J. Phys. Chem.* 33, 1175-83(1929).—The adsorption of SO<sub>2</sub> by Pt black is measured at 25° from 0.0 to 175-mm. pressure. The process is irreversible, 84 vols. of gas at normal temp. and pressure being adsorbed per vol. of Pt, of which 54 vols were retained after desorbing at 250°. Possible causes of irreversibility are discussed.

S. LENHER

The sorption of water vapor by activated charcoals. II. Isothermals in presence of air. A. J. ALLMAND, R. CHAPLIN AND D. O. SHIELS. *J. Phys. Chem.* 33, 1151-60(1929); cf. *C. A.* 22, 1510.—Sorption isotherms of H<sub>2</sub>O vapor in the presence of air on activated C were obtained by a flow method. The very marked hysteresis found between the sorption and desorption values at various partial pressures of H<sub>2</sub>O vapor agrees with previous work. The shapes of the sorption isotherms depend upon the temp. at which the C samples were outgassed. Activated coconut and pinewood C but not activated birchwood C yielded sorption isotherms that approached definite maxima with increasing partial pressures of H<sub>2</sub>O vapor. III. Isothermals in presence of nitrogen. A. J. ALLMAND AND P. G. T. HAND. *Ibid* 1161-6.—Sorption measurements of moisture on activated C in the presence of N<sub>2</sub> agree well in most respects with those made in the presence of air. However, sorption isotherms obtained from coconut C outgassed at 800°C. in N<sub>2</sub> approached no max. with increasing partial pressures of H<sub>2</sub>O vapor, whereas those obtained from samples outgassed in air reached such maxima. O<sub>2</sub> has no retarding effect on the rate of sorption of H<sub>2</sub>O vapor by the C samples.

P. H. EMMETT

Influence of ammonia on the adsorption of copper and nickel salts. M. GELOSO AND M. L. S. LÉVY. *Compt. rend.* 189, 175-7(1929).—To a clear soln. contg., in the presence of (NH<sub>4</sub>)<sub>2</sub>SO<sub>4</sub>, Cu or Ni sulfate and NH<sub>4</sub>OH in different concns., a known quantity of Fe alum is added. After 3 hrs. standing at 22° the ppt. is filtered off and analyzed. The concn. of the NH<sub>4</sub>OH has a considerable influence on the adsorption

of the salts.  $\text{NH}_4\text{OH}$  does not seem to be adsorbed. The  $\text{NH}_4\text{OH}$  may help to change the  $p_{\text{H}}$  of the medium or it forms complex compds. of which part, after hydrolysis, is adsorbed.

E. SCHOTTE

**Membrane equilibria and selective absorption.** NORMAN C. WRIGHT. *Biochem. J.* 23, 352-7(1929); cf. *J. Agr. Sci.* 16, 640(1926).—The unequal distribution of inorg. salts on either side of the membrane can be explained if the degree of dissociation of the protein salt and the establishment of a Donnan equil. are taken into account.

BENJAMIN HARROW

**Résumé of investigations on membrane equilibria and membrane potentials.** F. G. DONNAN. *Natl. Research Council Bull.* 69, 51-5(1929).—A review and bibliography of 45 papers.

W. D. LANGLEY

**Molecular sieve membranes.** LEONOR MICHAELIS. *Natl. Research Council Bull.* 69, 119-41(1929); cf. *C. A.* 23, 1035.—The p. d. between 0.1 and 0.01 *N* solns. of  $\text{KCl}$  sep'd. by a membrane is called the "characteristic concn. potential" of the membrane, or  $\text{CoP}$ . Similarly, the p. d. between 0.1 *N* solns. of different electrolytes is called the "characteristic chem. potential," or  $\text{ChP}$ . For the best membranes,  $\text{CoP}$  amts. to about 50 mv. This is close to the value calcd. from Nernst's (Gibbs') formula for p. ds. arising from diffusion gradients. For the best membranes,  $\text{ChP}$  between  $\text{KCl}$  and  $\text{NaCl}$  is also about 50 mv., the  $\text{NaCl}$  soln. being positive. On arranging different chem. chains, each being constructed from 2 sets of univalent cations, so that each cation is positive with respect to any preceding cation, the series is  $\text{H}^+$ ,  $\text{Rb}^+$ ,  $\text{K}^+$ ,  $\text{NH}_4^+$ ,  $\text{Na}^+$ ,  $\text{Li}^+$ .

W. D. LANGLEY

**The polarization of membranes by metallic foils.** J. LOISELEUR. *Compt. rend.* 189, 170-1(1929).—An animal membrane dividing a conductive soln. becomes polarized when an insulated metallic foil is brought into one of the divisions. The polarization increases when the foil is brought nearer to the membrane and is max. when the foil touches the membrane. The time of polarization is short and depends upon the nature of the electrolyte and the metal of the foil. A freshly polished foil gives the best results. The value of the polarization decreases with increasing concn. of the electrolyte. The polarization of the membrane changes the ionic equil. between the 2 parts of the liquid. The observed effect could have its origin in biol. phenomena connected with the presence of metals. The polarizing of the membrane and the new ionic distribution results in a modification of the cellular condition of the membrane.

E. SCHOTTE

**The significance of colloid chemistry in chemical research.** V. PODROUŽEK. (*Chem. Listy* 22, 106-8(1928)).—The study of dispersion systems has added new concepts to the dispersion of ions.

FRANK MARSH

**Influence of light on some colloids.** SHEILA ROY. *J. Indian Chem. Soc.* 6, 431-40(1929).—Sols of  $\text{Sn}(\text{OH})_4$ ,  $\text{Al}(\text{OH})_3$ ,  $\text{Th}(\text{OH})_4$  and  $\text{HgS}$  become unstable toward uni- and bivalent ions on exposure to light. Sols of:  $\text{As}_2\text{S}_3$ ,  $\text{Sb}_2\text{S}_3$ , uranium ferrocyanide and  $\text{Cu}_2\text{Fe}(\text{CN})_6$  are stabilized toward uni- and bivalent electrolytes by short exposures to light but become unstable on long exposure. Long exposures of sols of  $\text{Sb}_2\text{S}_3$ ,  $\text{HgS}$  and uranium ferrocyanide to light produce coagulation without the addn. of an electrolyte. Sols exposed to light have a higher cond. than those kept in the dark. F. E. B.

**The role of dielectric constant, polarization and dipole moment in colloidal systems.**

IV. **The swelling of acetylcellulose in single organic liquids.** ICHIRO SAKURADA. *Kolloid.-Z.* 48, 277-83(1929).—The soly. and swelling of an acetylcellulose (I) ( $\text{HOAc}$  combined 53.4, free 0.024; moisture 0.36%), dried over  $\text{H}_2\text{SO}_4$ , was observed in  $\text{CHCl}_3$ ,  $\text{EtOAc}$ ,  $\text{PhNO}_2$ ,  $\text{MeOH}$ ,  $\text{EtOH}$ ,  $\text{PrOH}$ ,  $\text{BuOH}$ ,  $\text{Et}_2\text{O}$ , isobutyl and isoamyl alc.,  $\text{PhCl}$ ,  $\text{PhH}$ ,  $\text{PhMe}$ ,  $\text{CCl}_4$  and  $\text{CS}_2$  at room temp. by (a) a volumetric method (measuring the vol. of sediment remaining at equil. when 1 g. I is in contact with 20 cc. of liquid); (b) a gravimetric method (increase in weight of 100 g. of I). Equil. is usually attained in 1-2 weeks; only  $\text{CHCl}_3$  requires longer; the liquids are listed in the decreasing order of activity; the last 4 have no swelling action. All liquids having solvent or swelling action have high d. c. (4.3-57.0) and dipole moment. All homopolar or slightly dipolar liquids have neither solvent nor swelling action. The relation of mol. vol. ( $V$ ) and mol. polarization ( $P_{\text{em}}/V^2$ ) or dipole moment ( $\mu/V$ ) plays an important role in detg. the solvent or swelling action of a liquid. For solvents the ratio is high ( $\mu/V = 17-36$ ); non-solvents low; swelling action intermediate ( $\mu/V > 12$ ). If assocn. is taken into account the  $P_{\text{em}}/V^2$  for alcs. falls in the non-solvent group (7.3-2.9). In homologous series of alcs. the degree of swelling decreases with increase in no. of C. Iso alcs. swell less than normal ones.

E. R. SCHIERZ

**The surface properties of soap solutions.** WALTER C. PRESTON AND A. S. RICHARDSON. *J. Phys. Chem.* 33, 1142-50(1929).—Measurements of surface tension, surface viscosity and foaming power were made on 0.1% solns. of 3 typical com. soaps. The

results show that there is no simple relation between these properties. It is concluded that unknown factors besides surface tension and surface viscosity det. the foaming power of soap solns. The effect of age on the solns. when exposed to air is to decrease the foaming power, while there is no effect on the surface tension and a variable effect on surface viscosity depending on the soap. Aging the solns. in closed vessels produced no significant variations in the properties measured.

R. H. FERGUSON

**Preparation of pure silicic acid solution by means of electrodialysis. I. Electrodialysis.** SHUMPEI OKA. *J. Soc. Chem. Ind. Japan* 31, 1281-9(1928); Suppl. binding 31, 306-7B.—See C. A. 23, 2088. **II. Some properties of silicic acid obtained.** *Ibid* 1289-95; Suppl. binding 307-8B.—Some of chem. and phys. properties of silicic acid solns. obtained by means of electrodialysis are reported. As the soln. aged, its sp. viscosity increased gradually, and sp. cond. decreased slowly, indicating the polymerization of silicic acid particles in the soln. But no coagulation occurred during 8-13 months' storing. The mol. wt. was detd. with a soln. 6 months after the prepn. by means of f.-p. depression, and found to be 9150 assuming silicic acid to exist as entirely undissocd. mols. such as  $(\text{SiO}_2)_n$ .

S. KONDO

**Physico-chemical properties of Japanese acid clay. II. The heat of wetting by water of Japanese acid clay, fuller's earth and Florida earth.** KYUHEI KOBAYASHI AND KEN-ICHI YAMAMOTO. *J. Soc. Chem. Ind. Japan* 31, 434-8(1928).—The heat of wetting by  $\text{H}_2\text{O}$  of Japanese acid clays, fuller's earth, Florida earth, kaolin and animal charcoal was detd. by an elec. calorimeter after U. Fischer. The results obtained in cal. per g. are: fuller's earth 21.03, Florida earth 16.75, Japanese acid clay (from Itoigawa) 12.51, Japanese acid clay (from Odo) 11.14, kaolin (Gairome), 58.4, animal C (Merck) 5.72. The previous report stated that Japanese acid clay is composed of much smaller particles than other clays. Their radii are now calcd. to be between  $1 \times 10^{-6}$  and  $2 \times 10^{-6}$  cm. Parks showed by special expts. that the heat of wetting is proportional to the area of the boundary surface. The authors consider that the heat of wetting by  $\text{H}_2\text{O}$  of Japanese acid clay is due to its large surface area. **III. The heat of polymerization of turpentine oil,  $\alpha$ -pinene by Japanese acid clay, fuller's earth and Florida earth.** *Ibid* 438-44.—The heats of polymerization of turpentine oil and of  $\alpha$ -pinene with Japanese acid clay, fuller's earth, Florida earth,  $\text{SiO}_2$  gel, kaolin and animal C were detd. by an elec. calorimeter. The results in cal./g. follow, the first figure being for turpentine oil and the second for  $\alpha$ -pinene: Japanese acid clay (Itoigawa no. 1) 1623.6, 2055.8, ditto (no. 2) 807.7, 2154.2, ditto (no. 3) 418.6, 1894.1, Japanese clay (Odo) 60.2, 38.8; Florida earth 48.8, (not detd.); kaolin (Gairome) 19.0, (not detd.);  $\text{SiO}_2$  gel 27.4, 28.8, animal C (Merck) 21.3, (not detd.).

S. KONDO

**The synthesis of a substance having properties analogous to the Japanese acid clay. I. NAOTO KAMEYAMA AND SHUMPEI OKA.** *J. Soc. Chem. Ind. Japan* 31, 1125-33 (1928); Suppl. binding 31, 269-71B.—According to Kobayashi, Japanese acid clay contains 49.90-68.42%  $\text{SiO}_2$  and 9.83-20.86%  $\text{Al}_2\text{O}_3$ . As minor constituents, it has  $\text{Fe}_2\text{O}_3$ ,  $\text{CaO}$ ,  $\text{MgO}$  and alkalis; the molecular ratio of  $\text{SiO}_2$  to all basic constituents calcd. as  $\text{Al}_2\text{O}_3$  is 6:1. Several kinds of  $\text{SiO}_2$  gel were prepd. by drying a pure soln. of  $\text{H}_2\text{SiO}_4$ , made from recrystd.  $\text{Na}_2\text{SiO}_3$  by means of electrodialysis, under different conditions. The products showed almost all properties of the acid clay, i. e., (1) turned blue litmus paper red, (2) set acid free from neutral  $\text{KCl}$  soln., (3) inverted cane sugar, (4) took up methyl violet from its aq. soln. But one property was lacking, namely oxidizing power toward aq. soln. of benzidine base. It has also been ascertained that addition of  $\text{Al}_2\text{O}_3$  strengthens the acidic properties. **II.** *Ibid* 32, 328-43(1929); Suppl. binding 32, 99-101B.—The authors reported in another paper that the blue coloration of the Japanese acid clay by benzidine is mainly due to the presence of some oxidizing agent in the clay. Mn was found in all 3 samples of the acid clay from different localities. Moreover, the comparison showed that the sample contg. most Mn showed the most intense coloration.  $\text{SiO}_2$  gel contg.  $\text{Al}_2\text{O}_3$  as much as 1 mol. per 6 mols.  $\text{SiO}_2$  and 0.1%  $\text{MnO}_2$  was prepd. This powdery product had all properties of the Japanese acid clay. A small addn. of  $\text{NaOH}$  to the constituents of the artificial clay improves the decolorizing property toward methyl violet and also the coloration property of the benzidine test.

S. KONDO

**Clay and water.** H. SALMANG. *Kolloid-Z.* 48, 377-80(1929).—A review covering the last 6 years.

E. C. M.

**Crystallization phenomena of dye salts.** HANS WAGNER. *Kolloid-Z.* 48, 248-52 (1929).—Pigment Scarlet 3B was flocculated by  $\text{NaCl}$ ,  $\text{BaCl}_2$ ,  $\text{CaCl}_2$  and the coagula were studied microscopically and polariscopically.

FRANK URBAN

**The process of coagulation in smokes.** H. S. PATTERSON, R. WHYTIAW-GRAV AND W. CAWOOD. *Proc. Roy. Soc. (London)* A124, 502-22(1929); cf. C. A. 21, 843.—

Although the equation  $\sigma = \sigma_0 + Kt$ , where  $\sigma$  = vol. of smoke at time  $t$  and  $\sigma_0$  is the initial particulate vol. (by extrapolation), fits the data for smokes,  $K$  varies within wide limits even when conditions are carefully reproduced. The method of counting was improved by making the app. perfectly rigid, decreasing the dead space on the exit side of the cell, and perfecting the finish of the bore of the rotating tap to interrupt the stream sharply. By keeping the counting chamber moist the particles were brightened and the small  $\text{NH}_4\text{Cl}$  particles previously invisible in dil. smokes could be counted so that the curvature in the data disappeared. The results were also improved by detg. the actual wt. concn. of the cloud by absorption of the  $\text{NH}_4\text{Cl}$  and treatment with Nessler reagent. The wt. concn. was always less than the amt. actually volatilized. An equation for coagulation is derived theoretically. Unblown smokes show good agreement but blown smokes because of greater heterogeneity do not agree. A. F.

**The structure and electrification of smoke particles.** H. S. PATTERSON, R. WHYTE-LAW-GRAY and W. CAWOOD. *Proc. Roy. Soc. (London)* **A124**, 523-32(1929); cf. preceding abstract.— $\text{CdO}$ ,  $\text{MgO}$ ,  $\text{Ag}$  and  $\text{Au}$  clouds were prepared by arc discharge, while  $\text{As}_2\text{O}_3$ ,  $\text{HgCl}_2$  and some org. compd. smokes were prep'd by volatilization.  $\text{CdO}$  smokes are composed of chains  $10^{-3}$  cm. long with particles of  $10^{-6}$  cm. radius. The other arc discharge smokes are similar in structure.  $\text{As}_2\text{O}_3$  and  $\text{HgCl}_2$  smokes show a slight degree of aggregation. Fluorescein forms non-crystalline spheres; salol forms super-cooled liquid droplets. Azonaphthols form super-cooled spherical droplets which develop cryst. hair-like tails. Smokes from violent chem. reactions such as  $\text{Mg}$  ribbon and  $\text{O}_2$  give a high percentage of electrified particles, while volatilized smokes such as  $\text{NH}_4\text{Cl}$  smokes show a slight initial electrification with gradual increase on standing.

ARTHUR FLEISCHER

**The precipitation rule for emulsions on the basis of sulfonated oils.** WILHELM SCHINDLER. *Kolloid-Z* **48**, 254-70(1929).—Using technical products S. studied the emulsification of a light-colored, heavy mineral oil, d. 0.91 (I) with  $\text{H}_2\text{O}$  in the presence of sulfonated fish oils (II), (III) and castor oils (IV), (V), (VI). Analyses of the oils for total fat, total sulfate, org. combined,  $\text{SO}_3$  and inorg. combined  $\text{SO}_3$  gave for (II) 73.8, 4.75, 4.345, 0.405; (III) 69.8, 3.86, 3.62, 0.24; (IV) 61, 5.1, 4.7, 0.4; (V) 63.0, 7.45, 6.96, 0.49; (VI) 34.7, 3.12, 2.90, 0.22%. The emulsifying agent was stirred with the mineral oil to a creamy consistency; then  $\text{H}_2\text{O}$  was added to make the vol. 100 cc.; no attempt to homogenize was made. From const. quantities of (I) with increasing quantities of (II) an emulsion stable for 14 days was obtained at optimum concn. (I) 5 g (II) 5 g. If less (II) were used dispersion was poor; if more, coagulation resulted. Adding  $N$   $\text{NaOH}$  to produce  $p_H$  7.1-11.1 gave emulsions stable for 8 days with no optimum (cf. *C. A.* **20**, 302). (III) has less emulsifying power than (II), nor does it cause coagulation in slight excess of optimum. Using increasing quantities of mixts. of (I) and (II) or (III) made up to def. vol. with  $\text{H}_2\text{O}$  optimum were obtained which varied with nature and proportion of the emulsifying agent. (IV) to (VI) were not as good for emulsifying (I) as the fish oils; there was no relation between org. combined sulfate and emulsifying power; addn. of small amts. of oleic acid enhanced the emulsifying power and produced a max. in the case of (VI) only. The fact is emphasized that the value of a substance as an emulsifying agent depends on the method of producing the emulsion and specifically on the substance to be emulsified. E. R. S.

**Coagulation of colloidal titanic hydroxide.** SUBODH KUMAR MAJUMDAR. *J. Indian Chem. Soc.* **6**, 357-60(1929).— $\text{TiO}_2$  hydrosol behaves as a typical positively charged hydrosol.  $\text{MeOH}$  and  $\text{EtOH}$  sensitize this sol. toward the majority of coagulating agents but such sp. effects occur as stabilization against  $\text{K}_4\text{Fe}(\text{CN})_6$  by higher concns. of  $\text{MeOH}$  and sensitization by all concns. of  $\text{EtOH}$ . Aging the sol increases its stability against coagulation by electrolytes. F. E. BROWN

**Coagulation of gelatin sols in alcohol-water mixtures.** S. GHOSH, S. N. BANERJEE and N. R. DHAR. *J. Indian Chem. Soc.* **6**, 321-31(1929).—A positively charged gelatin sol in alc.- $\text{H}_2\text{O}$  mixts. is stabilized by diln. against coagulation by  $\text{KCl}$ ,  $\text{HCl}$  and  $\text{MgCl}_2$ . This sol cannot be coagulated by  $\text{BaCl}_2$  and  $\text{Al}(\text{NO}_3)_3$ . Ionic antagonism is developed when coagulation is produced by mixts. of  $\text{KCl}$  and  $\text{MgSO}_4$ ,  $\text{MgCl}_2$  and  $\text{K}_2\text{SO}_4$ ,  $\text{HCl}$  and  $\text{K}_2\text{SO}_4$ , and  $\text{HCl}$  and  $\text{KCl}$ . The sol. shows positive acclimatization when coagulated by  $\text{KCl}$ ,  $\text{HCl}$  and  $\text{MgCl}_2$ . A negatively charged gelatin sol in alc.- $\text{H}_2\text{O}$  mixts. is stabilized by diln. against coagulation by  $\text{K}_2\text{SO}_4$ ,  $\text{K}_4\text{Fe}(\text{CN})_6$  and  $\text{KOH}$ . Ionic antagonism is observed when this sol is coagulated by mixts. of  $\text{K}_2\text{SO}_4$  and  $\text{MgCl}_2$ .  $\text{KOH}$  stabilizes the sol, when it is being coagulated by  $\text{KCl}$ . Positive acclimatization is developed when the coagulant is  $\text{K}_2\text{SO}_4$  or  $\text{KOH}$ . Marked negative acclimatization is developed when the coagulant is  $\text{HCl}$ ,  $\text{BaCl}_2$ ,  $\text{MgCl}_2$  or  $\text{Al}(\text{NO}_3)_3$ . Positively charged gelatin

sol can adsorb cations and negatively charged gelatin can adsorb anions but gelatin adsorbs more of a cation than of an anion.

F E BROWN

**Absorption of water by gelatin. III. The sulfate system.** WINIFRED B. PLEASS, *Biochem. J.* 23, 358-72(1929); cf. *C. A.* 23, 18.—From a physico-chem. point of view,  $\text{HNO}_3$ ,  $\text{HCl}$ ,  $\text{H}_2\text{SO}_4$ , and their corresponding salts are similar in many respects, but the  $\text{SO}_4$  ion is differentiated by its bivalent character.  $\text{H}_2\text{SO}_4$  is not ionized to so great an extent, and has a great affinity for water. Max. swelling of gelatin occurs in a soln. of  $\text{H}_2\text{SO}_4$  at  $p_{\text{H}}$  3.0.  $\text{Na}_2\text{SO}_4$  in concns up to 0.5 *M* in the presence of  $\text{H}_2\text{SO}_4$  suppresses the osmotic swelling of gelatin due to the acid. At greater concns of the salt the gelatin coagulates.

BENJAMIN HARROW

**Intensity of Tyndall cone in agar gels as a function of hydration.** EMIL HATSCHKE, *Kolloid-Z.* 48, 246-8(1929).—Increasing intensity of Tyndall cone in cooling agar sols cannot be due to hydration alone.

FRANK URBAN

**Changes in the viscosity and hydrogen-ion concentration of some inorganic substances during the process of jelly formation.** SATYA PRAKASH AND N. R. DHAR, *J. Indian Chem. Soc.* 6, 391-409(1929).—Viscosity and  $p_{\text{H}}$  measurements were made on sols of  $\text{Fe}(\text{OH})_3$ ,  $\text{Cr}(\text{OH})_3$ ,  $\text{Al}(\text{OH})_3$ ,  $\text{Sn}(\text{OH})_4$ ,  $\text{HgO}$ , mercurisulfosalicylic acid,  $\text{FeAsO}_4$ ,  $\text{FePO}_4$ ,  $\text{Fe}_3(\text{MoO}_4)_3$ ,  $\text{CrAsO}_4$ ,  $\text{Sn}(\text{WO}_4)_2$ ,  $\text{Sn}(\text{MoO}_4)_2$ , ferric borate,  $\text{Th}_3(\text{PO}_4)_4$ ,  $\text{Th}(\text{MoO}_4)_2$ , and  $\text{Th}_3(\text{AsO}_4)_4$  during gelation. There are 3 stages in the viscosity changes: (1) very little change, (2) a regular exponential change with time, (3) a rapid increase in viscosity ending in the formation of a jelly. (1) Coincides with the change from true soln. to colloid, (2) with the partial neutralization of the charges on the micelles and their hydration, (3) with the formation of the jelly. During gelation the concn. of H ion falls  $50 \pm 20\%$  of the original value. The firmness of jellies is directly proportional to their transparency. Transparency depends on hydration, which in turn depends on slow neutralization of charges on the colloidal particles. Slow neutralization permits high hydration before coagulation occurs. Excess of electrolytes even in a clear jelly promotes agglomeration and consequent synecresis.

F E BROWN

**Germanate gels of the alkaline earths.** JOHN H. MÜLLER AND CHARLES E. GULEZIAN, *J. Am. Chem. Soc.* 51, 2029-42(1929).—The neutralization of dil. germanic acid by  $\text{Ca}(\text{OH})_2$  produces a highly dispersed colloidal Ca germanate. The water present appears to be simply trapped; nearly all of it can be removed by pressure or suction filtration. Gelation at max. diln. occurs when acid and base are combined in the ratio 4  $\text{CaO} : 3\text{GeO}_2$ . The water of the hydrogel may be replaced by other liquids such as  $\text{MeOH}$ ,  $\text{EtOH}$  or acetone, which in turn may be replaced by ether or  $\text{C}_6\text{H}_6$ . These non-aq. dispersoids are permanent if protected from evapn. Sr germanate dispersoids are similar to Ca but gels are not obtained at dilns. comparable to those used in the case of Ca. Ba germanate is distinctly cryst. and appreciably sol. in water.

R I RUSH

**The problem of solubility changes.** L. J. WEBER, *Z. anorg. allgem. Chem.* 181, 385-94(1929).—If a salt raises the surface tension of  $\text{H}_2\text{O}$  it decreases the solv. of a non-conductor dissolved in the salt soln.; if the salt decreases the surface tension of  $\text{H}_2\text{O}$  it increases the solv. of the nonconductor. The exptl. results on  $\text{Li}_2\text{CO}_3$  and  $\text{K}_2\text{SO}_4$  solns in the presence of various capillary-active compds. verify the statement. A large number of references are given.

ARTHUR FLEISCHER

**The determination of the solubility of slightly soluble liquids in water and the solubilities of the dichloroethanes and -propanes.** PAUL GROSS, *J. Am. Chem. Soc.* 51, 2362-6(1929).—Solubilities are detd. by analyzing satd. solns by means of a liquid interferometer, for which a scale is calibrated with known concns of the liquid. Solubilities at 25° so detd. are, in g. per 100 g.  $\text{H}_2\text{O}$ : 1,1-dichloroethane, 0.506; 1,2-dichloroethane, 0.865; 1,2-dichloropropane, 0.280; 1,3-dichloropropane, 0.273;  $\text{CCl}_4$ , 0.077.

T H. CHILTON

**The solubility of arsenic trisulfide and arsenic pentasulfide.** ROBERT HÖLTJE, *Z. anorg. allgem. Chem.* 181, 395-407(1929).—The solubilities of  $\text{As}_2\text{S}_3$  and  $\text{As}_2\text{S}_5$  were appreciable in pure water at 0°, decreased with slight amt. of  $\text{H}_2\text{S}$  and then increased again with increase in  $\text{H}_2\text{S}$  concn. In the presence of  $\text{HCl}$ ,  $\text{H}_2\text{S}$  has no effect on the soly. In the presence of  $\text{HCl}$ ,  $\text{As}_2\text{S}_3$  is pptd. quant. from soln. when a slight excess of  $\text{H}_2\text{S}$  is present. The soly. of the sulfides in pure water is explained by hydrolysis to compds. like  $\text{H}_2\text{AsO}_4\text{S}_3$ .

ARTHUR FLEISCHER

**Solubility of calcium hydroxide.** L. B. MILLER AND J. C. WITT, *J. Phys. Chem.* 32, 285-9(1929).—The  $\text{Ca}(\text{OH})_2$  was prepd. by hydrating  $\text{CaO}$  obtained by igniting Iceland spar. The soly., expressed as g.  $\text{CaO}$  per 1000 cc. of satd. soln. at 30°, was 1.198. Gravimetric and elec. cond. methods were employed.

E. J. C.

**The solubility of sodium and potassium hydroxides in methanol and ethyl alcohol.**

A. G. MURRAY. *J. Assoc. Official Agr. Chem.* 12, 309(1929).—NaOH and KOH in excess were placed in bottles of EtOH and MeOH and allowed to stand with occasional shaking at room temp. (about 28°) for about 3 weeks. Ordinary lab. reagents were used. The soly. in g per 100 ml. and the d. of the satd. soln. were found, resp., 29.0 and 1.04 for KOH in EtOH, 40.3 and 1.14 for KOH in MeOH, 13.6 and 0.93 for NaOH in EtOH, 23.9 and 1.01 for NaOH in MeOH.

The miscibility of phenol with aqueous salt solutions. G. CLAXTON AND H. M. DAWSON. *Proc. Leeds Phil Lit. Soc. Sci. Sect. 1*, 416–20(1929).—The measured solubilities in phenol–water–salt systems are closely represented by the formula:  $\log S = \log S_0 - km$ . ( $m$  = mol. concn.;  $k$  = const. ( $S_0$  values smaller than that from expts using pure water as solvent show that salts in dil. soln. do not behave in accordance with the exponential formula. These deviations may be connected with interionic forces. The salting out effects by concd. salt soln. are in agreement with the Debye-Hückel requirements.

MARY E. LEAR

Equilibrium between alcohols and salts. II. GRAHAM C. GIBSON, JOHN O'LEARY DRISCOLL AND WM. J. JONES. *J. Chem. Soc.* 1929, 1440–3; cf. *C. A.* 22, 2099.—Solubilities of  $MgSO_4$ ,  $ZnSO_4$ ,  $CdSO_4$ ,  $Th(SO_4)_2$ ,  $MnSO_4$ ,  $CoSO_4$ , and  $NiSO_4$  in MeOH at 15°, 25°, 35°, 45° and 55° are reported.  $Na_2SO_4$ ,  $K_2SO_4$ ,  $(NH_4)_2SO_4$ ,  $Ag_2SO_4$ ,  $CaSO_4$ ,  $SrSO_4$ , and  $Al_2(SO_4)_3$  all have solubilities less than 0.0001 g. per g. MeOH at 25°,  $BaSO_4$  and  $PbSO_4$  less than 0.00001. The amt. of salt dissolved increases at first, then attains a max. value and subsequently falls as the sparingly sol. basic salt is being formed. Alcoholation is always subsequent to the attainment of the max. The compn. of the solid phases in equil. with the resp. satd. solns. between 15° and 55° and the dissoen. pressures of the alcoholates at 12°, 16° and 20° are given for  $MgSO_4 \cdot 3.5MeOH$ ,  $ZnSO_4 \cdot 2.5MeOH$  and  $ZnSO_4 \cdot MeOH$ . Between 15° and 55°, Cd, Th, Mn, Co and Ni sulfates exist in equil. with their resp. satd. solns. as the non-alcoholated salts. In no case was a transition pt. observed. The solubilities of Mg, Zn, Cd, Mn, Co and Ni sulfates in EtOH are reported at 15°, 25°, 35°, 45° and 55°; Ca, Sr, Ba and Pb sulfates in EtOH at 25° have solubilities of less than 0.00009; the solid phase in contact with the satd. soln. is the non-alcoholated normal salt.  $Th(SO_4)_2$  and  $CoSO_4$  (anhydrous) extd. with MeOH (Soxhlet) for 100 hrs., showed no trace of basic decompn.,  $ZnSO_4$  gave a ratio of basic to normal sulfate of 0.0019; with  $CuSO_4$  basic decompn. was complete. One vol. 100%  $H_2SO_4$  added to 6 vols. well-cooled abs. MeOH gave with Fe ferrous sulfate hemisulfate methyl alcoholate, olive green; Mg gives  $MgSO_4 \cdot 3.5MeOH$ , and Zn,  $ZnSO_4 \cdot MeOH$ . C. J. W.

Influence of different salts on the solution of pure aluminum in hydrochloric acid. J. CALVET. *Compt. rend.* 189, 183–6(1929), cf. *C. A.* 22, 1317; 23, 3431.—The effect of small amts. of chlorides on the action of HCl on pure Al was detd. The results of different series of expts. are tabulated. Most of the 14 metals in 0.5 N HCl have little influence, except Pt and Ni. At the end of 6 days the action of 0.004 mg. Pt is comparable to 0.608 mg. Au 0.312 mg. Cu produces the same effect after 14 days. In 2.5 N HCl with small amts. of  $HgCl_2$ , the attack is discontinuous and irregular. In the presence of 20 mg.  $HgCl_2$ , the reaction started only after 1.5 hrs. The velocity increases rapidly and after 25 min. a value is obtained 60 times higher than with pure HCl.

E. SCHOTTE

The rate of solution of lead. L. AUBER. *Magyar Chem. Folyóirat* 34, 62–4, 77–83(1929).—Gróh detd. the quantity of Pb dissolved from the activity of amalgamated Pb over which aq.  $Pb(NO_3)_2$  activated with  $Th(NO_3)_4$  was flowing. The radioactive  $Pb(NO_3)_2$  soln. was replaced in these expts. by  $Cu(NO_3)_2$ . The rate of solution was found to be influenced by the concn. of Cu ion in case of relatively small Cu concn. but by Pb concn. in the amalgam in case of relatively large Cu ion concn. Thus a relatively concd.  $Cu(NO_3)_2$  soln. should be used for detg. the max. of rate of solution. The result was  $11.4 \times 10^{-4}$  g.  $cm^{-2}$   $sec^{-1}$  calcd. for satd. Pb amalgam, agreeing with the data of Gróh (*C. A.* 22, 11). This method can also be used in other cases by applying the soln. of a metal of similar solution tension instead of radioactive solns.

S. S. DE FINÁLY

Diffusion coefficients of gases in water and their temperature dependence. G. TAMMANN AND VITUS JESSEN. *Z. anorg. allgem. Chem.* 179, 125–44(1929).—The rates of diffusion of gases into de-gassed 1 to 3% agar in  $H_2O$  solns. were detd. Columns of solns. 10 cm. in length and 156 sq. cm. in cross section were used. The diffusion coeff.,  $k$ , is given by the equation  $k = \pi v^2 / 4a^2 q^2 t$ , where  $v$  is the vol. of gas absorbed,  $a$  is the Bunsen absorption coeff.,  $q$  is the area of the cross section of the column of liquid and  $t$  is the time. Expts. with  $CO_2$  gave no appreciable differences in the values of  $k$  for liquid columns of 4 and 10 cm. in length. Expts. with  $CO_2$ ,  $C_2H_2$ , and  $H_2$  showed no effect of concn. from 1 to 3% of agar on the values of  $k$ . The temps., values of  $a$

used in the calcs. and the resulting coeffs. in  $\text{cm.}^3/\text{day}$  are, resp.:  $\text{CO}_2$  0.0°, 1.713, 0.83; 10.0°, 1.194, 1.06; 17.5°, 0.942, 1.25; 25.0°, 0.759, 1.50; 30.0°, 0.665, 1.51— $\text{C}_2\text{H}_2$  0.0°, 1.73, 0.95; 10.0°, 1.31, 1.30; 17.5°, 1.09, 1.46; 30.0°, 0.84, 1.89— $\text{H}_2$  10.0°, 0.0196, 2.42; 17.5°, 0.0185, 2.93; 25.0°, 0.0175, 3.53; 30.0°, 0.0170, 3.88— $\text{N}_2$  1.0°, 0.0230, 0.98; 10.0°, 0.0190, 1.16; 17.5°, 0.0166, 1.40; 25.0°, 0.0149, 1.56; 30.0°, 0.0140, 1.73— $\text{O}_2$  1.0°, 0.0476, 1.06; 10.0°, 0.0380, 1.57; 17.5°, 0.0325, 2.12; 25.0°, 0.0284, 3.06. The values of  $k$  for  $\text{CO}_2$ ,  $\text{C}_2\text{H}_2$ ,  $\text{H}_2$  and  $\text{N}_2$  increase linearly with the temp. The values for  $\text{O}_2$  increase more rapidly.

**Thermal diffusion at low temperatures.** T. L. IBBS, K. E. GREW AND A. A. HIRST. *Proc. Phys. Soc. London* 41, 456-75(1929).

E. J. C.

**Measurements on the lowering of the freezing point of dilute solutions of mixtures of two electrolytes.** RAGNVALD WESØE. *Physik. Z.* 30, 412-9(1929).—Lowerings of the f. p. were detd. on dil. aq. solns. of equimol. mixts. of  $\text{KNO}_3$ ,  $\text{K}_2\text{SO}_4$ ,  $\text{MgSO}_4$ ,  $\text{Ca}(\text{NO}_3)_2$ , using the salts in pairs. From these data the exptl osmotic coeffs. were calcd. and these compared with those calcd. by means of the Debye-Hückel theory. The exptl. values were in fair agreement with the calcd. ones.

L. W.

**Studies in the region of concentrated solutions.** V. P. SHISHOKIN. *Z. anorg. allgem. Chem.* 181, 137-53.—A study of the Schröder formula  $\log S = -Q(T_m - T)/4.58 T_m T$ . ( $S$  is the concn. of the crystd. component;  $Q$ , its heat content,  $T_m$ , its abs. m. p.; and  $T$ , the abs. temp. of the beginning of crystn. of the mixt.  $4.58 = 2.3 R$ .) Three series of binary systems are considered: (1) Allylphenylthiourea as solvent, the 2nd component one of a series of 21 org. substances such as  $p\text{-C}_6\text{H}_4\text{Br}$ ,  $o\text{-C}_6\text{H}_4\text{NO}_2\text{NH}_2$ ,  $m\text{-C}_6\text{H}_4\text{NO}_2\text{NH}_2$ ,  $\text{C}_6\text{H}_5\text{NO}_2$ ,  $\text{EtOH}$ ,  $\text{MeOH}$ ,  $\text{CCl}_3\text{COOH}$ ,  $\text{CH}_3\text{COOH}$ ,  $o\text{-MeC}_6\text{H}_4\text{NH}_2$ , etc., (2)  $p\text{-C}_6\text{H}_4\text{Br}_2$  as solvent, the 2nd component one of six org. substances, (3) acetanilide as solvent, the 2nd component one of five org. substances. M. p. diagrams for all series are obtained, by plotting  $\log S$  against  $1/T$ . It is pointed out that the individual branches of the m.-p. diagrams conform to the equation  $S = Ke^{-\alpha/T}$ , a simplified form of the Schröder formula ( $K$  and  $\alpha$  are consts.), when the heat content  $Q$ , as calcd. by the Schröder formula does not vary to any great extent from the actual heat of fusion of the crystg. component. It is also concluded that the individual branches of the m.-p. diagrams formed between one substance and a series of other substances conforms to the equation  $S = Ke^{-\alpha/T}$  only when the m.-p. curves of the pure components conform to the same equation. Conversely, if the m.-p. curve of any component of a binary system does not fulfil the equation, neither will the branches of the m.-p. diagram of the binary system. For example, the m.-p. curves for  $\text{C}_6\text{H}_6$  and  $\text{C}_6\text{H}_5\text{NO}_2$ , as well as the individual branches of the diagram for the system  $\text{C}_6\text{H}_6\text{—C}_6\text{H}_5\text{NO}_2$ , agree with the equation. The variation of the value for  $Q$  as calcd. by the Schröder formula from that of the actual heat of fusion of the pure substance is explained by assuming chem. action between the components when the mixt. is melted. The heat capacities of allylphenylthiourea and acetanilide were detd. Several examples of systems not in accordance with the equation  $S = Ke^{-\alpha/T}$  are discussed.

L. L. QUILL

**The existence of monocalcium aluminate in solution.** A. TRAVERS AND SCHNOUTKA. *Compt. rend.* 189, 182-3(1929).—A soln. of any Al salt treated with lime water gives 3 distinct phases. (1) A ppt. of gelatinous Al hydroxide. The reaction is quant. with 3CaO per  $\text{Al}_2\text{O}_3$ . (2) On addn. of a 4th mol. CaO the ppt. disappears. It is impossible to crystallize the hydrated mono-Ca aluminate. Decompn. will take place on evapn. (3) Excess  $\text{Ca}(\text{OH})_2$  gives crystals, the shape of which changes with the  $p_H$ . The impossibility of concentrating solns. of  $\text{Al}_2\text{O}_3\text{—CaO}$  without decompn. is due to the insoly. of polycalcium aluminates. The latter are formed by the action of Ca, liberated by hydrolysis, on the monocalcium aluminate.

E. SCHOTTE

**The transport number of water in a 0.1 N hydrobromic acid solution.** J. BABOROVSKÝ AND A. WAGNER. *Chem. Listy* 23, 97-8(1929); cf. *C. A.* 22, 1517.—By the method of Baborovský, the transport no. of  $\text{H}_2\text{O}$  in 0.1 N solns. of HBr is detd. as 0.860; the exact transport no. of the cation  $(1 - N) = 0.867$ . The influence of parchment membranes has not been considered in the above detns.; the detns. have not been checked without membranes. In 0.1 N solns. of HCl, the introduction of a membrane increased the transport no. of the electrolyte. The transport of HBr by 96,490 coulombs was detd. with and without membranes.

FRANK MARESH

The electrical conductivities of ammonia-water mixtures, between 26 and 82 per cent ammonia and from  $-30^{\circ}$  to  $+30^{\circ}$ . M. DEKAY THOMPSON AND R. B. ATKINSON. *Trans. Am. Electrochem. Soc.* 56 (preprint) 11 pp. (1929).—These measurements were originally suggested as a means of analyzing refrigerating mixts. of water and  $\text{NH}_4\text{OH}$  by detns. of elec. cond. and temp. in the circulating system. The results show that above  $15^{\circ}$ , in the absence of impurities, the compns. of mixts. up to 50%  $\text{NH}_3$  could be detd. to 0.5% or better. As the temp. falls the cond. changes less and less with the compn., so that at  $-30^{\circ}$  mixts. contg. more than 32%  $\text{NH}_3$  could not be analyzed by this means. The conductivities of mixts. above 50%  $\text{NH}_3$  at  $-30^{\circ}$  are about the same as that of the pure  $\text{NH}_3$  here used. C. G. F.

Dissociation constants of organic acids. I. The primary dissociation constants of some alkylmalonic acids. ARTHUR ISRAEL VOGEL. *J. Chem. Soc.* 1929, 1476–87.—This work was undertaken to study the influence of substituents and of unsatn and the effect of ring closure. Details are given of the prepn. of the acids and their Na salts and the measurement of resistance (bridge assembly, cond. cells, detn. of cell consts., prepn. of solns., cond. measurements, solvent correction). The following values for  $\mu_0$  and  $K_1 \times 10^4$  are reported for  $\text{CH}_2(\text{CO}_2\text{H})_2$  (I) and its alkyl derivs.: (I) 407.9, 14.10; Me (II), 404.2, 7.99; Et (III), 398.3, 10.30; Me<sub>2</sub> (IV), 398.4, 6.57; MeEt (V), 397.3, 13.94; Et<sub>2</sub> (VI), 396.85, 63.9; EtPr (VII), 392.2, 73.7; Pr<sub>2</sub> (VIII), 389.65, 90(?). For the di-Na salts there are reported  $\mu_0$ ,  $L_x$ —(ionic cond. at infinite diln. of the neutral anion),  $b$  and  $n$  ( $\mu_0 = \mu + bC^n$ ): I, 220.55, 117.7, 2071, 0.8387; II, 213.1, 110.3, 961, 0.6551; III, 201.3, 98.5, 2643, 0.9271; IV, 201.5, 98.7, 2978, 0.9085; V, 199.3, 96.5, 1115, 0.7080; VI, 198.4, 95.6, 1416, 0.8185; VII, 189.1, 86.3, 1424, 0.7619; VIII, 184.0, 81.2, 1170, 0.7917. The effect of successively substituting Me groups for the 2 H atoms of I is a lowering of the dissocn. const., whereas the substitution of larger groups causes an increase. The diminution of  $K_1$  with decrease of concn. is an outstanding feature of the results. II. The primary dissociation constants of some cyclic 1,1-dicarboxylic acids. *Ibid* 1487–94.—Methods of prepn. of the acids are reported.  $K_0$  and  $K_1$  are given for the following 1,1-di- $\text{CO}_2\text{H}$  acids: cyclopropane (I), 402.5, about  $1.4 \times 10^{-2}$ ; cyclobutane (II), 397.0,  $6.96 \times 10^{-4}$ ; cyclopentane (III), 395.95,  $5.47 \times 10^{-4}$ ; cyclohexane (IV), 394.2,  $3.14 \times 10^{-4}$ . Na salts ( $K_0$ ,  $L_x$ —,  $b$  and  $n$  as above): I, 209.6, 106.8, 1105, 0.7151; II, 198.75, 95.95, 1498, 0.7924; III, 196.65, 93.8, 1127, 0.7521; IV, 193.1, 90.3, 805, 0.6870. There seems at present no apparent relation between the primary dissocn. consts. of these four acids and those of IV, V, VI and VII the open-chain compds. from which they may be regarded as derived. C. J. WEST

Interionic forces and the ionization of weak electrolytes. H. M. DAWSON. *Proc. Leeds Phil. Lit. Soc. (Sci. Sect.)* 1, 491–6 (1929).—By using the results of work published elsewhere (cf. *C. A.* 21, 2834; 22, 4333; 23, 1337) it is shown that the catalytic effect of salt-free acid solns. is due solely to the concn. of the H-ion. The agreement of observed and calcd. velocity consts (assuming  $K$ , ionization const., remains const., i. e., elec. field effect negligibly small) is evidence for the view that the interionic forces of salt-free solns. are very small in comparison with those which would correspond with the Debye-Hückel theory and the ionic strength hypothesis of Lewis and Randall. In the presence of salts the catalytic activity of H-ion as measured by the catalytic const.  $k_a$  varies with the nature and concn. of the salt. The ionization const.  $K$  increases with increasing quantities of inert salt to a max. then decreases. It can be closely represented by  $K_x/K_0 = 10^{m\sqrt{a-nx}}$ ;  $K_0$  = ionization const. of acid in salt-free soln.,  $K_x$  its value in soln. contg.  $x$  mol salt/l;  $m$  and  $n$  are consts. which are but slightly affected by the nature of the acid, but vary when the NaCl used usually is replaced by other salts. The interionic forces which det. the value of the ratio in solns. of low ionic strength are much smaller than those suggested by the D.-H. theory. The ionic strength hypothesis is not applicable when the H-ions are involved in the elec. field effect. The consistency of the results obtained with different salts, acids and reactions justifies the use of the catalytic method for the study of interionic forces. E. R. SCHIERZ

The frequency dependence of the electrical conductance of solutions of strong electrolytes. HANS FALKENHAGEN AND JOHN W. WILLIAMS. *J. Phys. Chem.* 33, 1121–34 (1929).—The elec. conductance of dil. solns. as a consequence of the existence of a finite time of relaxation possessed by the ionic atm. of each ion is reviewed (cf. *C. A.* 22, 2705, 3573) and extended by a math. discussion based on tables, graphs and formulas. The reason why a dispersion of the elec. cond. must exist is shown. The factors influencing that dispersion are: concn. (which is inversely proportional to the times of relaxation), mobilities of the ions, dielec. const., valence and temp. (at higher temps.,

smaller wave lengths go with the same values of the ratio of the conductances). The magnitude of the dependence on the frequency is recognized when the difference between the mol. cond. for the frequency  $\omega$  and that for zero is compared to the mol. conductance at infinite diln. The max. dispersion effect would be of the order of 2%.

M. E. L.

**Potential differences across the boundaries between solutions of mixed univalent chlorides.** EDGAR R. SMITH. *Bur. Standards J. Research* 2, 1137-43(1929).—Potential differences were measured across liquid junctions of the types:

using a flowing junction and Ag-AgCl electrodes. There was no evidence of complex formation, and the detns. gave reproducible values for the liquid-junction potentials which can be accurately computed from the formula  $E = RT/F \ln [(1 - N_{\text{Na}}) - x_2(N_{\text{H}} - N_{\text{Na}})] / [(1 - N_{\text{Na}}) - x_1(N_{\text{H}} - N_{\text{Na}})]$ , where  $x_1$  and  $x_2$  represent the molal proportions of NaCl to the total electrolyte concn., and  $N_{\text{Na}}$  and  $N_{\text{H}}$  are the cation transference nos. in solns. of the pure electrolytes at the same concn. as the total concn. of the mixt.

H. STOERTZ

**Potential of an inert electrode in a solution of acetaldehyde.** LOUIS RAPKINE. *Compt. rend.* 189, 171-3(1929).—When a Pt electrode is brought into a soln. contg. a substance the oxidation of which is irreversible, a definite potential may be observed. The potential is dependent upon the kinetic equil. between the velocity of the formation and that of the disappearance of the active substance on the electrode. The curve given represents the limiting potential as a function of the  $p_{\text{H}}$  at 40° for a concn. of 2% acetaldehyde. The soln. contains a phosphate buffer. The curve is linear till about a  $p_{\text{H}} = 10$ ; then there is an inflection to the electroneg. region. Near the  $p_{\text{H}} = 12$  the curve reaches the value of the limiting potential of glucose (cf. C. A. 22, 3343). This and the bending of the curve at the  $p_{\text{H}} = 10$  seems to indicate that in a very alk. medium a more and more intensive condensation of aldehyde into sugars takes place. The irreversibility of the potential is proved in different ways. E. S.

**The cell ammonia-oxygen.** C. MARIE AND C. HAENNY. *Compt. rend.* 189, 149-50(1929).—The e. m. f. of the chain air- Pt- Pyrex glass- Pt-  $\text{NH}_3$  was measured. The system becomes a conductor at about 480°. The e. m. f. varies with the temp., from 1.090 at 510° to 0.951 at 790°. The values are in accordance with that of the reaction in which  $\text{NH}_3$  is oxidized to  $\text{N}_2$ .

E. SCHOTTE

**Electromotive behavior of single zinc crystals.** M. STRAUMANIS. *Nature* 124, 56(1929).—No difference could be observed in the potentials of different, artificially prepd. planes of single Zn crystals against a neutral  $\text{ZnSO}_4$  soln. This contradicts reports by Anderson (C. A. 23, 1792). The potential varied with the concn. of the electrolyte and with the previous mech. treatment of the surface, etching, etc. Similar results were obtained with single crystals of Zn-Cd alloys contg. up to 0.2% Cd.

W. W. STIFLER

**The theory of passivity.** ROBERT MÜLLER. *Z. Elektrochem.* 35, 459-60(1929).—Theories of passivity are reviewed and a combination of the  $\text{H}_2$  and  $\text{O}_2$  theory with allotropic change in the metal is advanced as an explanation of passivity. R. D. B.

**The passivity of metals.** I. N. STRANSKI AND Z. C. MUTAFTSCHIEW. *Z. Elektrochem.* 35, 393-5(1929).—Soln. of a crystal can be retarded merely by hampering the soln. of a few ions or mols. situated on its surfaces and edges. Cf. C. A. 22, 4289.

R. D. BUMBACHER

**The rate of absorption of carbon dioxide by calcium cyanamide solution and the product found therein.** YOGORO KATO AND SHIGEN FUJINO. *J. Soc. Chem. Ind Japan* 32, 332-7(1929); Suppl. Binding 32, 99B(1929).—The rate of absorption was found to be proportional to the partial pressure of  $\text{CO}_2$ , to the initial concn. of the soln. and also to the final concn. of Ca. The presence of an undissocd. compd. having the compn.  $\text{Ca}(\text{CN})_2 \cdot \text{CO}_2$  in the soln. was proved by means of cryoscopic and cond. methods.

S. OKA

**Influence of nonelectrolytes on the speed of ionic reaction.** E. HATZ. *Magyar Chem. Folyóirat* 34, 141-4, 154-60, 177-9(1928).—The influence of nonelectrolytes on the speed of reaction between  $\text{S}_2\text{O}_8$  and I ions was studied in the presence of neutral salts. It was found that MeOH, EtOH and glycerol diminish the speed; carbamide and saccharose, on the contrary, increase it. The connection between the total ionic concn. and the retarding action of EtOH and MeOH was detd.

S. S. de FINÁLY

**The classification of induced reactions.** WILDER D. BANCROFT. *J. Phys. Chem.*

33, 1185-92(1929).—The classification given is based on the induction factor detd. at the end of reaction. All of the induced reactions are arranged in 3 groups: (a) the acceptor I reacts with a lower stage of the actor II, (b) I reacts with a reaction product of the inductor III, (c) II reacts with a reaction product of III and I. Consecutive reactions are classed under induced reactions.

**New view of autoxidations.** NICHOLAS A. MILAS. *J. Phys. Chem.* 33, 1204-16 (1929).—The new interpretation of autoxidations is a compromise of the widely different views held by various investigators.

**Influence of neutral salts on the oxidation velocities by permanganate.** B. V. TRONOV AND A. A. LUKANIN. *J. Russ. Phys.-Chem. Soc.* 61, 727-34(1929).—Permanganate solns. contain mols. of the non-dissocd. salt as well as the ions of the metal and of  $\text{MnO}_4^-$ . In oxidation with permanganate solns., the metal ions take no part, whereas  $\text{MnO}_4^-$  and the non-dissocd. mols. combine with electrons of the substance which is being oxidized. Theoretically a neutral substance is apt, more easily, to acquire a neg. charge than a substance which is already negatively charged, and a positively charged substance combines with electrons more easily than a neutral substance. Again, electrons are more easily lost by a negatively charged body than by a neutral or positively charged body. It follows that a permanganate mol. is apt to acquire electrons (thus acting as an oxidizer) with greater facility than  $\text{MnO}_4^-$ . These theoretical considerations are confirmed by the fact that solns. of alk. nitrates are very weak oxidizers on account of their being completely dissocd., whereas nitrates of Cu, Fe, and Pb and  $\text{HNO}_3$ , which are less dissocd., have a more powerful oxidizing effect. To verify the theory for permanganates, a series of expts. was made to follow the changes in oxidizing capacity at various stages of dissocn. The concns. remaining the same, the variations of the degree of dissocn. were effected by adding neutral salts which had a common ion with the permanganate; KCl, NaCl,  $\text{KNO}_3$ ,  $\text{NaNCl}_3$ ,  $\text{KClO}_4$ ,  $\text{K}_2\text{SO}_4$ , and  $\text{Na}_2\text{CO}_3$  were thus used for this purpose. EtOH was the substance to be oxidized, and the reactions were carried out in alk. soln. Most of the measurements were made at 16.8-18°. The reactions were followed only till 20% of the oxidizer was used up; this corresponds to the first stage of permanganate reduction, whereby the 7-valent Mn is transformed into the 6-valent Mn. Conclusions: (1) All the neutral inorg. salts actually accelerate the reaction between  $\text{KMnO}_4$  and EtOH in presence of KOH, the increase of the reaction velocity being almost proportional to the concns. of the added salts. (2) The nature of the cation of the neutral salt ( $\text{K}^+$  or  $\text{Na}^+$ ) has no noticeable influence on the velocity. (3) The nature of the anion has little influence in the case of univalent strong acids, but the salts of  $\text{H}_2\text{SO}_4$  accelerate the oxidation to a considerably less extent, and carbonates, as well as free caustic, even retard it. (4) Changes in permanganate concns. within the limits of 0.0001 to 0.0004 M have practically no influence on the reaction velocity. (5) The temp. coeff. of the reaction (from 16.8 to 26.8°) calcd. for the same % active O consumed noticeably increases with the addn. of KCl, and still more with the addn. of  $\text{K}_2\text{SO}_4$ ; the ratio of reaction velocities is, for  $\text{K}_2\text{SO}_4$  and KCl, equal to 0.7 at 16.8°, and is more than 1 at 26.8°. Thus, as a whole, theoretical considerations are exptly. confirmed, with the exception of the retarding influence of  $\text{Na}_2\text{CO}_3$ . The latter, as well as the exceptional action of  $\text{K}_2\text{SO}_4$ , is explained by the formation of elec. fields around the ions, in conformance with the theory of Brönsted developed by Christiansen (*C. A.* 19, 2157; 20, 324). B. N.

**The action of hydrochloric acid on alcohol.** VI. Velocity coefficient. S. KILPI. *Z. physik. Chem.*, Aht A, 142, 195-210(1929).—Velocity measurements were made on  $\text{H}_2\text{O}$ -alc. mixts. contg. 25 and 50% of alc., at 96.5° and 110°, and on mixts. contg. 65 and 80% alc., at 96.5°. Equations for the reaction-velocity coeffs. were derived, taking into account changes in the velocity-coeff.  $C_1$  of the action of HCl on alc. If  $N_a < 0.5$ ,  $C_1$  can be taken as const. for purposes of integration.  $C_1^{(0)}$ , the velocity-coeff. at infinite diln., and the corres.  $C_1^{(0)}/[\text{C}_2\text{H}_5\text{OH}]$  increase rapidly with increasing alc. content.  $C_1^{(0)}/[\text{C}_2\text{H}_5\text{OH}]$  was compared with the corresponding electrically measured activity of HCl in various  $\text{H}_2\text{O}$ -alc. mixts. The same relation between the reaction velocity and the electrically measured activity of HCl, which was observed on varying the concn. of the electrolyte in the same  $\text{H}_2\text{O}$ -alc. mixt., seems to be present when the compn. of the  $\text{H}_2\text{O}$ -alc. mixt. is varied.

**Oxidation of sodium sulfite by air in the presence of ferrous hydroxide, and a theory of negative induced reaction.** S. MIYAMOTO. *Sci. Papers Inst. Phys. Chem. Research* (Tokyo) 11, 81-92(1929).—The oxidation velocity of  $\text{Na}_2\text{SO}_3$  in the presence of  $\text{Fe}(\text{OH})_2$  with a flow of air equal to 7.78 l./hr. and at 20°, decreases rapidly with time and proves the reaction to be a negative induced reaction of the second kind or

one in which the active states of the mols. of the reacting substances of the secondary reaction can transfer to the mols. of the reaction products. The oxidation velocity of  $\text{Na}_2\text{SO}_3$  in the presence of  $\text{Fe}(\text{OH})_3$  is very low, showing that the decrease of the oxidation velocity of  $\text{Na}_2\text{SO}_3$  in the mixt. is due to the formation of  $\text{Fe}(\text{OH})_3$ .  $\text{Na}_2\text{SO}_4$  has no appreciable effect on the oxidation velocity of  $\text{Na}_2\text{SO}_3$ . H. STOERTZ

A study of the catalysis by silver of the union of hydrogen and oxygen. D. L. CHAPMAN AND W. K. HALL. *Proc. Roy. Soc. (London)*, A124, 478-93(1929); cf. C. A. 19, 1082.—The elec. resistance method of Hughes and Bevan (cf. C. A. 22, 716) for the detn. of the presence of an oxide film was applied to Ag. Metallic Ag wire which has been heated in  $\text{H}_2$  forms an oxide film at room temp. This film is more active than Ag which has an oxide film formed at higher temp. A Ag wire becomes coated with the oxide film in a mixt. of  $\text{H}_2$  and  $\text{O}_2$ . The activity of the low temp. film decreases with increase in temp. by reason of the conversion from an unstable configuration of atoms to a more stable one. The mechanism of catalysis by Ag is due to alternate oxidation and reduction at the Ag surface. ARTHUR FLEISCHER

An enquiry into the catalytic activity of molten tin. The relative efficiencies of tin and its oxides as catalysts for the reduction of nitrobenzene vapor. GWYN WILLIAMS. *Trans. Faraday Soc.* 25, 446-51(1929).—As catalysts for vapor-phase reduction to  $\text{PhNH}_2$  by  $\text{H}_2$  at  $310^\circ$  tin oxides are effective but molten tin is not. G. B. TAYLOR

Gibbs' theorem applied to heterogeneous equilibria. V. POLARA. *Atti accad. Lincei* [6], 8, 500-5(1928).—Mathematical. H. L. D.

Absorption of hydrogen in calcium and its alloys. G. KASSNER AND B. STEMPEL. *Z. anorg. allgem. Chem.* 181, 83-94(1929).—At  $250^\circ$ , finely rasped Ca metal rapidly takes up  $\text{H}_2$  to form the hydride  $\text{CaH}_2$ . As the temp. is raised the reaction becomes less rapid, but at  $500^\circ$  Ca is quantitatively converted into  $\text{CaH}_2$  in 2-3 hrs.; at about  $800^\circ$  the velocity of the reaction is very great. Measurements of the disson pressure of the hydride prep'd at  $250^\circ$  give a vapor-pressure curve, the equation of which between  $755^\circ$  and  $920^\circ$  is approx given by  $\log p = -3.475 + 0.005322 T$ . The vapor pressure is considerably higher than values given by other authors and corresponds to the equil.  $2\text{CaH} \rightleftharpoons 2\text{CaH} + \text{H}_2$ . Previously given values are probably represented by  $2\text{CaH} \rightleftharpoons 2\text{Ca} + \text{H}_2$ . Calcn. of the heat content of  $\text{CaH}_2$  between  $755^\circ$  and  $920^\circ$  by van't Hoff's formula gives 24.8-31.5 cal., and by Nernst's formula 22.6 cal. These values are in good agreement with calorimetric detns. The hydride can be prep'd in the form of white hexagonal prisms. A grouping of metal hydrides into salt-like, metallic and gaseous is made on the basis of the potential series. H. STOERTZ

Determination of transition point by the viscosity method. M. MATSUI AND S. OGURI. *J. Soc. Chem. Ind. (Japan)* 32, 43-8(1929); Suppl. Binding 32, 16B(1929).—By means of a modified Hartshorne viscometer, the viscosity of sat'd. solns. was measured at several temps. and the transition temps. of the following reactions were detd.: (1)  $\text{Na}_2\text{HPO}_4 \cdot 12\text{H}_2\text{O} \rightleftharpoons \text{Na}_2\text{HPO}_4 \cdot 7\text{H}_2\text{O} + 5\text{H}_2\text{O}$ . (2)  $\text{Na}_2\text{SO}_4 \cdot 10\text{H}_2\text{O} \rightleftharpoons \text{Na}_2\text{SO}_4 + 10\text{H}_2\text{O}$ . (3)  $\text{NiSO}_4 \cdot 7\text{H}_2\text{O} \rightleftharpoons \text{NiSO}_4 \cdot 6\text{H}_2\text{O} + \text{H}_2\text{O}$ . The transition points obtained graphically were: (1)  $35.6^\circ$ , (2)  $32.5^\circ$ , (3)  $31.8^\circ$ . The following were obtained mathematically as the intersection of two curves of viscosity which were assumed to be parabolas. (1)  $32.88^\circ$ , (2)  $32.46^\circ$ , (3)  $31.36^\circ$ . SHIRO OKA

Melting-point curves of a few hydrated salts. G. TAMMANN. *Z. anorg. allgem. Chem.* 179, 186-92(1929).—Fusion pressures for  $\text{Na}_2\text{SO}_4 \cdot 10\text{H}_2\text{O}$  were detd by pressing the salt in a steel cylinder at const. temp. At the following temps. the pressures in kg./sq. cm. are, resp.,  $8.0^\circ$ , 7730;  $12.5^\circ$ , 7480;  $14.0^\circ$ , 6656;  $18.0^\circ$ , 6320. By increasing the temp. at const. pressure, the values obtained were  $19.1^\circ$ , 6415;  $22.8^\circ$ , 5810;  $23.6^\circ$ , 5360;  $10.8^\circ$ , 7120. These data give a continuous  $p$ - $t$  curve, the m. p. decreasing with increasing pressure. Data were obtained for  $\text{MgCl}_2 \cdot 6\text{H}_2\text{O}$ , by using Hg in transmitting the pressure. The m. ps. and pressures in kg./sq. cm. are, resp.,  $128^\circ$ , 1082;  $139^\circ$ , 2066;  $148^\circ$ , 2826. The  $p$ - $t$  diagram is a straight line, the m. p. increasing with increasing pressure. Geller's data (C. A. 19, 951) for the above and other hydrates give  $p$ - $t$  curves with distinct minima. The method consisted of imbedding a crystal of the salt in clay and heating under pressure. Using the latter method, T. verified G.'s results for  $\text{Na}_2\text{SO}_4 \cdot 10\text{H}_2\text{O}$  and accordingly considers G.'s method and resulting data to be incorrect. J. E. SNYDER

Melting-point diagram of cryolite-barium fluoride. NAOTO KAMEYAMA AND EIICHI MASUDA. *J. Soc. Chem. Ind. (Japan)* 31, 1134(1928); Suppl. Binding 32, 271B(1928).—The cryolite used contained 24.30%  $\text{Al}_2\text{O}_3$  and 0.04% matter insol. in  $\text{H}_2\text{SO}_4$  and HCl.  $\text{BaF}_2$  was prep'd. by double decompn. of  $\text{BaCl}_2$  and NaF, and the purified product contained 0.19% NaF and 99.48%  $\text{BaF}_2$ . The NaF used was purified by pptg. contaminating sulfate with benzidine chloride. Cooling curves show a eutectic

point at 835°, the eutectic mixt. being composed of  $\text{BaF}_2$ , 62.5% by wt. No compd. was found.

BaF <sub>2</sub> in the mixt. by weight	Beginning of freezing	Eutectic point

N. KAMEYAMA

A determination of the temperature prevailing at the solid-liquid phase boundary during crystallization from undercooled melts. HERBERT POLLATSCHKE. *Z. physik. Chem., Abt. A.*, **142**, 289-300(1929).—Direct measurements on *salol* show that Tamman's assumption that the solid-liquid interface attains the melting temp. of the substance during crystn. from undercooled melts is not correct.

J. B. AUSTIN

The system: water and hexamethylenetetramine. V. EVRARD. *Naturw. Tijdschr.* **11**, 99-107(1929).—The soly. diagram of hexamethylenetetramine has been exptly. detd. by measuring the  $n$  of the solns., and by Kjeldahl N detns. Below are listed the temps. and the urotropine concns. in % wt. of soln.: line AB(ice line): -0.56, -0.90, -1.80, -4.00, -5.70, -8.00, 8.30, -9.00°; 3.71, 5.80, 10.5, 19.8, 23.0, 27.6, 28.8, 29.8%. Line BC(soly. of the hydrate): -6.0, -5.0, 0.0, 7.0, 9.2, 10.8, 12.0, 13.0; 30.5, 30.8, 34.8, 40.5, 42.0, 43.3, 45.0, 46.8%. Line CM(metastable solns.): -4.0, -1.0, 7.0°; 47.3, 47.2, 47.0%. Line CDE: 13.0, 16.0, 20.0, 30.0, 40.0, 49.0, 65.0, 85.0, 95.0, 100.0, 110.0, 115.0, 130.0, 145.0, 150.0, 165.0°; 46.8, 46.5, 46.5, 46.3, 46.2, 46.0, 45.7, 45.6, 46.0, 46.3, 36.8, 47.4, 48.6, 50.0, 51.0, 52.5%. The refractive indexes of solns. contg. from 1 to 10 g. hexamethylenetetramine per 100 cc. soln are: 1.33493, 1.33659, 1.33831, 1.33999, 1.34162, 1.34331, 1.34507, 1.34683, 1.34851 and 1.35021, resp.

ALBERT L. HENNE

Liquid ammonia and sodium nitrate. NAOTO KAMEYAMA AND SAKAE YAGI. *J. Soc. Chem. Ind. (Japan)*, **31**, 1141(1928); Suppl. Binding **31**, 272B(1928).—The vapor tension of  $\text{NH}_3$  over the soln. of  $\text{NaNO}_3$  in liquid  $\text{NH}_3$  was measured at various concns. The presence of solid  $\text{NaNO}_3$  besides the satd. soln. makes the system univariant. The pressure of  $\text{NH}_3$  in mm. Hg at which the system is univariant are, resp., 325, 400, 500, 600, 760, 800, 1000, 1200 at the temps in °C -35.0, -30.7, -26.0, -22.1, -16.7, -15.6, -10.3 and -6.3. The absorbed heat during the isothermal evapn. of  $\text{NH}_3$  from the satd. soln., leaving  $\text{NaNO}_3$  as solid, was calcd. from  $dP/dT$  and was found to be about 5.4 kg.-cal./g.-mol.  $\text{NH}_3$  at -20°. The heat of soln. of  $\text{NaNO}_3$  in the satd. soln. is small.

S. OKA

Examination of a system containing three liquid phases. T. SZAFFKA. *Magyar Chem. Folyóirat* **34**, 145-9(1928).—Weszelszky found during the radiological examn. of silt from the baths *Ilévis* and *Budapest-Császár-fürdő*, that a soln. prepd. during the work yielded a system with 3 liquid phases when shaken with  $\text{Et}_2\text{O}$ . Analysis showed that the soln. contained  $\text{CaCl}_2$ ,  $\text{AlCl}_3$  and  $\text{NH}_4\text{Cl}$  and  $\text{HCl}$ . The  $\text{CaCl}_2$  caused the formation of 3 phases. Two series of expts. were made to det. the concn. of  $\text{HCl}$  and  $\text{CaCl}_2$  at which 3 phases form.

S. S. DE FINÁLY

Density of calcium hydroxide and the role of that material in the shrinkage of portland cement. P. JOYE AND P. DEMONT. *J. chim. phys.* **26**, 317-8(1929).—There has been considerable disagreement about the d. of  $\text{Ca(OH)}_2$ . The d. should be greater than that of  $\text{CaCO}_3$  to accord with the fact that the vol. of portland cement after setting is less than that of the cement before setting. J. and D. found the d. of  $\text{CaCO}_3$  to be 2.702, while that of  $\text{Ca(OH)}_2$  was found to be 2.239. The  $\text{CaCO}_3$  was placed in a weighed crucible and transformed into the oxide by heating at 1100° for one hr. The oxide was placed in a desiccator contg.  $\text{KOH}$ . The loss of  $\text{CO}_2$  agreed with that calcd. The hydration of the oxide occurred under a bell jar by contact with satd.  $\text{H}_2\text{O}$  vapor. The reaction required 24 hrs and there was no loss by swelling of the material. The crucible was placed under a bell jar in the presence of  $\text{P}_2\text{O}_5$  until const. wt. was attained. The d. of  $\text{Ca(OH)}_2$  thus prepd. was detd. in a pycnometer with  $\text{C}_6\text{H}_6$  as the filling liquid. The value found agrees with that of Lamv [*Ann. chim. phys.* **114**,

172-5(1878)]. It is evident that  $\text{Ca}(\text{OH})_2$  plays a part in the diminution of vol. of portland cement.

A. J. MONACK

**Specific heat, heat of formation and decomposition pressure of strontium halide hydrates.** GUSTAV F. HÜTTIG AND CH. SLONIM. *Z. anorg. allgem. Chem.* 181, 65-77(1929).—Dehydration at const. pressure indicated the following hydrates:  $\text{SrCl}_2 \cdot \text{H}_2\text{O}$  (I),  $\text{SrCl}_2 \cdot 2\text{H}_2\text{O}$  (II),  $\text{SrCl}_2 \cdot 6\text{H}_2\text{O}$  (III),  $\text{SrBr}_2 \cdot \text{H}_2\text{O}$  (IV),  $\text{SrBr}_2 \cdot 6\text{H}_2\text{O}$  (V),  $\text{SrI}_2 \cdot \text{H}_2\text{O}$  (VI),  $\text{SrI}_2 \cdot 2\text{H}_2\text{O}$  (VII),  $\text{SrI}_2 \cdot 6\text{H}_2\text{O}$  (VIII). Vapor-pressure curves are given in tables. Mean sp. heat is given as follows: for  $\text{SrCl}_2$ , 0.1201; for I, 0.1626; II, 0.1967;  $\text{SrBr}_2$ , 0.0773; IV, 0.1090; V, 0.2308;  $\text{SrI}_2$ , 0.0574; VI, 0.0792; VII, 0.1036; VIII, 0.1888. Heat of soln. in cal. is as follows: for  $\text{SrCl}_2$ , 11,441; for I, 6017; II, 2569; III, —7441;  $\text{SrBr}_2$ , 16,248; IV, 8862; V, —7106;  $\text{SrI}_2$ , 20,660; VI, 12,407; VII, 10,174; VIII, —4729. Density is detd. at 25° and is as follows: for  $\text{SrCl}_2$ , 2.953; III, 1.931;  $\text{SrBr}_2$ , 4.175; V, 2.386;  $\text{SrI}_2$ , 4.437; VIII, 2.672. The following mol. heat values were obtained:  $\text{SrCl}_2$ , 19.04; I, 28.70; II, 38.26;  $\text{SrBr}_2$ , 19.13; IV, 28.95; V, 82.03;  $\text{SrI}_2$ , 19.60; VI, 28.48; VII, 39.12; VIII, 84.87. H. STÖRRTZ

**Heat of solidification and solution of sucrose.** A. TIAN. *Compt. rend.* 189, 164-7(1929); cf. C. A. 23, 4608.—The heat of soln. of undercooled sugar is pos. In dissolving simultaneously in the proper proportions undercooled and cryst. sugar a thermic effect = 0 can be obtained.  $\alpha Q_s + Q_1 = 0$ ,  $Q_s$  and  $Q_1$  are the mol. heats of soln. The mol. heat of solidification is then  $X = Q_1 - Q_s = -(\alpha + 1)Q_s$ . For  $\alpha$  the value 3.474 was found with a microcalorimeter (cf. C. A. 18, 1070). At 17° for the heat of soln. of 1 g.-mol. of the sugar in 5 l.  $\text{H}_2\text{O}$  the value —1027 was obtained. The values calcd. for  $X$  and  $Q_1$  are, resp., 4595 and 3548. The two soly. curves of the 2 varieties of sugar should meet in a point most probably the m. p. of sugar. E. S.

**The heat of solution at the saturation point of a few hydrates. Direct method.** J. PÉRREU. *Compt. rend.* 189, 167-9(1929).—The heat of soln. of the hydrates was detd. at 11-12° by adding to the solns. of the salt increasing amts. till near the satn. point. The extrapolated values are —13.54 for  $\text{Na}_2\text{CO}_3 \cdot 10\text{H}_2\text{O}$ , —21.845 for  $\text{Na}_2\text{HPO}_4 \cdot 12\text{H}_2\text{O}$ , —16.83 for  $\text{Na}_2\text{SO}_4 \cdot 10\text{H}_2\text{O}$ , —4.73 for  $\text{BaCl}_2 \cdot 2\text{H}_2\text{O}$  and —2.44 for  $\text{CuSO}_4$ . The solubilities of the salts were, resp., 49, 11.5, 25, 41.5 and 32 g. per 100 g.  $\text{H}_2\text{O}$ . E. S.

**Measuring the specific heats of metallurgically important materials through a large range of temperature with the aid of two new types of calorimeters.** W. A. ROTH AND W. W. BERTRAM. *Z. Elektrochem.* 35, 297-308(1929).—The buffer calorimeter, using paraffin oil as a heat-absorbing liquid, is capable of measuring av. sp. heats up to 900°. The all-metal calorimeter consists of a cylindrical Al block 14 cm. high and 13 cm. diam. with a hole 10 cm. deep and  $1\frac{1}{2}$  to 2 cm. diam. in its center. Thirty-seven thermocouples are inserted in the bottom of the block through 4 concentric rows of holes. When there are no changes (transformations or melting) the measured av. sp. heats fall on smooth, generally slowly rising curves. The equations derived from detd. av. sp. heat values are as follows:  $\beta$ -quartz (20-900°) =  $0.1794 + 0.001645(t-20^\circ) - 0.000000850(t-20^\circ)^2$ ; amorphous  $\text{SiO}_2$  (20-900°) =  $0.1782 - 0.000104(t-20^\circ) - 0.000000403(t-20^\circ)^2$ ; cryst quartz glass (20-900°) =  $0.1782 - 0.0001231(t-20^\circ) - 0.0000004937(t-20^\circ)^2$ ;  $\text{CaO}$  (99.94%)(20-900°) =  $0.1823 + 0.000087(t-20^\circ) - 0.000000366(t-20^\circ)^2$ ;  $\text{CaSiO}_3$  (20-900°) =  $0.1749 + 0.0001107(t-20^\circ) - 0.000000705(t-20^\circ)^2$ ; cryolite (12.81% Al, 30.02% Na, 53.45% F, 0.27%  $\text{SiO}_2$ , 0.04%  $\text{Fe}_2\text{O}_3$ , 0.85%  $\text{H}_2\text{O}$ )( $\alpha$  form)(20-565°) =  $0.2251 + 0.0001977(t-20^\circ) - 0.000001086(t-20^\circ)^2$ ; cryolite ( $\beta$  form)(565° m. p.) =  $0.2359 + 0.0001977(565-20^\circ) - 0.000001086(565-20^\circ)^2 + 0.000100(t-565^\circ)$ ;  $\text{NaCl}$  (20-800°) =  $0.2006 + 0.00007024(t-20^\circ) - 0.000000375(t-20^\circ)^2$ ;  $\text{Fe}$  (0.055% C, 0.023% S, 0.18% P, 0.39% Mn, 0% Si)( $\alpha$  form)(20-720°) =  $0.1060 + 0.00006003(t-20^\circ)$ ; hematite (1.19%  $\text{SiO}_2$ , 0.08%  $\text{H}_2\text{O}$ )(20-700°) =  $0.1514 + 0.0001239(t-20^\circ) - 0.000000577(t-20^\circ)^2$ ; magnetite (67.24%  $\text{Fe}_2\text{O}_3$ , 30.31%  $\text{FeO}$ , 1.31%  $\text{FeSiO}_3$ , 0.15%  $\text{CaSiO}_3$ , 0.94%  $\text{SiO}_2$ )(20-800°) =  $0.1487 + 0.000148(t-20^\circ) - 0.000000725(t-20^\circ)^2$ ; fayalite (97.84%  $\text{Fe}_2\text{SiO}_4$ , 0.54%  $\text{Fe}_3\text{O}_4$ , 0.50%  $\text{Al}_2\text{O}_3$ , 0.23%  $\text{MgO}$ , 0.64%  $\text{SiO}_2$ )(0-700°) =  $0.1447 + 0.0001407(t-20^\circ) - 0.000000700(t-20^\circ)^2$ . The values of av. sp. heats for  $\alpha$  quartz as detd. are 0.1911 at 96°, 0.2325 at 455° and 0.2330 at 503°. The heat of fusion for cryolite was detd. as 16.64 kg. cal./mol., and for  $\text{NaCl}$  as 7.41 kg. cal./mol. The heat of transformation from  $\alpha$  to  $\beta$  cryolite was detd. as 1.24 kg. cal./mol., and from  $\alpha$  to  $\beta$  Fe as 0.324 kg. cal./gr.-atom. C. H. LORIG

**The thermolysis of solid salts (Ludwig-Soret phenomenon).** H. REINHOLD. *Z. physik. Chem., Abt. A*, 141, 137-40(1929).—Mixed crystals of  $\text{CuI}$  and  $\text{AgI}$ , 25 and 75 mol. %, resp., show a concn. change of about 15 mol. % when subjected to a temp. difference of 100° from 200° to 300°. Also in *Z. Elektrochem.* 35, 627-31(1929).

**Some modern developments of wave mechanics and their bearing on the understanding of crystal structure.** P. P. EWALD. *Trans. Faraday Soc.* 25, 402-9(1929).—The principles of at. structure and at. forces, which include the Schrodinger picture of the atom, Pauli's exclusion principle and electron spin, and the principle of energy shift by resonance and London-Heitler's application to exchange energy are reviewed and applied to the problems of chem. action and of crystal structure. H. W. WALKER

**A constant permitting a new classification of the atoms.** GEORGES FOURNIER. *Compt. rend.* 188, 1553-5(1929).—Neither  $N$ , the at. no. nor  $A$ , the at. wt., defines an atom.  $U = (3/4)(A - N)$  docs. From this it follows that  $A - N$  is the no. of nuclear electrons;  $A - 2N$ , the excess nuclear electrons on the periphery (Harkins' isotope no.);  $A/4$ , the " $\alpha$ -capacity," the loss of  $\alpha$ -particles in radioactive transformation; and  $(A/2) - N$ , the " $\beta$ -capacity."  $U$ , the "filiation capacity," is the sum of the last two. V. F. H.

**The relative masses of the proton, electron and the helium nucleus.** ENOS E. WITMER. *Nature* 124, 180-1(1929).—Through several equations  $e$  is proportional to the square root of mass. Further, the ratio between the proton and electron masses  $\rho = M/m$  is a pure no., which according to quantum considerations should be integral.  $\sqrt{\rho} = \sqrt{1847} = 43$  approx.  $= 1^2 + 2^2 + 2^2 + 3^2 + 3^2 + 4^2$ . Multiplying the right-

hand term by 2 gives the length of the successive periods of the periodic table. The relation between the mass of the He nucleus and that of the proton is also the square of an integer, 2. W. suggests that the He nucleus may be also an ultimate particle in which the identities of the protons and electrons have been lost. GREGG M. EVANS

**Some problems of cosmical physics, solved and unsolved.** LORD RAYLEIGH. *Science* 70, 77-84(1929).—An address. R. discusses the problems of the unknown lines in the nebular spectra, the green and red lines in the aurora, and their possible significance. Freeman's proposal of attributing the green line to argon is criticized. The excitation of these spectra is considered and the possibility of reproduction in the lab. Other points discussed are dark patches in nebulae, luminosity of comets (R. criticizes Zantra's view of this matter), metastable states of atoms, and elements of at. no. above 92. R. seems opposed to the proposal of the latter by Jeans as being the source of stellar energy. WILLIAM E. VAUGHAN

**The two quantum excited states of the hydrogen molecule.** E. C. KEMBLE AND C. ZENER. *Phys. Rev.* 33, 512-37(1929).—There are 16 possible wave functions for a pair of interacting H atoms which dissociate adiabatically into a normal H atom and a two quantum H atom. These wave functions give rise to 8 distinct *S* states and 4 distinct *P* states (the latter are degenerate in the fixed-nuclei problem). Those states may be divided into 4 groups of 3 according to the symmetry of the wave functions with respect to (a) an interchange of electron coordinates and (b) reflection in the plane which forms the perpendicular bisector of the internuclear axis. The principles of selection for transitions between these various types of electronic states are formulated. A first-order perturbation-theory computation of the potential energy curves for the *P* states shows that 2 of them have the form requisite for the formation of stable molecules. These 2 may be identified, resp., with the *C* state (upper level for Werner bands) and the  $2^3P$  state reported by Richardson. The agreement between the computed curves and the empirical data is fair. The computation shows that in the excited states of H the union of valence electrons to form sym. pairs is not the essential feature of mol. formation as London's (*C. A.* 22, 1531; 23, 758) original valence theory supposed. The rule that mol. formation is contingent on the removal of degeneracy from the wave functions of the interacting atoms seems to have a greater range of applicability than London's rule. The authors believe, however, that the latter is undoubtedly correct for a great variety of cases. BERNARD LEWIS

**Mean square angular momentum and diamagnetism of the normal hydrogen molecule.** J. H. VAN VLECK AND AMELIA FRANK. *Proc. Natl. Acad. Sci.* 15, 539-41(1929).—The nuclear field is not of central character in the H mol. since the 2 nuclei act as sep. attracting centers and there thus exists a torque upon the 2 electrons. The mean square electronic angular momentum is theoretically derived by using as the wave equation  $\psi = A(e^{-b(p_1 + q_1)} + e^{-b(p_2 + q_2)})$ . The treatment gives  $\overline{P^2} = 0.394 (h^2/4\pi^2)$ , somewhat less than half the square of a Bohr unit. The Pauli formula for diamagnetism is corrected by addn. of a second term for the summation over the various excited states. Calcn. gives  $-4.20 \times 10^{-6}$  as the diamagnetic susceptibility. WILLIAM E. VAUGHAN

**$\sigma$ -Type doubling and electron spin in the spectra of diatomic molecules.** J. H. VAN VLECK. *Phys. Rev.* 33, 467-506(1929).—The distortion due to mol. rotation causes the width of a spin multiplet to depend on *j*, and tends to uncouple the spin axis from quantization relative to the axis of figure, thus bringing about a gradual passage from Hund's case (a) to (b). Another rotational effect is "sigma-type doubling" of spectral lines due to removal of the degeneracy associated with the equality in energy of left- and right-handed axial rotations in stationary molecules. The paper treats these 2 effects, especially in their interrelation. V. first calculates the *perturbing matrix elements* due to the components of angular momentum perpendicular to the figure axis. Neglect of the relatively small sigma-doubling yields identically the formulas for the rotational distortion of spin multiplets which Hill and Van Vleck (*C. A.* 23, 34) obtained by a different method. Singlet *P* states should exhibit a sigma-doubling proportional to  $j(j+1)$  and *D* states ordinarily a negligible doubling. In doublet *P* states the spin profoundly modifies the sigma-doubling. In Hund's case (b) both spin components should exhibit equal doublings proportional to  $j_k(j_k+1)$  but in case (a) the  $P_{1/2}$  sigma-doubling should be negligible, but the  $P_{3/2}$  fairly large and proportional to  $j + 1/2$ . Formulas are developed for the sigma-doublet width which apply throughout the range between (a) and (b). The pronounced doubling of the  $P_{1/2}$  component in case (a) is due to a rather complicated superposition of the rotational distortion on the magnetic coupling between the components of spin and orbital angular momentum which are perpendicular to the axis of figure. A similar superposition explains the so-called "rho-type doubling" in doublet *S* states whereby levels like  $j_k$  but unlike  $j$  differ by small quantities proportional to  $j_k$ .

$1/2$ . In triplet  $P$  states for case (b) all 3 components should have equal doublings proportional to  $j_k(j_k + 1)$  but in (a) the  $P_0$  and  $P_1$  doublings should be, resp., independent of  $j$  and proportional to  $j(j + 1)$ , while  $P_2$  is negligible. A summary and comparison with exptl. data taken from a paper by Mulliken (see next abstr.) are given. There is a striking agreement between theory and expt. on the type of variation with  $j$  in the various multiplet components in case (a). The theoretical orders of abs. magnitude are also confirmed.

BERNARD LEWIS

**Electronic states and band spectrum structure in diatomic molecules. VIII. Some empirical relations in  $\sigma$ -type doubling.** ROBERT S. MULLIKEN. *Phys. Rev.* 33, 507–11(1929); cf. *C. A.* 23, 769. —Some of the empirical relations which exist in  $\sigma$ -type doubling are summarized. In particular, the magnitudes of the doublet intervals as a function of  $j$ , and in relation to  $\Delta E/B$  are considered. The observed relations, though very varied, are consistently in agreement with theoretical work of Van Vleck (preceding abstract). Van Vleck's work shows definitely that the  $^3P$  levels involved in the second positive  $N_2$  bands are both normal (not inverted).

BERNARD LEWIS

**The distribution of charge in the carbon atom.** G. W. BRINDLEY. *Proc. Leeds Phil. Lit. Soc. Sci. Sect.* 1, 402–11(1929). —In connection with the question of asymmetry of the  $C$  atom values of  $U(r)$ , radial density of charge for spherical distribution at a distance  $r$  from the nucleus, in electrons per atomic unit are calcd. for the free  $C$  atom (diamond) from the values for electrons 1, 2, and 2<sub>2</sub>. Comparison of total charge distribution for the atom with its radius shows considerable overlapping of the atoms. The  $F$  curve does not agree well with the exptl. curve of Ponte (cf. *C. A.* 21, 1058) most noticeably for large values of  $\sin \theta$ . This disagreement can hardly be due to distortion of the  $K$  or  $L$  electrons. Spectra between  $\sin \theta = 0.10$  and  $0.30$  will be most important in such investigations.

MARY E. LEAR

**An isotope of carbon, mass 13.** ARTHUR S. KING AND RAYMOND T. BIRGE. *Nature* 124, 127(1929). —A faint band about 7.5  $\mu$  U. to the red of the band  $\lambda$  4737 on plates where the latter band is strong, is attributed to an isotope of  $C$  of mass 13. Six individual lines within the band have been measured. Further evidence of the carbon isotope, mass 13. RAYMOND T. BIRGE. *Ibid.* 182–3. —Bands in Hopfield's absorption spectrogram of  $CO$  corresponding to  $C^{13}O^{16}$  have been identified. These were wide enough to have included a band  $C^{13}O^{18}$ , but sepn. was impossible. In King's furnace (emission) spectrogram of the  $\lambda$  3883  $CN$  band identification has been made of  $C^{13}N^{14}$  bands which are outside the limits of error for  $C^{12}N^{15}$  or  $C^{12}N^{16}$ . No other isotopic lines are observable, indicating the absence of  $N$  isotopes.

GREGG M. EVANS

**Note on structure of atomic nuclei.** M. F. SOONAWALA. Maharaja's Coll., Jaipur. *Indian J. Physics* 3, 489–92(1929). —A table and notes representing the formation of at. nuclei by synthesis from protons, electrons and rare-gas nuclei. W. E. V.

**Temperature coefficient of radioactive disintegration.** OSCAR KNEFLER. *Proc. Natl. Acad. Sci.* 15, 593–5(1929). —Assuming that an  $\alpha$ -particle assumes harmonic oscillations within the nucleus,  $R$  calcs. that the difference in energy of the "discrete" state of the  $\alpha$ -particle within the nucleus and of the next higher state is  $1.6 \times 10^{-7}$  ergs. By use of the Boltzmann expression the probability of the second state is found to be  $e^{-2} \times 10^5$ . The total rate of decompn. is of the order  $10^{20} \times e^{-2} \times 10^5$  per atom per sec. at  $5000^\circ$ . Conclusion: A single level is responsible for ordinary radioactive decompn. up to temps. of  $5000^\circ$ ; therefore no temp. coeff. is to be expected. This level is supposed to be very sharp. Similar reasoning may be applied to  $\beta$ -particle disintegrations.

WILLIAM F. VAUGHAN

**Thorium emanation.** JAN SĚBOR. *Chem. Listy* 22, 521–6(1928). —Expts. with  $Th(NO_3)_4$  solns indicate that the course of decompn. is a function of the accumulation time. As the accumulation time increases, the half-period time decreases. S. considers this to be due to an increased ionization caused by the deposits of the  $Tn$  during its accumulation.

FRANK MARESH

**Scattering of  $\alpha$ -rays by helium atoms.** WILLY HARDMEIER. *Helv. Phys. Acta* 1, 193–207(1928). —Theoretical. The scattering of  $\alpha$ -rays is calcd., by assuming that the nucleus as well as the  $\alpha$ -particle are polarizable. The results do not completely agree with the exptl. results of Rutherford and Chadwick. The polarizability of the  $He$  nucleus gives as vol  $1.6 \times 10^{-36} \text{ cm}^3$ .

EGON BRETSCHER

**Electronic charge  $e$ .** J. H. J. POOLE. *Nature* 123, 530(1929). —The possibility that a new value of  $\pi$  should be used in obtaining the value of  $hc/2\pi e^2$  is suggested (cf. Birge. *C. A.* 23, 4618; Bäcklin, *C. A.* 23, 4118).

B. C. A.

**Diffusion of cathode rays, of 100 volts velocity, in gaseous media.** O. HOLTZMANN. *Ann. Physik* 86, 214–40(1928). —True reflection of electrons (i. e., large angle deflection from the original line of travel) is found to occur in  $H$ ,  $N$ ,  $He$ ,  $Ne$  and  $A$ . An electron

suffering such reflection undergoes no loss in velocity. The true reflection masks the diffusion so that it was possible only in the case of N to det. the value of the "turbidity factor" in the absorption equation.

H. L. D.

**Ionization through electronic collision.** ARTUR VON HIPPEL. *Ann. physik* [4], 87, 1035-87(1928).—A theoretical discussion is given of the ionization of atoms by electronic collision on the basis of classical theory. An ionization function representing the probability of ionization taking place through a collision is deduced. Under certain limiting conditions this function for a single at. electron shows a max. at a collision-electron speed corresponding with double the ionization potential of the atom. Former exptl. methods are critically discussed and a new one is described. A stream of electrons of homogeneous velocity hits perpendicularly a stream of atoms; the ions formed are carried on with the stream of atoms and are sepd. from the non-ionized atoms by passage through a mass spectrograph. The deflected ray of ions is then collected on a suitable ion collector. Hg vapor has been examd. afresh by this method, and the existence of a max. of ionization yield for an electronic speed in the neighborhood of double the ionization voltage of Hg is demonstrated. The measured collision yield, however, at this max. is 8.3% compared with that predicted of 15%. A short description is given of a high-frequency method suitable for the qual. study of collision ionization and also for expts. with streams of ions.

GREGG M. EVANS

**Metal analysis with electron waves.** E. RUPP. *Metallwirtschaft* 8, 446-8(1929), cf. C. A. 22, 3094.—Adopting the hypothesis that light waves possess corpuscular properties and corpuscles have wave properties and applying DeBroglie's quant. expression which equates the impulse of a body to the impulse of a wave and gives a wave length to an electron beam corresponding to the voltage, R. analyzes metal crystal surfaces with an electron stream. The electrons, produced at a hot wire in a high vacuum, impinge on a metal surface at a known angle and velocity and are reflected into a collecting tube. The layer of crystal particles of max. bending effect is given by the equation:  $V(1 - \sin^2 \alpha) = (150 n^2 / 4d^2) - E_0$ , where  $V$  is the volt-velocity of the electrons,  $E_0$  the inner lattice potential of the metal under analysis,  $d$  the interplanar crystal distance,  $\alpha$  the reflection angle and  $n$  a whole no. Cu, Ag and Au have been analyzed. The electron rays may be passed through a thin layer of many crystals and patterns resembling x-ray figures obtained on a photographic plate. The sp. crystal faces can be calcd. from the concentric reflection rings of the pattern.

H. W. WALKER

**A crucial experiment on the diffraction of electrons.** F. DACOS. *Bull. acad. roy. Belg* 15, 452-60(1929).—Using a slit formed between 2 beveled steel plates clamped in a V, D. has succeeded in obtaining electron diffraction similar to that obtained from crystals. Photographic plates, photometric curves and a diagram of the app. are reproduced.

GREGG M. EVANS

**The rate of formation of negative ions by electron attachment.** AUSTIN M. CRAVATH. *Phys. Rev.* 33, 605-13(1929).—By a new method the fraction  $h$  of the collisions between electrons and mols. which result in the attachment of the electron to form a negative ion has been measured in air and  $O_2$  as a function of the av. electron energy, the gas pressure and the moisture content. In  $O_2$   $h$  had a min. at 0.9 v. av. electron energy, and increased with either increase or decrease of the energy from this value. In air  $h$  increased as the av. electron energy was reduced below 0.9 v. The abs. value was about 0.4 of that predicted from the value in  $O_2$  by assuming simple additivity, but this difference is possible within the limits or error. The variation with electron energy and the order of magnitude of  $h$  are in agreement with Bailey's (C. A. 20, 11) results for air. On the other hand, a rapid increase in  $h$  with increase in pressure at const. electron energy was found at low energy, while Bailey's results show no variation with pressure. In  $H_2O$   $h$  is of the same order of magnitude as in  $O_2$  but in mixts. of  $H_2O$  and  $O_2$   $h$  is much larger than in either alone, showing that here the attachment process is complex. Evidence was found for the detachment of electrons from negative ions in  $O_2$  at very high fields.

BERNARD LEWIS

**Emission from oxide-coated filaments: a process phenomenon.** VERNON C. MACNABB. *J. Optical Soc. Am.* 19, 33-41(1929).—The different methods of producing oxide filaments of Ba and Sr differ only in degree. The fundamental underlying action of all methods is that the filament, to become emissive, must undergo a gaseous bombardment which presumably causes a breaking down of the higher oxides or compounds like the carbonates, to the lower oxides or the pure metal; and conversely the breaking

down must be caused by or accompanied by a gaseous discharge in order to produce an active filament. The gas most suitable for this action is best obtained from the filament, and is best produced from a carbonate that has not been reduced until put into a vacuum; the gas then liberated and used is probably  $\text{CO}_2$ . The baked-on coating acts merely as a mechanical bond. The core may be of a variety of material.

LOUIS WALDBAUER

**Dependence of electron emission from metals upon field strengths and temperatures.** ROBERT A. MILLIKAN AND CHARLES C. LAURITSEN. *Phys. Rev.* 33, 598-604 (1929).—The paper contains reasons for believing that field currents are independent of temp. only up to about  $100^\circ\text{K}$ . and that at that temp. the energy of thermal agitation begins to assist the fields appreciably in causing the escape of electrons through metals. The precise form of function describing this dependence is not accurately determinable exptly., but the form originally suggested by the authors fits the observed facts known thus far satisfactorily, no better, however than does the theoretical form suggested by Houston (*C. A.* 23, 4138).

BERNARD LEWIS

**Angular scattering of electrons in helium, neon, hydrogen and nitrogen.** G. P. HARNWELL. *Phys. Rev.* 33, 559-71 (1929); cf. *C. A.* 22, 3829.—An attempt was made to investigate in a qual. way the angular distribution of electrons scattered by a gas (He, Ne,  $\text{H}_2$  and  $\text{N}_2$  were used). The energy of the primary electron beam varied from 75 to 300 equiv. v. Those electrons which were scattered elastically were deflected in general through only a few degrees. In He fewer than  $1/1000$  of the 200-v. electrons were scattered through  $15^\circ$ . Electrons which had sustained an exciting collision were scattered through slightly larger angles. Evidence of electrons which had suffered 2 inelastic collisions was obtained; these were distributed through still larger angles. A general tendency for slower electrons to be scattered through larger angles was observable.

BERNARD LEWIS

**The motion of ions in constant fields.** LEIGH PAGE. *Phys. Rev.* 33, 553-8 (1929).—It is shown that the effect of a const. elec. or gravitational force  $F$  on ions passing through a const. magnetic field  $H$  is to cause the circular or helical ion paths to advance in a direction at right angles to both  $F$  and  $H$  with the const. velocity  $u = c[F \times H]/eH^2$ . Ions paths relative to a rotating earth are discussed on the assumption that the earth's field is purely magnetic relative to the inertial system of the center of the earth. The essential features of the theory are shown to be unaltered if the const. mass of the classical theory is replaced by the variable mass of the relativity theory.

BERNARD LEWIS

**Problem of the ionized hydrogen molecule.** C. Y. CHAO. *Proc. Natl. Acad. Sci.* 15, 558-65 (1929).—Mathematical; on the basis of the wave equation for  $\text{H}_2^+$ :  $(\partial^2\psi/\partial x^2) + (\partial^2\psi/\partial y^2) + (\partial^2\psi/\partial z^2) + (8\pi^2 m_e c^2/h^2)[E + (e^2/r_A) + (e^2/r_B)]\psi = 0$ . W. E. V.

**Luminous discharges in gas at low pressures.** HANS PETTERSSON. *Nature* 123, 978-9 (1929).—If the Lecher circuit previously employed for generating a luminous discharge in electrodeless tubes by elec. oscillations of high frequency (cf. *C. A.* 23, 2657) is exchanged for short coils, the luminosity is greatly increased. It is thus possible to make the discharge pass through narrow quartz capillaries and to realize a source of light suitable for spectrography with a min. quantity of the gas under examn. The luminosity is very intense with inert gases, especially with Ne. CO and  $\text{CO}_2$  are rapidly disso. by the oscillating discharge; this prevents the sepn. of their spectra by the flow method. CO excited when passing through a narrow capillary at the rate of 5 m. per second gives a deposit of C. Hydrocarbons from tap grease do the same. The deposit cannot be removed unless by passing O for a long time. If the discharge is made to pass through a tube contaminated in this manner, the O produced by disintegration of the quartz is largely converted into oxides of C which emit the white light erroneously ascribed to ozonized O in the previous communication. The red fluorescence of glass or quartz excited by the oscillation is probably due to excited mols. or ions of O, as is demonstrated by deflecting with a horse-shoe magnet the egg-shaped luminosity which is formed between the electrodes in a discharge tube of wider diameter contg. pure O at low pressure. With other gases, quartz fluoresces in the deep blue or violet, sometimes in the green, whereas the red fluorescence, corresponding to a band near  $620\mu\mu$ , is only observed with O at low pressure.

ALBERT L. HENNE

**Experimental studies on form and structure of sparks.** VI. Long sparks in organic vapors. T. TERADA, U. NAKAYA AND R. YAMAMOTO. *Sci. Papers Inst. Phys. Chem. Research (Tokyo)* 10, 271-90 (1929).—In general, halogen compds. require less than 0.5% added to air to transform zig-zag sparks to the smooth three-part type, Cl being most effective, I next, with little effect from Br up to 2.3%.  $\text{C}_2\text{H}_4$  produced a spark similar to a small-capacity spark in air, but alcs.,  $\text{Et}_2\text{O}$ , and  $\text{Me}_2\text{CO}$  have little effect.

The authors suggest that the formation of the smooth pos. or neg. part of a long spark is brought about by the formation of a pilot brush, which may be connected with the generation of soft x-rays at the electrode. Branches or gaps may be caused by local combustion.

GREGG M. EVANS

**The emission of anodic rays of sodium and chromium.** A. POIROT. *Compt. rend.* 189, 150-1(1929).—With pure  $\text{Na}_2\text{Cr}_2\text{O}_7$  the emission of the anodic rays is regular and stable. The emission starts suddenly below the m. p. of the salt. The anode is surrounded by a yellowish glimmer. The bundle of rays, conveniently directed, is faintly yellow. There is also an intense yellow spot on the cathode where it is hit by the anodic rays. The spectrum of the light from the cathode is formed by the arc spectra of Na and Cr. That of the light of the anode and between the anode and cathode shows the more intensive lines of Cr. No rays relative to O were observed.

E. SCHOTTE

**Effects of a crystallographic transformation on the photoelectric and thermionic emission from cobalt.** ALVIN B. CARDWELL. *Proc. Natl. Acad. Sci.* 15, 544-51 (1929).—A Co strip, hung inside a Mo receiving cylinder, the whole being encased in Pyrex, was thoroughly outgassed for 210 hrs. The thermionic and photoelec currents were measured by use of a Compton electrometer. Consistent results depended upon the completeness of outgassing. The temp. of the filament was detd. by use of an optical pyrometer and a Hg-quartz lamp served as illuminator. The heating current was gradually raised and the corresponding photoelec currents were measured; it was found that the sensitivity of undercooled Co (in face-centered cubic form) is greater than that of ordinary Co (in hexagonal close-packed). At higher temps. the 2 curves coincide. With decreasing temp., the trend of the curve is to a max. not reached on the increasing-temp. curve, followed by a drop to near coincidence. The max thermionic current was about  $1/10$  as strong as the max. photoelec. The curves are similar to those obtained for the photoelec. current. It is concluded that the thermionic work function is less for cubic Co than for hexagonal.

**New x-ray effect.** C. V. RAMAN AND P. KRISHNAMURTI. *Nature* 124, 53 4 (1929).—The diffraction photographs obtained when the K radiation of Cu is scattered by graphite show a notable amt. of scattered radiation surrounding the primary beam, terminating abruptly at the first diffraction ring, and reappearing with smaller intensity between the first and second rings. The effect becomes more noticeable with increasing fineness of the graphite powder. This result is correlated with the fact that the diamagnetic susceptibility of graphite is several times greater than that of C in other forms, and it is suggested that the scattering may be due to the mobile electrons which give graphite its elec. cond.

**Energy measurement of x-rays.** FRIEDRICH VIERHEILER. *Contrib. estudio ciencias fis. mat. La Plata* 4, 185-96; *Chem Zentr.* 1928, 11, 126; cf C. A. 22, 2713.

C. R. FELLERS

**Measurement of absolute intensity of x-rays.** MAX STEENBECK. *Ann. Physik* [4], 87, 811-49(1928).—A method is described for the detn. of the abs. no. of quanta which pass in unit time through the area of cross-section of a beam of x-rays. The no. of quanta absorbed over a given track are counted as ions the rays being made to pass perpendicular to the lines of force of a homogeneous elec. field, and the resulting ions counted by means of a Geiger counter. It is necessary to ascertain the fraction of ions registered by the counter. The ionizing power of a monochromatic ray was measured and its intensity obtained in this way. For the formation of ionic doublets the necessary energies for Cu-K $\alpha$  and Cr-K $\alpha$  are practically the same, and are in agreement with other detns. The possible errors in the method are discussed.

B. C. A.

**Production and absorption of soft x-rays and secondary electrons.** ERIK RUBENBERG. *Proc. Roy. Soc. (London)* A121, 421-32(1928); cf C. A. 23, 29.—The work of several investigators is considered, and it has been calcd. that the no. of photoelectrons produced in a solid conductor by soft x-rays is of the same order of magnitude as the no. produced in gases by the same radiation. Also the no. of primary electrons inside the conductor is about 10 times the no. escaping from the surface. In the case of the pro

duction of secondary by primary electrons, it is suggested that the apparent loss in efficiency may be accounted for (1) by the absorption of slow electrons by the body in which they are produced, (2) by collisions which reduce the energy of the escaping electron and (3) by the fact that there may be slow electrons, the energy of which is not sufficient to overcome the surface field. Conclusion: All the energy of the bombarding electrons can be converted into that of secondary electrons within the target. The source of the secondary electrons has been considered and it is concluded that on the whole the evidence points to their origin as being the free electrons initially present in the conductor.

**The intensity, sharpness and reproducibility of Debye-Scherrer lines.** H. MÖLLER AND A. REIS. *Trans. Faraday Soc.* 25, 386(1929).—The intensity distribution of each spectral line is dependent upon and deduced from the conditions of the expt. Two essentials are (1) a strictly parallel beam and (2) a detn. of whether the size of the line is limited by the size of the focal spot image or the aperture of the screen. The conditions for highest intensity and sharpest lines which are reproducible for all angles of diffraction have been worked out

H. W. WALKER

**The determination of particle size by the use of x-rays.** H. MARK. *Trans. Faraday Soc.* 25, 387-9(1929).—Equations for particle size detn. agreeing with expts. for the case of (1) parallel radiation and non-absorbing material and (2) a divergent x-ray beam and a transparent substance are discussed. A correction factor for absorbing substances is given. The difficulties of applying the distribution law of particle size are considered and favor is given the sym. law of the Gauss type rather than the Maxwellian distribution. A study of natural cellulose for knowledge of particle-size distribution is suggested.

H. W. WALKER

**Lattice determination in polycrystalline aggregates.** K. WEISSENBERG. *Trans. Faraday Soc.* 25, 391-2(1929).—Two methods for detg. the x-ray structure of org. compds. of high mol. wt. existing in polycryst. form have been worked out. In (1) a growth or deformation structure is obtained in which only a few distinct crystallite orientations occur in statistical preponderance and in (2) the interferences of the planes with the greatest spacing are strengthened by making the prepn. as long as possible (1 to 1.5 cm.) in the direction of the beam

H. W. WALKER

**X-ray absorption limits and the distribution of electrons round the atom.** B. B. RAY. *Indian J. Phys.* 3, 477-88(1929).—Kossel's view that the absorption edges or fine structure may be due to removal of electrons from inner to outer levels is treated and is considered to be a general phenomenon and not confined to atoms where a fine structure is observed. It is shown by examples that, in general, for similar compds. of different elements the sepn. of the *K* edge in the elementary atoms from that of the *K* edge in the compds. is approx. the same. Absorption and emission data are utilized to lend support to the Saha scheme in preference to that of Main-Smith and Stoner.

W. E. V.

**Nature of interference lines in x-ray diagrams of many crystalline materials.** I. H. MÖLLER AND A. REIS. *Z. physik. Chem.*, Aht A., 139, 425-38(1928).—The influence exerted by the nature of the cross-section of the powder rod on the interference lines obtained in x-ray photographs taken by the Debye-Scherrer method is examd. mathematically assuming that a parallel primary radiation is used. The shape, dimensions and absorption of the rod are considered and results are given for 3 different shapes—flat slab, wedge and cylinder. Weakening of intensity of the lines through increase in the coarseness of the particles is considered. II. *Ibid.*, Aht. B., 2, 317-39.—The relation of the effective width of the focus of the primary radiation and the variation of intensity across it to the character of the lines obtained in the Debye-Scherrer method of x-ray investigation, using non-parallel radiation, has been examd. theoretically. The various arrangements to secure sharpness and accuracy are described.

B. C. A.

**Diffraction of x-rays by two-dimensional crystal lattice.** W. L. BRAGG. *Nature* 124, 125(1929).—It is not necessary to postulate a 2-dimensional lattice to account for the arrangement of spots described by Linnik (*C. A.* 23, 4138) for mica. A rocking of the crystal  $6.5^\circ$  in every direction will bring other planes into position so that an equiv. effect is produced.

GREGG M. EVANS

**Scattering of x-rays by gases.** I. GERHARD HERZOG. *Helv. Phys. Acta* 2, 169-216(1929).—A new method to det. the scattering function is described. A finite beam of x-rays is used, a photographic plate being placed at a certain angle  $\varphi$  in the field covered with the scattered radiation. From the distribution of intensity on the plate, the scattering function for any angle  $\alpha$  may be obtained by differentiation with respect to  $\alpha$ . Argon has been studied, by means of  $\text{Cu}_\alpha$  radiation. The scattering function decreases monotonously with increasing scattering angle. II. *Ibid.* 217-56.—The scattering power of air,  $\text{H}_2$ , CO,  $\text{N}_2$ ,  $\text{C}_2\text{H}_2$ ,  $\text{C}_2\text{H}_4$ , A,  $\text{N}_2\text{O}$  and  $\text{CO}_2$  has been measured for various wave lengths at

a right angle to the incident beam. The method used was this of J. A. Crowther; 2 scattering chambers (one with air as standard) are irradiated with x-rays from the same tube; 2 ionization chambers are attached to the scattering chambers and connected to an Edelmann electrometer; the pressure in the scattering chambers is regulated so that zero position of the electrometer is obtained. The scattering coeff. increases with increasing wave length of the incident beam; mols with the same no. of electrons have different scattering coeffs.; the additivity rule of Crowther does not hold.

**Domain of the atom of bismuth in its crystal.** H. PERLITZ. *Sitzb. Naturforsch.-Ges. Univ. Tartu* 35, 113-20 (1928).—Theoretical. In cryst. Bi every atom has 6 neighbors in 2 triplets. The decrease of vol. at fusion suggests that the domains of atoms cannot intersect. From the distribution of the shared electrons it is inferred that the electrons of the outer completed shell, consisting of 2 sub-shells, occur in pairs, and that diams. of the inner and outer sub shells are equal to the shorter and longer inter-atomic distances and form the boundaries of  $\text{Bi}^+$  and  $\text{Bi}^{--}$ , resp. A distribution of electrons of the outer shell in vertices of 2 regular tetrahedra is indicated. The observed and calcd. rise of cond. at fusion are in good agreement, if it is assumed that the non-shared electrons in the crystal carry the elec. current, and that the shared electrons are liberated on melting.

B. C. A.

**Total reflection of x-rays from nickel films. II.** HIRAM W. EDWARDS. *Phys. Rev.* 33, 463-6 (1929).—The total reflection of x-rays ( $\lambda = 0.707 \text{ \AA. U.}$ ) is obtained from a series of thin Ni films of thickness varying from zero to  $2.05 \times 10^{-8} \text{ cm.}$  The films were sputtered upon thick Pt which was, in turn, sputtered upon a glass support. The crit. angle for each film was measured. The values of the crit. angle varied from 0.0040 radians (that of bare Pt) to 0.0034 radians. With the exception of an increase in the crit. angle (max. value of 0.0043 radians) for the thinnest films, the crit. angle decreased logarithmically with increasing thickness of the Ni film. The value obtained from the thickest film agrees with that calcd. by the Lorentz dispersion formula. These results together with those reported earlier (*C. A.* 23, 2099) seem to prove conclusively that the phenomenon of total reflection is not a purely surface phenomenon but is one which requires a layer of metal of definite thickness for the particular reflecting matter and wave length of radiation used. An explanation of the variation of the crit. angle with the thickness of the metal films is given. This is based upon the assumption that the contribution to the intensity of the reflected ray made by the deepest electrons will be effective only when the total length of the path of the radiation in the metal is not too great. The max. effective depth is that which reduces the intensity of the emerging radiation by absorption to a value less than that which may be detected in the reflected beam.

BERNARD LEWIS

**Soft x-ray levels of iron, cobalt, nickel and copper.** O. W. RICHARDSON and F. C. CHALKLIN. *Proc. Roy. Soc. (London)* A121, 218-36 (1928); cf. *C. A.* 22, 2712.—In a previous investigation of the excitation of soft x-rays from Fe, Co, N and Cu by the photoelec. method (*loc. cit.*), a considerable no. of discontinuities which had been detected were attributed to transitions from provisional  $X_1$  and  $X_2$  levels and a series of Rydberg terms. An attempt has now been made to arrange the remaining discontinuities which have been observed into the same scheme. Experimentally observed breaks are attributed to transitions from levels denoted by  $X_1$  and  $X_2$  to the  $b/n^2$  terms, so that there are now 4 initial states from which jumps can be made to the "b" series of terms. The values in v. of all the L and X levels for the 4 metals are tabulated, and the values of the square roots are plotted as a Moseley diagram against at. no. The L levels fall accurately on a straight line, in agreement with the view that this level is unaffected by the external atom-building. The  $X_1$ ,  $X_2$  and  $X_3$  levels are practically the same for each element, the slight variations shown being common to all these levels. The  $X_0$  level shows a variation very similar to the shape of the Moseley diagrams of the L and M levels when they are being completed. This may explain the constancy of the  $X_1$ ,  $X_2$  and  $X_3$  levels. If the no. of electrons in the  $X_0$  level increases by unity from element to element with increasing at. no., the approx. constancy of the factor  $b$  for all the virtual orbit levels  $b/n^2$  would be accounted for. Some of the soft x-ray level differences show a marked agreement with corresponding x-ray emission transitions. The value of the const.  $b$  corresponds in each case with an effective nuclear charge of 13.2e-13.2e. The case for the inclusion of Cu in the suggested scheme is not so definite as that for the other

metals. The  $L_{II}, III \rightarrow X_2$  transition and the  $X \rightarrow X$  transitions are absent, and other important differences are found. It was at first considered that the  $X$  levels were identical with the  $M$  levels, but evidence has since been obtained that the systems of levels here described are only parts of much larger systems, so that any assocn. between the  $X$  and  $M$  levels now appears to be highly improbable.

**Boundary of the solar chromosphere.** W. H. McCREA. *Nature* 123, 527-8(1929); cf. *C. A.* 23, 3626. B. C. A.

**Structure of the solar chromosphere.** L. D'AZAMBUJA. *Compt. rend.* 188, 773-5 (1929).—The granular structure of the monochromatic solar spectrographs has been examd. by simultaneous photography of the 2 couples of lines Ca 4227—Fe 4384 and Ca 4227—Fe 4202, but no appreciable difference in the form and distribution of the grains was detected, and the difference between the heights of the two Fe rays (1200 and 700 km., resp.) is apparently too small to affect them. A similar granulation was observed for the  $H_\alpha$  ray, which occurs at a higher level. B. C. A.

**Measurement of the strength of sunlight.** J. EWART MOSS AND ARTHUR W. KNAPP. *Analyst* 54, 334-5(1929).—A discussion of the precautions to be taken to det. the quantities of ultra-violet radiations by chem. tests. W. T. H.

**The possibility of observing an emission spectrum of the calcium substratum in the galaxy.** YNGVE ÖHMAN. *Nature*, 124, 179-80(1929).—Ö. concludes that because of interstellar Ca the forbidden doublet  $1s-1s$  may be present in emission in the spectrum of the night sky, but the  $H$  and  $K$  lines are not to be expected. GREGG M. EVANS

**Spectrography at the temperature of liquid air.** G. BECK. *Deut. Z. ges. gericht. Med.* 12, 1-4(1928).—A tube for the spectrographic examn. of alkaloid soln. at  $-180^\circ$  to  $-200^\circ$  is described, and the eutectics of mixts. of ether, Pr alc., pentane, methylocyclohexane and decahydronaphthalene have been examd. in order to select a suitable solvent. B. C. A.

**Spectral relation between certain isoelectronic systems and sequences.** I. Ca I, Sc II, Ti III, V IV and Cr V. H. E. WHITE. *Phys. Rev.* 33, 538-46(1929).—The neutral atoms of V and Cr contain 5 valence electrons,  $3d^4s^2$  and 6 valence electrons,  $3d^4s$ , resp. The removal of 3 electrons,  $3d^4s^2$ , from V and 4 electrons,  $3d^4s$ , from Cr yields 2 isoelectronic systems, V IV and Cr V, the lowest energy levels of which arise from the 2 remaining electrons,  $3d^2$ . The spectra from these 2 systems should resemble very closely the spectra of neutral Ca, singly ionized Sc and doubly ionized Ti. Extrapolation from the already known data of Ca I, Sc II and Ti III to V IV and Cr V have led to the identification of some 30 energy levels in both triply ionized V and quadruply ionized Cr. The strongest lines in these spectra arise from combinations between  $^2P$ ,  $^3D$ ,  $^3F$ ,  $^1P$ ,  $^1D$ ,  $^1F$  ( $3d4p$ ) and  $^3D$ ,  $^1D$  ( $3d4s$ ) and  $^1S$ ,  $^3P$ ,  $^1D$ ,  $^3F$ ,  $^1G$  ( $3d^2$ ). Following the irregular doublet law, the radiated frequencies resulting from transitions between the terms arising from  $3d4p$  and  $3d4s$  as well as from transitions between the terms arising from  $3d4d$  and  $3d4p$  in going from element to element are displaced to higher and higher frequencies by very nearly a const.-frequency interval. The combination of ordinary energy level diagrams with a Moseley diagram brings out interesting relations between the isoelectronic systems K I, Ca II, Sc III, Ti IV, V V and the isoelectronic systems Ca I, Sc II, Ti III, V IV and Cr V. The Moseley diagram and the irregular doublet law serve to det. the approx. positions of the various singlet and triplet levels as well as the approx. location in the spectrum of the radiated frequencies. The triplet term seps. follow fairly well the Landé interval rule. In general, Hund's rule is valid for low-lying terms in each spectrum; the  $^1D_2$  term arising from the electronic configuration  $3d4p$  lies deeper than the triplet terms. The ionization potentials, that is, the voltages necessary to remove the  $3d$  electron from the normal state  $^3F_4$  ( $3d^2$ ) of V IV and Cr V to the normal state  $^3D_3$  ( $3d$ ) of the once-more ionized atoms, are detd. at about 48.3 v. and 72.8 v., resp. BERNARD LEWIS

**Spectra of phosphorus and arsenic in the far ultra-violet.** Multiplets of As IV and As V. PAUL QUENEY. *Compt. rend.* 189, 158-9(1929).—For As IV and As V a table of the multiplets is given. E. SCHOTTE

**Abnormal broadening of spectral lines.** ALFRED W. PORTER. *Trans. Faraday Soc.* 25, 389-91(1929).—The causes for broadening of the spectral lines are discussed with emphasis given to the character of the illumination. Equations are given for the diffracted vibration and intensity which take into account a common phase difference between 2 illumination beams and values dependent upon the monochromator. H. W. WALKER

**Asymmetry in the radiation from the hydrogen atom in the electric field.** J. STARK. *Nature* 124, 125-6(1929).—There are emitted along the axis of the field, those components of the lines  $H_\alpha$ ,  $H_\beta$ ,  $H_\gamma$  and  $H_\delta$ , which appear electrically normally vi-

brating to the axis of the field when the axis of vision is normal to the axis of the field. Components displaced toward the red are emitted more intensely in the direction of the field; those displaced toward the violet are emitted more intensely in the direction opposite the field. This asymmetry is incompatible with the Bohr-Epstein-Kramers theory and the Sommerfeld theorem.

GREGG M. EVANS

**Refractive index of sodium vapor and width of D in absorption.** S. A. KORFF. *Phys. Rev.* 33, 584-8(1929).—Continuing the study by Stewart and Korff (*C. A.* 23, 767) of the  $n$  of Na vapor near the D lines, more accurate measurements are obtained. The variation of  $n$  is found to agree with the classical formula, within exptl. errors. Similarly, the relation of dispersion to the width of the D lines in absorption, measured visually, is found to agree with classical prediction. By these optical methods a value of the "radius" of the electron can be found. It is of the order  $10^{-13}$  cm. To det. a more exact value further study with a densitometer is necessary.

B. L.

**Variation in the intensities of mercury spectrum lines with pressure of the vapor.** JOHN G. FRAYNE AND CAROL G. MONTGOMERY. *Phys. Rev.* 33, 549-52(1929).—The relative intensities of spectrum lines of Hg vapor in the d. c. arc and at a pressure  $10^{-3}$  mm. in a high-frequency electrodeless discharge have been measured for wave lengths between  $\lambda 7000$  and  $\lambda 3000$ . There is a decided increase in intensity, relative to the triplet line  $\lambda 5460$ , of the singlet members in the low-pressure discharge, the sharp series showing the greatest increases. The relative intensity increases rapidly with ascending members of the series. Five new lines in the sharp singlet series were observed. Combination singlets appeared strong in the red in the low-pressure discharge. The first members of the triplet series do not show much change but the higher members show an increasing intensity at low pressure. Combination lines also show decided increase in the low-pressure discharge.

BERNARD LEWIS

**The spark spectrum of nickel (Ni II).** R. J. LANG. *Phys. Rev.* 33, 547-8(1929).—Twenty-six lines resulting from intercombinations between the low terms  $d^9\ ^2D_{3,1}$  and 11 more terms of the  $d^9p$  configuration  $b^1S'$ ,  $b^4P$ ,  $b^4D'$ ;  $c^2S'$ ,  $c^2P$ ,  $c^2D'$ ;  $b^2P$ ,  $b^2D'$ ,  $b^2F$ ;  $c^2F$ ;  $b^2G'$  have been classified. These lines lie between  $\lambda 1537$  A. U. and  $\lambda 1250$  A. U.

BERNARD LEWIS

**Wave lengths and atomic levels in the spectrum of the vacuum iron arc.** KEVIN BURNS AND FRANCIS M. WALTERS, JR. *Pub. Allegheny Observatory, Univ. Pittsburgh* 6, 159-211(1929).—Wave lengths of about 600 lines of Fe I, between 2800 A. U. and 8800 A. U. emitted by an arc *in vacuo*, have been measured by interference methods with a median accuracy of one part in 5,000,000. No wave lengths furnished the standards of reference. These new wave lengths have been used to calc. accurate values of the Fe I terms, which in turn have been employed to check the observations, on the basis of the combination principle, and to compute the wave lengths of about 1200 additional Fe I lines between 2100 A. U. and 9000 A. U. This work thus supplies a long-felt need for wave-length standards in the near ultra-violet. The observed and computed wave lengths and also the terms of Fe I are presented in detail in the tables.

C. C. KIESS

**An ultra-violet lead oxide band system.** SIDNEY BLOOMENTHAL. *Science* 69, 676-7(1929).—When Pb is excited in an arc or flame a system of bands is emitted with heads at 3209.2 A. U. (2,0), 3264.4 A. U. (1,0), 3320.7 A. U. (0,0), 3341.8 A. U. (1,1), 3401.9 A. U. (0,1), 3485.7 A. U. (0,2) and 3594.2 A. U. (1,4) the quantum nos. assigned being in ( ). These bands are attributed to PbO. This is supported by the fact that the isotope effect of 0.033 A. U. calcd. from the formula for the PbO system agrees with the value 0.037 A. U. found by direct measurement of the bands obtained first by using  $Pb_{206}$  and then  $Pb_{208}$ , 207, 206 in the light source.

C. C. KIESS

**Infra-red spectra.** ROBERT ROBERTSON. *Proc. Roy. Inst. Great Britain* (preprint), March 1, 1929, 7 pp; *Trans. Faraday Soc.*, Advance proof, 1929, Sec. III(c) No. 1, 6 pp.—An address.

C. C. KIESS

**Further investigations of the spectrum of ionized nitrogen (N II).** I. J. FREEMAN. *Proc. Roy. Soc. (London)*, A124, 654-67(1929).—The analysis of N II previously given (*C. A.* 21, 2224) is here extended to include the quintet-system terms which arise by adding  $s$ ,  $p$  and  $d$  electrons, resp., to the term  $^4P$  of N III. It is not possible to assign abs. values to these terms because the inter-system combinations have not yet been found. In addn. to these terms 2 new triplet terms,  $^3P$  and  $^3F$ , coming from the  $^4p$  and  $^4d$  electrons have been found. Altogether the new terms lead to classification of 75 more N II lines.

C. C. KIESS

**The structure of the high-pressure carbon bands and the Swan system.** R. C. JOHNSON AND R. K. ASUNDI. *Proc. Roy. Soc. (London)* A124, 668-88(1929).—New observations, with high dispersion, have been made of the "high-pressure" C bands, emitted by a discharge tube contg. CO at 20- to 40-mm. pressure and having at least 1

electrode of C. In addn. to the bands already known, 4 new and relatively faint ones in the ultra-violet have been found and 2 new ones in the deep red. These bands belong to a single progression given by the formula  $\nu = 29212 - (1627n'' - 11.7n'^2)$ , where  $n''$  is the vibrational quantum no. This progression shows a close relationship with the bands of the Swan system and it is apparent that the two-band systems have a common final electronic state which is the normal state of the  $C_2$  mol. A detailed study of the fine structure of the high-pressure bands (0.4), (0.5), (0.8) and (0.9) shows that they consist of  $P$  and  $R$  branches only and represent an electronic transition  $^3P \rightarrow ^1P$ . Application of the methods of Hund and Mulliken to the interpretation of data derived from the fine-structure analysis leads to the view that the structure of the  $C_2$  mol. in the initial state of the high-pressure bands is such as to produce a normal  $^3P$  level, whereas the ground state of the mol. gives an inverted  $^3P$  level. C. C. KIESS

The thermal excitation of atoms in the reversing layer of the sun. ALBRECHT UNSOLD. *Astrophys. J.* 69, 322-9(1929).—The method previously described (*C. A.* 22, 1277) is applied to det., from photometric measurements of the contours of a Fraunhofer line, the no. of atoms,  $N$ , in a particular state of excitation which lie above 1 sq. cm. of the photosphere, multiplied by  $f$ , the "oscillatory power" of the spectrum line corresponding to the excited state. The data thus obtained from  $Ca^+$  and  $Ba^+$  lines representing corresponding term combinations show that, for excitation potentials up to 1.7 v., Boltzmann's relation holds for the no. of atoms in a given stage of excitation or ionization for a state of thermal equil. C. C. KIESS

The spectrum of B. D. + 11° 4673. PAUL W. MERRILL. *Astrophys. J.* 69, 330-78 (1929).—In addn. to absorption lines the spectrum of the star B. D. + 11° 4673 contains the emission lines of H, He, Fe II, Al II, Al III, N II, Si I, Si II, Si III, Ti II, Cr II, Mg II, C II and Sc II. Of the Fe II lines some occur which represent not only the forbidden transitions between the low metastable states but also transitions for which  $\Delta j = 2$ . The bright lines are variable both in position and in intensity. At. phenomena thus occur in the star which it is as yet impossible to produce in the lab. C. C. KIESS

The absorption spectra of halogens and inter-halogen compounds in solution in carbon tetrachloride. A. F. GILLAM AND R. A. MORTON. *Proc. Roy. Soc. (London)* A124, 604-16(1929).—The absorption spectra of solns. in  $CCl_4$  of Cl, Br and I were measured spectrophotometrically to det. not only the absorption curves of the halogens but also of the compds. ICl, IBr, BrCl and of the less stable trichlorides and tribromides. The results obtained are presented in the tables and are shown by graphs. At the dilns. necessary to permit measurement of the absorption, dissocn. of the compds. occurred to some extent, barely detectable with ICl, small with IBr, but pronounced with BrCl. Solns. contg. halogens in the proportions necessary for the formation of the trichlorides or tribromides contained the monohalide and free halogen only. C. C. K.

The arc spectrum of chlorine and its structure. C. C. KIESS AND T. L. DEBRUIN. *Bur. Standards J. Research* 2, 1117-36(1929).—More than 200 wave lengths between 4000 Å. U. in the violet and 9900 Å. U. in the infra-red have been measured in the hitherto almost unknown arc spectrum of Cl. The light source was an uncondensed discharge in a Geissler tube contg. the gas at low pressure. Sixty-two percent of these lines, together with those observed by Turner in the Schumann region (*C. A.* 20, 2613), have been classified as members of the doublet- and quartet-series systems. Nine sets of series-forming terms, arising from  $^3P$  of the Cl ion, have been found. From them the distance between  $^3P_2$ , the base term of the neutral atom, and  $^3P_2$ , the lowest term of  $Cl^+$ , is found to be  $104991\text{ cm}^{-1}$ . This gives 12.96 v. as the ionization potential of neutral Cl. C. C. KIESS

Fine structure of the magnetic spectrum of  $\alpha$ -rays. S. ROSENBLUM. *Compt. rend* 188, 1549-50(1929).—The fine structure found for the  $\alpha$ -rays of Th C (*C. A.* 23, 4132) has not been found for Ra A, Ra C' and Th C' when studied by the same method. C. C. KIESS

The spectrum of carbon. DATTATRAYA SHRIDHAR JOG. *Indian J. Physics* 3, 451-61(1929); cf. *C. A.* 23, 2884.—New ultra-violet wave lengths of C between 1930 Å. U. and 2930 Å. U. have been observed in an arc excited with a heavy current. A few of these lines, together with some in the Schumann region observed by others, have been classified as members of the singlet and triplet systems and as inter-system combinations. C. C. KIESS

New bands in the spectrum of oxide of lanthanum. GIORGIO PICCARDI. *Nature* 124, 129(1929).—By a simple arrangement of the O-H flame P. was able to vaporize the oxide completely. The spectrum was photographed with a quartz spectrograph between  $\lambda 7000$  and  $\lambda 2400$  and shows groups of bands at  $\lambda\lambda 6540, 6154, 5866, 5600, 5380, 5178 (5058), 4582, 4543, 4531, 4418, 4372, 4357, 3708, 3671, 3620, 3612, 3566$ . The

groups between  $\lambda 6540$  and  $\lambda 5058$  are composed of double-headed bands, the sepn. of the heads decreasing with the wave length.

GREGG M. EVANS

**Band spectra of mercury, cadmium and zinc halides.** K. WIELAND. *Helv. Phys. Acta* 2, 46-64(1929).—Photographs of the band spectra of the chlorides, bromides and iodides of Zn, Cd and Hg in the region from 7000 Å. U. to 2000 Å. U. are obtained. In the ultra-violet region sharp edges are observed. Some of these follow the rule of Deslandres (mols. with 2 atoms). The isotope effect is observed for  $\text{HgCl}^{18}$  and  $\text{HgCl}^{17}$ ,  $\text{HgBr}^{79}$  and  $\text{HgBr}^{81}$ .

EGON BRETSCHER

**Optical studies on the mercury atom.** MARCEL SCHEIN. *Helv. Phys. Acta* 2, Supplement 1-114(1929); cf. *C. A.* 22, 1541.—(1) *The hyperfine structure of line 2536.7 Å. U. of Hg* is studied. Light from a Hg-resonance lamp (Wood) is allowed to fall on a second one which is placed in a magnetic field (up to 18,000 gauss); the light scattered at right angles to the incident beam of the second lamp shows periodic changes in intensity with increasing strength of field. A max. of intensity is obtained when the wavelength shift, due to the magnetic field, corresponds to the difference of wave length of the lines of the fine structure (Resonanzkurvenmethode). The intensity of the light is detd. by means of a photoelec. cell, whose sensitivity is increased by using a valve amplifier. Line 2536.7 Å. U. consists of 5 lines, placed at a distance of about 0.01 Å. U. from each other (agreement with Wood); analogous results were obtained by studying the absorption instead of emission. No Paschen-Back effect could be found. The *intensity distribution* of line 2537 Å. U. is compared with the calcd. value (based on the Doppler effect); the agreement is only qual. (2) *The Stark effect of the Hg-resonance line* is measured by further refinement of the resonance curve method; a change of  $7.65 \times 10^{-6}$  Å. U. of wave length can be detected; the shift of wave length of the resonance line amounts to  $5.4 \times 10^{-4}$  Å. U. in a field of  $10^5$  v./cm. Expts. with crossed and parallel magnetic and elec. fields combined are described, for details see original. (3) *Doppler effect and thermal velocity of Hg atoms.* The above outlined method is applied to det. the distribution of the mol. velocity. There is approx. agreement with idealized calcn.

EGON BRETSCHER

**Infra-red investigations of molecular structure. I. Apparatus and technic.** C. P. SNOW AND A. M. TAYLOR. *Proc. Roy. Soc. (London)* A124, 442-52(1929).—A rock-salt prism is used to segregate a frequency band of less than one octave. This band is then analyzed by means of a grating. With this app., evidence of fine structure in the CO 4.66 $\mu$  band has been obtained. Very exact details are given. II. *The molecule of nitric oxide.* C. P. SNOW, F. I. G. RAWLINS AND E. K. RIDEAL. *Ibid* 453-64. The vibration-rotation band spectrum of NO is shown to be a fundamental, with its center at 1882.9  $\text{cm}^{-1}$ ,  $n' = \frac{1}{2}$ , with the fine structure consisting of *P*, *Q* and *R* branches with at least 42 rotation bands in each of the *P* and *R* branches. No overtone ( $n' = \frac{3}{2}$ ) was found. The mol. consts. derived from the sepn. of the fine-structure bands ( $3.35 \text{ cm}^{-1}$ ) correspond almost exactly with those obtained from electronic band spectral data.

GREGG M. EVANS

**A new ultra-violet band spectrum of hydrogen chloride.** BROOKS A. BRICE AND F. A. JENKINS. *Nature* 123, 944(1929).—Photographs have been taken of an extended band system in the region  $\lambda 2830$ -3966 from a low-pressure discharge in pure HCl gas with Pt electrodes. The bands are degraded toward long wave lengths, and have the characteristic widely spaced structure always observed in hydride spectra. A discharge in H gives the same band system if a small amt. of AgCl or CuCl is fused on the electrodes but not if AgBr is used. There is thus strong evidence that this spectrum is due to HCl. The emitter is probably the singly charged HCl ion. Because of the unusual intensity distribution, it has not been possible to reach an assignment of vibrational quantum nos. and thus to det. the electronic frequency. The bands occur in pairs of const. sepn., indicating that a doublet electronic level is involved. The 2 components of a pair have about equal intensities. The wave nos. of the band heads may be represented by  $\nu = \frac{28446}{27778} \left\{ + 1561 p - 30.3 p^2 - 2573 n, \text{ observed values of } (p,n) \text{ being } (-1,0)?, (0,1), (3,1)?, (0,0), (1,0), (2,0), (3,0), (4,0), (5,0). \right.$  The pair (0,0) at  $\lambda 3514, 3598$  is the strongest, and the 5 succeeding pairs have regularly decreasing intensity. They apparently form a progression with a common vibrational quantum no. in the lower state.

ALBERT L. HENNE

**The ultra-violet absorption spectra of *o*-, *m*- and *p*-cresols.** JEAN SAVARD. *Compt. rend.* 188, 782-3(1929).—The vapor spectra of *o*-, *m*- and *p*-cresols present the same differences as shown in the dihalogen derivs. by Henri and Errera. The electronic energy decreases as one passes from *o*, to *m*, to *p*. The *o* and *m* have 2 states of activa-

tion but the  $p$  has only one. A formula is given for the absorption spectra and data are included on the 3 cresols, phenol, toluene and benzene. WALLACE R. BRODE

The absorption spectra of rubrene and of its derivatives. ANTOINE WILLEMART. *Compt. rend.* 188, 988–90 (1929).—Rubrene and its di-Me and dibenzo derivs. present a similar absorption spectrum with 3 sharp bands at 4650, 4950 and 5300 Å. U.

Absorption spectrum of liquid benzene: a criticism of a paper bearing this title by Barnes and Fulweiler. JOSEPH W. ELLIS. *Phys. Rev.* 33, 625–6 (1929).—It is shown that the assumption of Barnes and Fulweiler (*C. A.* 23, 769) of a const. amplitude of vibration for all stationary states of an anharmonic oscillator is theoretically unsound. It is also pointed out that the precision of these authors' measurements on 4 bands in the visible and near infra-red absorption spectra of liquid benzene cannot be used as a test for the superiority of the new wave mechanics over the classical quantum theory. Reply. JAMES BARNES. *Ibid* 627. WALLACE R. BRODE

Spectrophotometric study of micas. T. YOSHIMURA. *Suppl. Sci. Papers Inst. Phys. Chem. Research (Tokyo)* 11, No. 11, 1–4 (1929).—Tables of extinction coeffs. and certain other optical properties for some Japanese micas are given. The Lambert law does not hold for mica flakes. Since no characteristic bands appear which might be due to absorbing mols. it is concluded that the color is due to colloidal particles. G. M. E. BERNARD LEWIS

Some experiments on the Raman effect of liquids. R. BÄR. *Helv. Phys. Acta* 2, 154–6 (1929).—A lecture. The original method of Raman and the modification of Wood are combined in order to be able to use polarized light and to insert filters. A 100-cm. long and 3-cm. wide tube, contg. the liquid to be investigated is closed at one end with a glass window. Through  $\frac{1}{2}$  of this window the liquid is irradiated. The modified radiation leaving the tube through the other half of the window is deflected by a mirror placed at  $45^\circ$  to the axis of the tube and is led to the spectroscope. No new effects have been detected; the continuous ground usually found on Raman spectrograms is shown to be due to fluorescence. EGON BRETSCHER

The Raman spectra of sulfuric acid and the sulfates. S. K. MUKHERJEE AND P. N. SENGUPTA. *Indian J. Physics* 3, 503–5 (1929).— $\text{MgSO}_4$ ,  $\text{Na}_2\text{SO}_4$  and  $\text{CuSO}_4$ , when excited by the Hg lines 4358 Å. U. and 4046 Å. U., give scattered lines of wave lengths 4552 Å. U. and 4213 Å. U., resp. These correspond to an infra-red absorption band at  $10.2\mu$ , whereas the observed infra-red absorption of sulfates is at  $9.2\mu$ . For  $\text{H}_2\text{SO}_4$  5 scattered lines were observed, corresponding to infra-red absorption bands at  $4.68\mu$ ,  $11.01\mu$ ,  $17.9\mu$  and  $18.4\mu$ . Observed bands of  $\text{H}_2\text{SO}_4$  lie at  $8.6\mu$ ,  $9.55\mu$ ,  $10.4\mu$  and  $11.35\mu$ . The  $4.68$  and  $9.55$  bands are regarded as harmonics of the fundamental at  $18\mu$ . C. C. KIESS

The spectrum of trebly ionized thallium (Tl IV). P. PATTABHIRAMIAH. *Indian J. Physics* 3, 523–9 (1929).—The application of the regular doublet law to the spectra Au II and Hg III has led to the analysis of Tl IV, trebly ionized Tl being isoelectronic with singly ionized Au and doubly ionized Hg. The classified lines lie between 1030 Å. U. and 2026 Å. U. in the far ultra-violet and represent combinations of  $P$ ,  $D$  and  $F$  terms of the singlet and triplet systems. C. C. KIESS

Series spectrum of Se IV. P. PATTABHIRAMIAH AND A. S. RAO. *Indian J. Physics* 3, 531–5 (1929).—A table of classified lines is presented representing combinations between the doublet terms of Se IV. Trebly ionized Se is isoelectronic with neutral Ga, singly ionized Ge and doubly ionized As. A comparison is made of the common spectral structures of these 4 similar at systems. C. C. KIESS

Chemiluminescence of aminophthalic hydrazide. HERBERT O. ALBRECHT. *Z. physik. Chem.* 135, 321–30 (1928).—The strong chemiluminescence observed when 3-aminophthalic hydrazide and its diacetyl deriv. are oxidized in alk. soln. has been investigated. Most oxidizing agents which may be used in alk. soln. are active, especially hypochlorites and ferricyanides. The action of  $\text{H}_2\text{O}_2$  alone is feeble, but the max. effect is obtained with a mixt. of  $\text{H}_2\text{O}_2$  and hypochlorite or ferricyanide. The luminescence is visible even at concns. of  $10^{-8} M$ . Of the various cyclohydrazides and hydrazine derivs. investigated, only those related in some manner to phthalic acid exhibit this highly developed luminescence. B. C. A.

Theory of sensitized fluorescence. A. CARELLI. *Atti accad. Lincei* [vi], 8, 495–500 (1928).—A mathematical treatment based on wave mechanics. H. G.

Technic of fluorescence analysis. MAX HAITINGER AND VIKTOR REICH. *Chem. Fabrik* 1929, 379–80.—Description of an app. which permits ultra-violet rays to fall only vertically on the surface of liquids, the concns. of which are measured by the depth of penetration of the rays. Cf. *C. A.* 20, 3827; 22, 2291. J. H. MOORE

Fluorescence and infra-red absorption. V. POSEPAL. *Compt. rend.* 189, 159–61 (1929); cf. *C. A.* 23, 2659.—A general theory is developed from the earlier findings.

Applied to Na an exptl. verification is obtained for the formulas of Haber and Liebermann for the infra-red absorption. E. SCHOTTE

**The cause of the after-glow of calcium tungstate.** ARTHUR SCHLEEDÉ AND TIEN HUAN TSAO. *Ber.* 62B, 763-8(1929).—Ca tungstate has been prepd. from  $\text{WO}_3$  and from  $\text{NH}_4$  tungstate and  $\text{CaCl}_2$ . In every case investigated, the after-glow could be referred to the presence of traces of As. Recrystn. is the best method of purification. ALBERT L. HENNE

**The phosphorescence of beryllium sulfide and a device for the analysis of luminescence specially suitable for weakly luminous preparations.** ERICH TIEDE AND FRIEDA GOLDSCHMIDT. *Ber.* 62B, 758-62(1929).—Be sulfide has been prepd. by treating the chloride with pure  $\text{H}_2\text{S}$  at  $900^\circ$ . The chloride had been obtained in a very pure state from the oxide, cane sugar C and Cl or HCl, and resublimed several times. The phosphors prepd. with that material exhibited no phosphorescence even after a strong irradiation with an Fe arc. Traces of Sb or Bi caused the appearance of a weak yellowish or purple phosphorescence. Traces of other elements were without effect. Phosphors have also been prepd. with a Be sulfide batch obtained by heating the metal with S vapors in a H current at  $1000$ – $1300^\circ$ ; they exhibited a weak blue phosphorescence, even without addn. of NaCl or traces of metals. The phosphorescence was attributed to traces of Fe which were present in the metallic Be used as starting point. Further addns. of Fe did not modify the phosphorescence and this is in good agreement that only traces of a metal are required to exhalt the phosphorescence. Addns. of Sb or Bi were rendered impossible by the fact that those elements distil off at the temp. used to prep. the phosphors. Details are given of a simple app. which was used very successfully to study the weak phosphorescence of small quantities of materials. ALBERT L. HENNE

**Chemical studies of synthetic galena as a radio detector. I. Metallographical observation of the synthetic crystals.** WAKASABURO OGAWA. *J. Soc. Chem. Ind. (Japan)* 31, 476-80(1928); Suppl. Binding 31, 115-6B(1928).—Synthetic galena contg. some  $\text{Ag}_2\text{S}$  is a good radio detector. Such crystals contain Ag particles, which are seen as white brilliant spots on the polished and etched surface under the microscope. The content of Ag particles increases with the increasing content of  $\text{Ag}_2\text{S}$  in the crystal up to 10%, and then decreases. The sensitivity of the synthetic galena increases with the increasing content of  $\text{Ag}_2\text{S}$  up to 10% and then decreases. From this parallelism, the Ag particles are supposed to play an important role in the detector action. **II. Activation of galena by metallic silver and its compounds.** *Ibid* 481-6; 116-8B. Sensitive galena is obtainable by incorporating a suitable amt. of Ag in galena (1) by heating a mixt. of Ag and PbS, (2) by fusing a mixt. of PbS with an easily reducible Ag compd. such as nitrate, oxide, etc., (3) by heating PbS crystals imbedded in Ag powder or easily reducible Ag compd. to a temp. below the m. p. of Ag, say  $500^\circ$ , (4) by heating during 2 hrs. at  $800^\circ$  Ag-plated galena (by immersion in 0.1 N  $\text{AgNO}_3$ ), (5) by heating a mixt. of powd. galena with Ag powder or easily reducible Ag compd. compressed in a mold at its sintering temp. ( $700$ – $800^\circ$ ) for 1-2 hrs., or (6) by heating a molded mixt. of powd. galena with  $\text{AgNO}_3$  soln. at its sintering temp. for 2 hrs. **III. Activation of galena by various elements and compounds.** *Ibid* 486-90; 118-20B. S activates galena when treated at high temp., say  $800^\circ$ . Tl compds. are also effective. The salts of all the alkali metals, Fe, Al, Zr and many rare earth compds. have a remarkable effect. Ba, Hg, Zn, Th, As, Sb, Cr, Mo, U and Mn salts appear to have some activating effect. Anions seem to have no important effect except halogens which are decidedly injurious. **IV-VI.** *Ibid* 553-69; 135-40B. **IV. Rectifying properties of synthetic galena.**—The d. c. characteristic curves for the synthetic galena of various Ag contents are given. The contact pressure between Pt needle and synthetic galena must be small, in a certain limit, to get a good sensitivity. Although a heavier contact increases the current in the rectifying direction (from crystal to needle), it also increases the current in the opposite direction, resulting in a decreased rectification. The current in the rectifying direction for a given voltage was smaller in a more sensitive crystal, which shows that the improvement of sensitivity by Ag is not caused by an increase of current in the rectifying direction, but must be due to a decrease of current in the opposite direction. **V. Direction of the rectified current.**—The direction of rectification is primarily detd. by the chem. compns. of substances which constitute the contact part. O. obtained the following series, of which, if any 2 crystals are coupled, the rectified current will flow from the former in the order to the latter in the order: Argentiferous galena, Carborundum A, Si, Te, Ni, bornite, chalcopryrite, pyrite, Carborundum B, zincite. The order may be modified by impurities and by a phys. change of surface. **VI. Electrical conductivity.**—The sp. resistance ( $x$ ) at  $t^\circ$  between  $20^\circ$  and  $150^\circ$  for galena contg. various amts. of Ag was measured, and exptl. formulas of the form  $x = a(1 + bt)$ ,  $a$  and  $b$  being consts., were

made. VII-IX. *Ibid* 711-27; 169-74B. VII. Thermoelectrical properties.—The thermoelec. e. m. fs. of synthetic galena as well as other minerals commonly used as detectors were measured against Cu between 0° and 25°. E. m. fs. in  $\mu$ v. were 13,000 for Fe pyrite A, 12,850 Si, 10,000 bornite, 6650 Te, —1000 smaltite, —5400 pyrite C, —5700 galena IV, —6500 for galena III, 5250 synthetic galena contg. 7.5% Ag<sub>2</sub>S, —8500 Fe pyrite B, —10,500 for chalcopyrite, —16,000 zincite, —34,500 molybdenite at the hot junction. The pos. sign denotes that current flows from Cu into mineral at the hot junction. One mineral cut in two, and the two parts brought into contact with each other showed a thermoelec. power which depended on their form at the contact. VIII. A theory of crystal detector.—The rectification by a crystal detector is caused by difference of electron affinity, and is due to the difference between nos. of electrons emitted from each electrode. A good detector must have 3 important properties, namely, proper degree of contact, a large difference of electron emission, between the two substances, and proper elec. resistance to minimize metallic conduction through the contact point, but not so much as to retard the conduction in the materials in contact themselves. IX. A confirmation of the theory.—By using vacuum tube with two electrodes, not in direct contact, of such metals and crystals as are used in the detector, a c. was rectified at ordinary temp. by cold electron emission. From the direction of the rectified current, O. obtained for the increasing electron emissibility in the following order: Most sensitive natural galena, synthetic galena (5% Ag), Si, Pt, Ag, synthetic galena (2.5% Ag), Cu, Sn, CuO, Sb, German silver, Bi, brass, Pb, Cd, Fe pyrite, Al, Mg. Synthetic galena activated by impregnating with LiNO<sub>3</sub>, Na<sub>2</sub>SO<sub>4</sub>, TiNO<sub>3</sub>, FeSO<sub>4</sub>, Ba(NO<sub>3</sub>)<sub>2</sub> and Zr(NO<sub>3</sub>)<sub>2</sub> were nobler than Ag, and these impregnated with Cu(NO<sub>3</sub>)<sub>2</sub>, Sb and As comp., and Ca(NO<sub>3</sub>)<sub>2</sub> were between Cu and Fe. Muscle Shoals relative to conservation (ammonia). FARLEY G. CLARK. *Trans.*

*Am. Electrochem. Soc.* 56 (preprint) 6 pp.(1929).—The Muscle Shoals plant is practically idle today. As a power site it is as yet unimportant. The 8 installed elec. generators will deliver 215,000 kw. at full head, and probably 70,000 kw. at extreme low water. Based on government data the cost of the first 80,000 kw., primary power, will be around \$50 per kw. yr. To compete with synthetic  $\text{NH}_3$  plants elsewhere the primary power cost will have to be about \$25 per kw. yr. It appears practical to utilize surplus or secondary power, free of cost, for the electrolytic generation of  $\text{H}_2$  and to supply this gas to a synthetic  $\text{NH}_3$  plant. A continuous plant of a private company would thus produce  $\text{NH}_3$  at \$97.83 per ton of fixed N, and an intermittent plant at \$83.67 per ton, assuming \$25 per kw. yr. for primary and no charge for secondary power. With govt. costs for capital, the secondary power plant could deliver  $\text{NH}_3$  at \$59.23 instead of \$83.67 per ton of fixed N. C. G. F.

**Electrothermal manufacture of ferro-silicon-manganese.** K. TH. KÜRTEN. *Zentr. Hütten- u. Walzwerke* 32, 281-3; *Chem. Zentr.* 1928, II, 1028; cf. C. A. 23, 3428.—The compn. of Fe-Si-Mn varies within wide limits. The following alloys are the most usual ones: Mn %, 48-52, 60-65, 70-75, 80-85; Si %, 20-25, 25, 23, 10-15. The C content varies between 0.5 and 1%. The P content should not exceed 0.1% and the S content 0.05%. With a Si content of over 25%, decompn. phenomena occur unless the alloys are very poor in P. Fe-Si-Mn alloys are manufd. in the elec. furnace by reduction of the natural Mn silicate, rhodonite ( $\text{MnSiO}_3$ ) or by reduction of oxidized manganese ores with addn. of  $\text{SiO}_2$  in form of quartz, etc. The Mn yield is higher than with the manuf. of ferro-manganese. A voltage of 35-55 v. and a c. d. of 2-4 amp. per sq. cm. are used. Practical examples are given including the compn. of furnace charges, yields, etc. G. SCHWOCH

**Economies of firing stained glass electrically.** P. N. RUGG. *Elec. World* 94, 377-8(1929).—A 15-kw 220-v. box type elec. furnace permits firing of 1.9 sq. ft. (0.177 sq. m.) of glass per kw. hr. with improved quality and a min. of rejects. The hearth area is 12 in.  $\times$  24 in. (0.305 m.  $\times$  0.61 m.) and a door opening of 11 in. (0.28 m.). The max. temp. used is 649° for this work. A second chamber at one side of the kiln preheats the glass to about 315° before charging into the kiln. Annealing is done in an adjoining cooling chamber, which is equipped with ten 500-w. strip heaters operating on 220 v. Five of these strip heaters are in the preheating section and 5 in the cooling section. Five snap switches afford easy adjustment of chamber temps. W. H. B.

**Lead alloys for anodes in electrolytic production of zinc of high purity.** U. C. TANTON, A. G. TAYLOR AND H. P. EHRLINGER. *Am. Inst. Mining Met. Eng., Tech. Pub.* No. 221, 12 pp.(1929).—A research purporting to overcome the difficulties encountered in the use of pure Pb anodes. These include: disintegration under electrolysis; part of the Pb goes to the cathode, lowering the purity of the deposited Zn and decreasing the  $\text{H}_2$  overvoltage; the remainder of the Pb from the disintegration of the anode goes into the  $\text{MnO}_2$ , rendering it unsalable as a by-product; the plain Pb anodes tend to bend and buckle during electrolysis, because of intercryst. oxidation. Elements tried alloyed with Pb were: As, Sb, Ba, Bi, Ca, Ce, Cu, Hg, Ag, Th and Sn. The Pb-Ag series contg. no free Ag, *i. e.*, at or below the eutectic of 2.6% Ag, proved so much superior to the other alloys tried that results are confined in this paper to an alloy contg. 1% Ag and 99% Pb. Results comparing pure Pb and this alloy as anode, and with different electrode spacing and with various addn. agents, are given. Finally, 2 lb. (0.917 kg.)  $\text{SiO}_2$  and 2 lb. gum arabic were used as addn. agent continuously in the plant. Over a month's operation, terminal voltage and current efficiency were 3.37 and 91.5, resp., and the Pb in the Zn was 0.004%. Among a no. of ternary alloys contg. Pb-Ag and another element some advantage was found in Pb-Ag-As and Pb-Ag-Sn combinations. The Pb-Ag-Sn anodes give exceptionally smooth deposits, while the Pb-Ag-As anodes put very little Pb in the Zn and in the  $\text{MnO}_2$ . The large plant has produced Zn of 99.994% purity. The properties of this metal are surprisingly different from those of ordinary high-grade Zn; it is very malleable and can be rolled indefinitely without annealing and beaten into extremely thin sheets like gold leaf. It can be drawn, stamped and extruded to a severity beyond the range of com. Zn metal. It is almost unaffected by  $\text{H}_2\text{SO}_4$  and but slowly by HCl, and has great resistance to atm. oxidation. A brief discussion is included. W. H. BOYNTON

**Progress in the realm of zinc electrolysis with special reference to Tainton's method.** GEORG EGER. *Metall u. Erz.* 46, 373-83(1929).—An address. Development of  $\text{ZnSO}_4$  electrolysis on a com. basis, a discussion of Tainton's method and a description of a large Tainton installation at Kellogg, Idaho. H. STORRY

**The electrolysis of molten zinc chloride.** RICHARD THRELFALL. *J. Soc. Chem. Ind.* 48, 210-23T(1929).—An account of extended work on  $\text{ZnCl}_2$  during the period

1903-15. The sources of Zn were ash from galvanizing tanks, and pickle liquor which consists mostly of  $\text{FeCl}_2$ . Means of removing Fe and other impurities before electrolysis are pointed out. The Fe is removed as  $\text{Fe}(\text{OH})_3$  and is furnace to yield pigment iron.  $\text{ZnCl}_2$  has a brightening effect on the color of Fe oxide, due to the fraction of  $\text{ZnCl}_2$  adsorbed by the coagulated  $\text{Fe}(\text{OH})_3$ . Chlorination of pickle liquor was carried out in towers packed and unpacked, or by passing it through an earthenware fan where it is beaten with Cl.  $\text{HCl}$  gas is necessary to effect complete removal of water from  $\text{ZnCl}_2$ . The means of removing Pb and Cd are noted. Types of cells used for electrolysis are described and illustrated. The behavior of a 6-pole high amperage cell and that of an 8-pole multiplate cell are compared. The arrangement of graphite electrodes in a single element of a multiplate cell and the structure of the graphite electrodes showing corrugations on the cathode face are illustrated, along with types of cells employed, also of the plan of automatic gas draught control for the Cl recovery. This Cl is used for the production of  $\text{CCl}_4$ .

W. H. BOYNTON

**Electrolysis of metallic oxides dissolved in fused boric acid and in fused borates (tungsten, molybdenum, zinc).** LUCIEN ANDRIEUX. Masson et Cie, Paris, France, *Thesis*, 1929.—A. found that in the electrolysis of borax, Na metal is the primary product. This Na thus liberated reacts with the  $\text{B}_2\text{O}_3$ , resulting in amorphous B at the cathode. Thus, the electrolysis of a metal borate is a means of liberating the metal of this borate. The electrolysis of K and Li borate likewise produces B. Electrolysis of borates of the alk. earths results in a product composed of amorphous B and boride of the alk. earth metal. The borates of Ce and Mn produce borides of these 2 metals. Mg borate results in a very pure B. This reaction was studied in detail. The addn. of  $\text{MgF}_2$  facilitates the reaction. A graphite crucible was used and the charge consisted of  $\text{B}_2\text{O}_3$ ,  $\text{MgO}$  and  $\text{MgF}_2$ . The method is much better than the older method of Moissan. The electrolysis of tetraborate of Ca results in a mixed product of B and boride of Ca. With Mg there is a tendency to form pyroborates. These borates gather around the cathode in the shape of a solid, cryst. ball surrounded by the bath, which is perfectly fluid at  $1000^\circ$ . This is a new and curious phenomenon. To obtain the boride of a metal A. electrolyzes a mixt. of borate and of fluoride of the metal. In this way 17 borides have been prepd., 10 of which are new:  $\text{CaB}_6$ ,  $\text{SrB}_6$ ,  $\text{BaB}_6$ ,  $\text{ThB}_6$ ,  $\text{ZrB}_6$ ,  $\text{Cr}_3\text{B}_2$ ,  $\text{MnB}$ , and the new borates  $\text{CeB}_6$ ,  $\text{LaB}_6$ ,  $\text{NdB}_6$ ,  $\text{GdB}_6$ ,  $\text{YB}_6$ ,  $\text{ErB}_6$ ,  $\text{YbB}_6$ ,  $\text{TiB}_2$ ,  $\text{VB}_2$ ,  $\text{UB}_4$ . Among the metals produced are Zn, W and Mo. Zn can be obtained by the electrolysis of the oxide of Zn dissolved in a bath of  $\text{B}_2\text{O}_3$  or of borates to which have been added fluorides or other salts to lower the fusing temp. of the bath. W and Mo can be obtained by dissolving the trioxide of the metal in the bath of borate and fluoride with an addn. of oxide of Zn.

C. G. F.

**Electrode potentials of copper anodes and copper cathodes.** EDWARD F. KERN AND ROBERT W. ROWEN. *Trans. Am. Electrochem. Soc.* 56 (preprint) 13 pp. (1929).—The electrode potentials of Cu anodes and cathodes were detd., as well as the effect upon the electrode potentials by varying the temp. and the compn. of the electrolyte, by the compn. and phys. character of the anodes, and by the addns. to the electrolyte of glue and sulfite-waste residue in the proportions usually added to Cu refining electrolytes. The static potentials of Cu anodes and cathodes were practically identical in the same cells, whereas the dynamic potentials and the polarization potentials varied, and were dependent upon circulation and temp. of the electrolyte, upon compn. and phys. condition of the electrodes, and upon the presence of glue and of sulfite-waste residue, in the amt. usually added to Cu refining electrolytes. A comparison of the results obtained by the use of the Haring polarization and resistivity cell, by means of a satd. calomel half-cell and a  $\text{Hg}_2\text{SO}_4$  half-cell, showed that the most satisfactory results were obtained by the satd. calomel half-cell in connection with a potentiometer. Agitation or circulation of the electrolyte caused a decrease in anode polarization, and a greater decrease in cathode polarization. The amt. of free  $\text{H}_2\text{SO}_4$  in the electrolyte did not have an appreciable effect upon either the anode or the cathode polarization. The effect of increase of temp. of the electrolyte was to decrease slightly anode polarization and to decrease greatly cathode polarization. The impurities in the anode caused an increase in anode polarization; the larger the amt., the higher the anode polarization. The phys. condition of the anode had some effect upon the anode potentials, the rolled anode having a higher static potential than cast anodes. The addn. of glue to the electrolyte had scarcely any effect upon the anode static potential. It decreased the dynamic potential, causing an increase in anode polarization. Presence of glue in the electrolyte slightly decreased cathode static potential, greatly decreased cathode dynamic potential, causing a corresponding increase in the cathode polarization, which was higher with increase in the temp. of the electrolyte. Addition of sulfite-waste residue ("goulac," "lignin

sulfite," etc.), to the electrolyte slightly increased anode polarization, and caused a considerable decrease in cathode polarization after the current had passed through the electrolyte for a few min. At a higher temp. of the electrolyte the presence of sulfite-waste residue caused a decrease in cathode polarization. The combined effect of glue and sulfite-waste residue in the electrolyte was additive, the increase in cathode polarization being due to the effect of the glue. C. G. F.

**Some chromium plating experiments.** CHESTER M. ALTER AND FRANK C. MATHERS. *Trans. Am. Electrochem. Soc.* 56 (preprint) 6 pp. (1929).—The authors find that Cr deposits more easily upon Cu or Fe than upon Pt or graphite. It is thought that this may, in some measure, account for the early controversy concerning whether or not Cr could be deposited from  $\text{CrO}_3$  solns. Those who used Cu cathodes had a much better chance of success than those who used Pt cathodes. Co salts in the  $\text{CrO}_3$  bath prevent the deposition of Cr. Periodic reversal of the current, whereby the cathode is made anode for only a small proportion of the time, prevents the deposition of Cr. Stirring the bath or momentarily lifting the cathode out of the bath reduces or prevents the deposition of Cr. Silica gel in the bath in sufficient quantities to prevent convection currents does not improve the throwing power nor increase the yield in Cr deposition. Cu, Ni, Fe and various other metals in the form of chromates were without effect upon the deposition of Cr. These metals were not deposited with the Cr unless they were added in large amts., and in no cases were the deposits satisfactory where another metal was deposited with Cr. Current efficiencies were increased by the use of a porous diaphragm, but the color of the deposits was poor when a porous cup was used. C. G. F.

**The preparation of articles for chromium plating.** W. L. PINNER. *Metal Cleaning and Finishing* 1, No. 3, 249-52 (1929). E. I. S.

**Direct electrolytic preparation of ammonium permanganate.** GASTON RAPIN. *Compt. rend.* 188, 1547-8 (1929).—Expts. are described which prove that  $\text{NH}_4\text{MnO}_4$  can be prepd. by direct electrolysis starting from silico-manganese. Because of poor cond. of ammoniacal solns. used the results are only of theoretical value. Addn. of  $\text{NH}_4\text{Cl}$  to ammoniacal soln. does not increase cond. sufficiently to increase formation of  $\text{MnO}_4$ . M. McMAHON

**Crystalline mercurous sulfate and the Weston normal standard cell.** DONALD B. SUMMERS AND W. CECIL GARDINER. *Trans. Am. Electrochem. Soc.* 56 (preprint) 18 pp. (1929).—Methods of prepg. cryst.  $\text{Hg}_2\text{SO}_4$  by oxidation, reduction and recrystn. are described. A table showing the sizes of crystals obtained by the different methods and photographs of some typical crystals are given. Cryst.  $\text{Hg}_2\text{SO}_4$  of large grain size is shown to give a high initial value, and a steady decrease of the e. m. f. of the Weston normal cell. The results obtained are explained by assuming that large crystals of  $\text{Hg}_2\text{SO}_4$  favor an increased rate of hydrolysis of the  $\text{Hg}_2\text{SO}_4$  by the  $\text{CdSO}_4$  soln. C. G. F.

**Hysteresis in standard cells.** WENDELL S. NIEDERHAUSER AND GEO. A. HULETT. *J. Am. Chem. Soc.* 51, 2345-51 (1929).—A study of the sep. electrodes of the Cd cell showed considerable hysteresis if the temp. was raised to  $35^\circ$  for as little as 3 min. No hysteresis was observed in cathode half-cells in which the electrolyte was a soln. satd. with  $\text{Hg}_2\text{SO}_4$  and  $\text{CdSO}_4$  at  $25^\circ$ , but which contained no solid  $\text{Hg}_2\text{SO}_4$ . A new theory, based upon the rate of establishment of satn. equil. between the soln. and the solid salts present, is suggested to explain hysteresis. New cells show high initial e. m. f. values, due at least in part to overloading in construction, which do not become normal until after a month or so. Cells constructed in such manner as to hold the temp. below  $25^\circ$  reach normal e. m. f. within a few hrs. H. STÖERTZ

**Polarization in standard cells.** WENDELL S. NIEDERHAUSER AND GEO. A. HULETT. *J. Am. Chem. Soc.* 51, 2327-44 (1929).—A study of the polarization of the individual limbs of the satd., unsatd. and acid Cd cells, and of the Zn cell at very low currents. Most of the polarization is found in the Hg limbs; the presence of acid diminishes the magnitude of polarization; no noticeable change in the resistance of a cell accompanies polarization. The apparent recovery from polarization, which occurs in the Hg limbs of cells during the passage of current, is attributed to an increase in the rates of soln. and of crystn. at the surface of the  $\text{Hg}_2\text{SO}_4$  crystals. H. STÖERTZ

**Life of dry cells. I. Rate of discharge and the life.** NAOTO KAMEYAMA. *J. Soc. Chem. Ind. Japan* 32, 461 (1929); Suppl. Binding 32, 142-4B (1929).—If  $\omega_0$  is taken as the theoret. amt. of active material to be consumed per amp. hr. supplied by a dry cell,  $W$  the quantity of the active material originally present in the cell and  $B$  that still remaining active at the end of the life ( $T$ ) then the following relation should hold for the const. discharge current (1 amp.): (1)  $W-B = (\omega_0/\bar{\varphi}) \times IT$ , where  $\bar{\varphi}$

represents the av. efficiency of utilization of the active material for the whole period of the life.  $\bar{\varphi}$  is less when the discharge rate  $I/W$  is greater, and the effect becomes more pronounced when the rate becomes greater. K. assumed the following relation: (2)  $\bar{\varphi} = \text{const.}/(I/W)^n$ , where  $n$  varies with the discharge rate ( $I/W$ ), but in the limited range of the rate, it may be taken approx. const. "B"-batteries of wireless service.—As the discharge rate is usually small, K. considered  $n = 0$  and derived the following equation from (1) and (2) for const.  $I$ :  $T = A(W-B)$ ;  $A$  and  $B$  are const. Calcd. value of this relation between  $T$  and  $W$  was compared with the result of the discharge tests through a const. resistance (10,000  $\Omega$  for 45-v. batteries), the cut-off voltage being 1.13 v. per cell. Six cells of a manufacturer were in series, ( $T$  in hr.,  $W$  in g.),  $T = 15.55 (W-3.6)$ , 24 cells of other manufacturers were in series  $T = 11.1 (W-10)$ . The cell having a larger value of  $A$  and a smaller value of  $B$  is superior to that having smaller  $A$  and larger  $B$ . K. discussed the relation of electrode area, vol. of active materials, etc., to the const.  $A$  or  $B$ . "A"-batteries of wireless service.—The cut-off voltage is much lower than with "B"-batteries. Consequently  $B$  can be negligible compared with  $W$ . This gives the following from equations (1) and (2):  $T(I/W)^{n+1} = \text{const.}$  Validity of this relation was exam'd. by the results of the discharge test of 54 cells of 20 kinds made by 4 makers of Japan, with the largest  $W$  1020 g. and the smallest 218 g.; the discharge currents 65, 125, 180 and 250 milliamp. gave  $T(I/W)^{1.5} = 25.4$ , cut-off voltage being 0.90 v. Thus, these cells had a const.  $n = 0.5$ . II. Discharge mechanism of grains of active material. *Ibid* 469-75, Suppl. Binding 144-5B(1920).—As  $\text{MnO}_2$  is in grain form, the reaction must occur at the interface of the grain and the soln., and the reacting zone of the grain must recede into the interior of the grain as the discharge proceeds. To supply a const. current per grain, the receding velocity of the reaction zone must be greater and greater as the discharge proceeds, because the area of the reacting zone becomes less and less in the interior of the grain. Finally, a limit will be reached beyond which the receding velocity cannot be greater, and the grain begins to fail to supply the const. current. But the grain may still be able to supply another const. current, which is less than the previous one, because the small current does not require so large a receding velocity as the larger current does. Thus, the limiting receding velocity is a function of the discharge rate per grain. When the limit is reached, the grain as a whole is dead as active material, although there is still some  $\text{MnO}_2$  remaining active in the interior of the grain. Thus the utilization of  $\text{MnO}_2$ -grain is not always complete. On the basis of the above idea of the receding velocity of reaction zone in a grain and the rate of discharge per grain, K. tried to work out a quant. relation between the efficiency of utilization of active material and the discharge rate, the active material of a dry cell having been considered as the assemblage of reacting grains.

S. OKA

The electromotive force of the dry cell. SEIZI KANEKO. *J. Soc. Chem. Ind. Japan* 32, 120-5(1929); Suppl. Binding 32, 37B(1929).—The e. m. f. of the following equations was calcd. from known thermodynamical data: (1)  $\text{Zn} + 2\text{MnO}_2 + 2\text{NH}_4\text{Cl} = \text{Zn}(\text{NH}_4)_2\text{Cl}_2 + \text{Mn}_2\text{O}_3 + \text{H}_2\text{O}$ . (2)  $2\text{Zn} + 4\text{NH}_4\text{Cl} + 3\text{MnO}_2 = 2\text{Zn}(\text{NH}_4)_2\text{Cl}_2 + \text{Mn}_2\text{O}_3 + 2\text{H}_2\text{O}$ . (3)  $\text{Zn} + \text{MnO}_2 + 2\text{NH}_4\text{Cl} = \text{Zn}(\text{NH}_4)_2\text{Cl}_2 + \text{MnO} + \text{H}_2\text{O}$ . (4)  $\text{Zn} + \frac{1}{2}\text{O}_2 + 2\text{NH}_4\text{Cl} = \text{Zn}(\text{NH}_4)_2\text{Cl}_2 + \text{H}_2\text{O}$ . The values (1) 1.605 v., (2) 1.367 v., (3) 1.160 v. and (4) 1.720 v. were obtained. Since the e. m. f. of a dry cell actually measured was 1.63 v., K. concluded that the reaction in the cell is (1).

S. OKA

The fundamental chemical reaction of the lead accumulator. NAOTO KAMEYAMA. *J. Soc. Chem. Ind. Japan* 31, 689-94(1928); Suppl. Binding 31, 163B(1928).—The standard free energy change of the following chem. reaction was calcd. with the following results:  $\text{Pb}(s) + 2\text{H}_2\text{SO}_4(\text{aq. soln.}) + \text{PbO}_2(s) \longrightarrow 2\text{PbSO}_4(s) + 2\text{H}_2\text{O}(l)$ ,  $\Delta F_{298}^\circ = -93,416$  cal., equiv. to  $E^\circ = 2.0243$  v. Of the data of free energy of formation used for the calcn., the following first 3 values were taken from the literature: (1)  $\text{H}_2$ , S (rhomb.),  $2\text{O}_2 \longrightarrow 2\text{H}^+, \text{SO}_4^{--}$ ,  $\Delta F_{298}^\circ = -176,500$  cal. (2)  $\text{Pb}$ ,  $\text{O}_2 \longrightarrow \text{PbO}_2(s)$ ,  $-52,367$ . (3)  $\text{H}_2$ ,  $\frac{1}{2}\text{O}_2 \longrightarrow \text{H}_2\text{O}$  (1),  $-56,560$ . (4)  $\text{Pb}$ , S (rhomb.),  $2\text{O}_2 \longrightarrow \text{PbSO}_4$ ,  $-192,828$ . The fourth value was calcd. from (1) and (5)  $\text{Pb}$ ,  $2\text{H}^+ \longrightarrow \text{Pb}^{++}$ ,  $\text{H}_2$ ,  $\Delta F_{298}^\circ = -5630$  taking the soly. of  $\text{PbSO}_4$  to be  $1.45 \cdot 10^{-4}$  mol/l. (Boettger) at  $24.95^\circ$ . The above value of  $F^\circ$  coincides within 0.3% with the exptl. value, 2.0184 v. (*C. A.* 22, 2718) found by K.

Electrolysis in gels. I. P. HAPPEL, R. E. LIESEGANG AND O. MASTBAUM. *Kolloid-Z.* 48, 80-2(1929).—Electrolysis took place in a layer of 10% gelatin on glass plates. Pt wires served as electrodes. The potential was 15-25 v. In some cases, the current completely inhibited normal diffusion. The direction of the lines of flow was found to be significant. *Ibid* 252-4.—Gelatin does not merely act as a substrate during elec-

trolisis, but reacts as an ampholyte. The swelling conditions of gelatin, electroosmose and the electrolytic water transport according to Remy are superimposed upon this. This study should throw more light on conditions within sepg. membranes. F. U.

**Electrolytic reduction of aldehydes. V. Cinnamaldehyde.** G. SHIMA. *Mem. Coll. Sci. Kyoto Imp. Univ.* A12, 69-72(1929); cf. C. A. 23, 2371.—The best yield (72%) of  $\gamma$ -phenylpropyl alc. from cinnamaldehyde by electrolytic reduction was obtained by using a Hg cathode and adding the aldehyde slowly to a cathode soln. contg. satd.  $\text{NaHCO}_3$  soln. (50 cc.) and alc. (70 cc.) at 20-22°, with a c. d. of 6 amp./100 sq. cm. The results of varying the conditions are tabulated. In alc. ethyl acetate soln. the max. yield was 50%. **VI. Complete reduction of the carbonyl group.** *Ibid* 73-80.—The use of a Zn amalgam cathode gives better results than Cd (Schepss, C. A. 8, 93) in the complete electrolytic reduction of the aldehyde-group to methyl. The best yields of *p*-tolyl methyl ether from anisaldehyde (68%), and of *o*-cresol from salicylaldehyde (66%), were obtained by using a cathode soln. contg. 60%  $\text{H}_2\text{SO}_4$  (60 cc.) and alc. (20 cc.) at 35-40° with a c. d. of 72 amp./100 sq. cm. The best yields of *p*-cresol from *p*-hydroxybenzaldehyde (58%), and of cresol from vanillin (75%), were obtained under the same conditions, but in the absence of alc. The best yield of 3,4-methylenedioxytoluene from piperonal (55%) was obtained under the same conditions in a mixt. of 60%  $\text{H}_2\text{SO}_4$  (50 cc.) and alc. (30 cc.). The results of varying the conditions are tabulated. The effect of the presence of alc. is discussed. Müller's theory (C. A. 17, 1621) does not account for the different behavior of aldehydes and additive products. B. C. A.

**Production of tetrachloroquinone, trichloroquinone and *s*-trichloroaniline by electrolysis of aniline.** J. ERDELYI. *Magyar Chem. Folyóirat* 34, 180-4(1928).—Aniline may be chlorinated by electrolysis. The higher the HCl concn., the smaller is the value of oxidation. Tetrachloroquinone can be produced in 10% HCl soln., trichloroquinone in 20% HCl, *s*-trichloroaniline in solns. contg. more HCl. Tetrachloroquinone is formed if the soln. gets warmed to 30-40° during electrolysis. Trichloroquinone, on the contrary, requires cooling down to 5-15°. The current density in all cases was about 0.1 amp./sq. dm. S. S. DE FINÁLY

**The electrochemical oxidation of toluene.** R. W. MITCHELL. *Trans. Am. Electrochem. Soc.* 56 (preprint) 16 pp.(1929).—The direct oxidation of hydrocarbons at an anode has long been an attractive possibility. The oxidation of toluene to benzaldehyde or benzoic acid is interesting, and has been attempted in this investigation. Previous workers have almost always sought to carry on their oxidation in an electrolyte contg. a large proportion of some water-miscible org. solvent as acetone, ether or glacial acetic acid to bring toluene into soln. A few have recommended the electrolytic prepn. of an inorg. oxidizing agent, to be subsequently used in a chem. oxidation and then regenerated electrolytically; this latter is, however, not an electrochem. oxidation of toluene. M. describes the employment of other means than these in attempts to oxidize toluene electrolytically. Expts. on "batch" versus continuous process of operation show the latter theoretically and practically superior. A process which continually removes emulsified toluene from an electrolytic cell, which is forming  $\text{Mn}_2(\text{SO}_4)_3$  or  $\text{H}_2\text{CrO}_4$ , and which exts. oxidation products from the toluene, and returns the toluene to the cell, gives the most efficient method for oxidizing toluene by electrochem. means to benzaldehyde and benzoic acid, resp. C. G. F.

**The electrolytic preparation of iodoform without platinum.** ANT. VYSKOČIL. *Chem. Listy* 23, 212-5, 249-51(1929).—In the electrolytic prepn. of iodoform from EtOH, the Pt anode may be replaced by graphite in the form of long slender rods; on drying, the CHI<sub>3</sub> had a slightly gray color. Steel rods plated with Cr gave pure CHI<sub>3</sub>, but the Cr was dissolved off too rapidly; the soln. about the anode was colored yellow red ( $\text{Cr}_2\text{O}_7$ ), the remaining soln. was yellow ( $\text{CrO}_4$ ). Ni, Cu and Ag were unsatisfactory. Nichrome was too resistant; alloys of Cu and Ag did not function well. "Nike lin" Ni (26%, Cu 54%, Zn 20%), Ni bronze (Ni 20%, Cu 80%) and (Ni 25%, Cu 75%) and constantan (Ni 50%, Cu 50%) were tried; Nikelin was the least satisfactory. Ni-bronze the most satisfactory. The soln. was clear, the anode was not attacked, and a loss in wt. was not perceptible if the soln. was kept slightly alk. with  $\text{Na}_2\text{CO}_3$ , which functions better than NaOH. With NaOH a greater soln. of the anode occurred. An excess of I has a favorable effect upon the formation of CHI<sub>3</sub> and prevents the formation of an excess OH and  $\text{HCO}_3$  ions, which have a tendency to corrode the anode. The OH ions present function as depolarizers and remove the freed I from the vicinity of the anode. For cathodes, plates of Ni, Cu or Nikelin were used. FRANK MARESH

**Gaseous combustion in electric discharges. III. Cathodic combustion of dry carbonic oxide detonating gas.** G. I. FINCH AND D. L. HODGE. *Proc. Roy. Soc.*

(London) A124, 303-17(1929); cf. C. A. 22, 860.—A d. c. elec. discharge can be passed through a mixt. of dry CO and O<sub>2</sub> in such a manner that combustion is confined to the cathode zone over a considerable range of pressure, gap width and current, and is proportional to the current. Cathodes of freely sputtering metals cause more vigorous combustion. The phenomenon is regarded as ionic, with sputtered metal-gas complexes as an intermediate stage.

GREGG M. EVANS

**Dielectric loss in electrolyte solutions in high-frequency fields.** WILLIAM T. RICHARDS and ALFRED LOOMIS. *Proc. Natl. Acad. Sci.* 15, 587-93(1929).—The heating of electrolyte solns. in condenser containers by short electrostatic waves of from 14 to 1000 m. wave length has been measured for 0.5-0.0005 M NaCl, 0.816-0.026 M Pb(C<sub>2</sub>H<sub>3</sub>O<sub>2</sub>)<sub>2</sub> and 0.079-0.0016 M HgCl<sub>2</sub>. The results were reproducible within 5%. The equation  $\Delta T \approx A'kw/(B' + Dk^2)$  is given as approximating the exptl. results and is derived from theory.  $\Delta T$  is temp. increase,  $k$  sp. cond.,  $\omega$  frequency,  $A'$ ,  $B'$  and  $D$  are consts. The application to *physiol. behavior in high frequency fields* is suggested.

WILLIAM E. VAUGHAN

**High ohm resistors (carborundum). A new method of testing them.** G. LEIT-HÄUSER. *Elek. Nachr. Tech.* 6, 335-8(1929).—L. uses high-frequency currents to test the resistors: slight imperfections are easily revealed. They are applicable to resistors of 100,000 ohms and higher.

C. G. F.

**The Rectox rectifier (copper oxide). Its application to industrial control.** D. SANTINI and I. R. SMITH. *Elec. J.* 26, 416-20(1929).—The Rectox (Cu oxide) rectifier is rugged, dry (completely metallic), has no moving parts and operates noiselessly. It produces almost a perfect rectified wave form with very little reverse current, and operates electronically. Full-wave connections are made with great facility permitting direct operation from a line of any no. of phases without intermediate transformers. It has high thermal capacity, minimizing dangers of great overload. Units may be connected in series or in parallel. Temp. control is essential in the application of this rectifier because both the useful and the high-resistance characteristics vary with temp., decreasing with a rise in temp. Provision must be made for the change in rectifier resistance which occurs in use. Means for this provision are outlined. Radio has furnished the application of Rectox, but advantages claimed for elevator applications are: ready connection for any no. of phases and use on any com. frequency without intervening transformers; easily and cheaply mounted behind the control panel without complicating the wiring or taking up excessive space; easy maintenance and rugged construction; and automatic protection against phase failure or polyphase circuits. Several illustrations and charts are shown.

**Hydrogen—a successor to air.** C. J. FECHHEIMER. *Elec. J.* 26, 405-7(1929).—Large elec. generators can be rated a quarter more when cooled with H<sub>2</sub> instead of air, as indicated by phys. data and exptl. tests. Tables show the cooling qualities of various gases in comparison with those of air and a comparison of air and H<sub>2</sub> for cooling. The desirable properties of a cooling medium in order of importance are: (1) high thermal cond.; (2) low d.; (3) high sp. heat; (4) freedom from damage by corona to the insulation; and (5) it must not support combustion. The advantages obtained by the use of H<sub>2</sub> are summarized as: (1) higher efficiency due largely to decrease in windage; (2) decreased size of the machine; (3) reduction in fire hazard; (4) freedom from injury from corona; (5) cleanliness, as all joints are tightly sealed, and the small leakage is outward due to pos. internal pressure; (6) greater certainty in calcn. of temps. as the thermal drops through stagnant gas pockets are greatly reduced and (7) greater freedom from local high temps.

**Electric discharge devices.** M. O. VALVE CO., LTD., A. L. REIMANN and J. W. RYDE. Brit. 306,281, Feb. 20, 1928. Cathodes are coated with one or more alk. earth oxides to which about 5% metallic Th is added (suitably by dipping a support of Pt-Rh alloy in a pasty mixt. of Ba and Sr carbonates and Th, drying and heating to decompose the carbonates). La may be used instead of Th, and Pt, Ni or W may be used instead of the Pt-Rh alloy.

**Electric discharge tube.** GUSTAV L. HERTZ (to N.-V. Philips' Gloeilampenfabriek). U. S. 1,726,107, Aug. 27. See Ger. 473,141 (C. A. 23, 2668).

**Electrodeposition of iron.** E. KELSEN. Brit. 306,151, Feb. 16, 1928. An electrolyte used comprises an Fe salt such as  $\text{FeCl}_2$  together with 2 or more salts such as  $\text{CaCl}_2$  and  $\text{KCl}$ , the combined wt. of which exceeds that wt. of one salt only which would produce satn. Several examples are given.

**Electroplating apparatus.** OSCAR L. MAAG (to Timken Roller Bearing Co.). U. S. 1,725,877, Aug. 27. Structural features.

**Electroplating apparatus of the barrel type.** WM. J. O'NEILL (to Elmer J. Merch). U. S. 1,726,308, Aug. 27. Structural features.

**Electrolysis.** MAX BOLLIGER. Swiss 131,828, May 19, 1928. An app. with a moving anode for rapid deposition of metal is described.

**Electrolyzing solution of sodium chloride and sodium carbonate.** HERSCHEL C. PARKER. U. S. 1,726,236, Aug. 27. A soln. contg.  $\text{NaCl}$  and  $\text{Na}_2\text{CO}_3$  is subjected to electrolysis, using an iron anode, so that Fe hydroxide and  $\text{NaHCO}_3$  are formed; these compds. are sepd. from soln. (suitably by gravity). An app. is described.

**Purification of nickel electrolytic baths.** FRANZ VON WURSTENBERGER. Swiss 131,827, Apr. 12, 1928. Ni baths are cleared of foreign metals, especially Cu, by the interpolation of a different current at intervals in the electrolysis.

**Electrolytic gas producer.** MASCHINENFABRIK OERLIKON. Swiss 132,298, Mar. 22, 1928. Details are given.

**Apparatus for the electrolytic decomposition of water.** MACHINENFABRIK OERLIKON. Swiss 132,486, July 5, 1928. Addn. to 118,711. The construction of the electrodes is described.

**Electrolytic renewal of the coverings of copper-coated rollers.** LOUIS SIMÉANT and HERMANN KUPPEL. Ger. 480,420, May 18, 1926. The Cu coatings of rotary printing-machine rollers are renewed by a process in which the rollers form the cathodes in a bath consisting of water 78,  $\text{CuSO}_4$  18 and  $\text{H}_2\text{SO}_4$  4%, through which a current of 3 v. 0.4–0.5 amps. is passed at 17–18°.

**Stirring apparatus for molten electrolytes.** FRANZ ELLINGER. Ger. 479,746, Mar. 15, 1927.

**Device for feeding the electrolyte to a cell in which electrolytic decomposition is effected under pressure.** HANS NIEDERREITHER. Ger. 480,430, May 5, 1925. Details of construction and arrangement are described.

**Electrometallurgy.** ALUMINIUM-INDUSTRIE-A.-G. Ger. 480,549, Nov. 23, 1926. Pure Al is obtained from crude Al or alloys by using these as the anode in an electrolytic bath of molten halides of Al and alkali- or alk. earth metals with a m. p. below that of the electrodes.

**Pure aluminum.** ALUMINIUM-INDUSTRIE-A.-G. Swiss 131,405, Jan. 24, 1927. Pure Al is prepd. electrolytically from aluminiferous metals by the employment of an Fe-Si anode contg. at least one atom of Si to each Fe atom.

**Purifying aluminum oxide.** SVEN E. SIEURIN and ALFRED S. EDLUND. U. S. 1,726,001, Aug. 27. Purifying of materials such as bauxite is effected by melting in an elec. furnace with such a proportion of reducing material such as C that there is a deficiency of reducing material during the melting; after melting is completed, addnl. carbonaceous reducing material such as C is added in excess of that required to reduce all impurities.

**Fluorine.** PAUL M. A. LEBEAU and AUGUSTIN A. L. J. DAMIENS. Ger. 476,732, Dec. 7, 1926. F is prepd. by the electrolysis of alkali fluorides m. 0–150° with an anode of Fe, Ni or Co or an alloy of these metals. The cathode may be made of Cu, Fe, Ni or an alloy.

**Acetylene and hydrocyanic acid.** I. G. FARBENIND A.-G. Brit. 306,008, Oct. 13, 1927. Treatment of coke-oven gas, coal gas or similar gases in an elec. arc to obtain  $\text{C}_2\text{H}_2$  (together with HCN if N or N compds. are present) is improved by converting CO present into innocuous compds. as by catalytic conversion into  $\text{CH}_4$  or decompn. with steam previous to the arc treatment. The fresh gases are preheated by gases from the arc furnace. Cf. C. A. 23, 3635.

**Gas purification.** "EINTRACHT" BRAUNKOHLENWERKE UND BRIKETTFABRIKEN A.-G. Ger. 480,895, Dec. 2, 1924. The gas is distributed over the whole area of a shaft in which dust is pptd. electrically.

**Purification of gases.** METALLGESELLSCHAFT A.-G. Ger. 481,128, April 18, 1920. A method of cleaning the dust-collecting bands of an electric gas-purification app. is described.

**Electric gas-purifying plant with dust-removing channels.** OSKI A.-G. Ger. 180,801, Aug. 17, 1924.

**Device for cleaning the electrodes of a gas purifier.** WITKOWITZER BERGBAU- UND EISENHÜTTEN-GEWERKSCHAFT and GEORG RASCHKA. Ger. 467,040, July 8, 1927.

**Electric induction furnace.** P. E. BUNET and ACIERIES DE GENNEVILLIERS. Brit. 306,144, Feb. 17, 1928. Structural features.

**Electric induction furnace.** E. F. RUSS. Brit. 306,172, Nov. 15, 1927. Structural features.

**Electric induction furnace for melting light metals such as aluminum, etc.** HIRSCH KUPFER-UND MESSINGWERKE A.-G. Brit. 305,952, Feb. 11, 1928. Structural and elec. features.

**Electric resistance heater.** J. KATUNSKY. Brit. 305,799, Jan. 24, 1928. A resistance wire is wound on a core of a calcined mixt. of ground emery, feldspar and waterglass, and is surrounded by an outer layer of a similar calcined mixt.

**Resistance-heated muffle furnace for heat treating steel or other metal articles.** V. SORREL and L. A. LAFONT (to Infra Soc. Anon.). Brit. 306,446, Feb. 20, 1928. A magnetic field holds the articles until sufficiently heated and they are then discharged into a tempering bath. Cf. C. A. 23, 2668.

**Electric furnace for metal founding.** SIEMENS-SCHUCKERTWERKE A.-G. Ger. 480,203, Dec. 31, 1927. The mounting of the crucible is described.

**Electric annealing furnace.** HERAUS-VACUUMSCHMELZE A.-G. and WILHELM ROHN. Ger. 480,891, Dec. 16, 1924. Details of construction are given.

**Electric annealing and hardening furnace.** ALLGEMEINE ELEKTRICITÄTS-GES. (Ferdinand Brieger, inventor). Ger. 480,768, April 22, 1927. The heating chamber is suspended in a salt bath.

**Gas-tight connection for an electric annealing furnace.** A.-G. BROWN, BOVERI & CIE. Swiss 131,457, April 17, 1928.

**Annealing.** ALLGEMEINE ELEKTRICITÄTS-GES. Ger. 480,432, July 27, 1926. An article to be annealed or hardened in an electrically heated salt-bath kiln is heated to the required temp. by radiation from the salt bath.

**Electric water heater.** A. W. NEWLAND and J. SABEL. Brit. 305,713, Nov. 11, 1927. Structural features.

**Electrical apparatus for treating metal surfaces to prevent corrosion.** LUDWIG ERENYI. Swiss 132,326, Dec. 7, 1926.

**An agent for the reduction of metals.** GOTTHARDWERKE A.-G. FÜR ELEKTRO-CHEMISCHE IND. and ARTURO PAOLONI. Swiss 131,627, Aug. 26, 1927. An agent for the reduction of metal compds. is prepd. from crude alumina by smelting electrolytically with quartz in such quantities that the product is an alloy contg. Al 40-60, Si 30-50, Fe 2-15 and Ti 1-3%.

**An apparatus for condensing vapor.** RICHARD BLASBERG. Ger. 480,860, Jan. 26, 1928. An app. is described for condensing the vapor from high temp. electrolytic processes, such as nickeling.

**Electric gas-condensing device.** CARL BAUMANN. Swiss 131,666, Mar. 16, 1928.

**Thermal cut-out for electric circuits.** CLARENCE D. PLATT (to Trumbull Electric Mfg. Co.). U. S. 1,726,503, Aug. 27. Structural features.

**Mercury-vapor lamp for producing ultra-violet rays for treating foods, etc.** C. A. COOPER. Brit. 305,758, Dec. 9, 1927. Structural features.

**Electric heater and ultra-violet ray apparatus combined.** L. G. HAWKINS & Co., LTD., and L. G. HAWKINS. Brit. 305,788, Jan. 12, 1928. Structural features.

**Light rays for therapeutic purposes, for promoting plant growth, etc.** SIEMENS & HALSKE A.-G. Brit. 306,112, Feb. 16, 1928. In app. such as that described in Brit. 296,724 (C. A. 23, 2378-9) a metal vapor lamp is used, preferably with a quartz envelope. Metals which may be thus used in lamps include K, Na, Ca, Mg, Ti, Zr, La, Zn, Cd, Hg, Co and Ni, and alloys of these and other metals such as an alloy of Al 3 and Ag 7 parts.

## 5—PHOTOGRAPHY

C. E. K. MEES

**Methods of analysis of photographic emulsion.** SHIRO MATSUMAYE. *J. Soc. Chem. Ind. Japan* 32, 99-106(1929); Suppl. Binding 32, 34B(1929).—After several trials, Clark's method was found best with slight modifications. Ext. the dry plate with KCN soln., boil the ext. with Zn for 1 hr., decomp. the cyanide with HCl and expel HCN with a stream of CO<sub>2</sub>. Filter the reduced Ag ppt., dissolve it in HNO<sub>3</sub> and titrate the soln. with AmCNS soln.; the result gives the total Ag. Add 5% of Ba(NO<sub>3</sub>)<sub>2</sub> to the filtrate and titrate the soln. electrometrically with AgNO<sub>3</sub>; this is a test for I, Br and Cl. From this, AgI, AgBr, free (adsorbed) Br and Cl (if present) can be calcd. It is also a test for sulfate (perhaps in the form of alum); it gives a white ppt. with Ba(NO<sub>3</sub>)<sub>2</sub>.  
S. OKA

**Analysis of the commercial photographic emulsion.** SHIRO MATSUMAYE. *J. Soc. Chem. Ind. Japan* 32, 106-11(1929); Suppl. Binding 32, 35B(1929).—Emulsions of 13 kinds of com. photographic plates were analyzed (cf. preceding abstr.). The results were tabulated and discussed as follows: comparison of analyses of plates of the same emulsion no., comparison of the emulsion of the same name or similar name, relation between the total Ag and the emulsion concn., the total Ag and AgI content, the speed and AgI content, the sol. bromide and chloride, the presence of Cr and sulfate, fluctuation of the weight of glass plate.  
S. OKA

**The metallic silver content of photographic emulsions.** FRITZ WEIGERT and FRANZ LÜHR. *Z. Elektrochem.* 35, 209(1929).—The authors take up the defense of their method (cf. C. A. 22, 548) against the criticisms of Kieser (C. A. 23, 1829, 2894, 3175) and state that K.'s own method is not reliable.  
ALBERT L. HENNE

**Photographic sensitivity. I. Effect of heat on sensitivity curve of photographic plates.** O. MASARI. *Mem. Coll. Sci. Kyoto Imp. Univ.* A12, 1-12(1929); cf. C. A. 19, 1103; 23, 4415; Kellner, C. A. 20, 1763.—The effect of a preliminary heating for 1 hr. at 80° on the sensitivity of photographic plates to light of various wave lengths has

been investigated. With panchromatic and other slow plates, the sensitivity, as measured by the inertia, is increased for all wave lengths, the effect near a max. point on the sensitivity-wave-length curve being greater on the side corresponding with longer wave lengths, i. e., the max. point is shifted toward the red. The sensitivity of fast plates shows the same shift, but is usually diminished by heating. With all plates and for all wave lengths the contrast is increased by heating, and for panchromatic and orthochromatic plates the increase is greatest for long wave lengths. Plates which have been heated gradually regain their normal sensitivity on keeping at the ordinary temp. Drying the plate has very little effect on its sensitivity. **II. Sensitivity of photographic plates at various temperatures.** *Ibid* 13-22.—The relation between the temp. of preliminary heating,  $t$ , and the inertia and contrast,  $\gamma$ , for a given plate and a given wave length has also been investigated. The inertia varies most between about 30° and 70°, while  $\gamma$  and  $t$  are connected by the empirical expression  $\gamma = e^{a t^{1/2} + b}$ , where  $a$  and  $b$  are consts. depending on the wave length of the light to which the plate is exposed, on the time of development and on the properties of the emulsion. If  $D_m$  is the max. d. at 0°,  $E$  the length of exposure and  $D$  the d. of the developed plate, it is further found empirically that  $D = D_m e^{a t^{1/2}} \{1 - e^{-(b t^{1/2} + c) E}\}$ , where  $b$  and  $c$  are consts. of the same nature as  $a$ ,  $b$ , being neg. for some rapid plates and pos. for other plates. This formula is valid from 10° to 80°. B. C. A.

**Color photography.** K. WAHL. Brit. 306,026, Feb. 14, 1928. Transparent color positives are made by coating the support on both sides with a non-Ag sensitizing material and exposing one side to a negative and the other side to a positive from the negative, printing being in register (a light-absorbing intermediate layer being provided). Each side is then colored separately.

**Color photography.** O. E. WHEELER. Brit. 305,775, Dec. 28, 1927. Low-relief color-record images in uncolored gelatin on celluloid or similar supports are produced from bromide color-record prints by the "carbo" chem. contact process, and are used to produce a tri-color paper picture or transparency by dye-impression printing (in which pinatype dyes may be used).

**Color photography.** SOC. ANON. SPLENDICOLOR and L. J. B. DIDIER. Brit. 306,328, April 25, 1928. Tri-color photographs are produced on a film sensitized on one side as with a Ag gelatino-bromide layer and coated on the other side with a layer of plain gelatin, by printing on the sensitized side a positive image from a negative made with an orange-red filter and toning this image blue, sensitizing the gelatin layers on both sides with alk. bichromate and printing thereon, simultaneously from opposite sides, images from positives made from color-record negatives produced, resp., with blue-violet and green filters, washing and drying; the 2 images printed in the bichromated gelatin are then colored by moistening and applying strips of paper coated with gelatin layers contg., resp., yellow and green dyes of the pinatype class capable of being absorbed by unhardened but not by hardened gelatin. Brit. 306,329 relates to an optical system for color photography.

**Photographic chromated colloid process.** C. ROEHRICH. Brit. 306,027, Feb. 14, 1928. The sensitive layers are moistened after printing and are then exposed again to light before development.

**Photographic diazotype processes.** KALLE & Co. A.-G. Brit. 306,408, Feb. 16, 1928. Diazotype sensitive layers contg. an azo coupling component and which may be developed with alk. gases, as described in Brit. 234,818 (C. A. 20, 716), are stabilized by the addn. of S compds. such as thiourea, thiosinamine, thiocarbamic acid and its derivs., thioglycolic acids and colloidal S. Various examples are given. Cf. C. A. 23, 4154

**Photographic developing.** ERVIN BURG. Ger. 480,352, Jan. 27, 1927. See Brit. 284,253 (C. A. 22, 4395).

**Fixing and washing photographic materials.** SCHERING-KAHLBAUM A.-G. (Wolfgang M. Schultz, inventor). Ger. 480,884, Sept. 2, 1928. Photographic materials are fixed and washed in baths undergoing electrolysis. The materials may be arranged between the electrodes, or the electrolysis may occur at a part of the bath remote from the materials. Thus, fixing may be effected in baths through which current at 1 v. is passed to effect sepn. of Ag, while during washing d. c. or a. c. at 220 v. or so may be passed so as to decomp. the fixing bath residues. The materials may be spread on the surface of a hollow perforated rotary drum, and various ways of leading in the current are described.

**Photographic emulsions.** I. G. FARBENIND. A.-G. (Walter Frankenburger and Georg K. Rössler, inventors). Ger. 470,619, Aug. 20, 1927. The sensitiveness of

photographic emulsions contg.  $(\text{COO})_2\text{Hg}$  or its complex ammine compds. as the active ingredient is enhanced by means of a suitable inorg. salt or org. dye. Suitable salts are those of Hg, Ag, Tl, Au and Pt, and suitable dyes are eosin and erythrosin. These sensitizing agents may be added to the emulsion or produced therein. Thus, in using the emulsions in the prepn. of printing-out papers, the rate of direct darkening may be increased by adding  $\text{HgI}_2$  and a small amt. of  $\text{AgNO}_3$  to the emulsion. Again, in using the emulsions in developing processes, the production and developing of the latent image may be promoted by adding  $\text{HgI}_2$  and a small amt. of  $\text{AgI}$  to the emulsion. Tannin or the like may also be added for toning. Cf. Brit. 307,716.

**Silver halide photographic emulsions.** JOSEF REITSTÖTTER (to Agfa Ansco Corp.). U. S. 1,725,934, Aug. 27. Light-sensitive Ag halide photographic emulsions are prepd. in the presence of a thiazole compd., such as thiazole yellow, which serves to give increased speed.

**Light-sensitive layers.** I. G. FARBENIND. A.-G. (John Eggert, Richard Schmidt and Bruno Wendt, inventors). Ger. 480,729, July 18, 1928. Light-sensitive layers are prepd. from one or more org. compds. capable of being transformed into stereoisomers under the action of light. A catalyst promoting the transformation may be present, e. g., a halogen or a compd. splitting off halogen under the action of light, such as  $\text{Hg-Br}_2$ ,  $\text{C}_6\text{H}_5\text{Br}_4$  or  $\omega$ -bromoacetophenone. The layers may be exposed in a camera or under a negative, and the development or fixing may involve the removal of one isomer or the elimination of the catalyst or the conversion of one isomer into a suitable deriv. Examples are given.

## 6--INORGANIC CHEMISTRY

A. R. MIDDLETON

Some recent advances in inorganic chemistry. WARREN C. JOHNSON. *Chem. Bull.* **16**, 233-6, 256(1929). E. J. C.

**Ruthenium.** H. REMY. *Z. angew. Chem.* **42**, 289-90, 291(1929). H. GALL. *Ibid.* 290-1; cf. *C. A.* **23**, 50, 1580.—Polemical. A discussion of the valency of Ru in the blue chloride soln. and in solns. obtained by treating the tetroxide with HCl (cf. Remy and Luhrs, *C. A.* **23**, 1580.) B. C. A.

**A new type of rare-earth salt.** G. A. BARBIERI. *Atti accad. Lincei* **9**, 906-9(1929).—It has been found possible to prep. argentocyanides as well as aurocyanides of the tervalent elements of the Ce group of the type  $\text{M}^{+++}[\text{Ag}(\text{CN})_2]_3$  and  $\text{M}^{+++}[\text{Au}(\text{CN})_2]_3$ . Attempts to prep. similar compds. of tervalent Al, Cr, Fe were failures. Prepn. of  $\text{Ce}[\text{Ag}(\text{CN})_2]_3 \cdot 3\text{H}_2\text{O}$ : to 10 cc. of a neutral soln. of  $\text{Ce}(\text{NO}_3)_3$  contg. about 1 g. Ce, a soln. of 10 g.  $\text{KAg}(\text{CN})_2$  in 50 cc. of cold  $\text{H}_2\text{O}$  is added slowly without stirring. In a few min. the soln. becomes turbid and a cryst. powder ppts. Rubbing the sides of the beaker assists the deposition, and after about 2 hrs. it is collected on a suction filter. In a similar manner  $\text{La}[\text{Ag}(\text{CN})_2]_3 \cdot 3\text{H}_2\text{O}$ ,  $\text{Nd}[\text{Ag}(\text{CN})_2]_3 \cdot 3\text{H}_2\text{O}$ ,  $[\text{Co}(\text{NH}_3)_6][\text{Ag}(\text{CN})_2]_3$ ,  $\text{Ce}[\text{Au}(\text{CN})_2]_3 \cdot 3\text{H}_2\text{O}$ ,  $\text{La}[\text{Au}(\text{CN})_2]_3 \cdot 3\text{H}_2\text{O}$  and  $[\text{Co}(\text{NH}_3)_6][\text{Au}(\text{CN})_2]_3$  were prepd. A. W. CONTIERI

**Addition of ammonia to lead nitrate and lead sulfate.** W. KRINGS. *Z. anorg. allgem. Chem.* **181**, 309-36(1929); cf. *C. A.* **23**, 4619.—A survey of the additive power of Pb salts for  $\text{NH}_3$  would indicate that Werner's concept of max. coordination no. is not generally applicable. It seems to hold only for those complexes existing as free groups in soln. Pressure-compn. and pressure-temp. studies of the systems  $\text{Pb}(\text{NO}_3)_2 \cdot \text{NH}_3$  and  $\text{PbSO}_4 \cdot \text{NH}_3$  revealed the existence of a monammonate, triammonate (m.  $115^\circ$ ) and hexammonate of  $\text{Pb}(\text{NO}_3)_2$ , and a di- and tetrammonate of  $\text{PbSO}_4$ . Density detns. of the ammonious salts as well as of the ammonates were made to det. the expansion of the crystal lattice as a result of the addn. of  $\text{NH}_3$ . These results, with the sp. vols., etc., are tabulated. A special pycnometer is described, which may be employed with substances exhibiting a high vapor pressure. L. F. AUDRIETH

**The action of chlorine on iron oxides.** WALTHER KANGRO and RUDOLF FÜGGE. *Z. Elektrochem.* **35**, 189-94(1929).—Contrary to the common belief, Cl is capable of reacting with Fe oxides but only at high temps. At  $700^\circ$  the reaction is noticeable with pptd.  $\text{Fe}_2\text{O}_3$ , and at  $900^\circ$  it becomes very vigorous. The various natural oxides are generally less susceptible, but they are slightly affected at  $700^\circ$ . At  $1000^\circ$  they are totally decompd. The possibility of replacing C by Cl in the extn. of Fe from its ores is discussed. ALBERT L. HENNE

**The reactivity of iodine cyanide in different organic solvents.** ERWIN CHARLGAFF. *J. Am. Chem. Soc.* **51**, 1999-2002(1929).—In a previous paper (cf. *C. A.* **22**, 3816, (4083))

it was shown that the Ag salt of saccharin reacts with I in certain solvents to give an addn. compd., in others to ppt. AgI. However, ICN fails to react with the same salt, indicating that ICN is a "heteropolar compd." and does not function in this case as a "mixed halogen" as claimed by Ephraim (cf. C. A. 16, 2277; 17, 940; 20, 2962; 22, 553).

M. A. DAHLEN

**The decomposition of alkaline carbonate in boiling aqueous solution. II.** B. L. VANZETTI AND A. OLIVERIO. *Gazz. chim. ital.* 59, 288-300(1929); cf. C. A. 23, 4157.—An extension and elaboration of the previous article. A discussion of the nature of the equilibria, which are established in aq. solns. of alk. carbonates between the liquid phase and the supernatant gaseous phase, leads to deductions which indicate the possibility of a decompn. to a marked extent of the carbonates as a result of the application of heat (boiling solns.), when the supernatant gaseous phase is maintained free of CO<sub>2</sub>. Expts show that at various concns. of Na<sub>2</sub>CO<sub>3</sub>, viz., 0.2-0.4 N, up to 74% was decompd. into NaOH in about 6 days, and with 0.2 N K<sub>2</sub>CO<sub>3</sub> up to 65% was decompd. in 5-7 days. The decompn. occurred in a current of inert gas in the same way that it did in air or in a current of steam. The decompn. was, however, inappreciable when the boiling was carried out *in vacuo*, because of the relatively low temp. at which the solns. boiled and the consequently smaller hydrolytic decompn. The character of the receptacle in which the reaction was carried out had little influence on the course of the reactions. Under the conditions studied in the expts. the decompn. followed a very simple law, viz., that the proportion of carbonate decompd. was proportional to the square root of the time. **III. The manner in which lithium carbonate decomposes in boiling aqueous solution.** B. L. VANZETTI AND A. OLIVERIO. *Ibid* 300-4.—Li<sub>2</sub>CO<sub>3</sub> decompn. in boiling water in the same way that Na<sub>2</sub>CO<sub>3</sub> and K<sub>2</sub>CO<sub>3</sub> do, only more slowly. By maintaining the gaseous phase free of CO<sub>2</sub>, 71% of the Li<sub>2</sub>CO<sub>3</sub> in a 0.27 N soln. decompd. in about 10 days, which is about the same decompn. occurring with 0.4 N Na<sub>2</sub>CO<sub>3</sub>. With Li<sub>2</sub>CO<sub>3</sub>, too, the decompn. was proportional to the square root of the time. The decompn. is moreover continuous and does not reach an equil. between Li<sub>2</sub>CO<sub>3</sub> and LiOH, provided that the supernatant gaseous medium is maintained perfectly free of CO<sub>2</sub>.

C. C. DAVIS

**The thiosulfate process of iodine separation.** J. J. DEUGARTE. *Caliche* 11, 49-51 (1929).—The method of Smith (cf. *Caliche* 8, 515(1927)) admits of different final amts. of H<sub>2</sub>SO<sub>4</sub> from the iodate reaction. This is not strictly proportional to the initial acidity but with given conditions is dependent also on the rate of adding acid. This affects the time and yield. Rise in temp. tends to cause excessive I in the foam rather than in the ppt.

J. HOWARD FLINT

**Ternary system: water-sodium nitrate-potassium perchlorate from 0° to 100°.** E. CORNEC AND A. NEUMEISTER. *Caliche* 10, 488-91(1929).—At const. temp. NaNO<sub>3</sub> raises KClO<sub>4</sub> soly., increasingly so with temp. rise. A cyclic method of purifying these 2 salts by evapg. and cooling from their mixt. is outlined. Equimolar quantities of NaClO<sub>4</sub> and KNO<sub>3</sub> show double decompn.

J. HOWARD FLINT

**Quaternary system: water-sodium nitrate-sodium chloride-potassium perchlorate from 0° to 100°.** E. CORNEC AND A. NEUMEISTER. *Caliche* 10, 494-99(1929).—From curves presented it is observed that cooling a satd. soln. of these 3 salts crystallizes NaNO<sub>3</sub> and KClO<sub>4</sub>; adding water to maintain NaNO<sub>3</sub> in soln. permits obtaining pure KClO<sub>4</sub>. From a soln. not satd. with respect to KClO<sub>4</sub>, pure NaNO<sub>3</sub> may be crystd. by cooling. A cyclic sepn. is outlined.

J. HOWARD FLINT

**Quaternary system: sodium nitrate-sodium sulfate-magnesium chloride-water from 0° to 100°.** G. LEIMBACH AND A. PFEIFFENBERGER. *Caliche* 11, 61-85(1929).—A reprint to correct unspecified errors in C. A. 23, 4633 presenting a review of data from the literature.

J. HOWARD FLINT

**Monofluorophosphoric acid and the similarity between its salts and the sulfates.** WILLY LANGE. *Ber.* 62B, 793-801(1929).—The hydrolysis of M'PO<sub>3</sub>F<sub>2</sub> in a dil. KOH soln. gives K<sub>2</sub>PO<sub>3</sub>F; if a large excess of AgNO<sub>3</sub> is then added, a cryst. ppt. of Ag<sub>2</sub>PO<sub>3</sub>F is obtained. The monofluorophosphate of any other metal can be prepd. from this Ag salt by double decompn. The alk. salts are neutral toward phenolphthalein, but basic to methyl orange: this property permits the titration of a mixt. of PO<sub>4</sub>H<sub>3</sub> and FPO<sub>4</sub>H<sub>2</sub>. The PO<sub>3</sub>F ion is similar to the SO<sub>4</sub> ion. The solubilities of some of the salts in mol./l. are: CaPO<sub>3</sub>F.2H<sub>2</sub>O,  $6.3 \times 10^{-2}$ ; SrPO<sub>3</sub>F.H<sub>2</sub>O,  $5.5 \times 10^{-2}$ ; BaPO<sub>3</sub>F,  $6 \times 10^{-4}$ ; Ag<sub>2</sub>PO<sub>3</sub>F,  $5.93 \times 10^{-2}$ ; PbPO<sub>3</sub>F,  $3.2 \times 10^{-4}$ ; Hg<sub>2</sub>PO<sub>3</sub>F,  $5 \times 10^{-4}$ . The La salt is sol. at room temp. in a dil. AcOH soln. but ppts. at higher temp. (NH<sub>4</sub>)<sub>2</sub>PO<sub>3</sub>F is most conveniently prepd. by fusion of 1 mol. P<sub>2</sub>O<sub>5</sub> and 3 mols. NH<sub>4</sub>F. A. L. H.

**Molybdates and tungstates. Binary systems:** Li<sub>2</sub>MoO<sub>4</sub>-MoO<sub>3</sub>, Na<sub>2</sub>MoO<sub>4</sub>-MoO<sub>3</sub>, K<sub>2</sub>MoO<sub>4</sub>-MoO<sub>3</sub>, Li<sub>2</sub>WO<sub>4</sub>-WO<sub>3</sub>, Na<sub>2</sub>WO<sub>4</sub>-WO<sub>3</sub>, K<sub>2</sub>WO<sub>4</sub>-WO<sub>3</sub>, Li<sub>2</sub>MoO<sub>4</sub>-Na<sub>2</sub>MoO<sub>4</sub>,

$\text{Li}_2\text{WO}_4$ - $\text{Na}_2\text{WO}_4$ ,  $\text{Li}_2\text{MoO}_4$ - $\text{K}_2\text{MoO}_4$ . FRITZ HOERMANN. *Z. anorg. allgem. Chem.* 177, 145-86(1928).—The simple molybdate and tungstate of Li sep. from aq. soln. and from fusions as anhyd. trigonal crystals, whereas the K salts, which are also anhyd., crystallize in the monoclinic system; the dihydrated Na salts form rhombic-bipyramidal crystals. Thermal analysis of the systems,  $\text{Li}_2\text{MoO}_4$ - $\text{MoO}_3$  and  $\text{Na}_2\text{MoO}_4$ - $\text{MoO}_3$ , indicates the existence of di-, tri- and tetramolybdates; with K the trimolybdate alone is formed. The salts,  $\text{Li}_2\text{O} \cdot 2\text{MoO}_3$ ,  $\text{Na}_2\text{O} \cdot 2\text{MoO}_3$  and  $\text{K}_2\text{O} \cdot 3\text{MoO}_3$ , crystallize in the rhombic system. The rhombic ditungstates of Li and Na melt without decompn., and are probably isomorphous with the corresponding molybdates; K ditungstate does not appear to exist. Tetratungstates of Li and Na, and tri- and tetratungstates of K exist. The following m. ps. have been detd.:  $\text{Li}_2\text{O} \cdot \text{MoO}_3$  705°,  $\text{Li}_2\text{O} \cdot 2\text{MoO}_3$  (532°),  $\text{Li}_2\text{O} \cdot 3\text{MoO}_3$  (549°),  $\text{Li}_2\text{O} \cdot 4\text{MoO}_3$  (568°),  $\text{Na}_2\text{O} \cdot \text{MoO}_3$  687°,  $\text{Na}_2\text{O} \cdot 2\text{MoO}_3$  612°,  $\text{Na}_2\text{O} \cdot 3\text{MoO}_3$  (528°),  $\text{Na}_2\text{O} \cdot 4\text{MoO}_3$  (515°),  $\text{K}_2\text{O} \cdot \text{MoO}_3$  926°,  $\text{K}_2\text{O} \cdot 3\text{MoO}_3$  571°,  $\text{Li}_2\text{O} \cdot \text{WO}_3$  742°,  $\text{Li}_2\text{O} \cdot 2\text{WO}_3$  745°,  $\text{Li}_2\text{O} \cdot 4\text{WO}_3$  (800°),  $\text{Na}_2\text{O} \cdot \text{WO}_3$  700°,  $\text{Na}_2\text{O} \cdot 2\text{WO}_3$  738°,  $\text{Na}_2\text{O} \cdot 4\text{WO}_3$  (784°),  $\text{K}_2\text{O} \cdot \text{WO}_3$  921°,  $\text{K}_2\text{O} \cdot 3\text{WO}_3$  (660°),  $\text{K}_2\text{O} \cdot 4\text{WO}_3$  (930°),  $\text{Li}_2\text{MoO}_4 \cdot 3\text{Na}_2\text{MoO}_4$  (484°),  $\text{Li}_2\text{WO}_4 \cdot 3\text{Na}_2\text{WO}_4$  (511°). Figures in parentheses are incongruent m. ps. B. C. A.

**Chromic ethylates. Preparation and properties.** P. A. THIESSEN AND B. KANDELAKY. *Z. anorg. allgem. Chem.* 181, 285-94(1929).—Chromic chloride tetraethylalcoholate,  $\text{CrCl}_3 \cdot 4\text{C}_2\text{H}_5\text{OH}$ , is obtained in the form of ditetragonal bipyramidal crystals ( $A:C=1:0.7744$ ) by the action of dry HCl upon Cr under abs. EtOH. Drying at 50° in a vacuum yields the trialcoholate,  $\text{CrCl}_3 \cdot 3\text{C}_2\text{H}_5\text{OH}$ . The action of Na upon  $\text{CrCl}_3$  in abs. EtOH results in the formation of *chromic ethylate triethylalcoholate* (I),  $\text{Cr}(\text{OC}_2\text{H}_5)_3 \cdot 3\text{C}_2\text{H}_5\text{OH}$ . Concn. of the mother liquor, or treatment of  $\text{CrCl}_3$  in abs. EtOH with  $\text{NaOC}_2\text{H}_5$  followed by evapn., yields green amorphous *chromic ethylate* (II),  $\text{Cr}(\text{OC}_2\text{H}_5)_3$ . Both I and II are rapidly attacked by moisture and may be used in the prepn. of pure hydrous chromic oxides. L. F. AUDRIETH

**Chromic *p*-toluenesulfonate.** GUSTAV JANTSCH AND K. MECKENSTOCK. *Monatsh.* 52, 169-84(1929).—Evapn. at room temp. of concd. solns. of (*p*- $\text{MeC}_6\text{H}_4\text{SO}_3$ )<sub>2</sub>Cr (I) gives grey-green crystals of hydrates varying between I + 8H<sub>2</sub>O and I + 12H<sub>2</sub>O. Crystn. below 12° gives a blue-violet salt contg. probably 16H<sub>2</sub>O. Hydrolysis in the crystal water at temps. as low as 50° interferes with an accurate analysis. The hydrate I + 16H<sub>2</sub>O is stable between -0.5 and +12°. The hydrate I + 9H<sub>2</sub>O, which at 10 mm. Hg is stable up to 61°, was obtained by dehydrating I + 16H<sub>2</sub>O at 10° or the crystals I + 8H<sub>2</sub>O to I + 12H<sub>2</sub>O at 30° over H<sub>2</sub>SO<sub>4</sub> of definite vapor pressure. By further dehydration of I + 16H<sub>2</sub>O or I + 9H<sub>2</sub>O over concd. H<sub>2</sub>SO<sub>4</sub>, a green hydrate I + 4H<sub>2</sub>O was obtained. Its deep green aq. soln. soon turns blue-violet, while solns in EtOH or Me<sub>2</sub>CO remain green; the tetrahydrate seems to form, by addn. of H<sub>2</sub>O, the blue-violet complex ion  $[\text{Cr}(\text{OH})_2]^{+++}$ . Solns. of I + 16H<sub>2</sub>O are blue, those of I + 9H<sub>2</sub>O are blue-violet. Both turn green on heating. Attempts to obtain corresponding acido-aquo-salts by concn. of the green soln. at 76° yielded only I + 10H<sub>2</sub>O and concn. at 100° gave a green sirup that did not crystallize. The presence of acido-aquo ions could be proved by electrolytic transference expts. and it was shown on soln. of the mixed hydrate (8-10H<sub>2</sub>O) that, while below 60° only aquo chromic complexes migrate to the cathode, above 65° acido-aquochromic complexes are present. G. T.

**Dipyridine iodostannate.** A. G. DIMITRIOU. *Praktika* 2, 496(1927).—The compd ( $\text{C}_5\text{H}_5\text{N}$ )<sub>2</sub>SnI<sub>4</sub>, orange-red, is obtained by interaction of the components in anhyd. light petroleum. B. C. A.

**Complex derivatives of triazinetricarboxylic acid.** PAUL PASCAL AND RENÉ LÉCUR. *Compt. rend.* 189, 49-51(1929).— $[\text{C}_3\text{N}_3(\text{CO}_2)_3]^{---} = 1$ . When 1K<sub>3</sub> is treated with a heavy metal, a ppt. is generally formed which is sol. in an excess of 1K<sub>3</sub>. The metal forms a part of a complex ion. The compn. of the complex formed may be one of 3 types according to the conditions employed. The first type is obtained when the addn. of the heavy metal salt is stopped at the point when the ppt. is no longer dissolved. A colored ppt. is obtained after some time and has a compn., of which the following are examples:  $[\text{Fe}^{+++}]_2\text{Fe}^{+++}\text{K} \cdot 24\text{H}_2\text{O}$ ,  $[\text{Mn}^{+++}]_2\text{Mn}^{+++}\text{K}_2 \cdot 6\text{H}_2\text{O}$ ,  $[\text{Cr}^{+++}]_2\text{Cr}^{+++}\text{K}_2 \cdot 40\text{H}_2\text{O}$ ,  $[\text{Co}^{+++}]_2\text{Co}^{+++}\text{K}_3 \cdot 24\text{H}_2\text{O}$  (2),  $[\text{Fe}^{+++}]_2\text{Fe}^{+++}\text{K}_3 \cdot 3[\text{Fe}^{+++}]_2\text{K}_2 \cdot 40\text{H}_2\text{O}$ . The compd. 2 is obtained from the Co<sup>++</sup> complex by treatment with H<sub>2</sub>O<sub>2</sub>. Formation of the Co<sup>++</sup> and Ni<sup>++</sup> complexes,  $[\text{Co}^{++}]_2\text{Co}^{++}\text{K}_4 \cdot 8\text{H}_2\text{O}$  (3) and  $[\text{Ni}^{++}]_2\text{Ni}^{++}\text{K}_2 \cdot \text{H}_2\text{O}$ , is preceded by the pptn. of the compds. of the second type. These compds. are generally formed when the heavy metal salt is added in excess, under which conditions all of the K is replaced. Examples of this type are  $[\text{Fe}^{+++}]_2\text{Fe}^{+++} \cdot 24\text{H}_2\text{O}$ ,  $[\text{Co}^{+++}]_2\text{Co}^{+++} \cdot 9\text{H}_2\text{O}$  (4) and  $[\text{Ni}^{+++}]_2\text{Ni}^{+++} \cdot 4\text{H}_2\text{O}$ . Cr and Mn salts give complexes of the first type only. The third type is obtained when the alkali salt is in excess and is pptd.

from soln. by addn. of 95% alc.  $[Fe^{++1}_2]K_4$  and  $[Fe^{+++1}_2]K_3 \cdot 20H_2O$  are examples,  $Co^{++}$  salts under the same conditions give the tan compds. 4 and 3 successively. The former then undergoes mol. isomerism for the color of the soln. turns red and a red compd. ppts. out. This compd. has the same compn. as 4 but besides the  $C_6N_2$  group it contains the oxalate and  $NH_4$  groups. It is formed from 4 by internal hydrolysis and has the compn.  $[Co^{++1}_2][Co^{+++1}_2 \cdot 9(Co(C_2O_4)_2)(NH_4)_2]$ . The hydrolysis takes place at the expense of the  $H_2O$  of crstn. and ceases as soon as this has all reacted. J. M. L.

**The oxygen addition product obtained by treatment of tetramethylammonium hydroxide with ozone.** WILHELM TRAUBE AND FRITZ KUHBIER. *Ber.* 62B, 809-20 (1929).— $Me_4NOH$  treated with  $O_3$  gives a red compd., analogous to the "hydroxoxides" obtained by treating  $KOH$ ,  $RbOH$  or  $CsOH$  with  $O_3$ . The hydroxide of  $Me_4NOH$  is much more stable than those of the alk. metals: the formula,  $(Me_4NOH)_2O_3$ , is proposed to represent it. When the alk. hydroxides are decompd. by  $H_2O$ , they liberate exactly the amt. of  $O$  picked up for their formation. With  $Me_4NOH$ , only about one half of the  $O$  is recovered as such: during the decompn. by  $H_2O$ ,  $H_2O_2$  is formed.  $CO_2$  and  $HCO_2H$  can be detected as  $NH_4$  salts: it is not evident whether that oxidation occurs during the  $O_3$  absorption period or during the  $H_2O$  decompn. stage. A. L. H.

Magnetic and crystallographic researches: Hydrated  $Fe_2O_3$  (ALBRECHT) 2.

## 7—ANALYTICAL CHEMISTRY

W. T. HALL

**Applications of recent analytical interest.** J. J. FOX. *J. Oil and Color Chem. Assoc.* 12, 38-45(1929).—F. briefly reviews and recommends the use of 8-hydroxyquinoline and pyridine-thiocyanate reagents and the potentiometric titration methods in quant. analysis. Examples of interest in *paint analysis* are given. G. G. SWARD

**Practical guides for gas-analytical investigations.** G. NEUMANN AND F. STRÄHUBER. *Arch. Eisenhüttenw.* 2, 557-74(1929).—The adjustment, manipulation and sources of error of the Orsat app. are discussed. App. for exact gas analysis is described and also automatic measuring app. The taking of samples and evaluation of results are also considered. W. T. H.

**The effect of shaking on various reactions of precipitation.** GUSTAV THANHEISER AND PETER DICKENS. *Arch. Eisenhüttenw.* 2, 575-81(1929).—With chemically pure salts and the customary procedures, it was found that Ba, S, Ca and Mg could be pptd. completely as  $BaSO_4$ ,  $CaC_2O_4$  and  $MgNH_4PO_4$  by 10-min. shaking, but, contrary to general opinion, the shaking of a molybdate ppt. in the detn. of P accomplishes nothing more than 10-min. standing will do. W. T. H.

**Analysis by x-ray spectroscopy.** C. F. EDDY, T. H. LABY AND A. H. TURNER. *Proc. Roy. Soc. (London)* A124, 249-68(1929).—In spectral analyses with x-rays an element is usually identified by its 4 K-series lines or by at least 6 of its L-series lines. With very small quantities of an element in a mixt. some of these lines may be undiscernible. As compared with other methods of spectral analysis, x-ray spectra have the following advantages: (1) the no. of lines is small; (2) Moseley's law simplifies the identification of a line; (3) a min. potential is required to excite a group of lines, so the 2nd or higher order lines can be excluded. In this paper the technic of constructing the x-ray tube and spectrometer and the identification of the lines are described. Results show that the method is capable of detecting as little as 0.0003 of an impurity in a metal. Seven samples of Zn were examd., one of which was spectroscopically pure and the others were of compn. known by analysis or synthesis. W. T. H.

**New method for the determination of chlorine and sulfur in sulfur monoxide.** HIDEMARO ENDO. *J. Soc. Chem. Ind. Japan* 32, 422-30(1929); Suppl. Binding 32, 126B(1929).—For the detn. of Cl, 10 cc. of soln. is taken and 20 cc. of glacial AcOH acid, 50 cc. of 1%  $NaNO_2$  soln., 20 cc. of 10%  $CuSO_4$  soln. together with 50 cc. of water are added; the whole is heated for  $\frac{1}{2}$ -1 hr. to expel  $CS_2$ .  $CuS$  ppt. is filtered off and the filtrate is acidified with 2 or 3 drops of concd.  $HNO_3$  and boiled;  $AgNO_3$  is then added and Cl is estd. as  $AgCl$ . For the detn. of S, 10 cc. of sample soln. is taken, to which 60 cc. of glacial AcOH and 5 cc. of concd.  $HNO_3$  are added. After 15 min. it is heated on a water bath for one hour, 5 cc. of  $Br_2$  is then added to the soln. and 300 cc. of hot water is added in small quantities at a time, the whole is evapd. to dryness and  $BaSO_4$  is pptd. in the usual way. FUZIBAYASHI

**Notes on the determination of hydrogen and methane in the Orsat apparatus.** HERBERT A. BAHR. *Arch. Eisenhüttenw.* 2, 495-502(1929).—Orsat app., such as is used today in many labs. with the glowing wire pipets, gives unreliable results because of oxidizability of the electrodes and the use of unsuitable confining liquids. If a satd. soln. of NaCl is used as confining liquid and Au, or protected Hg, used as electrodes, satisfactory results can be obtained. A const., slight neg. error in the  $\text{CH}_4$  detn. indicates that when the combustion is accomplished by means of a glowing Pt wire, some oxidation product other than  $\text{CO}_2$  is formed, possibly  $\text{HCHO}$  or  $\text{HCO}$ . Two new modifications of the Orsat app. are shown, which are designed especially to overcome the errors encountered. W. T. H.

**Determination of available oxygen by the Bunsen method.** THOMAS W. PARKER AND PERCY L. ROBINSON. *J. Chem. Soc.* 1929, 1106-7.—An app. is described in which the danger of the liquid from the receiver sucking back into the distg. flask is obviated and it is not necessary to transfer the  $\text{KI}_2$  soln. to another vessel for titration. The results obtained in the analysis of  $\text{K}_2\text{Cr}_2\text{O}_7$  by the Bunsen iodometric method were distinctly better with the new app. and procedure. W. T. H.

**Volumetric method for the determination of potassium with  $\text{Na}_2\text{PbCo}(\text{NO}_2)_6$ .** V. I. TOVARNITZKII AND P. S. SERGEENKO. *Zhurnal Sakharnoi Promyshlennosti* 2, 228-36(1928).—K can be detd. by the following method without ptg. other bases except  $\text{NH}_4$ , with a max. error of 1-2%. To 50 cc. of the soln. to be tested and contg. 10-20 mg. of K, add 2-4 cc. of  $\text{Na}_2\text{PbCo}(\text{NO}_2)_6$  reagent. Stir for 20 min. to get complete pptn. Add  $\text{BaSO}_4$  till the ppt. changes from orange to a light yellow color. Filter through filter paper and wash with 200-250 cc. of  $\text{H}_2\text{O}$ . Wash the ppt. from the filter into the first beaker, then add 50 cc. 0.1 N  $\text{KMnO}_4$  and 20 cc. of  $\text{H}_2\text{SO}_4$  (1:3) and make up to 300-400 cc. Heat the beaker on a water bath at  $100^\circ$  for 30 min. After heating add to the beaker 0.1 N  $\text{Na}_2\text{C}_2\text{O}_4$  and titrate back with 0.1 N  $\text{KMnO}_4$ . Calc. the results by the formula  $x = [(a + c) - b] \times 0.0006521$ , where  $a$  = cc. of  $\text{KMnO}_4$  used for oxidation,  $b$  = cc. of  $\text{Na}_2\text{C}_2\text{O}_4$ ,  $c$  = cc. of  $\text{KMnO}_4$  used for titration; 0.0006521 is the factor. Reagents required are: 0.1 N  $\text{KMnO}_4$ ; 0.1 N  $\text{Na}_2\text{C}_2\text{O}_4$ ;  $\text{H}_2\text{SO}_4$  (1:3),  $\text{BaSO}_4$  suspended in water. The  $\text{Na}_2\text{PbCo}(\text{NO}_2)_6$  can be obtained by mixing 22 g. of  $\text{NaNO}_2$ , 3 g. of  $\text{Co}(\text{NO}_3)_2$  and 5 g. of  $\text{Pb}(\text{NO}_3)_2$ , crushed and dissolved in a little hot  $\text{H}_2\text{O}$ . Then wash into a graduate cylinder, make up to 80 cc. and add 5 cc. of  $\text{AcOH}$ . When the pptn. is complete, filter the soln. and keep the absolutely clear filtrate in dark glass bottles. V. E. BAIKOW

**Smith's method for the determination of arsenic.** YU. D. GNESIN. *Farm. Zhur* 1928, 442-4.—Correction of journal reference (*C. A.* 23, 4161). E. J. C.

**A study of the accuracy of the Gutzeit method for arsenic.** J. R. NELLER. *J. Assoc. Official Agr. Chem.* 12, 332-41(1929).—The accuracy of the Gutzeit test was studied with Pb arsenate solns. obtained by dipping sprayed apples in boiling 10%  $\text{HCl}$  and with Pb arsenate powder. Variations in averages obtained when aliquots of the same size were used ranged from 4.5 to 13.4%. The av. probable error in % of the mean of all possible pairs obtainable in the various groups of 8-11 detns. each was 6.6%. An evolution and absorption temp. of  $18-20^\circ$  was equally as accurate as a temp. of  $30-3^\circ$ . The addn. of  $\text{SnCl}_2$  either before or after heating the soln. with  $\text{KI}$  did not affect the results; if  $\text{H}_2\text{SO}_4$  is present it is advisable to add the  $\text{SnCl}_2$  at the time of cooling to avoid the possibility of forming  $\text{SO}_2$ . A convenient method of prepg. the sensitized strips is described and several precautions are listed with reference to the technique of the method. A. PAFINEAU-COUTURE

**Note on the colorimetry of bismuth.** FRICK AND ENGERMANN. *Chem.-Ztg.* 53, 505-7(1929).—By dissolving black  $\text{BiI}_3$  in  $\text{KI}$  a yellow soln. of  $\text{KBiI}_4$  is obtained and the color is proportional to the Bi content. The method of carrying out the colorimetric test and the necessary app. are described. W. T. H.

**Reaction restriction and reaction acceleration in analytical procedures.** P. FUCHS. *Z. angew. Chem.* 42, 704(1929); F. FEIGL. *Ibid.*—The formation of complex fluosilicates and fluoaluminates in analytical procedures is discussed somewhat polemically with respect to priority. W. T. H.

**The determination of trivalent and bivalent cobalt in cobalt compounds.** V. CUVELIER. *Natuurw. Tijdschr.* 11, 123-30(1929).—Total Co is titrated by a modification of the Willard method (use of diphenylamine as inside indicator instead of  $\text{K}_3\text{Fe}(\text{CN})_6$  as outside indicator). To titrate trivalent Co, the mineral is dissolved directly in titrated  $\text{SnCl}_4$ , in a  $\text{CO}_2$  atm. and the above procedure is then applied. Bivalent Co is computed by difference of the results thus obtained. So-called "Heterogenite from Katanga (Belgian Congo)" has been analyzed: it is not true Heterogenite, but

a colloidal mineral whose chem. compn. is  $3\text{Co}_3\text{O}_4 \cdot 2\text{CuO} \cdot 10\text{H}_2\text{O}$  and whose  $n$  is 1.85.

**The determination of ash.** C. WEKER. *Gaz. Cukrow*, 36, 134 (1929); *Listy Cukrovar Roshledy* 47, 29.—The app. and method are described. Ash was detd. by cond. method and compared with carbonate ash detd. by heating with  $\text{H}_2\text{SO}_4$ . The cond. method for ash detn. gives a rapid result, and the differences in the results obtained by the 2 methods were very small. Electrolysis of the soln. and polarization at the electrodes can be ignored for the time the current flow is very short. Scrupulous cleanliness of the cells is necessary, otherwise differences in the cond. and ignition detns. occur.

FRANK MARESH

**Report on (the determination of) bromides (in the presence of) chlorides.** H. WALES. *J. Assoc. Official Agr. Chem.* 12, 302-3 (1929).—The Winkler method (C. A. 10, 867) gave 99.43-100.83% of theoretical results.

A. PAPINEAU-COUTURE

**Qualitative analysis of a mixture of ferrocyanide, ferricyanide and thiocyanate.** PARES CHANDRA BANERJEE. *J. Indian Chem. Soc.* 6, 259-62 (1929).—Treat the neutral soln. with  $\text{Ce}(\text{NO}_3)_3$  soln. (instead of  $\text{Th}(\text{NO}_3)_4$  as recommended by Browning and Palmer) to ppt.  $\text{KCeFe}(\text{CN})_6$ . Wash the ppt. with cold water, decomp. with  $\text{NaOH}$  soln., make the filtrate acid and test with  $\text{FeCl}_3$  soln. To the filtrate from the original Ce pptn. add  $\text{Ni}(\text{NO}_3)_2$  to ppt.  $\text{Ni}_2(\text{Fe}(\text{CN})_6)_3 \cdot 18\text{H}_2\text{O}$ . Filter and treat the filtrate in the acid and  $\text{FeSO}_4$  soln. Finally, in the filtrate from the Ni ppt., test for  $\text{CNS}^-$  with ferric salt.

W. T. H.

**Quantitative analysis of phosphoric acid. I. Determination as magnesium pyrophosphate.** M. ISHIRASHI. *Mem. Coll. Sci. Kyoto Imp. Univ.* A12, 23-38 (1929); cf. C. A. 23, 4645.—In the gravimetric detn. of phosphate by pptn. as  $\text{MgNH}_4\text{PO}_4$ , the magnesia mixt. should be adjusted to a  $p_n$  of 5-6. The mol. ratio of  $\text{NH}_4\text{Cl}$  to  $\text{MgCl}_2$  should be 5-15:1, and the ratio of  $\text{MgCl}_2$  to  $\text{P}_2\text{O}_5$  1.3-10.5:1. If the  $p_n$  of the phosphate soln. is 4.4-8.3, and the pptn. is effected below  $35^\circ$ , the ppt. will settle satisfactorily in 30 min.  $\text{AcONa}$ ,  $\text{KCl}$  and  $\text{NH}_4$  and  $\text{Na}$  sulfates interfere. **II. Gravimetric and volumetric methods.** *Ibid* 39-47.—The spontaneous oxidation of manganous  $\text{NH}_4$  phosphate in alk. soln. may be prevented by addn. of hydroxylamine, so that it becomes possible to det. phosphate by pptn. as the double phosphate and weighing as pyrophosphate after ignition. Excess of a soln. contg.  $\text{NH}_4\text{Cl}$  and  $\text{MnCl}_2$  in the mol. ratio of 75-125:1 and a little hydroxylamine-HCl are added to the phosphate soln., which must be not too dil. and of such acidity that only a very slight ppt. results. The soln. is then heated nearly at the b. p., pptd. by addn. of  $\text{NH}_3$  and filtered after 2 hrs.  $\text{NH}_4$  citrate, tartrate and oxalate interfere, and, if  $\text{NH}_4$  molybdate is present, it is necessary to ppt. from a strongly ammoniacal soln., then dissolve in acid and reppt. The double phosphate may also be dissolved in acid and titrated with permanganate at  $80-90^\circ$ , the end point being reached when the color of the soln. does not change for 2-3 min.; 2 g. of  $\text{AcONa}$  must be added for each 10 cc. of 0.1  $N$ -permanganate. **Determination as zinc ammonium phosphate. III.** *Ibid* 49-56.—Phosphate may also be detd. by pptg. as  $\text{ZnNH}_4\text{PO}_4$ , igniting and weighing as pyrophosphate. Excess of a soln. contg.  $\text{NH}_4\text{Cl}$  and  $\text{MgCl}_2$  in the mol. ratio of 50-100:1, and 2.0-3.6  $N$  in respect of the former chloride, is added to the phosphate soln., the acidity of the mixt. being so regulated that very little pptn. occurs. The soln. is then heated nearly at the b. p., and  $\text{NH}_3$  slowly added until pptn. is complete, the  $p_n$  being kept at 5-6.5 during this process.  $\text{NH}_4$  molybdate interferes. Instead of the ppt. being ignited, it may be converted into  $\text{Zn}$  oxalate by treatment with oxalic acid and titrated with permanganate.

B. C. A.

**Analysis of a mixture of water, nitric acid and sulfuric acid by thermometric titration.** T. SOMIYA. *Chem. News* 137, 14 (1928).—Addn. of fuming  $\text{H}_2\text{SO}_4$  to a mixt. of water,  $\text{HNO}_3$  and  $\text{H}_2\text{SO}_4$  results in a well-defined temp. max. when the water is converted into  $\text{H}_2\text{SO}_4$  and the  $\text{HNO}_3$  into  $\text{OH} \cdot \text{SO}_3 \cdot \text{ONO}_2$ . Further addn. of the fuming acid gives a less well-marked temp. max. when the  $\text{HNO}_3$  is converted into  $(\text{SO}_3)_2\text{N}_2\text{O}_6$ .

B. C. A.

**Determination of polysulfide sulfur and nitrogenous substances in commercial sodium sulfide.** KOTARO SHIMO AND YUTAKA MAKITA. *J. Soc. Chem. Ind. Japan* 32, 123-5 (1929); Suppl. Binding 32, 32B (1929).—Polysulfide S is first converted into thiosulfate by boiling the sample with a small excess of  $\text{Na}_2\text{SO}_4$  and  $\text{MgCl}_2$  soln. in an atm. of  $\text{CO}_2$ . When the sulfite-thiosulfate mixt. thus obtained is treated with  $\text{I}_2$  soln., the former is oxidized to sulfate and the latter to tetrathionate. By treating the mixt. with  $\text{Al}$  and  $\text{HCl}$ , the tetrathionate alone is reduced to  $\text{H}_2\text{S}$ , which is absorbed in  $\text{I}_2$  soln.; thus, thiosulfate can be estd. The value of thiosulfate (A) thus obtained is the sum of the original thiosulfate and that which corresponds to the polysulfide S.

The true amt. of thiosulfate in the original sample (B) can be detd. by the usual method, and then polysulfide S. can be calcd. from the difference (A-B). Y. and U. found that nitrogenous substances are present mainly as ammoniacal nitrogen and thiocyanate. They estd. the former by distg. the sample with MgO and the latter by the iodometric method.

FUZIBAYASHI

**The determination of silicon in ferrosilicon and other ferrous alloys.** A. STADELER. *Arch. Eisenhüttenw.* 2, 425-37(1929).—The results tabulated in this paper represent a great deal of work on the identical sample in 11 different chem. labs. It is the most thorough investigation ever made on the detn. of Si in alloys contg. 11-97% Si and deserves study by all chemists having to do with such work. Samples contg. up to 15% Si present little difficulty because they are easily decompd. by acids. The most satisfactory method for these alloys appears to be the following: Treat 1 g. of the sample with 25 cc. of Br-HCl (500 cc. concd. HCl, 500 cc. of water and 100 cc. of Br<sub>2</sub>). Heat until decompn. is complete, evap. to dryness and bake 1 hr. at 130°. Take up the residue in 10-15 cc. of concd. HCl. Dil. and filter. Evap. the filtrate, except the washings, to dryness and recover the small quantity of SiO<sub>2</sub> that escaped pptn. the first time. Treat the SiO<sub>2</sub> with HF and H<sub>2</sub>SO<sub>4</sub> as usual. The following rapid method gives nearly as good results: Treat 1 g. of material with 40 cc. of concd. HCl at a moderate temp. and allow to stand overnight. Dil., filter and weigh the ppt. without correcting for impurities. With 15% of Si in the alloy, the impurities in the ppt. counterbalance the wt. of SiO<sub>2</sub> in soln. With materials higher in Si, it is necessary to use a fusion method but the expts. show that Na<sub>2</sub>CO<sub>3</sub> itself can serve for the oxidation of both Fe and Si. All the chemists engaged in this cooperative investigation agreed that the following procedure was the most satisfactory: Fuse 0.5 g. of sample with 6 times as much of a mixt. of 2Na<sub>2</sub>KCO<sub>3</sub>:1Na<sub>2</sub>O<sub>2</sub> in a Ni or Fe crucible, heating gradually at first and only using a common burner. Cool, ext. the melt with water and carefully acidify with HCl. Evap. to dryness and heat 1 hr. at 130°. Take up the residue in a little concd. HCl, filter and evap. the filtrate to dryness again to recover residual SiO<sub>2</sub>, running a blank on all reagents. Treat with HF and H<sub>2</sub>SO<sub>4</sub> as usual. The same method proved satisfactory with material very rich in Si, although it seemed best to heat first with KNaCO<sub>3</sub> and add the Na<sub>2</sub>O<sub>2</sub> later. Expts. with direct treatment of the sample with HF and H<sub>2</sub>SO<sub>4</sub> gave results which were not entirely satisfactory although fair results were obtained with high materials when it was assumed that 0.7 of the wt. of residue represented the corresponding wt. of original material.

W. T. H.

**The analysis of sodium sulfide, sulfite and bisulfite.** M. AUERBACH. *Lederlech. Rundschau* 21, 83(1929).—Comments on note by Paessler (*C. A.* 23, 3187). I. D. C.

**Analysis of a mixture of acetic acid, acetic anhydride and sulfuric acid and the acetylation bath of cellulose by thermometric titration.** TAKAYUKI SOMIYA. *J. Soc. Chem. Ind. Japan* 32, 490-5(1929); Suppl. Binding 32, 153-4B; cf. *C. A.* 23, 2907.—When acid mixts. were titrated thermometrically with standard C<sub>6</sub>H<sub>5</sub>NH<sub>2</sub> soln. in the presence of pyridine, the end point corresponding to the sum of Ac<sub>2</sub>O and acetylsulfuric acid was obtained, but it was not sharp, because there was a further rise of temp. even after the end point. When a mixt. contg. Ac<sub>2</sub>O and sulfoacetic acid was titrated with C<sub>6</sub>H<sub>5</sub>NH<sub>2</sub>, without adding pyridine, the end point corresponding to the sum of the 2 components was gained, but was not accurate enough. When an excess of the standard C<sub>6</sub>H<sub>5</sub>NH<sub>2</sub> soln. was added first to the acid mixt. and then the excess of C<sub>6</sub>H<sub>5</sub>NH<sub>2</sub> was thermometrically titrated with Ac<sub>2</sub>O soln. in the presence of pyridine, a sharp end point was obtained and the sum of Ac<sub>2</sub>O and acetylsulfuric acid could be detd. with accuracy.

S. OKA

**Application of the iodometric method to the estimation of small amounts of aldoses.** MORNA MACLEOD AND ROBERT ROBISON. *Biochem. J.* 23, 517-23(1929).—Satisfactory results are obtained by using 3-4 times the theoretical quantity of I with Na<sub>2</sub>CO<sub>3</sub> as the alkali, and allowing the oxidation to proceed during 30 min. at 21°. B. H.

**Determination of invert sugar in sucrose solution with the titrimetric reduction method.** IV. Influence of calcium salts on the reduction. JOHN A. A. GABREELS AND A. L. VAN SCHERPENBERG. *Chem. Weekblad* 26, 394-8(1929); cf. *C. A.* 19, 1835.—Ca salts have a large influence on the reducing power of sucrose on alk. Cu solns. and may even stop the same when the sucrose concn. is low. With higher concns. the influence is less and increase of reducing action is found. The detn. of invert sugar in sucrose solns. contg. 3.46 g. tartrate per 50 cc. is not influenced by Ca salts. The "acid adsorption" of the glassware used is mostly due to a permutite action of the glass.

E. SCHORR

**Graphical method for calculating the composition of a saccharin mixture containing sucrose, dextrose and levulose.** J. DUMAQUIÉ. *Ann. fals.* 22, 352-3(1929).—

A graphical method is described in detail, and it is claimed that the error is negligible as compared with those inherent to polarimetric readings and sugar detns. by Fehling's soln.

A. PAPINEAU-COUTURE

The reducing power of polybasic alcohols on alkaline solutions of potassium mercuric iodide. PAUL FLEURY AND JEAN MARQUE. *Compt. rend.* 188, 1686-8(1929).—The reducing action of aldehydes and monoses on alk. solns. of  $K_2HgI_4$  is shared by polybasic alcs. as mannitol (I), dulcitol (II), erythritol, inositol, glycerol and glycol (III), and to a smaller extent, inversely proportional to the mol. wt., by di-, tri-, tetra- and even polysaccharides. Among the acid alcs., gluconic acid is 50% as powerful as I, while glycolic, lactic, malic, saccharic, mucic and salicylic acids are 0.5-3% as effective. Dibasic acids as tartaric and citric acids do not exhibit this property. Heat has to be applied in all cases. The reaction may be used as a means of *detg. polybasic alcs.* The mixt. is added to 7.5 cc. of a soln. contg. 108 g. of  $HgCl_2$  and 288 g. of KI per l. and 10 cc. of NaOH soln. contg. 300 g. per l., to make a total vol. of 35 cc. It is heated for 45 min. on the  $H_2O$  bath, acidified with  $H_2SO_4$ , an excess of standard I soln. is added, and the excess detd. with  $Na_2S_2O_3$ . About 1 g. of pptd.  $BaSO_4$  is added during the reduction to agglomerate the Hg. For 1-15 mg. of alc. the amt. of I fixed is linearly proportional to the amt. of alc. and is 7.33 cc. of 0.1 N for 10 mg. of I. The procedure has been applied successfully to I, II and III. A mixt. of I and glucose (IV) may be detd. approx. in spite of a previous finding that the reaction is specific for IV. In this case the alky. was 30 times as weak as that used by F. and M., who found that I in a mixt. with IV is attacked when it is present in a ratio of more than 4:1. For sucrose the ratio must be greater than 20:1. The reducing action of  $\alpha$ -glycerophosphoric acid is more marked than that of the  $\beta$ -compd., showing the greater activity of the secondary OH group in comparison with the primary one. I. M. LEVINE

Detection of benzene with dracorubin. BERGER. *Zentr. Gewerbehyg. u. Unfallverhüt.* 15, 227-8(1928).—The dye "dracorubin," which is sol. in benzene but not in benzenes, is used in the form of test-paper. B. C. A.

Report on (the determination of) ether. H. M. JOSLIN. *J. Assoc. Official Agr. Chem.* 12, 288-9(1929); cf. Spencer, C. A. 22, 4410.—As it may not always be convenient to heat the alc. vapor absorption tube in a const.-temp. bath at 50°, the acid concn. in the tube was increased from 9 N to 12 N  $H_2SO_4$ ; in addn., iodometric methods were used to det. the excess  $K_2Cr_2O_7$  remaining after oxidation of the  $Et_2O$ . 97.7-102.1% recovery was obtained with known wts. of anhyd.  $Et_2O$ , and 94.8-98.9% with  $H_2O$ -alc.- $Et_2O$  solns. of known concns. A. PAPINEAU-COUTURE

Determination of 2-phenyl-4-quinolinecarboxylic acid in the presence of salicylic acid, acetylsalicylic acid and hexamethylenetetramine. E. SCHULEK AND G. VASTAGH. *Magyar. Gyóg. Társaság Értesítője* 5, 218-25(1929).—The material should be dissolved in 5% NaOH; 50%  $H_2SO_4$  is added to the soln. until a ppt. is formed. The ppt. is transferred to a Gooch filter or better to a crucible with porous glass bottom. The filter is washed out 3 times with water, the soln. made alk. and concd. to 20 cc. The cooled soln. is treated with  $H_2SO_4$  as before and the same treatment repeated. The ppt. produced now with addn. of  $H_2SO_4$  consists almost of pure salicylic acid. The filter contg. this ppt. is treated 5 times with 5 cc. warm, satd. phenylquinolinecarboxylic acid soln. to remove salicylic acid. The last traces of the latter are washed out with cold satd. phenylquinolinecarboxylic acid. The ppt. is dried at 1200°. The results agree very well with calcd. values. One part phenylquinolinecarboxylic acid is dissolved by 199 parts  $H_2O$  of 100° temp. and by 15,000 parts  $H_2O$  of 20°. S. S. DE FINALLY

A reaction of resorcinol and a new colored indicator. LIGOR BEY AND M. FAILLER-BIN. *Compt. rend.* 188, 1679-81(1929).—The blue substance (I) obtained when  $NH_3$  is added to an aq. soln. of resorcinol in the presence of cations such as  $Cd^{++}$ ,  $Zn^{++}$ ,  $Cu^{++}$ ,  $Pb^{++}$  and  $Sn^{++}$  is not formed in an atm. of  $N$ . Oxidation is necessary and this process is catalyzed by the cations. A second colored substance (II), combined with the cation, is formed when no  $NH_3$  is added. This is red in acid soln. and green in a soln. of  $pH$  9.18. When  $NH_4OH$  is added to this, it is transformed irreversibly into I, which is blue in alk. and red in acid medium. The color changes between  $pH$  4.3 and 5.9, within which interval the color is violet. Both I and II may be isolated from their aq. soln. by extn. with AmOH. I. M. LEVINE

Following up the inversion danger (BRUHNS) 28. The effect of Fe on the magnetic susceptibility of Al (MASON) 2. Determination of some medicinal products by the mercurimetric method (IONESCO-MATTU, POPESCU) 17. The HCN question. XXV. Detection of substances capable of uniting with HCN in hydrocyanic distillates (ROSENTHALER) 17. Smelting in the lead blast furnace (OLDRIGHT, MILLER) 9.

## 8—MINERALOGICAL AND GEOLOGICAL CHEMISTRY

EDGAR T. WHERRY AND J. F. SCHAIRER

**New occurrences of germanium. II. The occurrence of germanium in silicate minerals.** JACOB PAPISH. *Econ. Geol.* 24, 470-80(1929); cf. *C. A.* 23, 4423.—A large no. of silicate minerals showed the presence of small quantities of Ge on spectroscopic examn., but no Ge was indicated in 5 quartz and 2 opal specimens, although part of these came from localities in which Ge-bearing silicate minerals were found

ELLIOTT J. ROBERTS

**Etching tests and x-ray examination of some manganese minerals.** WILLIAM V. SMITTHRINGALE. *Econ. Geol.* 24, 481-505(1929).—Etching tests and measurements of x-ray powder photographs are given for manganite, pyrolusite, hausmannite, braunite, bementite, psilomelane and wad. Analyses are given of the first 3 minerals. E. J. R.

**The absorption of a dialogite crystal.** PIERRE LEROUX. *Compt. rend.* 189, 162-3 (1929).—In dialogite ( $MnCO_3$ ) the light absorption is greater in the direction perpendicular to the optic axis. The pleochroism is most marked in the ultra-violet, the difference for  $\lambda 3655$  being 4 times greater than for D. E. SCHOTTE

**Natrolite from Viagrande, Etna.** S. DI FRANCO. *Atti accad. Lincei* [6], 9, 657-68 (1929).—Natrolite crystals having the approx. compn.  $Na_2O$  16.43,  $Al_2O_3$  27.02,  $SiO_2$  46.93,  $H_2O$  9.58%, corresponding to the formula  $Na_2Al_2Si_3O_{10} + 2 H_2O$ , have been found

A. W. CONTIERI

**Further examination of pseudophite from Borostyánkő.** G. VAVRINECZ. *Magyar Chem. Folyóirat* 34, 149-50(1928); cf. *C. A.* 22, 4416.—Another pseudophite was analyzed giving  $SiO_2$  33.04,  $Al_2O_3$  17.72,  $Fe_2O_3$  0.66,  $MgO$  32.07,  $FeO$  3.00,  $CaO$  0.67,  $H_2O$  13.40, sum 100.56%. Hardness was 2.5; sp. gr. 2.67. This compn. does not agree with the formula of pure orthochlorites, and the mineral consists of serpentine, amesite and another compd.,  $H_4MgAl_2SiO_8$ , differing from amesite in 1 mol.  $MgO$ . S. S. DE F.

**Analyses of minerals from Recsk.** G. VAVRINECZ. *Magyar Chem. Folyóirat* 35, 4-9(1929).—Chalcanthite, melanterite, pisanite, halotrichite and brochantite were analyzed, the last 2 minerals being new to the locality. S. S. DE FINÁLY

**The Sheritt Gordon copper-zinc deposit, northern Manitoba.** E. L. BRUCE. *Econ. Geol.* 24, 457-69(1929).—The ore, carrying approx. 3% each of Zn and Cu, was probably formed by contact metamorphic reactions between ore-bearing solns. high in Fe and the original minerals of a bed of gneiss. ELLIOTT J. ROBERTS

**The formation of cupriferous "black earths" in the Niari basin, French Congo.** RENÉ BURKHARDT. *Arch. sci. phys. nat.* [5], 11, 59-82(1929).—The mineralization of the entire region is discussed, and chem. equations are given for the formation of the several minerals found. The primary mineral, supposedly chalcopryite, has been decomposed by waters rising through the anticlinal fissures in limestone to be arrested by the sandstone layer on top, and slowly transformed into the present ores. The black earth is found in pockets, sometimes 20 m. thick and 100 to 200 m. in extent, between the sandstone and limestone, often in the latter but never in the former. It is a very complex material, the uppermost layers being richest in ore; d. = 1-2; it yields a very fine powder when dry. Its compn. is:  $SiO_2$  68.72, Pb 0.84, Zn traces, Cu 4.92 (chrysocolla, malachite, diopside and chalcocite in the order of their frequency), S 0.37,  $MnO_2$  4.46,  $Mn_2O_3$  0.23,  $Fe_2O_3$  4.46,  $Al_2O_3$  1.81,  $CaO$  4.96,  $MgO$  2.66%. II *Ibid* 163-83(1929).—Complete analyses are given, showing the variations in compn. (1) with the deposits, (2) with the layers, and (3) with the compact nature of the earths. According to the hypothesis formulated, the "black earths" are the residue from the dissoln. of limestones, usually dolomitic and very siliceous, by surface waters charged principally with  $CO_2$  and silicic acids. Analyses of samples of "black earths" and adjacent limestone, resp., gave: insol. in aqua regia 65.5, 5.74; Pb 0.42, trace; Zn trace, none; Cu 2.94, 0.65;  $MnO_2$  7.00, 1.93;  $Fe_2O_3$  5.2, 2.64;  $Al_2O_3$  traces;  $CaO$  6.63, 32.11.  $MgO$  3.21, 13.27; S 0.01, 0.02%. W. L. HILL

**Comparison of the conditions of occurrence of bituminous coal and petroleum.** E. MCKENZIE TAYLOR. *J. Inst. Petroleum Tech.* 15, 372-84(1929).—The shales forming the roofs of bituminous coal seams are identical in character with those which form the cap rocks of oil sands. Both contain Na clay, capable of being hydrolyzed in fresh  $H_2O$ . It is a generally accepted theory that coal was formed by the decompn. of land

plants. The lignocellulose of those plants is the most probable source of the solid coal substance. No remains of land vegetation are found in or about petroleum deposits. An explanation of the *origin of petroleum*, which takes account of these facts, is that petroleum is the result of the deposition and decompn. of marine flora and fauna in shallow deltaic or estuarine waters.

**Genesis of Japanese acid clay.** KYUHEI KOBAYASHI and KENICHI YAMAMOTO. *J. Soc. Chem. Ind. Japan* 32, 564-8(1929); Suppl. Binding 32, 174-5B(1929); cf. *C. A.* 22, 2250.—The Japanese acid clay is a decompn. product of Na feldspar and Na silicates. The decompn. was accelerated by ascending gases, such as  $\text{CO}_2$ ,  $\text{SO}_2$ ,  $\text{H}_2\text{S}$  and  $\text{H}_2\text{O}$ , and boiling water during post volcanic action, the feldspar being essentially transformed into a gel of hydrated Al silicate. The presence of  $\text{Fe}_2\text{O}_3$ ,  $\text{CaO}$ ,  $\text{MgO}$ , etc., may be partly due to accidental contamination and partly to adsorbing activity of acid clay. It is suggested that a part of this Al silicate and  $\text{SiO}_2$  flowed in while in a state of colloidal soln., which became coagulated into the deposits. S OKA

**The bauxite industry of northern South America.** L. LITCHFIELD, Jr. *Eng. Mining J.* 128, 242-8, 346-9(1929). E. H.

Magnetic and crystallographic researches: Hydrated  $\text{Fe}_2\text{O}_3$  (ALBRECHT) 2. Mosses and their subsoil (GYÖRFFY) 11D. The question of the soil-indicating mosses (BOROS) 11D. The determination of trivalent and bivalent Co in Co compounds (CUVELIER) 7.

STINY, JOSEF: Technische Gesteinkunde für Bauingenieure, Kulturtechniker, Land- und Forstwirte, sowie für Steinbruchbesitzer und Steinbruchtechniker. 2nd ed., revised and enlarged. Berlin: J. Springer. 550 pp.

## 9--METALLURGY AND METALLOGRAPHY

D. J. DEMOREST, R. H. ABORN

**The treatment of ore from the Sunny South Lease, Jimble Bar, Murchison Goldfield.** W. G. CLARKE AND B. H. MOORE. *West Australia School Mines Bull.* No. 4, 23-6(1929).—Report on tests by combinations of amalgamation and cyanidation.

E. I. S.

**The treatment of ore from Waterloo Gold Mine, Holden's Find.** W. G. CLARKE AND B. H. MOORE. *West Australia School of Mines Bull.* No. 4, 6-11(1929).—Report on extn. tests by amalgamation and concn., by cyanidation of Wilfley table residues and by flotation with or without other treatments. The ore is white quartz with galena, chalcopryite, pyrite, cerussite and traces of Cu carbonates.

E. I. S.

**The treatment of oxidized and sulfide ores from the Emu North Mine, Reedy's Mararoa Leases, Cue.** W. G. CLARKE AND B. H. MOORE. *West. Australia School of Mines Bull.* No. 4, 44 9(1929).—Agitation with cyanide soln. gave good extn. with low cyanide consumption. Cyanidation of sulfide should be preceded by amalgamation. Pulp from mixed ore filters more readily than does oxidized alone and yields high extn. Incomplete data are given on flotation treatment.

E. I. S.

**The treatment of "mill tailings" from the Sand Queen-Gladsome Gold Mine, Comet Vale.** W. G. CLARKE AND B. H. MOORE. *West. Australia School of Mines Bull.* No. 4, 27-33(1929).—Tests showed varying conditions of treatment to have practically no effect on extn. of gold, which was considered satisfactory, being over 90%.

E. I. S.

**The treatment of pyrrhotitic apatite from the Coolgardie Bores.** W. G. CLARKE AND B. H. MOORE. *West. Australia School of Mines Bull.* No. 4, 12-4(1929).—Report on tests of ore by different combinations of amalgamation, flotation and cyanidation.

E. I. S.

**The importance of preliminary ore analyses by means of the stereoscopic binocular microscope.** A. E. DRUCKER. *State College of Wash. Eng. Bull.* No. 28, 19 pp.(1929).

E. I. S.

**Investigations on the relations between adsorption, wetting and flotation.** W. LUYKEN AND E. BIERBRAUER. *Metall u. Erz* 26, 197-202(1929).—In working out a method for winning apatite from Swedish slime waste by the application of a Na palmistate flotation process, the authors find the usual relations of adsorption influence, wetting and flotability to hold for this material.

L. T. FAIRHALL

**Flotative recovery of apatite.** W. LUYKEN AND E. BIERBRAUER. *Metall u. Erz* 26, 202-3(1929).—See *C. A.* 23, 2398

L. T. FAIRHALL

**Organization of the Korsokpay Copper Flotation Plant.** V. I. TRUSHLEVICH. *Gorniy J.* (Moscow) 105, 113-36(1929).—A description of the newly organized plant located on property formerly belonging to Athassar Copper Co., Ltd., in Turkestan and a review of special studies made to test the applicability of the flotation process to the treatment of Jezcazgan ores. E. I. S.

**The treatment of concentrates from the Brilliant Gold Mine, Gnow's Nest, Yalgoo Goldfield.** W. G. CLARKE AND B. H. MOORE. *West. Australia School of Mines Bull.* No. 4, 15-8(1929).—Complete treatment with amalgamation, concn. and cyanidation gave extn. of over 98% Au and 88% of Ag content. E. I. S.

**The treatment of concentrates from Ives Reward Mine.** W. G. CLARKE AND B. H. MOORE. *West. Australia School of Mines Bull.* No. 4, 19-22(1929).—Roasting, fine grinding, amalgamation and cyanidation of roasted concentrates yielded best extn. but the roasting furnace was not considered as warranted. The use of CNBr offered no advantages. Suggestions are made as to fine grinding. E. I. S.

**Analyses and methods of concentrating tungsten ores of the Gumbey Mines in Ural.** M. ORTIN. *Gorniy J.* (Moscow) 105, 272-8(1929).—Physical analysis of scheelite contg. 13.26% W. The concn. process makes use of Humboldt concentrators. E. I. S.

**Technical control methods used in the concentration of tin and tungsten ores.** RUDOLF WEBERS. *Metall u. Erz* 26, 325-31(1929).—The enrichment of a Sn + WO<sub>3</sub> concentrate may be rapidly detd. by measuring its d., provided the percentage Sn + WO<sub>3</sub> is above 25%. Small quantities of Sn are detd. by reduction of the ore in porcelain boats with H<sub>2</sub> at 575°-600°. The Sn is leached out with warm HCl (sp. gr. 1.12), the leachings being dild. with water to throw out Cu and Sb, reduced with ferrum reductum, pptd. with H<sub>2</sub>S and roasted and weighed as SnO<sub>2</sub>. WO<sub>3</sub> is detd. by distn. of a complex chloride in the presence of CCl<sub>4</sub>. This complex, dissolved in water, throws out WO<sub>3</sub>, which may be dried and weighed. HANS C. DUUS

**Present practice in tin smelting, also researches on carbon reduction.** J. B. JOHNSON. *Metallbörse* 17, 2584, 2694-5(1927); *Chem. Zentr.* 1928, I, 2985-6.—In the Straits Settlement Sn mines, the Sn concentrate is smelted with high-C metals. American and English practices are briefly outlined. C. R. FELLERS

**Notes on lead mining and smelting in West Yorkshire.** A. R. RAISTRICK. *Trans. Newcomen Soc.* (London) 7, 81-96(1926-7).—Historical notes. E. I. S.

**Smelting in the lead blast furnace. I. A method for approximating the form of the lead in slag and other products of the lead blast furnace.** G. L. OLDRIGHT AND VIRGIL MILLER. *Bur. Mines, Repts. of Investigations* No. 2954, 8 pp.(1929).—Dissolve 0.5-5 g. sample in 25 cc. NH<sub>3</sub> acetate, dil. to 100 cc., boil 10 min., filter and wash. The filtrate contains Pb as oxide, sulfate or basic sulfate. Add 10-20 cc. 10% soln. AgNO<sub>3</sub> to residue, treat 1 hr. cold, filter and wash. The filtrate contains the metallic Pb. Add to the residue 25-50 cc. of a satd. soln. of NaCl contg. 60 g. FeCl<sub>3</sub>·6H<sub>2</sub>O per l., treat at 25-28° for 12 hrs., filter and wash. The filtrate contains the Pb present as sulfides, the residue the Pb silicates. The filtrates are analyzed for Pb and the mineral percentages calcd. II. **The gases from the top of the lead blast furnace.** *Ibid.* No. 2957, 18 pp.—Very little S is removed from the charge in furnace gases. Top gas (if undiluted with air) is of sufficient calorific value to be used as a fuel. Its CO content differs little from that of Fe blast-furnace gas. Variations of temp. and compn. of top gases are similar to those that would occur in a gas producer having a variable height of combustion zone. Highest top temps. accompany the highest CO<sub>2</sub>. "Hot top" is caused by the combustion zone rising too high in the charge. Analyses of 150 samples of gas from 21 position at the top of a Pb blast furnace are given. ALDEN H. EMERY

**How is the basic steel smelting furnace to be rated against the acid?** E. PIWOWARSKY. *Die Giesserei* 16, 685-93(1929).—A lecture in which the reactions and phys. chem. equil. occurring in the steel smelting furnace are derived from the latest publications on the constitution of slags, and critically discussed. J. BALOZIAN

**Coordination between blast furnaces, coke ovens and Martin furnaces in a metallurgical works.** CH. BERTHELOT. *Trans. Fuel Conference, World Power Conference, London* 1928, III, 1420-56(1929).—If blast-furnace gas be used for elec. power generation, for heating Cowper stoves and coke ovens and if coke-oven gas be used for heating Martin furnaces, soaking pits and rolling mills, there will be 26% coke-oven gas and 8.2% blast-furnace gas as surplus. By such management 35 cwt. of coal (26% volatile) will make 1 ton of steel and give a surplus of 261 kw. hr. and a quantity of by-products after supplying all necessary power to the works. ALDEN H. EMERY

**Temperature measurements on Siemens-Martin furnaces.** ALFRED SCHACHT. *Arch. Eisenhüttenw.* 3, 7-13(1929).—The gas, waste gas and air temps. in the crown of

Siemens-Martin furnaces, fired with (I) mixed and generator gas and with (II) pure generator gas, are detd. with a new type of *flow pyrometer*. In this a Pt-Pt/Rh thermocouple, protected by a close-fitting Freiburger pyrometer tube, is placed inside a larger one of sillite; the hot gases flowing between the 2 and are pumped out. Comparative measurements with a thermoelement and an optical pyrometer are in practical agreement with one another. The temp. of waste gases in the drawing off head does not exceed  $1610^{\circ}$ , further decreasing  $100-200^{\circ}$  on the way to the chamber. The air temp. in the flue is  $120^{\circ}$  lower and the waste gas  $50^{\circ}$  higher than is obtained with the optical pyrometer. The mixed gas temp. in the gas flue over the scaffold is  $1100^{\circ}$  in the furnace fired with I and  $1080^{\circ}$  in the other, the air temps. in the rising air flues being  $1200^{\circ}$  and  $1300^{\circ}$ , resp. Calcs. show that from the flues over the scaffold to the chambers the temp. decrease ( $103^{\circ}$ ) is due to conduction through the walls ( $57^{\circ}$ ) and leakage of contaminated air ( $46^{\circ}$ ). Measurements of the bath temp. with the thermoelement in I is  $1640^{\circ}$  and with the optical pyrometer  $1660^{\circ}$ , while in II they are  $1530^{\circ}$  and  $1610^{\circ}$ , resp. J. BALOZIAN

**The relationships between output and hearth measurements of blast furnaces.** GEORG RICHENBERG. *Arch. Eisenhüttenw.* 3, 1-5(1929).—From figures of 173 German blast furnaces (in operation) the truest measure of the output is obtained. The blast-furnace performance may best be regarded as the amt. of C gasified in a given time before the tuyères, the latter being 80% for 168 furnaces. Neither the hearth diam. nor its area is a true measure of the probable output of a blast furnace; in the former case the output increases with the diam., while in the latter the output decreases with increase in the hearth breadth. Up to a diam. of 3.50 m the output of a blast furnace is apparently directly proportional to the hearth area, while from thereon it is proportional to the diam., the depth of the combustion zone diminishing 1.75 m. J. BALOZIAN

**Different kinds of explosions in cupola practice. Causes and measures of prevention.** ALBERT LÖBNER. *Die Giesserei* 16, 557-9(1929).—Explosions from explosive materials in the charge are generally of a simple nature and of little consequence. Explosive gas mixts. may form in the wind box during the lighting of the cupola and when the blast is momentarily shut off during its operation. The action of  $\text{SO}_2$  and  $\text{H}_2$  gases in the forehearth during the desulfurizing process may result in an explosion. Moisture in the forehearth lining, slag buggy or bottom of cupola is a source for dangerous explosions. C. H. LORIG

**Copper converter practice.** ARTHUR J. CADDICK. *Metal Ind.* (London) 35, 51-3 (1929).—Data representing 121 converter blows and the treatment of 3903 tons of mat are given showing the relation of grade of mat (Cu content) to general converter practice, amt. of flux, amt. of cold material added, slag produced, air compressor and converter times, amts of air used and required, and process losses for mat contg. 22-45% Cu. Data are given for another series of mat contg. 12, 14 and 20% Cu showing the relation of the grade of the mat to the time required to blow to the white metal stage. C. L. R.

**Microscopic composition and structure of basic slag after different heat treatments and their relation to the citric acid solubility.** H. SCHNEIDERHÖHN. *Stahl u. Eisen* 49, 345-52(1929).—See C. A. 23, 2679. E. H.

**Determination of the iron loss from the cupola slag.** EMIL KNOPPICK. *Die Giesserei* 16, 321-3(1929).—The  $\text{FeO}$  content of the slag alone does not det. the Fe losses in the cupola. The quantity of slag and the  $\text{FeO}$  content of the coke ash, limestone and cupola lining must be known to calc. Fe losses. C. H. LORIG

**Comparative properties of wrought iron made by hand-puddling and by the Aston process.** H. S. RAWDON AND O. A. KNIGHT. *Metals and Alloys* 1, 46-56(1929).—The "Aston" process (C. A. 20, 3728; *Am. Iron and Steel Institute, Yearbook*, 15, 117 (1925)) consists of melting pig Fe in a cupola, refining the molten metal in a Bessemer converter, producing slag of the proper compn by itself in an open-hearth furnace, and mechanically disintegrating the Fe and incorporating the slag with it by pouring the molten Fe into the molten slag. The remainder of the process is similar to the hand-puddling process. A résumé of the process is given and the essential operations are shown by photographs. The following tables of data are included: results of chem. analysis of metal at different stages of the process, chem. analysis of slag used, d. of wrought Fe in various stages of working, tensile properties of wrought Fe in the muck bar state, tensile properties of 1 in. wrought Fe pipe as detd. on full-size specimens, tensile properties of wrought Fe in the form of pipe skelp, tensile properties of 1 in. wrought Fe pipe detd. on longitudinal strips machined from the pipe, torsional properties of 1 in. wrought Fe pipe, results of chem. analysis of the three types of pipe used, chem. compns. of slags, results of flattening tests of 1 in. wrought Fe pipe, av. corrosion losses of wrought Fe pipe in accelerated lab. tests, 3 months duration. The following graphs are given: stress-strain curves of wrought Fe in the muck bar condition tested in tension,

stress-strain curves of wrought Fe in the form of pipe skelp tested in tension, corrosion of 1 in. wrought Fe pipe, comparison of the tensile properties of wrought Fe pipe with specification values. Photomicrographs show the structure of the Fe during various stages of manuf. Conclusions: The chem. compn. of the Fe made by the new process agreed closely with that of the hand-puddled (HP) Fe. The C content was consistently lower in the new-process (AP) Fe and more uniform. Metallographic examn. showed the entire absence of C streaks in the (AP) Fe. The S content of the (AP) Fe was slightly higher than that of the (HP) Fe. The densities of the (AP) Fe and the HP product were practically identical, that of the former being slightly higher. No marked differences in mech. properties were found in the 2 irons, in pipe form, as shown by tension, torsion and flattening tests. The (AP) Fe showed a slightly lower tensile strength accompanied by higher ductility. A slight difference in corrosion resistance as shown by accelerated lab. tests was in favor of the (HP) Fe. The difference was less than that due to the different methods used. The structural features of (AP) Fe were similar to those of all wrought irons. The important reactions entering into the manuf. of wrought Fe by the 2 processes seem to be fundamentally the same. The (AP) Fe does not seem to be inferior to (HP) Fe with respect to welding, galvanizing and machining. A. J. M.

**Summarized data of zinc production.** ELMER W. PEHRSON AND THE COMMON METALS DIVISION. Bur. of Mines. *Econ. Paper* 2, 47 pp.(1929).—Shows the relation of production in the United States to that of the world. E. J. C.

**The reduction of zinc ferrite.** V TAFEL AND H GROSSE. *Metall u. Erz* 26, 354-7 (1929).—At 1050° Zn ferrite is reduced by charcoal as rapidly as ZnO, but below this temp. somewhat more slowly. Reduction may also be brought about by metallic Fe but ZnO is the more easily reduced. The addn. of CaO to ferrite promotes the reduction very markedly. HANS C. DIUS

**Beryllium.** MENAHEM MERLUB-SOBEI. *Metals and Alloys* 1, 69-70(1929).—A review. A. J. MONACK

**The production and uses of beryllium.** KURT ILLIG. *Chem. Age* (London), Monthly Met. Sect. 21, 17-8(1929); cf. C. A. 23, 801. E. J. C.

**Utilization of metal scraps.** CONSTANTIN REDZICH. *Apparatebau* 41, 138(1929).—The economic importance of the utilization of metal scraps is stressed and practical suggestions are made. M. C. ROGERS

**Sodium sulfide fusions.** H. FINCKE. *Metallbörse* 17, 2637-8; *Chem. Zentr* 1928, 1, 481.—The behavior of PbS, ZnS, Cu<sub>2</sub>S, FeS and NiS<sub>2</sub> when fused with Na<sub>2</sub>S was investigated. PbS dissolved but ZnS did not. A mixt. of ZnS + PbS set at the bottom of the fused Na<sub>2</sub>S without complete soln. Metallic Cu or Pb was not obtained by fusion of the sulfides with Na<sub>2</sub>S. Somewhat better results were obtained by fusion of Cu<sub>2</sub>S and PbS with Na<sub>2</sub>SO<sub>4</sub> and charcoal. Similarly the Orford process, fusion with Na<sub>2</sub>SO<sub>4</sub> + C gave a better sepn. of Ni and Cu from their sulfides than when fused with Na<sub>2</sub>S alone. The sepn. of Cu<sub>2</sub>S-PbS in Pb-mat cannot be accomplished by Na<sub>2</sub>S fusion because of the FeS which is also present. C. R. F.

**Molding sand testing, theory and practice.** FRANZ ROLL. *Die Giesserei* 16, 393-401(1929).—Permeability of sand depends on the character of the grain, H<sub>2</sub>O content, compactness, bond material and the condition of the mold. For given conditions there is an optimum H<sub>2</sub>O content at which molding sand has the highest permeability. Air has a different permeability no. than CO<sub>2</sub> and CO. CO<sub>2</sub> passes through sand more readily than air. Addns. of coke or coal dust can increase or decrease the permeability of sand. Its strength increases with the H<sub>2</sub>O content, compactness and the amt. of clay bond until some optimum value for each is reached. On drying sand its ability to absorb dyes decreases as the temp. of drying rises. The strength of sand and its dye absorption properties are closely related. In general, the strength of sand increases with decreased porosity. The thermal cond. of sand increases rapidly with the H<sub>2</sub>O content. Sand contg. 10% H<sub>2</sub>O is 10 times more conductive than dry sand. Compactness of sand influences the heat capacity and thermal cond. Molding sand should not lose more than 6% of wt. when ignited for 4 hrs. at 500°. C. H. LORIG

**Melting and casting magnesium.** W. E. WARNER. *Metal Ind.* (London) 35, 203(1929). E. J. C.

**Eutectic cast iron.** BERNHARD OSANN. *Die Giesserei* 16, 565-7(1929).—The question of the formation of eutectic cast iron is considered from a theoretical standpoint. Fletcher's formula for C content of eutectic cast iron,  $C = 4.3 - 0.286 Si - 0.387 P + 0.018 (Mn - 1.8 S)$  gives values that are high. At no time will this calcd. value be below 3.43% C. In cast iron there are 6 components which det. the eutectic compn. of the Fe. Analysis made of the liquid removed from partially solidified cast

Fe gave the compn. of the eutectic alloy as C 3.00, Si 0.80, Mn 0.30, P 0.26 and S 0.07%.

**Molding of iron plates for gas and chemical tanks.** J. H. EASTHAM. *Foundry* 57, 801-2(1929). E. J. C.

**Steel-melting practice for large ingots and high-grade castings.** W. H. WHITE. *Fuels Furnaces* 7, 1389-92(1929). E. J. C.

**Effect of molten bronze on steel.** I. T. HOOK. *Welding Eng.* 14, No. 7, 53-6 (1929).—Molten high-strength bronze applied to steel which is free from stresses will not penetrate or cause cracks. E. I. S.

**Manufacture of wire bars from secondary copper.** W. A. SCHEUCH AND J. WALTER SCOTT. *Am. Inst. Mining Met. Eng., Tech. Pub.* No. 246, 16 pp.(1929). E. J. C.

**The patentability of alloys.** H. SCHACK. *Z. Metallkunde* 21, 246(1929).—A comprehensive analysis with discussion. ROBERT F. MEHL

**X-ray metallography in 1929.** II. GEORGE L. CLARK. *Metals and Alloys* 1, 57-68(1929); cf. *C. A.* 23, 4429.—A well-illustrated review. A. J. MONACK

**Examination of alloys by x-rays.** LÁSZLÓ TOKODY. *Technika* (Budapest) 10, 95-101(1929).—The theory of structure of crystals is summarized. The Debye-Scherrer method is described as the most efficient one for the analysis of alloys by x-rays. The results of x-ray analyses of various alloys are presented and, finally, a theoretical explanation of particular details in the data is given. S. S. DE FINÁLY

**X-ray studies on alloys.** A. F. WESTGREN AND G. PHRAGMÉN. *Trans. Faraday Soc.* 25, 379-85(1929); cf. *C. A.* 23, 587.—Structural similarity of intermetallic phases is connected with the concn. of valency electrons. The ratio of valency electrons to atoms is about 3/2 for several binary alloys of Cu, Ag and Au with other metals. In the cases of the 3/2 ratio the structure is body-centered cubic or that of  $\beta$ -manganese. The terms solid chemical compd. and solid soln. are discussed and a short account of the change of the av. vol. of the atoms in alloys with varying compn. is given. W. H. W.

**X-ray investigation of wire.** F. C. ELDER. *Wire* 4, No. 7, 236(1929).—Expts. with studies of crystn in low-C specimens promise possibilities of wider application for test purposes. E. I. S.

**A metallurgical specimen holder for use on an ordinary microscope stage.** E. E. JELLEY. *J. Sci. Instruments* 6, 266-7(1929). E. J. C.

**A study of the Ikeda accelerated test for determining endurance limit.** H. F. MOORE AND SEIICHI KONZO. *Metals and Alloys* 1, 70(1929).—Data are given to show that results obtained by the accelerated test compare favorably with those obtained by the long-time test. A. J. MONACK

**Rise of the break in the tensile strength curve of metals due to strain and aging.** GALIBOURG. *Compt. rend.* 188, 993-5(1929).—The curves representing the variation of the rise for extra-soft steel as a function of time are hyperbolas of the form  $x = ay/(b - y)$ , where  $x$  is the time of aging,  $y$  the difference between the final load of the first strain and the load corresponding with the break in the second strain curve, and  $a, b$  are consts. The rate of rise increases with the temp, the temps. of aging between the first and second strains being 12.5-14.5°, 50-53° and 175-180°. Pure Ni aged at 175-180° also showed the phenomenon. B. C. A.

**The correlation of fatigue and overstress.** J. H. SMITH, C. A. CONNOR AND F. H. ARMSTRONG. *J. Iron Steel Inst., Advance copy* No. 10, Oct., 1929, 29 pp. E. J. C.

**Nitride and cyanide hardening of vacuum cleaner parts.** R. G. ROSHONG. *Fuels Furnaces* 7, 1393-6, 1408(1929). E. J. C.

**Effect of service on the endurance properties of rail steels.** JOHN R. FREEMAN, JR., AND HAIG N. SOLAKIAN. *Bur. Standards J. Research* 3, 205-46(1929). E. J. C.

**The elastic properties of light metals.** H. SIEGLERSCHMIDT. *Metallwirtschaft* 8, 843-6(1929). E. J. C.

**Tarnishing the non-ferrous metals and alloys.** B. JEFFS. *Black and White* 2, No. 2, 9-10(1929).—Study of corrosion of different metals shows that products of corrosion may be divided into the following classes which are discussed: films which accelerate corrosion, films which neither accelerate nor retard corrosion but allow corrosion to proceed at a uniform rate and films which retard corrosion. E. I. S.

**Bimetallic thermometric elements.** W. ROHN. *Z. Metallkunde* 21, 259-65 (1929).—The choice of a proper bimetallic strip depends upon whether the strip is to be used to give temp. readings over a range of temps or to maintain a const. predetd. temp. For the first purpose the choice of the less expansive alloy is made difficult by the fact that the usual com. alloys (Ni-Fe) do not expand linearly with temp. to high temps. For a temp range up to 120° invar is recommended, up to 230° a 40% Ni-Fe alloy, up to 340° a 42% Ni-Fe alloy, up to 440° a 46% Ni-Fe alloy. Ni-Fe alloys cannot

be used at higher temps. since their thermal expansion becomes greater than that of the element usually chosen for the more expansive alloy. Constantan and Monel metal are better than Al, Cu or Pb for the high-expansion alloy. Ni-Fe alloys lower in Ni (22-27%) can be used for the high expansion alloy but show irregularities due to transitions at higher temps. These may be wholly suppressed by the addn. of 5% Mo. Such an alloy has an expansion greater than that of Cu. Expansion curves are given for a large no. of com. alloys. A combination of an alloy of 27% Ni (Fe-Ni) plus 5% Mo with an alloy of 42% Ni (Fe-Ni) can be used up to 550°. For a high elec. cond. an age-hardened Cu-Be alloy with invar is theoretically desirable but difficult to prepare and, in general, other combinations are more useful, especially Ni-invar. Some notes on the prepn. of bimetallic strips are given. Metals are always used in a hard-rolled condition in order to get the highest possible elastic limit. Slow and repeated heating up to 30-50° above the temp. of use is recommended as a preliminary aging. Mechanical requirements of thickness and length are discussed as well as methods of measuring the desired properties.

ROBERT F. MEHL

**Influence of heat treatment below the  $A_1$  point on the properties of technical iron.** W. KÖSTER. *Arch. Eisenhüttenw.* 2, 503-22(1928-9).—The solid soly. of cementite in  $\alpha$ -iron increases with rising temp. between 600° and the  $A_1$  point, so that steels with less than 0.9% C age-harden after quenching from above 600°, the max. effect being obtained with 0.09-0.1% C aged at room temp. In this case the yield point increases by 60%, the tensile strength by 55% and the hardness by 65%, whereas the elongation decreases by 50% and the reduction in area by 10%. The decompn. of the supersatd. solid. soln. begins to be appreciable in 1 hr. at 50°, and is completed at 200-250°; the pptd. carbide particles first sep. as black points throughout the grains, but with rising temp. they migrate to the grain boundaries. The coercivity increases slightly with increase of quenching temp. below  $A_1$ , but the remanence undergoes a marked decrease; on aging or annealing the quenched steel the values for these properties return more or less rapidly to the normal.

B. C. A.

**Molybdenum steels and their use in permanent magnets.** A. F. STOGOV AND V. S. MESKIN. *Arch. Eisenhüttenw.* 2, 595-600(1928-9).—Steel with 0.9-1% C and 2-2.5% Mo has considerably better magnetic properties than the usual W and C magnet steels, but the decrease in the magnetic moment by aging is approx. the same. The highest values for the remanence and coercivity are obtained by quenching in water from 800°; a slightly lower temp. gives much lower values for these properties, whereas a slightly higher temp. has little effect. Complete dissoln. of the Mo carbide into solid soln. does not occur below 1100°; at 800° the alloy has a granular pearlitic structure.

B. C. A.

**Study of stainless steels. II.** YOSHIHIRO KAWAKAMI. *Iron and Steel* (Japan) 14, 996-1059(1928); cf. *C. A.* 23, 2139.—K. carried out the tensile strength and impact tests of various kinds of quenched and quench-tempered stainless steels, finding that the tensile strength is a max. in W-contg. steel, while the impact resistance is max. in steels contg. Cr and more than 5% of Ni. At -60° the impact resistance decreases to a value less than  $\frac{1}{3}$  of the value at ordinary temp., the decrease being less when Ni, Si or Cu is contained in addn. to Cr. In the range 300-800° the tensile strength is max. in steels contg. more than 5% Ni and less than 3% Si. The min. temp. coeff. of expansion is shown in steels contg. Cr and a small quantity of C or W. The resistance to oxidation at 900° is high in steels contg. much Si or in those contg. Cr and more than 5% Ni. Steels contg. much Cr and less than 10% Ni are hardest to machine. An alloy contg. Ni 20%, Zn 30%, Ag 3%, Cu 46% is best for soldering. Steels contg. a small quantity of Cr are most easily gas welded.

K. SOMEYA

**The recrystallization of electrolytic copper after hot-rolling.** W. TAFEL. *Z. Metallkunde* 21, 265-7(1929).—It was previously shown that the recrystn. of Fe after hot-rolling is somewhat different than that after hot forging, probably because of different states of inner strain induced in the two processes (*C. A.* 23, 1853). Cu shows similar deviations. The grain size at deformations less than the critical and also at deformations greater than the critical is somewhat greater in the case of hot-rolling. The peak in the curve of grain growth vs. reduction is somewhat displaced toward higher deformations. These deviations of the hot-rolling curve from the hot-forging curve are thought to originate in the seizing action of the rolls, which introduces a drawing effect, making the recorded reductions in height somewhat too great for the amount of strain introduced in the metal.

ROBERT F. MEHL

**Solubility of gases in pure aluminum and in an aluminum alloy.** W. CLAUS. *Z. Metallkunde* 21, 268-70(1929).—The claim made by Czochralski (*C. A.* 16, 3862) that Al and Al alloys must be heated above 900° before porosity, owing to gas soly., occurs in

the cast alloy is contrary to foundry experience. C.'s expts. were repeated with pure Al and with an alloy of 8% Cu, 92% Al. Samples (250 g. each) were heated and gassed 30 min. at temps. of 700° and 800°, resp. for each gas. For pure Al, C.'s results are confirmed with N<sub>2</sub>, O<sub>2</sub>, CO, CO<sub>2</sub>, SO<sub>2</sub>, but not for H<sub>2</sub> and illuminating gas, in which soly. sets in at low temps. CH<sub>4</sub> and C<sub>2</sub>H<sub>4</sub> are slightly sol. at 800°. The 8% Cu alloy was more active than pure Al in dissolving the gases H<sub>2</sub>, illuminating gas, CH<sub>4</sub>, C<sub>2</sub>H<sub>4</sub> and water vapor. The results are tabulated in detail. Photomicrographs show inclusions and porosity. It is recommended that Al and Al alloys not be heated above 800° in manuf., that the furnace atm. be kept away from the melt, and that products of combustion of the fuel contain as little water vapor as possible. The usual porosity in com. Al alloys is probably caused by the decompn. products of water vapor. ROBERT F. MEHL

**Pouring height should be low in casting aluminum alloys.** DOUGLAS B. HOBBS. *Foundry* 57, 753-6 (1929).

**Regulated control in heat-treating aluminum-alloy castings.** ANON. *Am. Mach.* 71, No. 10, 403 (1929).—The method used by the Aluminum Company of America to heat-treat and test castings of Al alloys under nearly automatic conditions is illustrated.

**98 percent aluminum bars and ingots for remelting purposes, for rolling slabs and Billets.** ANON. *Brit. Eng. Standards Assoc.* (London) No. 359, 9 pp. (June, 1929).—Specifications cover quality of material, manuf. and provision of samples for analysis.

**99 percent aluminum notched bars and ingots.** ANON. *Brit. Eng. Standards Assoc.* (London) No. 360, 6 pp. (June, 1929).—Specifications cover quality of material, manuf. and provision of samples for analysis.

**Work on beryllium and its alloys.** H. W. GILLETT. *Metals and Alloys* 1, 71-2 (1929).—The properties of Be and Be alloys are reviewed.

**The possible use of beryllium in aircraft construction.** H. W. GILLETT. *Trans. Am. Electrochem. Soc.* 56 (preprint) 4 pp. (1929).—The phys. properties of Be are briefly reviewed. An outstanding property is the high modulus of elasticity, which is nearly 3 times that of Mg. Be is more abundant in the earth's crust than either Pb or Zn. The future development and application of the metal are discussed at length, and it is concluded that Be will some day be an important factor in aircraft construction.

**Lime process for coating aluminum.** LEON McCULLOCH. *Trans. Am. Electrochem. Soc.* 56 (preprint) 3 pp. (1929).—A dead-white coating can be given articles of Al by boiling them with 10 g. of unslaked lime and 10 g. of CaSO<sub>4</sub> per l. of water. Each day a fresh addition of lime and CaSO<sub>4</sub> should be made, as it is suspected that the bath deteriorates in some way on aging. The temp. should be kept at about 100°. The bath should be gently stirred to prevent settling. The coatings are extremely fine-grained, very adherent and do not separate from the metal on bending. A chemical analysis of the coating upon Al foil showed Al<sub>2</sub>O<sub>3</sub> 54.5, CaO 5.75, SO<sub>3</sub> 10.7, water expelled at 300° 29.0%.

**Hair line cracks on the surface of plates (metallic).** FRICH A. MATEYKA. *Metals and Alloys* 1, 80-1 (1929).—See C. A. 23, 3647.

**The heat resistance of aluminized steel and cast iron.** W. ZIMM. *Arch. Wärme-ert.* 10, 275-8 (1929).—In the aluminizing process Al is sprayed on, and the piece afterward heated away from air. Since the piece is not bedded in Al when heated, the alloy formed may be made to contain less than 25% Al. Above 1100° the process affords no protection. Cast iron is less evenly protected, as the Al will not diffuse through graphite; the finer the grain, the better the results. Tests for 4 months at 500-700° showed the coating to be of value in all cases, though the protection is not abs.

**Rept. of Committee A-5 on corrosion of iron and steel.** J. H. GIBBONEY, et al. *Proc. Am. Soc. Testing Materials* 1929 (preprint) No. 12.—Data of continuations of atm. and submerged corrosion tests of Comm. A-5 are presented without conclusions as to the relative corrodibilities of the various metals tested.

**Some methods of preventing pipe corrosion.** FR. BESIG. *Korrosion u. Metall-schutz* 5, 99-110 (1929).—A review of the modern methods for prevention of corrosion of underground pipes with special reference to corrosion by electrolysis.

**A critical study of the A.S.T.M. corrosion data on uncoated commercial iron and steel sheets.** V. V. KENDALL AND E. S. TAYLORSON. *Proc. Am. Soc. Testing Materials* 1929 (preprint) No. 37, 16 pp.—From the data of Committee A-5 on corrosion of Fe and steel it is concluded that Cu-bearing steel is more resistant to corrosion than ordinary steel in the atm. P combined with Cu in the steel is beneficial in Pittsburgh

atm., while Mn and S to the extent investigated have no marked effect either way. None of the elements studied seems to have any effect on submerged corrosion.

B. E. ROETHLI

**Effect of corrosion, accompanied by stress, on the tensile properties of sheet duralumin.** H. S. RAWDON. *Proc. Am. Soc. Testing Materials* 1929 (preprint) No. 42.—Full-sized tension specimens were corroded in a NaCl-H<sub>2</sub>O<sub>2</sub> soln. Al-coated duralumin sheet maintained its initial properties unimpaired under static tension for 60 days when loaded to 20,000 lb. per sq. in. and for 40 days when loaded to 31,000 lb. per sq. in., while the unprotected alloy suffered a marked depreciation in tensile properties after a few days. Al-coated duralumin was found far superior to the uncoated alloy when subjected to cyclic stress; it could be stressed much more severely than the alloy alone and even then the number of cycles to cause failure is considerably greater.

B. E. R.

**Atmospheric corrosion of metals—3rd report to the Atmospheric Corrosion Research Committee.** J. C. HUDSON. *Trans. Faraday Soc.* 25, 177-252 (1929).—Of 16 non-ferrous metals and alloys, most were but slightly subject to atm. corrosion. Changes in appearance might influence the use of one or the other if used for decorative purposes. No definite conclusions are presented regarding the rate of corrosion vs. time. However, it is believed that there is a direct proportionality between the two. Films of corrosion products may limit further corrosion, depending upon the solv and chem compn. of the resulting film, e. g., arsenical Cu is more resistant than high-cond Cu. Samples fully exposed to the atm. show higher rates than those under Stevenson screens. The changes in tensile strength and in elec. resistance agree closely except for brass indicating the absence of pitting or intercryst. corrosion. There is considerable difference between wt. loss, the wt. increment and the resistance tests. The discrepancies are attributed to wind shelter, to penetration of the metal at cryst. boundaries in wt.-loss tests and to local action due to H<sub>2</sub>O droplets. Dezinification of brass causes appreciable losses in strength (more for 60/40 brass than for 70/30 brass). The indices of corrodibility outdoors for rural, suburban, urban, marine and industrial atms. are, resp., 1.0, 1.6, 2.8, 2.1 and 2.3 with 1, 2.1, 5.8, 2.2 and 2.8 when under Stevenson screens. The corrosion rates in continuous tests show a decrease with time over the periods investigated. Cu, Cd-Cu, As-Cu, Sn-bronze and Al-bronze gave the lowest increments in wt., probably due to the formation of insol corrosion products. Evidence is given to show the existence of critical humidities for the various metals all being below satn. except for Al and Cu. Ni is liable to attack without much loss in tensile strength in atms. high in S compds. Resistance methods consistently give higher results than wt.-loss tests, because wt.-loss measurements are necessarily minimum value. Also in *Metal Ind.* (London) 34, 631-4; 35, 14-6, 35-7, 79-82 (1929).

B. E. ROETHLI

**The mechanism of oxidation processes. XVI. The corroding of iron.** HEINRICH WIELAND AND WILHELM FRANKE. *Ann.* 469, 257-308 (1929); cf. *C. A.* 23, 2196.—Fe amalgam shaken with H<sub>2</sub>O and air liberated H<sub>2</sub>O<sub>2</sub> in measurable quantities; the H<sub>2</sub>O<sub>2</sub> was detd. colorimetrically in acidulated Ti<sub>2</sub>(SO<sub>4</sub>)<sub>3</sub>. The quantity of H<sub>2</sub>O<sub>2</sub> liberated increased with increasing alky. The Fe is oxidized to Fe<sup>++</sup> and subsequently to Fe<sup>+++</sup>. HCN decreases the rate of decompn. With Fe (ferrum reduction) powder the isolation of H<sub>2</sub>O<sub>2</sub> is rendered more difficult because of its increased rate of catalytic decompn. Alkali is necessary to slow the rate of decompn. so as to enable the isolation of H<sub>2</sub>O<sub>2</sub>. Cooling increases the possibility of isolation. KCN does not appreciably lower the rate of decompn. The quantity of O<sub>2</sub> used up by Fe powder is increased by decreasing the  $p_H$  whereas the reaction Fe<sup>++</sup> to Fe<sup>+++</sup> is not affected appreciably. It is therefore concluded that the latter reaction is brought about by H<sub>2</sub>O<sub>2</sub> and not by O<sub>2</sub>. Complex formation affects the O<sub>2</sub> consumption in various ways. Neutral salts, amino acids (leucine, glycocoll, alanine and asparagine) increased the rate of O<sub>2</sub> consumption of Fe powder, whereas no appreciable effect was noted in case of Fe amalgam. Expts. with salts of noble metals altered the O<sub>2</sub> consumption not by the deposition of metal but by altering the Fe<sup>++</sup> concn. in the soln, further expts. on salts of Fe<sup>++</sup> confirming these observations. Passivating agents [(K<sub>3</sub>Fe(CN)<sub>6</sub>), K<sub>2</sub>CrO<sub>4</sub>, KMnO<sub>4</sub>] decrease the auto oxidation of Fe powder but have no appreciable effect upon Fe amalgam. For Fe powder the rate of consumption of O<sub>2</sub> decreases with time, while for Fe amalgam the rate remains uniform, thus indicating the passivating of the Fe powder and the const. activity of the Fe in the amalgam. Similar results are obtained with H<sub>2</sub>O<sub>2</sub>. Depolarizers such as quinone, methylene blue, diethyl peroxide and dithiodiglyc. l'c acid affect Fe powder in a manner similar to O<sub>2</sub>. The H<sub>2</sub>O<sub>2</sub> formed is used up (1) by catalytic decompn., (2) in oxidation of Fe to Fe<sup>++</sup> and (3) in oxidation of Fe<sup>++</sup> to Fe<sup>+++</sup>. The increase in O<sub>2</sub> consumption in the presence of neutral salts is attributed to increased elec. cond., and the effect of  $p_H$  to changes in the potential of the cell Fe | Fe<sup>++</sup> | H | H<sup>+</sup>.

The effects of HCN and amino acids are believed to be due to possible complex ion formations. The differences in behavior of Fe powder and Fe amalgam in passivating agents are attributed to the nature of particle distribution, *i. e.*, the Fe particles in the amalgam do not have the surface available for passivation, while in the powder the surfaces are always exposed to the passivating medium.

**Investigations on the corrosion of metals in automotive vehicles by fuels and mixtures thereof.** K. R. DIETRICH. *Korrosion Metallschutz* 5, 110-4(1929).—Samples of Fe, Cu, Zn, galvanized Fe, brasses and Fe plated with Ni, Sn or Pb were immersed in various liquids in use as motor fuels, such as benzine, benzene, light oil, alc., abs. alc. and monopolin. Fe was attacked by all the liquids to form an oxide or sulfide. Zn and Cu were attacked by hydrocarbons contg. S. Hard Al was attacked by the alc.-benzine mixtures but not by any of the liquids alone. Lautal was attacked by the hydrocarbons contg. S, somewhat by alc. and not at all by benzine-alc. mixtures. Fe plated with Ni or Sn was unattacked. Pb-coated Fe was unattacked only by abs. alc. Galvanized Fe was attacked by hydrocarbons contg. S. Brasses and bronzes were unattacked. Increasing the pressure on the liquid and the temp. of the corroding medium increased the corrosion rate about 50-fold.

**Corrosion of metals under cyclic stress.** D. J. McADAM, JR. *Proc. Am. Soc. Testing Materials* 1929 (preprint) No. 40, 54 pp.; cf. C. A. 23, 2410.—A discussion of the effect of stress, time and no. of cycles on corrosion in Severn river H<sub>2</sub>O and fresh H<sub>2</sub>O. The metals investigated were steels, duralumin, Monel metal and stainless Fe. The net effect of cyclic stress on corrosion is shown graphically by "net damage" diagrams. The net damage diagrams indicate that for the metals investigated the stress-time cycle relationship is exponential in character. The relationship for ordinary steels in both waters can be represented by practically the same diagram. Stress cycles, however small, increase the corrosion rate of ordinary steels and duralumin. There is apparently no limiting stress below which the effect of cyclic stress decreases suddenly. It is not known whether there is such a limiting stress for Monel metal or stainless Fe.

**Welding in the chemical and process industries.** A. G. WIKOFF. *J. Am. Welding Soc.* 8, 78-88(1929).—Various ways are presented in which chem. plants can utilize welded construction and apply oxy-acetylene welding and cutting processes advantageously.

**Welding of copper and high copper alloys.** I. T. HOOK. *J. Am. Welding Soc.* 8, 113-29(1929).

**Ore dressing.** THOMAS G. MARTYN. Ger. 479,672, Apr. 17, 1926. A method of sepg. the solid parts from the sludge is described.

**Ore-classifying apparatus.** FRANCIS B. McCONVILLE. U. S. 1,728,404, Aug. 27. Structural features.

**Working up ores by bubbling air into a suspension of slime.** ERZ- UND KOHLE-FLOTATION G. M. B. H. Ger. 480,425, Nov. 17, 1926. Details.

**Working up complex ores.** FRIEDRICH KRUPP GRUSONWERKE A.-G. Ger. 481,211, Aug. 8, 1925. Complex ores and similar metallic materials contg. metals easily volatilized mixed with those difficult to volatilize are worked up by first heating with reducing agents to remove the readily volatile metals, and then heating more strongly with chlorides to volatilize the other metals. The condensed metals are then sepd. from each other.

**Purifying aluminiferous ores.** U. B. VOISIN. Brit. 306,094, Feb. 15, 1928. Bauxite or like material contg. Fe is treated with gaseous HCl at 150–500° to volatilize the Fe as FeCl<sub>3</sub>. Effluent gases may be washed with H<sub>2</sub>SO<sub>4</sub> to recover Fe as sulfate, and regenerate HCl. Cl may be used with the HCl if any of the Fe is in the ferrous state. The ore may be preliminarily roasted.

**Machine for disintegrating and refining friable aluminiferous ores.** ILSEDER HÜTTE. Ger. 479,774, Dec. 15, 1925.

**Treating chromium ores.** I. G. FARBENIND. A.-G. Brit. 305,712, Nov. 10, 1927. Cr ores are given a preliminary "opening up" treatment, as by heating and quenching in water or by melting with 5% or more of an alk. reagent in a non-oxidizing atm. and are then treated (preferably at temps. of 500–650°) with HCl or Cl or both, with or without use of reducing agents. Treatment with Cl in the presence of charcoal followed by lixiviation with dil. HCl leaves Cr oxide free from Fe; treatment with HCl in the presence of a reducing agent leaves a residue of pure chromic chloride; treatment with mixed HCl and Cl or with HCl alone without a reducing agent leaves a residue of Cr oxide. Cf. C. A. 23, 590.

**Treating iron ores.** E. W. WESCOTT (to Comstock & Wescott, Inc.). Brit. 306,107, Feb. 16, 1928. Fe ores such as sulfide ores are chlorinated at about 375° to form FeCl<sub>3</sub> and after diluent gases are removed from the system further chlorination to form FeCl<sub>3</sub> is effected. The FeCl<sub>3</sub> may be treated with hot air at 700–800° to form Fe<sub>2</sub>O<sub>3</sub> and Cl. A small quantity of producer gas may be added catalytically to coarsen the oxide formed. Various details of operation and use of Cl in a cyclic process are described.

**Treating oxidized lead ores.** NIELS C. CHRISTENSEN. U. S. 1,726,258, Aug. 27. PbCO<sub>3</sub> ore or the like is lixiviated with a concd. NaCl brine contg. FeCl<sub>3</sub> to dissolve the Pb as chloride, the soln. is sepd. from ore residue and is electrolyzed with an iron anode to ppt. substantially two-thirds of the dissolved Pb and form FeCl<sub>2</sub> in the soln.; the soln. is thereafter electrolyzed with an insol. anode to ppt. approx. one-third of the Pb in soln. and the FeCl<sub>2</sub> is converted into FeCl<sub>3</sub> by electrolytic action and the FeCl<sub>3</sub> is used for treating a further quantity of ore. An app. is described.

**Treating tin-bearing materials.** P. ROBINSON (to D. Guggenheim, M. Guggenheim, S. R. Guggenheim, S. Guggenheim, J. K. MacGowan and E. A. C. Smith (trading as Guggenheim Bros.)). Brit. 306,108, Feb. 16, 1928. Crude Sn-bearing material is subjected to a preliminary purification treatment which may comprise treatment with acid and then successively leaching with NaCl and NaOH solns. and reduction is afterward effected in the presence of a carbonaceous reducing agent and a mixt. of alkali and alk. earth fluxes (preferably lime and soda with the lime in excess). Numerous details and auxiliary treatments are described.

**Agglomerating granular tin ores.** PAUL HAEDRICH and OTTO KIPPE (to Metallges. A.-G.). U. S. 1,726,066, Aug. 27. Mixts. formed from granular Sn ore and highly dispersed Sn oxide are pressed into pieces.

**Tin ores.** WILHELM WITTER and M. LISSAUER & CIE. Ger. 481,394, Sept. 1, 1925. See Brit. 304,829 (C. A. 23, 4664).

**Treating zinc ores.** S. ROBSON. Brit. 306,569, Oct. 24, 1927. In producing a porous sintered zinc oxide from ZnS ores, concentrates and like materials, the material is mixed with a coarse granular or nodular material (such as a crushed product from a previous blast-roasting operation, crushed pumice, slag or zinc retort residue) to ensure such porosity in the charge that air can readily be drawn through it, and the charge is subjected to blast-roasting with substantial exclusion of air other than that which is drawn through the charge itself, to produce a gas sufficiently rich in S that it may be used in the *manuf. of H<sub>2</sub>SO<sub>4</sub>*.

**Mercury from ore.** ITALO CAVALLI. Ger. 480,713, Sept. 21, 1927. See Fr 641,178 (C. A. 23, 1105).

**Zinc sulfate from ores.** FRIEDRICH JOHANNSEN (to Fried. Krupp Grusonwerk A.-G.). U. S. 1,725,865, Aug. 27. Sulfidic ore contg. Zn is subjected to an initial oxi-

dizing roast to eliminate part of the S content as  $\text{SO}_2$ ; the resulting Zn-contg. product is then subjected to a combined roasting and distg. treatment in the presence of an alk. earth metal compd. to liberate a Zn-contg. distn. product, and  $\text{SO}_2$ -contg. gases from the oxidizing roasting treatment are caused to react with the Zn-contg. distn. product, to produce  $\text{ZnSO}_4$ . An app. is described.

**Distilling zinc and other volatile metals.** H. E. COLEY. Brit. 306,425, Sept. 14, 1927. Zn and other volatile metal vapors are condensed by passing them directly from the reducing chamber into a condensing chamber where they ascend through a finely divided spray of water or other suitable liquid. The liquid with assocd. metal may be passed to a filter press. An app. is described.

**Platinum concentrates.** S. C. SMITH. Brit. 306,566, Oct. 21, 1927. In obtaining Pt concentrates from ores also contg. Ni, Cu and Fe, a sulfide mat is first produced, desulfurization is effected by roasting with or without first bessermerizing, the roasted mat is reduced to produce a metal sponge, with or without a previous leaching with acid to ext. Cu, Ni and Co, the sponge is treated with dil. acid to dissolve Ni and Fe and leave the Pt group metals, generally admixed with Cu. Various methods of reduction are specified.

**Chemical metal working.** ALADAR PACZ. Ger. 480,720, Dec. 2, 1926. Metal consisting wholly or chiefly of Al is given an irregular speckled coating by treating with an aq. soln. contg. a fluosilicate, a salt of Co or Ni and an alkali metal salt. A catalyzer such as a Mo compd. may be present.

**Metal founding.** CARL REIN. Ger. 480,831, May 7, 1927. A tilting trough for pouring molten metal, especially Fe, into molds, is described.

**Pump for molten metals.** G. WESTOVER and LANSTON MONOTYPE CORP., LTD. Brit. 306,339, May 9, 1928. Structural features.

**Water-cooled ingot mold.** JOHANN HOLTHAUS. Ger. 479,629, Feb. 22, 1927. Details of construction are described.

**Steel-pouring device for an ingot mold.** DANIEL LARNER. Ger. 479,627, Dec. 18, 1925.

**Molding metals.** LEO SZILARD. Ger. 476,812, Jan. 20, 1926. The metals are poured into the molds by elec. means.

**Molding metals.** PIEL & ADEY G. M. B. H. Ger. 480,900, May 23, 1923. Small castings of alloys contg. more than 50% Cu, such as brass, German silver and bronze, and difficult to melt, are produced in an ingot mold.

**Apparatus for molding metals.** EDWARD HARMES (to New Process Multi-Castings Co.). U. S. 1,726,022 3-4-5, Aug. 27. Structural features.

**Metal molding machine.** WILHELM KURZE. Ger. 480,311, July 7, 1927.

**Molding die-casting machine tubes in thin-walled ingot molds.** HEINRICH BURCHARTZ. Ger. 481,334, Apr. 10, 1927.

**Die-casting machine.** JOSEF POLAK. Ger. 479,632, Nov. 6, 1926. Details are described.

**Die-casting machine.** HALBERGERHÜTTE G. M. B. H. Ger. 480,204, Oct. 5, 1926. Details of pouring and filling.

**Die-casting machines.** HEINRICH PROJAHN. Ger. 480,993, Feb. 22, 1927. The improvement of the tubes, e. g., by coating with enamel, is described.

**Centrifugal casting of pipe.** WM. H. MORGAN, SR. (to Wm. H. Morgan, Jr.). U. S. 1,726,160, Aug. 27. Mech. features.

**Casting and rolling copper.** W. F. EPPENSTEINER and H. M. GREEN (to United States Metals Refining Co.). Brit. 305,998, Feb. 13, 1928. Ingots of Cu or other easily oxidized metal or alloy, for rolling into sheets or strips, are cast on end in cooled molds with but slight taper or no taper and then passed through rolls with the oxidized face in advance. An arrangement of app. and various details of procedure are described.

**Smelting iron alloys.** C. BRACKELSBURG. Brit. 306,141, Feb. 16, 1928. Smelting is effected in a rotary furnace by use of pulverulent fuel, and oxidation of the metal and absorption of gases are prevented by covering the molten charge with a layer of slag. Lime may be added to the charge and a slightly reducing atm. may be maintained in the furnace. An app. is described.

**Refining antimonial lead.** BRUCE W. GONSER and CALVIN W. HAFFREY (to American Smelting and Refining Co.). U. S. 1,726,346, Aug. 27. In order to recover Sb present in large proportion in Pb it is rapidly heated to a relatively high temp. and the bath is alternately subjected to oxidizing and reducing conditions so that volatile Sb oxides pass off as a fume and non-volatile oxides which form a scum on the surface are reduced to volatile oxides. Cf. C. A. 23, 86.

**Metallurgical furnace.** XAVIER DE SPIRLAT. Ger. 480,127, Apr. 17, 1927.

**Apparatus for use as a gas-producer ore-roasting furnace or for making bleaching powder, etc.** H. M. RIDGE. Brit. 305,883, May 1, 1928. Material treated is supported on a bed of inert granular material through which treating gas is introduced. Various structural details are described.

**Furnace suitable for heating ingots.** GEORGE NAISMITH and DONALD M. NAISMITH. U. S. 1,725,879, Aug. 27. Structural features.

**Oil-fired cupola furnace.** PETER MARX. Ger. 469,704, Nov. 15, 1927 and 477,241, Dec. 4, 1927. Details of construction are given.

**Rotary drum furnace.** WILHELM BUESS. Ger. 480,856, July 17, 1926. A cylindrical rotary drum furnace for refining metals and alloys is heated by gas or oil and can rotate through 360°.

**Smelting furnace.** FREIER GRUNDER EISEN- UND METALLWERKE G. M. B. H. Ger. 480,087, June 19, 1925. Details are given of the arrangement for sepg. and collecting the molten metal and the molten slag.

**Smelting furnace.** KARL SCHMIDT. Ger. 480,617, Sept. 22, 1927. A smelting furnace is mounted on an inclined axis to rotate through 360°.

**Tube furnace for treating ores.** MARCEL LAVOYE. Ger. 481,228, Aug. 11, 1926. The tube rotates and has a spiral internal flange. The app. is specially suitable for treating Al ores.

**Furnace for smelting tin ores.** W. J. CAYZER (to Cayzer Tin Smelting Co. (Proprietary), Ltd.). Brit. 306,445, Feb. 20, 1928. A reducing chamber with a dished hearth contains a bed of material such as spongy iron for filtering the molten tin. The furnace is heated electrically or by combustion of liquid or powdered fuel. In starting the furnace, powdered coke is used as the filtering material and during working this is replaced by spongy iron reduced from hematite or magnetite fed to the furnace or from impurities in the Sn ore. The furnace is operated with an atm. contg. at least 60% CO and at a temp. of about 950°. Various structural details are described.

**Oil burner for metal-smelting hearth.** ROBERT BÜHRER. Ger. 480,973, Nov. 2, 1927. Details.

**Air delivery system for blast furnaces.** JOHN C. HAYES, JR. (to Freyn Engineering Co.). U. S. 1,726,298, Aug. 27.

**Iron powder.** I. G. FARBENIND. A.-G. Brit. 306,215, Dec. 2, 1927. Pure Fe powder suitable for use in making cores of transformers or other elec. app. is made by treating Fe powder (which may have been produced from Fe carbonyl) at not over about 500° with a reducing gas, free from C, such as H, or an inert gas such as N until the C content is not over 0.5%, and subsequently heating to over 500° but below the m. p. in an inert atm., and grinding.

**Direct reduction of iron in a rotary furnace.** J. W. HORNSEY. Brit. 306,561, Aug. 18, 1927. Ore is passed through a rotary preheater and delivered to a rotary reducing chamber in which combustion is maintained under such conditions that the charge is kept from detrimental contact with the combustion air. An app. and various details of procedure are described.

**Strong machinable cast iron.** FRITZ GREINER. U. S. 1,726,433, Aug. 27. In treating molten cast iron having a content of (C plus Si) greater than 4%, to cause the metal upon solidification to contain the major part of the C in fine graphitic form, the (C plus Si) content is regulated in accord with the temp. from 4% for a temp. of 1400° to 6% for a temp. of 1700°.

**Magnetic testing system for detecting flaws in steel wire ropes, rails or other products.** T. F. WALL. Brit. 306,232, Dec. 20, 1927.

**Surface treatment of metals.** MARCEL FOURMENT. U. S. 1,726,431, Aug. 27. Articles such as bars, wires or tubes are highly heated superficially by the action of high frequency induction currents while in contact with coating material such as Zn or Al.

**Uniting metals.** PAUL HAESSLER. Ger. 481,363, May 9, 1926. Metals are joined by tinning and spraying with Al or Al alloy.

**Metallic pots for use in carburizing metals, etc.** F. K. LLANDGRAF and E. S. FITZSIMMONS (to Flannery Bolt Co.). Brit. 306,346, March 27, 1928. See U. S. 1,709,729 (C. A. 23, 2691).

**Heat treating conductors loaded with magnetic alloys.** G. W. ELMEN (to Electrical Research Products, Inc.). Brit. 306,543, Feb. 24, 1928. A coil of the conductor, on a reel of heat-resisting material, is heated and cooled in an annealing pot within an elec. furnace. The magnetic alloys may contain Ni 9-81, Co 5-80 and Fe 9-50% with or without up to about 10% of Mo or Cr. The material may be slowly heated to about 900°, maintained at this temp. for an hr. and then slowly cooled or it may be heated preliminarily to 800-900° by passing through a furnace as a continuous length, cooled

and reheated in the pot to 400–450°, or it may be heated to considerably above 450°, cooled to about 450° and either kept at 400–450° for several hrs. or very slowly cooled through the 450–400° range.

**Heat treating copper conductors.** V. E. LEGG (to Electrical Research Products, Inc.). Brit. 306,541, Feb. 24, 1928. A loaded or unloaded Cu conductor is heated in coiled form in an inert or rarefied atm. in a closed vessel to a temp. at which in the presence of reducing gases it would become brittle, and is then slowly cooled. An app. is described.

**Annealing.** ADALBERT BESTA. Ger. 479,851, Mar. 1, 1925. A method and a furnace filled with inert gas for annealing metals are described.

**Annealing metal strip in continuous lengths.** HIRSCH KUPFER- UND MESSINGWERKE A.-G. Brit. 305,951, Feb. 11, 1928. In passing through an annealing furnace, the material is exposed first to the highest annealing temp. and then to continuously decreasing temp. (which may be automatically controlled by a pyrometer).

**Metal sheets or strips.** O. JUNKER and O. JUNKER GES. Brit. 305,884, May 12, 1928. Sheets or strips such as those of Cu and its alloys are made by peeling off a surface layer from a metal block or ingot, with a cutting tool, at a temp. at which the metal assumes a plastic state. A temp. of 780–800° is suitable with an alloy contg. Cu 63 and Zn 37%. An app. is described.

**Utilizing light metal scrap.** HENRY CHAMBERLAIN. U. S. 1,725,780, Aug. 27. Scrap sheet metal such as tin-can scrap is intimately mixed with finely divided C, the mixt. is pressed cold to form bales, the bales are heated to about 1200° and while heated are subjected to high pressure to form solid bodies of metal.

**Degreasing metal objects.** GEBRÜDER FESSLER. Ger. 480,389, June 2, 1928. The degreasing agent, e. g.,  $C_2H_5Cl$ , is contained in a vessel with a layer of liquid such as water over it to protect it from contact with air.

**Degreasing metal objects.** EDUARD HAAS. Ger. 480,990, Feb. 1, 1928. Layers of grease or oil are removed from metal objects such as machine parts by a current of solvent. The app. is described.

**Alloys.** TH. GOLDSCHMIDT A.-G. Ger. 479,528, Dec. 10, 1922. An Al alloy with good casting qualities contains Ce 3–12 and Cu 2–20%, or Ce 2–12 and Si 1–8%.

**Alloys.** FRIEDRICH KRUPP A.-G. (Karl Schröter, inventor). Ger. 481,212, Dec. 13, 1925. Tools are made from hard metal alloys prepd. by sintering and contg. WC, Co and Ni or Fe. The alloy is heated to 700–1100°, sintered and molded as closely to the desired final form as possible. They are then sintered at higher temps. and ground. Cf. C. A. 23, 1103.

**Alloys.** ZINNWERKE WILHELMSBURG G. M. B. H. Ger. 479,661, Nov. 13, 1925. Converter dust contg. oxides of Zn, Sn, Pb and Cu is worked up by smelting with alkali. Thus dust contg. 25% Sn, 18% Pb and 30% Zn is mixed with 25% NaOH and 30% C and heated in a reverberatory furnace. The Zn is rapidly liberated and removed. After some hours, a Pb-Sn alloy almost entirely free from Zn is produced.

**Alloys for tools.** W. MÜLLER and KARL PRINZ ZU LÖWENSTEIN. Brit. 305,942, Feb. 11, 1928. A hard alloy for tools contains Fe 10–55% together with W, Cr and Co in about the proportions of 8:2:1 and preferably 1–4% C. Part of the W may be replaced by Mo and the Co by Ni, and there may be added up to a total of 4% of other elements such as Si, B, Zr, Ti, N, V, Be, Ce and Mn.

**Soot blower of special alloy.** H. G. C. FAIRWEATHER. Brit. 306,360, July 17, 1928. Ni or an alloy of Ni 96 and Mn 4% may be used.

**Alloy containing iron, nickel, etc.** NOAK V. HYBINETTE. U. S. 1,726,489, Aug. 27. Alloys which are suitable for cooking utensils, etc. contain at least 2.5 times as much Fe as Ni and contain also Cr, W and Mo in substantial quantity not exceeding about 8% in the aggregate.

**Nickel-iron alloy.** HEINRICH LANZ A.-G. Ger. 480,284, Dec. 2, 1923. Gray pig iron contg. at least 3% C and 1% Si is improved by replacing the Si wholly or in part by Ni. The Ni-Fe alloy so formed should contain 0.85% combined C.

**Iron-nickel-beryllium alloys.** SIEMENS & HALSKER A.-G. Brit. 306,035, Feb. 14, 1928. Alloys are formed contg. Fe, at least 0.1% Ni and 0.1–12.0% Be and may contain up to about 25% of other elements such as Cr, W, Mo, V, Mn, Cu, O, Si and P. They may be quenched from 800° to 1200° and artificially matured by reheating at 300–700°. Cf. C. A. 23, 564.

**Corrosion-resistant iron alloys.** H. L. MILLER. Brit. 306,320, April 13, 1928. Alloys are formed contg. at least 95% Fe together with Cu 0.2–2.0%, Mo up to 0.2%, Mn 0.2–1.0%, Si up to 0.5% and not more than 0.04% each of S and P, and traces of Al. Details for manuf. of the alloy are given.

**Aluminum alloys.** WILHELM SANDER (to Th. Goldschmidt A.-G.). U. S. 1,726,194, Aug. 27. See Fr. 647,407 (C. A. 23, 2414).

**Apparatus for leading off the acid vapor in etching and pickling plant.** FERDINAND BÄUML. Ger. 481,161, Apr. 22, 1928. Addn. to 426,205. Details of arrangement are given.

**Coating finely divided particles of magnetic metal or other hard material with softer material such as zinc.** WM. S. BUTTLES (to Western Elec. Co.). U. S. 1,726,340, Aug. 27. The particles are caused to travel a serpentine path in contact with surfaces of the coating material. An app. is described.

**Coating and coloring metals.** ALADAR PACZ. Ger. 480,995, Apr. 17, 1927. See Brit. 302,943 (C. A. 23, 4436).

**Metal coatings.** LAMBERT KOCHS. Ger. 480,991, Apr. 20, 1928. An app. for coating metal objects such as bolts and nails by plunging them into a bath of molten metal is described.

**Nickeling.** CHEMISCHES LABORATORIUM "CITY." Ger. 479,662, Oct. 15, 1925. A reagent for wet-nickeling metals, especially Cu and brass, is obtained by mixing Ni salt, Zn dust, a small quantity of Sn or Fe and an amt. of strong mineral acid equal to 50% of the wt. of the metal salt-Zn dust mixt.

**Galvanizing.** STAHLWERKE BRÜNINGHAUS A.-G. Ger. 479,554, Dec. 6, 1927. Excess of Zn after coating metal objects by immersion in molten Zn is removed by plunging them into a bath of molten salt such as KCl, NaCl or CaCl<sub>2</sub>.

**Galvanizing apparatus.** RICHARD BLASBERG. Ger. 480,754, Nov. 17, 1927.

**Apparatus for galvanizing sheet metal by immersion.** FRED W. BROWN. U. S. 1,726,336, Aug. 27. Structural features.

**Attaching handles to aluminum vessels.** J. H. WILSON and I. W. WOOD (to Aluminium, Ltd.). Brit. 306,455, Feb. 20, 1928. Cast Al base alloy handles contg. at least 7% (and preferably about 15%) Si are secured to wrought or Al alloy vessels by elec. spot-welding.

**Welding and heating metals by an electric arc struck in an oxy-hydrogen flame.** I. G. FARBENIND. A.-G. Brit. 305,999, Feb. 13, 1928.

**Apparatus utilizing liquid gases by vaporization and compression for welding or cutting metals, etc.** GES. FÜR INDUSTRIEGASVERWERTUNG. Brit. 306,130, Feb. 16, 1928.

**Welding and cutting burner.** AUTOGEN ENDRESS A.-G. Swiss 131,690, Feb. 6, 1928.

## 10—ORGANIC CHEMISTRY

CHAS. A. ROUILLER AND CLARENCE J. WEST

**A century of organic chemistry; 1828-1928.** H. GILLIG. *Pharm. Berichte* No. 6; *Schweiz. Apoth. Ztg.* 66, 625-8(1928).—The synthesis of org. substances since Wöhler led away from the concept of a vital force creating these. The modern trend is a return to the study of living force.

**A theory of optical activity in a homogeneous medium.** R. DE MALLEMANN. *Compt. rend.* 188, 705-7(1929).—A résumé of a mathematical theory. W. R. BRODE.

**Chemical effects of semi-corona discharge in gaseous hydrocarbons.** S. C. LIND AND GEORGE GLOCKLER. *J. Am. Chem. Soc.* 51, 2811-22(1929); cf. C. A. 22, 2353. Like C<sub>2</sub>H<sub>6</sub>, the other lower hydrocarbons, CH<sub>4</sub>, C<sub>2</sub>H<sub>4</sub>, C<sub>2</sub>H<sub>2</sub> and C<sub>2</sub>H<sub>6</sub>, condense to liquid and solid hydrocarbons in semi-corona discharge (central Al rod in a Pyrex glass cylinder). The condensation of saturates is brought about by the elimination of H and some CH<sub>4</sub> as under  $\alpha$ -radiation. In series gas flow through a no. of discharge tubes, the amt. of liquid condensate increases in successive tubes. If the rate of flow be so slow that depletion of reactant becomes considerable, then a max. of liquid yield is attained in an intermediate tube. The liquid products obtained from different hydrocarbons or in different tubes from the same hydrocarbon are similar in phys. properties, when obtained at the same trap temp. The liquid products are very complex. Fractionation was not attempted in the present work. Solid hydrocarbons are obtained in slight quantity in the Siemens tube, in larger quantity equal to that of liquid in the corona tubes. The solid is gummy or resinous, inert toward solvents and chem. reagents, except strong oxidizing agents. In corona discharge a small quantity of free C is deposited on the metal electrode in tree-like formation. A close correlation of  $n$ , mol. wt., d., color and viscosity characterizes all the liquid products. Increase in all these properties is inversely proportional to the yield, for which a simple explanation is given.

C. J. WEST

**Preparation of acetylene derivatives from epidibromohydrin.** LESPIREAU AND WIEGMANN. *Compt. rend.* 188, 998-1000(1929).—A study was made of the effect of removing HBr from epidibromohydrin, and the effect of a Grignard reagent. The following new compds. were reported:  $\text{EtCBr}:\text{CHEt}$ ,  $b_p$  34°,  $d^{20}$  1.197,  $n$  1.459;  $\text{EtCBr}:\text{CHBrEt}$ ,  $b_p$  105-6°,  $d^{20}$  1.9434,  $n$  1.5508;  $\text{EtCBr}:\text{CBrEt}$ ,  $b_p$  60-1°,  $d^{20}$  1.6128,  $n$  1.514;  $\text{EtC}:\text{CEt}$ ,  $m.$  -51°,  $b_{770}$  79-80°;  $\text{CH}:\text{CCHMeEt}$ ,  $m.$  65-70°,  $b.$  77°.

WALLACE R. BRODE

**Reactivity of atoms and groups in organic compounds. IX. Vapor pressures, densities and refractive indices of certain binary mixtures.** SPENCER W. PRENTISS. *J. Am. Chem. Soc.* 51, 2825-32(1929); cf. *C. A.* 23, 143.—The vapor pressures of several binary mixts. of  $\text{PhNO}_2$ ,  $\text{Me}_2\text{CO}$ ,  $\text{BuOH}$  and  $\text{C}_6\text{H}_6$  with  $\text{C}_6\text{H}_5\text{N}$  and with  $\text{EtI}$ , have been measured at 20° by a static method. The  $d.$  of similar mixts. of  $\text{PhNO}_2$ ,  $\text{Me}_2\text{CO}$ , *tert*- $\text{BuOH}$  and  $\text{C}_6\text{H}_6$  with  $\text{C}_6\text{H}_5\text{N}$  and of  $\text{PhNO}_2$  and  $\text{C}_6\text{H}_6$  with  $\text{EtI}$  and the  $n$  of mixts. of  $\text{PhNO}_2$  and  $\text{C}_6\text{H}_6$  with  $\text{C}_6\text{H}_5\text{N}$  and with  $\text{EtI}$ , have been measured at 25°. For the reaction between  $\text{C}_6\text{H}_5\text{N}$  and  $\text{EtI}$  an attempt has been made to show that the adjuvance of the solvent, reported in a previous paper, would bear some relation to the deviation, from ideal soln. laws, of vapor pressures,  $d.$  or  $n$  of binary mixts. of the solvent with each reactant. No such correlation, however, has been observed. C. J. WEST

**The configurational relationship of 2-methyl-6-heptanol to lactic acid.** With a note on the effect of unsaturation on optical activity. P. A. LEVENE AND H. L. HALLER. *J. Biol. Chem.* 83, 177-83(1929).—*d*-2-Methyl-6-heptanol has been correlated with lactic acid by the following reactions: *d*-2-methyl- $\Delta^2$ -6-heptenol  $\rightarrow$  *l*-4-hydroxypentanol  $\rightarrow$  *d*-4-hydroxyvaleric acid  $\rightarrow$  *d*-lactic acid and *d*-2-methyl- $\Delta^2$ -6-heptenol  $\rightarrow$  *d*-2-methyl-6-heptanol. Exaltation of the rotation by a double bond is produced when it is situated between C atoms 3 and 4 from the asym. C atom. It had been previously accepted that the effect was generally an exaltation of the rotation of the parent satd. substance. "The general conclusion from the work to date is that the optical rotation of a substance is the resultant of the simultaneous action of several factors, of which 3 have been definitely pointed out: the resp. masses of the radicals attached to the asym. C atom, the polarity of the groups, and the distances of the polar groups from the asym. C atom." A. P. LOTHROP

**Interaction of alkyl sulfides and salts of mercury.** W. F. FARAGHER, J. C. MORRELL AND S. COMAY. *J. Am. Chem. Soc.* 51, 2774-81(1929).—The action of alkyl sulfides on  $\text{Hg}^+$  salts is a conversion of the salt into  $\text{Hg}$  and the corresponding  $\text{Hg}^{++}$  salt and the formation of an addn. compd. of the sulfides with the  $\text{Hg}^{++}$  salt. In some cases the reaction takes place only in the presence of  $\text{H}_2\text{O}$ . Except for  $\text{Me}_2\text{S}$ , the alkyl sulfides have no action on  $\text{HgCl}$ .  $\text{Et}_2\text{S}$  and  $\text{HgCl}_2$  in equimol. proportions in  $\text{EtOH}$  give the compd.  $\text{Et}_2\text{S}:\text{HgCl}_2$ ,  $m.$  76.5-7°, if crystd. from  $\text{EtOH}$ ; excess  $\text{HgCl}_2$  in  $\text{EtOH}$  gives the compd.  $\text{Et}_2\text{S}:\text{2HgCl}_2$ ,  $m.$  119-9.5°; crystn. of  $\text{Et}_2\text{S}:\text{HgCl}_2$  from  $\text{Et}_2\text{O}$  or  $\text{Me}_2\text{CO}$  gives a mixt. of the 2 compds. and several crystns. from  $\text{Me}_2\text{CO}$  or  $\text{C}_6\text{H}_6$  gives  $\text{Et}_2\text{S}:\text{2HgCl}_2$ ; crystn. of  $\text{Et}_2\text{S}:\text{2HgCl}_2$  from  $\text{EtOH}$  effected no conversion.  $\text{Pr}_2\text{S}$  and  $\text{HgCl}_2$ , using an excess of either reagent, give the compd.  $\text{Pr}_2\text{S}:\text{HgCl}_2$ ,  $m.$  87.5-8°, if crystd. from  $\text{EtOH}$ ; crystn. from  $\text{C}_6\text{H}_6$  gives the compd.  $\text{Pr}_2\text{S}:\text{2HgCl}_2$ ,  $m.$  121-2°, reconverted to  $\text{Pr}_2\text{S}:\text{HgCl}_2$  on crystn. from  $\text{EtOH}$ . *iso*- $\text{Bu}_2\text{S}$  in  $\text{EtOH}$  gives the compd. *iso*- $\text{Bu}_2\text{S}:\text{HgCl}_2$ ,  $m.$  116°, converted by crystn. from  $\text{C}_6\text{H}_6$  to *iso*- $\text{Bu}_2\text{S}:\text{2HgCl}_2$ ,  $m.$  131°, and reconverted by crystn. from  $\text{EtOH}$ .  $\text{Bu}_2\text{S}$  (1 mol.) and 3 mols.  $\text{HgCl}_2$  in  $\text{EtOH}$  or  $\text{H}_2\text{O}$  give the compd.  $\text{Bu}_2\text{S}:\text{2HgCl}_2$ ,  $m.$  112-3°; in  $\text{H}_2\text{O}$ , mol. proportions of the reagents give a liquid, from which  $\text{Et}_2\text{O}$  ppts.  $\text{Bu}_2\text{S}:\text{2HgCl}_2$ , leaving  $(\text{Bu}_2\text{S})_2:\text{HgCl}_2$  in soln. *iso*- $\text{Am}_2\text{S}$  behaves similarly, giving the compds. *iso*- $\text{Am}_2\text{S}:\text{2HgCl}_2$  and (*iso*- $\text{Am}_2\text{S}$ ) $_2:\text{HgCl}_2$ .  $\text{Me}_2\text{S}$  gives the compd.  $2\text{Me}_2\text{S}:\text{3HgCl}_2$ ,  $m.$  151°, which may be a mixt. or mol. compd. of  $\text{Me}_2\text{S}:\text{HgCl}_2$  and  $\text{Me}_2\text{S}:\text{2HgCl}_2$ . C. J. WEST

**True mixed organo-magnesium carbonates.** D. IVANOV. *Compt. rend.* 189, 51-3(1929).—The compds. ordinarily known as organo-magnesium carbonates have the structure  $\text{RC}(\text{O})\text{OMgX}$  but the name should really be applied to compds. with the structure  $\text{ROC}(\text{O})\text{OMgX}$ . These may be prepd. by the oxidation of the Grignard reagent with mol.  $\text{O}_2$  at 0° in a closed tube and then treatment with  $\text{CO}_2$  under the same conditions. The true organo-magnesium carbonates of the following alkyl halides have been prepd.: *EtBr*, *PrBr*, *iso-PrBr*, *BuCl*, *BuBr*, *iso-BuBr*, *iso-AmBr*, *PhCH<sub>2</sub>Cl* and *cyclohexyl bromide*. The compds. derived from the primary halides are solids, the others, pastes. They are hydrolyzed by  $\text{H}_2\text{O}$  to give the corresponding alcs. but when a mineral acid is used both  $\text{CO}_2$  and the alc. are obtained. J. M. LEVINE

--- -- BRAUN AND ERNST

isomeric nonylaldehyde, is due to the branching of the chain has been tested with another pair of isomers. Hexahydrofarnesyl bromide reacts only slowly with NMe<sub>3</sub> in C<sub>6</sub>H<sub>6</sub> at 100° to form the quaternary bromide (50% yield after 17 hrs.) which is so hygroscopic that it instantly deliquesces in the air. Treated with Ag<sub>2</sub>O and distd. from 4 mols. alkali it yields an oil consisting of 20% *hexahydrofarnesylidimethylamine*, b<sub>10</sub> 155-7°, and 80% *hexahydrofarnesene*, b<sub>11</sub> 117-20°, d<sub>4</sub><sup>15</sup> 0.7797, n<sub>D</sub><sup>15</sup> 1.4398, which, on ozonization and decompn. of the ozonide with H<sub>2</sub>O and Zn dust, yields about 60% of 2,6,10-trimethylundecylaldehyde (*norhexahydrofarnesal*) (I), b<sub>9</sub> 133-5°, d<sub>4</sub><sup>12</sup> 0.8452, n<sub>D</sub><sup>12</sup> 1.4440; when freshly distd. it has an unusually pleasant, strong, refreshing, flower-like odor which becomes weaker and weaker on standing, the aldehyde at the same time becoming more dense (d. after 44 hrs., 0.8589). The aldehyde readily colors fuchsin-SO<sub>2</sub>; *semicarbazone*, m. 235-7°. *Hexahydrofarnesal*, obtained in 20-30% yield from hexahydrofarnesol in 2.5 parts cold AcOH slowly treated with the calcd. amt of CrO<sub>3</sub>, b<sub>11</sub> 145-7°; *semicarbazone*, m. 248-50°. Its odor is quite pleasant but not as refreshing and flowery as that of I. Myristaldehyde, the straight-chain isomer of I, has a very faint odor which, on account of its fatty tinge, is not very pleasant.

C. A. R.

**Synthesis of formaldehyde by catalytic oxidation of methyl alcohol.** HIROAKI KADOWAKI AND MASAMORI YAMADA. *Repts. Imp. Ind. Research Inst. Osaka, Japan* 10, No. 7(1929) —By using a modified app. and Ag wire gauze (99.7% pure, B. W. G. No. 33) as catalyst K. and Y. repeated the catalytic oxidation of MeOH to CH<sub>2</sub>O with special emphasis on the velocity of the reacting gas, ratio of reacting O and MeOH, initial temp., method of prepn. of the catalyst, and effect of water vapor, oxides of N and N on the reaction. The MeOH was 99.3% pure, d<sub>15</sub><sup>15</sup> 0.7987. The unoxidized MeOH and CH<sub>2</sub>O were analyzed by the usual method (Williams, *J. Am. Chem. Soc.* 27, 596(1905), and Blank and Finkenbeiner, *Ber.* 39, 1226(1906), resp.). The results of expts. are illustrated by 7 curves. The best yield was obtained under the following conditions: The amt. of air used is about 1.2-1.7 l. per min. when the diameter of the rolled Ag catalyst is about 1.5 cm. and the amt. of O in the air is about 0.38-0.48 g. per 1 g. MeOH. The initial temp. should be at 175-300°, the high initial temp. reduces the yield except when the catalyst has small holes. Cooling of the catalyst by air reduces the CH<sub>2</sub>O yield, but it also decreases the waste about 5%. The ideal length of catalyst is about 2-6 cm. The presence of water vapor (5% of MeOH) does not influence the final product. The presence of oxides of N (0.2-0.3% of MeOH) increases the yield, the highest yield being 78.9%. The presence of N (20-100% of the air) also increases the yield, the highest yield being 79.3%. In most cases the reaction time was 30 min. Catalytic oxidation of AcH to CH<sub>3</sub>CO, with Ag and Cu wire gauze as catalyst, gave a 15 and 20% yield, resp.

F. I. NAKAMURA

**Organic molecular compounds with coordination centers. II. The coordination numbers of alkyl esters of fatty acids in the choleic acids.** HEINRICH RHEINBOLDT, OTTO KONIG AND REINHARD OTTEN. *Ann.* 473, 249-59(1929); cf. C. A. 21, 1127. For the purpose of detg. coordination nos. the following esters were prepd.: *HCO<sub>2</sub>H*: dodecyl, b<sub>15</sub> 145-6°; tetradecyl, b<sub>17</sub> 166°; hexadecyl, b<sub>17</sub> 188°; *EtCO<sub>2</sub>H*: dodecyl, b<sub>16</sub> 166-8°; hexadecyl, b<sub>18</sub> 211-2°; *PrCO<sub>2</sub>H*: dodecyl, b<sub>18</sub> 177-8°; hexyl heptanoate, b<sub>15</sub> 137°; *heptyl pelargonate*, b<sub>16</sub> 210°; *octyl pelargonate*, b<sub>21</sub> 183°; *nonyl decaate*, b<sub>20</sub> 210.5-1.5°; *C<sub>12</sub>H<sub>24</sub>O<sub>2</sub>*: *Pr*, b<sub>18</sub> 155-6°; *Bu*, b<sub>18</sub> 180°; *hexyl*, b<sub>18</sub> 199°; *octyl*, b<sub>17</sub> 204-5°; *C<sub>14</sub>H<sub>28</sub>O<sub>2</sub>*: *Bu*, b<sub>18</sub> 195°; *hexyl*, b<sub>17</sub> 215°; *tetradecyl*, m. 43°; *hexadecyl*, m. 47°. The following mol. compds. with *desoxycholic acid* were prepd. by crystg. the 2 components from a little abs. EtOH and the compn. detd. by titration with alkali; the m. p. and coordination no. is given in each case. *Formates*: *hexyl*, m. 167.5°, 4; *heptyl*, m. 168-9°, 4; *octyl*, m. 170.5-1°, 6; *dodecyl*, m. 179°, 6; *tetradecyl*, m. 185°, 8; *hexadecyl*, m. 187.5°, 8. *Acetates*: *Me*, m. about 145° (decompn.), 3; *Et*, m. 140-5° (decompn.), 3; *Pr*, m. 142-6° (decompn.), 4; *hexyl*, m. 168-9°, 4; *heptyl*, m. 169°, 4; *octyl*, m. 172-3°, 6; *dodecyl*, m. 180.5°, 6; *tetradecyl*, m. 185.5-6°, 8; *hexadecyl*, m. 189°, 8. *Propionates*: *Me*, m. 144-8° (decompn.), 3; *Et*, m. 145-9° (decompn.), 4; *heptyl*, m. 170-1°, 4; *octyl*, m. 173.5-4.5°, 6; *dodecyl*, m. 182°, 6; *hexadecyl*, m. 187°, 8. *Butyrates*: *Me*, m. about 148-52° (decompn.), 4; *octyl*, m. 176-6.5°, 6; *dodecyl*, m. 183.5°, 6; *hexadecyl*, m. 189°, 8. *Valerates*: *Bu*, m. 169-70°, 6; *octyl*, m. 176-7°, 6. *Capronates*: *Am*, m. 173.5°, 6; *octyl*, m. 181-1.5°, 6. *Heptanoates*: *Me*, m. 169-70°, 4; *hexyl*, m. 177-7.5°, 6; *octyl*, m. 182°, 6. *Caprylates*: *Me*, m. 169-70°, 4; *heptyl*, m. 180.5-1°, 6; *octyl*, m. 181-1.5°, 6. *Pelargonates*: *Me*, m. 174-5°, 6; *heptyl*, m. 182.5-3°, 6; *octyl*, m. 185°, 8. *Nonyl caprate*, m. 186.5-7°, 8. *Laurates*: *Me*, m. 180°, 6; *Et*, m. 182°, 6; *Pr*, m. 183.5-4°, 6; *Bu*, m. 184-4.5°, 6; *hexyl*, m. 185.5°, 6; *octyl*, m. 186°, 6.

**Myristates:** *Me*, m. 181.5–2°, 6; *Et*, m. 183.5°, 6; *Bu*, m. 186°, 6; *hexyl*, m. 188°, 6; *tetradecyl*, m. 194.5–5.5°, 8; *hexadecyl*, m. 197–8°, 8. *Me pentadecylate*, m. 184.5–5°, 8. *Apocholic acid* and *hexadecyl acetate*, m. 187–8°, 8. *Octyl alc.* and *desoxycholic acid*, m. 169.5–70°, 6; with *tetradecyl alc.*, m. 183.5–4.5°, 8. Various relationships between coördination no. and structure are discussed.

C. J. WEST

**Diethyl pentasulfides.** G. R. LEVI AND A. BARONI. *Atti accad. Lincei* [6], 9, 772–8 (1929).— $\text{Et}_2\text{S}_5$  was prepd. by heating 7 g.  $\text{S}_2\text{Cl}_2$  in 5 parts of  $\text{CS}_2$  together with 10 g.  $\text{EtSH}$  also in 5 parts of  $\text{CS}_2$ , and 2 parts  $\text{S}$ , in a closed tube in a water bath, at 150°, and at 200°, 150° giving the optimum yield. Two isomers result,  $b_{25}$  119° and 130°, resp. The structures of the 2 pentasulfides are considered to be  $\text{EtS}(\text{:S:S:S:})\text{SEt}$

and  $\text{EtS}(\text{S—S})\text{SEt}$  by analogy with the tetrasulfide whose structure is  $\text{EtS}(\text{:S:})\text{S}(\text{:S:})\text{SEt}$ ; because of its prepn.  $\text{Et}_2\text{S}_2 + \text{S}_2$ , and since there is only 1 tetrasulfide known. The above structure explains the presence of 2 pentasulfides, while the other possible formula  $\text{Et}_2\text{S:S}(\text{S})\text{S}$  would only explain one pentasulfide. The consts. for the pentasulfide  $b_{25}$  119° are  $d_{16}$  1.1687,  $n_D^{25}$  1.60269; the isomer  $b_{25}$  130° has not been studied as yet.

A. W. CONTIERI

**Cleavage of the nitro group from tertiary nitro compounds. I. Derivatives of "nitroisobutylglycerol."** HANS KLEINFELLER. *Ber.* 62B, 1582–90 (1929); cf. Möller, *Diss. Kiel* 1927.—In attempting to convert *trichloronitroisobutane* (1,3-dichloro-2-chloromethyl-2-nitropropane),  $\text{O}_2\text{NC}(\text{CH}_2\text{Cl})_3$  (I), obtained from Henry's nitroisobutylglycerol,  $\text{O}_2\text{NC}(\text{CH}_2\text{OH})_3$  (II), with  $\text{PCl}_5$ , back into II it was found that no reaction occurs with  $\text{Ag}_2\text{O}$ , but when I is gently warmed with alc. KOH, 3.5 mols. of the KOH are used up, the  $\text{NO}_2$  group is split off as  $\text{KNO}_2$ , then 2 mols.  $\text{H}_2\text{O}$  are also eliminated and there is obtained the *compd.* III. The ease with which the  $\text{NO}_2$  group is split off led to trying the reaction on II itself, its tribenzoate (IV) and its dibenzoate (V); 4, 3 and 1 mols., resp., of KOH were used up, and  $\text{KNO}_2$  was formed in each case but only with V could a homogeneous org. *product* (VI) be isolated. Even in the chlorination of II with  $\text{PCl}_5$ , the  $\text{NO}_2$  is in part split off; along with I,  $\text{O}_2\text{NC}(\text{CH}_2\text{Cl})_2\text{CH}_2\text{OH}$  (VII), the phosphate (VIII) of VII and a *compd.* (IX) formed by loss of HCl from VII, are obtained the N-free unsatd. *compd.*  $\text{ClCH}:\text{C}(\text{CH}_2\text{Cl})_2$  (X), and its HCl addn. *product* (XI) which, from the laws of halogen acid addn., probably has the structure  $\text{Cl}_2\text{CHCH}(\text{CH}_2\text{Cl})_2$ . Bromination with  $\text{PBr}_5$  gives entirely analogous products, although the analogs of VII and IX were not obtained. VIII on heating gives  $\text{NO}$ ,  $\text{CO}_2$ , HCl and a *compd.* which most probably is a *dioxan* (XII). In the reaction between II and  $\text{SOCl}_2$  there are obtained a *sulfite* (XIII) and an *isomer* (XIV), m. 180°, of II forming a tribenzoate identical with IV; XIV is also obtained with  $\text{SO}_2\text{Cl}_2$  or  $\text{PCl}_5$ ; on standing for weeks it changes back into II. I, m. 104°, mol. wt. (Rast) 215; yield, 25 g. from 60 g. II. 2-Nitro-3-chloro-2-chloromethyl-1-propanol (VII), sep'd. from IX, X and XI by *distn.* *in vacuo*, m. 127°. 3-Nitro-3-chloromethyltrimethylene oxide (IX),  $b_{25}$  45–6°. 1,3-Dichloro-2-chloromethyl-1-propene (X),  $b_{25}$  62–4° (see following abstr.). 1,1,3-Trichloro-2-chloromethylpropane (XI),  $b_{25}$  77–80°. VIII cannot be *crystd.* or *distd.* and was purified by repeated soln. from alc., *extrn.* with  $\text{Et}_2\text{O}$  and finally drying *in vacuo* at 80° over  $\text{P}_2\text{O}_5$ . *Br analog* of I, m. 85°; of X,  $b_{25}$  105–7°, very irritating to the eyes, of XI,  $b_{25}$  133–6°, also very irritating to the eyes. With  $\text{Al-Hg}$  in alc. on the  $\text{H}_2\text{O}$  bath 3 g. I gives 2 g. of the 2-hydroxylamino *deriv.*, m. 81°, while with  $\text{SnCl}_2$  and boiling alc. HCl is obtained the 2-amino *compd.* as the HCl salt, m. 245–6° (decompn.). *Dibenzoyl-2-nitro-2-methylolpropane-1,3-diol* (V), obtained as a by-product in the prepn. of IV, cream-colored, sandy, *cryst. powder*, m. 122–4°. III,  $b_{12}$  80° (yield, about 60%), mol. wt. in freezing  $\text{C}_6\text{H}_6$  180. VI,  $b_{25}$  108–12°. VII,  $b_{25}$  60–1°. XIII, m. 104°, mol. wt. (Rast) 210. XIV, mol. wt. (Rast) 164. II. Action of sodium amalgam on

derivatives of "nitroisobutylglycerol." HANS KLEINFELLER (IN PART WITH ALFRED KIRSCH AND FRANZ ECKERT). *Ibid* 1590–7.— $\text{O}_2\text{NC}(\text{CH}_2\text{Cl})_3$  (I) and  $\text{O}_2\text{NC}(\text{CH}_2\text{Br})_3$  (II) do not react at all with  $\text{Ag}$ ,  $\text{Cu}$  or  $\text{Zn}$  at different temps. with or without a solvent. With  $\text{Na}$  in  $\text{Et}_2\text{O}$  under pressure the reaction mixt. tars completely. Boiling in  $\text{C}_6\text{H}_6$ .

PhMe or xylene with Na, K or Na-Hg gives the inorg. halide and large amts. of amorphous substances but the org. products can be isolated only incompletely and with great losses because of their unfavorable b. ps. and their enormous volatility with the vapors of the solvents; in the absence of solvents explosions generally occur. The reaction can, however, be successfully carried out by intimately mixing the finely powd. substance (about 5 g.) and 50 g. of 4.5% Na-Hg and starting the reaction, if necessary, by cautiously heating the mixt. at some point with a small flame; the reaction temp. is about 200°. I gives more than 70% of a mixt. of  $\text{ClCH}_2\text{C}(\text{CH}_2\text{Cl})_2$  (III) (see preceding abstr.) and 3-chloro-2-chloromethyl-1-propene,  $\text{CH}_2\text{C}(\text{CH}_2\text{Cl})_2$  (IV), b<sub>10</sub> 30–1°, mol. wt. in freezing  $\text{C}_6\text{H}_6$  119. Addn. of Br to these compds. gives 1,3-dichloro-1,2-dibromo-2-chloromethylpropane, b<sub>10</sub> 140°, and the 3-chloro-1,2-dibromo compd., b<sub>10</sub> 115°, while with Cl are obtained the 1,1,2,3-tetra- and 1,2,3-tri-Cl derivs., b<sub>12</sub> 99–101° and b<sub>8</sub> 87°, resp. With H and Pt sponge in alc. both III and IV yield 3-chloro-2-chloromethylpropane, b<sub>10</sub> 45°.  $\text{O}_2\text{NC}(\text{CH}_2\text{Cl})_2\text{CH}_2\text{OH}$  and  $\text{ClCH}_2\text{C}(\text{NO}_2)_2\text{CH}_2\text{O.C}_2\text{H}_5$  with

Na-Hg yield 3-chloromethylenetrimethylene oxide, b<sub>760</sub> 63–6°, and 3-methylenetrimethylene oxide, b<sub>760</sub> 35–40°. II and Na-Hg yield 2,5-bis(bromomethyl)1,5-hexadiene, b<sub>8</sub> 140–3° (slight decompn.), mol. wt. in freezing  $\text{C}_6\text{H}_6$  249,  $\text{BrCH}_2\text{C}(\text{CH}_2\text{Br})_2$  (see preceding abstr.) and 3-bromo-2-bromomethyl-1-propene, b<sub>8</sub> 70–2°. The 3 compds. with Br yield 1,2,5,6-tetrabromo-2,5-bis(bromomethyl)hexane, m. 115°, 1,1,2,3-tetrabromo-2-bromomethylpropane, b<sub>8</sub> 185–90° (slight decompn.), and 1,2,3-tribromo-2-bromomethylpropane, b<sub>8</sub> 143–5°.  $\text{O}_2\text{NC}(\text{CH}_2\text{OBz})_2$  and Na-Hg yield  $\text{Ph}_2\text{C}(\text{OBz})_2$ , dibenzoyl-2,5-dimethylol-1,5-hexadiene (V), yellow, b<sub>8</sub> 220°, mol. wt. (Rast-Carlsohn) 300, and benzoyl-2-methyl-1-propen-3-ol, yellow, b<sub>50</sub> 120°, mol. wt. 148. Dibenzoyl-1,2,5,6-tetrabromo-2,5-bismethylolhexane, from V and Br, decomp. completely on distn. in vacuo. C. A. R.

Separation of glycerides. VI–IX. BUNSUKE SUZUKI. *Proc. Imp. Acad. (Japan)* 5, 265–8(1929); cf. C. A. 22, 2549.—With the method previously described linseed oil gave bromides of linoleodiolein (I), solidifying at 5°, 3° and –2°, resp., of stearolinoleolein, –4° and of stearolinolenodolein, –7°. Soybean oil: bromides of oleodilinenin, solidifying at 6°, 5° and 3°, resp., and of I, 3°. Whale oil: bromides of steardioömarin, solidifying at 1°; stearolinoleozoömarin, –3°; stearolinolenozoömarin, –6°;  $\text{C}_{18}\text{H}_{33}\text{O}_2(\text{C}_{22}\text{H}_{41}\text{O})_2$ , –4° and palmitostearidonogadolein, –3°; the acid  $\text{C}_{22}\text{H}_{42}\text{O}_2$  could not be identified. Herring oil: bromides of gadoleo- $\text{C}_{22}\text{H}_{42}\text{O}$ -linolenin, m. 104°; zoömarostearidonarichidonin, 148°; zoömaroarachidonoclipanodonin, m. 150° (decompn.); zoömaro- $\text{C}_{22}\text{H}_{42}\text{O}$ -stearidonin, m. 150°; gadoleodiarachidonin, m. 180°; linoleodigadolein, m. 6°; linoleodizoömarin (II), m. 2°;  $(\text{C}_{22}\text{H}_{41}\text{O})_2$ -gadolein, m. 5°;  $(\text{C}_{22}\text{H}_{41}\text{O})_2\text{C}_2\text{H}_5\text{O}_2$ , m. –2°; stearolinolenozoömarin, m. –8°. The acid  $\text{C}_{22}\text{H}_{42}\text{O}_2$  will be discussed below. Cod oil: Bromides of zoömarolinolenoclipanodonin, m. 131°; zoömarolinoleoarachidonin, m. 255° (decompn.); II, m. 2°; linolenodizoömarin, m. –2° and –5°; steardionodizoömarin, m. –4°;  $(\text{C}_{22}\text{H}_{41}\text{O})_2$ -stearin, m. –7°. Sardine oil: Bromides of  $(\text{C}_{22}\text{H}_{42}\text{O})_2$ -arachidonin, m. 85°; zoömaro- $\text{C}_{22}\text{H}_{42}\text{O}$ -stearidonin, m. 120°;  $(\text{C}_{18}\text{H}_{33}\text{O})_2$ -arachidonin, m. 110°; steardiono- $\text{C}_{18}\text{H}_{33}\text{O}$ -zoömarin, m. 135°; triarachidonin, m. 205° (decompn.); triolein, m. 6°; linoleodigadolein, m. 2°;  $(\text{C}_{22}\text{H}_{41}\text{O})_2$ olein, m. –2°; stearolinoleolein, m. –5° and 6°;  $(\text{C}_{22}\text{H}_{41}\text{O})_2$ -arachidonin, m. –3°. The acid  $\text{C}_{18}\text{H}_{33}\text{O}_2$  is new and will be discussed below. X–XIV. *Ibid* 269–71.—Sandeel (*Ammodytes personatus*) oil: bromides of  $(\text{C}_{18}\text{H}_{33}\text{O})_2$ -clipanodonin, m. 124°;  $(\text{C}_{18}\text{H}_{33}\text{O})_2$ -arachidonin, m. 126°; linoleo- $\text{C}_{18}\text{H}_{33}\text{O}$ -arachidonin, m. 153°; arachidonoclipanodonin, m. 230°; linoleodizoömarin (I),  $(\text{C}_{22}\text{H}_{41}\text{O})_2$ -clipanodonin, diarachidoömarin, dioleoömarin, palmitozoömarin,  $(\text{C}_{22}\text{H}_{41}\text{O})_2\text{C}_2\text{H}_5\text{O}_2$ . Oil of *Theragra chalcogramma*: bromides of diclipanodonoarachidonin, m. 95°; steardionodclipanodonin, m. 125°; diclipanodonolinolenin, m. 165° (decompn.); triarachidonin (II), m. 205° (decompn.); arachidonodizoömarin; zoömarolinoleostearin. Cuttle fish oil: Bromides of  $(\text{C}_{18}\text{H}_{33}\text{O})_2\text{C}_2\text{H}_5\text{O}_2$ , m. 74°;  $(\text{C}_{18}\text{H}_{33}\text{O})_2$ -linolenin, m. 81°;  $(\text{C}_{18}\text{H}_{33}\text{O})_2$ -distearidonin, m. 125°; II, I and trizoömarin (III). Red salmon oil: bromides of linolenolinolenoarachidonin, m. 103°; linolenodiarachidonin, m. 115°; I, III and  $(\text{C}_{22}\text{H}_{41}\text{O})_2\text{C}_2\text{H}_5\text{O}_2$ . Shark liver oil: Bromides of arachidonodclipanodonin, m. 110°; clipanodonodiarachidonin, m. 140°; clipanodonoarachidonin; inolenin, m. 117°. II, III, digadoleolinolenin, triolein, dizoömarolinolenin and palmitodiolein. XV. Two new fatty acids obtained from fish oils. B. SUZUKI AND YOSHIKUNI YOKOYAMA. *Ibid* 272–3.—Sardine oil, on bromination and fractionation, gives in the  $\text{Et}_2\text{O}$  and  $\text{Me}_2\text{CO}$  fractions a glyceride contg. the acid  $\text{C}_{18}\text{H}_{33}\text{O}_2$ , whose octa-Br deriv. m. 96°. Removal of the Br and reduction gives behenic acid, m. 78°. The  $\text{C}_6\text{H}_6$ -sol. portion of the bromo-glycerides yields the acid  $\text{C}_{18}\text{H}_{33}\text{O}_2$ , whose octa-Br deriv. m. 104–5°; the satd. acid is stearic acid. C. J. WEST

The direct synthesis of optically active compounds and an explanation of the origin of the first optically active compound. HENRY GILMAN. *Iowa State Coll. J. Sci.* 3, 227-30(1929).—The application of the statistical theory of probability shows that there could be fortuitous expts. in which an excess of a *d*-acidic compd. might be formed. Segregation and reaction with a *dl*-base would start a cycle which would produce additional active mols.

F. E. BROWN

The reaction between nitrous acid and certain amino acids and related compounds at 45°. CARL L. A. SCHMIDT. *J. Biol. Chem.* 82, 587-94(1929).—Glycocoll, glycylglycine, cystine, cysteine, tryptophan, arginine and an unsatd. oxyindole deriv. yielded more N than could be accounted for on the basis of their free amino groups. Other substances reacted normally.

ARTHUR GROLLMAN

Preparation of *d*-gluconic and galactonic acids. M. HÖNIG AND W. RUZICZKA. *Ber.* 62B, 1434-6(1929); cf. Kiliani, *C. A.* 23, 3665.—H. and R. have also devised a method of prep. these acids in which the use of Ag or Pb compds. to remove the halogen is completely avoided. The glucose or galactose is oxidized either with Ba(OBr)<sub>2</sub> in the presence of a permanent slight excess of Ba(OH)<sub>2</sub> or with bleaching powder in the presence of an excess of Ca(OH)<sub>2</sub> at room temp. in direct sunlight or the light of a Hanauer anal. quartz lamp. The smaller the concn. of the sugar and of the alkali, the more homogeneous is the reaction; the best results were obtained with a 1% sugar soln., exactly 0.1 *N* hypobromite or hypochlorite (1 equiv. of O) and the calcd. amt. of 0.1 *N* Ba(OH)<sub>2</sub> or Ca(OH)<sub>2</sub> required to neutralize the resulting acid oxidation products. Usually the alkali is used up before the end of the oxidation and small amts. of Ba(OH)<sub>2</sub> must be added from time to time to keep the soln. permanently alk. The oxidation requires 30-45 min.; the soln. is then satd. boiling-hot with CO<sub>2</sub>, filtered, concd. *in vacuo*, treated with the calcd. amt. of dil. H<sub>2</sub>SO<sub>4</sub> (as detd. by a Ba analysis of a sample), filtered from the BaSO<sub>4</sub>, neutralized with CaCO<sub>3</sub>, filtered, evapd. *in vacuo* to a sirup and dropped into abs. alc., the pptd. Ca salt being repeatedly pptd. from a little H<sub>2</sub>O in the same way until it is free of Br. The yield of crude Ca gluconate is 85.3%. Galactonic acid is prepd. in the same way. Oxidation in the light of the quartz lamp requires 35 min. and the yield of crude Ca salt is 79.8%. The prepn. with Ca(OCI)<sub>2</sub> is even simpler, as the need of removing the Ba as BaSO<sub>4</sub> is avoided. Glucose after 3 hrs. oxidation gave 61.3% of crude Ca gluconate, galactose after 3.5 hrs. 58.13% of Ca galactonate. The gluconic acid can also be prepared from com. pure starch sirup.

C. A. R.

Chemistry of the associating lactolides: transformations of the aldols. MAX BERGMANN, ARTHUR MIEKELEY AND ERNST VON LIPPMANN. *Ber.* 62B, 1467-74(1929).—Like that of ordinary aldol the lactol acetate (I) of  $\beta$ -lactaldehyde is monomeric in gas form but in solvents associates to a dimer. The tendency to associate is accompanied by a pronounced tendency to rearrange, which often leads to unexpected products. Thus, on catalytic hydrogenation it does not simply exchange its OAc group for H but 2 mols. react with loss of only one OAc group and formation of 2-[ $\beta$ -acetoxyethyl]-1,3-dioxan (II),  $\text{AcOCH}_2\text{CH}_2\text{CH}(\text{O} \cdot \text{CH}_2 \cdot \text{CH}_2 \cdot \text{CH}_2 \cdot \text{O})$ . Removal of the

Ac group with alkali gives the hydroxyethyl compd. (III), which does not reduce Fehling soln., alk. hypoiodite or NH<sub>4</sub>-AgNO<sub>3</sub>, regenerates II on acetylation and yields a *mono-Me ether* (IV), which with boiling 2 *N* H<sub>2</sub>SO<sub>4</sub> yields MeOH, CH<sub>3</sub>:CHCHO and CH<sub>2</sub>:(CH<sub>2</sub>OH)<sub>2</sub>. CH<sub>3</sub>:CHCHO and CH<sub>2</sub>:(CH<sub>2</sub>OH)<sub>2</sub>, treated at 0° with HCl gas give 3-[ $\beta$ -chloroethyl]-1,3-dioxan (V), which with *N*/3 NaOH yields a compd. identical with III. This tendency to react as a double mol. is also exhibited by aldol cycloacetate (VI).  $\beta$ -Hydroxypropionaldehyde lactol acetate (I),  $\text{O} \cdot \text{CHMe} \cdot \text{CH}_2 \cdot \text{CHOAc}$  or

(6-7 g. from 10 g.  $\beta$ -lactaldehyde and Ac<sub>2</sub>O in C<sub>6</sub>H<sub>6</sub>N),

*b*<sub>0</sub>, 122-3°,  $n_D^{20}$  1.4490,  $d_4^{20}$  1.1795, mol. wt. in freezing AcOH, 232, in vapor form (at 180°) 137. II, obtained in about 53% yield from I in AcOH with H and Pd sponge, *b*<sub>12</sub> 115-8°,  $n_D^{20}$  1.4415,  $d_4^{20}$  1.0998, mol. wt. in freezing AcOH 169, in vapor form (at 180°) 292-330. III (3.3-3.5 g. from 5 g. II), *b*<sub>0</sub> 102-3°,  $n_D^{20}$  1.4566,  $d_4^{20}$  1.1057, mol. wt. in freezing AcOH 151, in H<sub>2</sub>O 120, in vapor form (at 180°) 251, does not react with PhNHNH<sub>2</sub> and reduces Fehling soln. only after acid hydrolysis. IV, from III boiled with MeI and Ag<sub>2</sub>O, *b*<sub>0</sub> 70-2°,  $n_D^{20}$  1.4334, mol. wt. in vapor form (at 180°) 313. V (20 g. from 20 cc. CH<sub>3</sub>:CHCHO), *b*<sub>0</sub> 74-5°,  $n_D^{20}$  1.4542, mol. wt. in vapor form (at

100°) 329. 2-[ $\beta$ -Acetoxypropyl]-4-methyl-1,3-dioxan (6.9 g. from 15 g. VI),  $b_{15}$  114-6°,  $n_D^{20}$  1.4347, does not react with  $NH_4OH$  or  $PhNHNH_2$ , is not oxidized by alk. hypoiodite, cannot be further acetylated and reduces Fehling soln. only after acid hydrolysis, mol. wt. in vapor form (at 180°) 423; it is also obtained in about the same yield when VI in gas form at 200° under 22 mm. is slowly passed with H over Pd-asbestos. Hydroxypropyl compd.,  $b_{15}$  100°, does not reduce alk. hypoiodite, gives on acid hydrolysis  $CH_3:CHCHO$  and 1,3-butanediol,  $b_{15}$  108-9°,  $n_D^{19}$  1.4418. C. A. R.

Isomeric  $\alpha,\beta$ -diphenylglutaric acids. S. AVERY AND W. D. MACLAY. *J. Am. Chem. Soc.* 51, 2833-9(1929).—The work previously published on the higher-melting acid (I), in so far as this paper relates to it, is confirmed in all essential points. The lower-melting acid (II) has been prep'd. in a pure condition by different methods, its cryst. habit noted and the m. p. found to be 208-10° (cor.). A mixt. of the 2 acids may be sep'd. by fractional crystn. I is transformed into the anhydride of II by heating with  $AcCl$  at 140° for 4 hrs.; it m. 126.5° and gives II with boiling  $H_2O$ . The Me ester, m. 143°, the Et ester, m. 93.3°, and the acid, m. 226-8°, belong to what is termed the higher-melting series; the Me ester, m. 87°, the Et ester, m. 76°, and the acid, m. 208-10°, belong to the lower-melting series. The CN and mono- $NH_2$  derivs., the imide, m. 225-9°, and the anilic acid, m. 201-2°, also appear to be members of the lower-melting series. The members of the higher-melting series might be termed "trans" or "fumaroid" compds., while those of the lower-melting series would be designated as "cis" or "maleinoid" forms, although these terms help to classify rather than to explain this and similar cases of stereoisomerism. Resolution of I by means of brucine gives *d*-I, m. 224-6°,  $[\alpha]_D^{20}$  58.7° (1 g. in 25 cc.  $Me_2CO$ ), and the *l*-I, m. slightly lower,  $[\alpha]_D^{20}$  -58.0°. Resolution of II gives a *d*-II, m. 202°,  $[\alpha]_D^{20}$  140.6° (0.2188 g. in 25 cc.  $Me_2CO$ ), and the *l*-II, m. 202°,  $[\alpha]_D^{20}$  -140°. The names proposed for I and its *d*- and *l*-forms are: *ad,bl-ad,bl-d*-, *ad,bl-* and *al,bl-d*-diphenylglutaric acids, for II, *al bl-ad,bl-d*-, *ad,bl-d*- and *al bl-d*-diphenylglutaric acids. C. J. WEST

New esters of thiocynoacetic acid. A. LAKNER. *Chem. Folyóirat* 34, 129-35 (1928).—Some thiocynoacetic esters can be used very well to produce thiazole derivs. Until now only some lower alc esters had been produced. Now the hexyl, heptyl, octyl, nonyl, phenol, resorcinol, pyrocatechol, hydroquinone, thymol, guaiacol, carvacrol, naphthol, benzyl, phenylethyl, phenylpropyl esters, further its Me salicylate and Me anthranilate esters have been produced and their phys. data det'd.

S. S. DE FINAIV

A note on the specific rotatory power of *d*-arginine. ANDREW HUNTER. *J. Biol. Chem.* 82, 731-6(1929).—The sp. rotatory power of *d*-arginine,  $\alpha_D^{20}$ , in the presence of an excess of  $HCl$  is at least 26.54°, the corresponding value for the  $HCl$  salt is 21.94°. Treated with  $HNO_3$ , arginine gives off 25% of its total N in 5 min. at room temp. and 30% more in 3 hrs.

ARTHUR GROLLMAN

Biguanides. I. Constitution of the heavy metal-complex compounds of biguanide. K. H. SLOTTA AND R. TSCHESCHE. *Ber.* 62B, 1390 8(1929).—It was previously shown for  $MeNHCONHC(:NH)NH_2$  and is now shown for [methylguanyl]urea,  $NH_2CONHC(:NH)NHMe$  (II), that these substances can no longer form complex compds., so that the presence of the unsubstituted  $NH_2$  group in guanylurea (III) is necessary for complex formation. It was desired to learn what influence alkylation of the middle N atom would have but when methylcarbethoxycyanamide (IV),  $NCNMeCO_2Et$ , was treated under mild conditions with  $NH_3$  the  $CO_2Et$  was split off with formation of  $MeNHCN$  which at once polymerized to trimethylmelamine. Contrary to the view of Chugaev that the metal complexes of II and of biguanide (V) have the same structure are the following facts: if V is singly or doubly substituted in positions 1 or 1 and 5, its ability to form complexes is not at all affected; derivs. substituted in positions 1 and 2 form no typical, difficultly sol. complexes although the color of the soln. changes to violet and no metal hydroxide is pptd.; substitution in positions 1, 2 and 3 completely prevents complex formation. These facts point definitely to the structure VI for the complexes of V, the 3-H atom being replaced by the metal. To test this view it was hoped that 3-methylbiguanide might be prep'd. by adding  $NH_3$  to Madelung and Kern's methylidicyanamide but their product proved to be a polymer (VII) and all efforts to obtain the monomer failed. That the 3-H atom is reactive, however, was shown by treating V with  $ClCH_2CO_2Et$  which gave a small amt. of a substance undoubtedly formed by primary reaction of the ester with the middle N atom with simultaneous splitting off of  $H_2O$  and  $EtOH$  and formation of the triazine VIII. The chief product, however, was biguanide-5-acetic acid  $HCl$  salt (IX). 1,1-Dimethylbiguanide gave

about equal parts of the *di-Me* derivs. (X and XI) of VIII and IX. The 1-derivs. of V were prepd. by addn. of amines to cyanoguanidine (XII) either in the presence of Cu ions in H<sub>2</sub>O (Herth method) or by fusing the amine salts with the XII. Aromatic derivs. were obtained by boiling the XII with the amine-HCl in H<sub>2</sub>O. 1,5-Disubstituted derivs. were prepd. by heating the Cu salt of dicyandiamide (XIII) with amines in H<sub>2</sub>O or fusing its Na salt with the amine-HCl. The 1,2-derivs. were prepd. by alkylating guanyllalkylthiouras with EtBr and treating the resulting S-Et derivs. with primary and secondary amines. 1,2,3-Triphenylbiguanide (XIV) was obtained from PhN:C(NHPh)<sub>2</sub> and NCNH<sub>2</sub>; attempts to extend the reaction to other aliphatic and aromatic guanidines failed. Sulfate of II (0.4 g. from 3 g. NH<sub>2</sub>CONHCN heated at 100° with alc. MeNH<sub>2</sub>, followed by pptn. of the product from EtOH with concd. H<sub>2</sub>SO<sub>4</sub>), m. 228-30° (slight gas evolution). IV (11 g. from 20 g. NCNNaCO<sub>2</sub>Et and Me<sub>2</sub>SO<sub>4</sub> in H<sub>2</sub>O), b<sub>s</sub> 100°. Biguanide acid sulfates: 1,5-Di-Me (6 g. from 8 g. of the Na salt of XIII and MeNH<sub>2</sub> HCl heated to 130°), decomp. 200°, isolated through the red Cu complex; 1,5-diallyl, viscous mass; 1,1,5,5-tetra-Me (6.5 g. from 8 g. of the Cu salt of XIII and aq. NHMe<sub>2</sub> at 120°), sinters 133-5°, decomp. 142°. *N*-Methyl-S-ethylguanyllthiurea-HBr (XV) (15 g. from 10 g. MeNHCSNHC(:NH)NH<sub>2</sub> and EtBr in boiling alc.), m. 173-5° (incipient decompn.). 1,2-Dimethylbiguanide-HBr (3.2 g. from 6 g. XV with aq. MeNH<sub>2</sub> on the H<sub>2</sub>O bath), decomp. 240-5°. 1,1,2-Tri-Me homolog (4 g. from 6 g. XV with NMe<sub>2</sub>), m. 185-90°. XIV (2.6 g. from 7 g. PhN:C(NHPh)<sub>2</sub> in C<sub>6</sub>H<sub>6</sub> and NCNH<sub>2</sub> in Et<sub>2</sub>O), decomp. 118-20°. VII, sinters 290° m. 235-8°. mol. wt. in PhOH 199. V from the sulfate boiled with NaOH.

(14.5 g.), m. 176° (darkening). II. Blood-sugar-lowering action of biguanides. *Ibid* 1398 1405.—In order to retain the blood-sugar-lowering action in biguanides, only 1 of the NH<sub>2</sub> groups can be substituted. In the Me, Et, Pr, iso-Bu, iso-Am series, the 1st member is the most effective and the same is true of the allyl, crotyl, isoamylenyl and isohexenyl series, as also of the 1,1-dialkyl series; the di-Et deriv. is wholly without action. Introduction of aromatic residues (Ph, MeOC<sub>6</sub>H<sub>4</sub>) or of CH<sub>2</sub>CO<sub>2</sub>H does not increase the activity. The 1-β-hydroxyethyl- and 1-β-mercaptoethylbiguanides and the ethylene-, hexamethylene- and decamethylenedibiguanides were inactive. The blood-sugar-lowering action is therefore limited to the 1st member of each series and is most pronounced in the 1,1-di-Me deriv., only the allyl deriv. having approx. the same activity; 0.1 g., subcutaneously, of each of these lowers the blood sugar of a middle-sized rabbit to the convulsive level, and they are effective by mouth. Glucose will restore the normal blood sugar level but adrenaline will not overcome the convulsions. Biguanide sulfates: 1-Pr (4 g. from 6 g. PrNH<sub>2</sub> and NCNHC(:NH)NH<sub>2</sub> with CuSO<sub>4</sub> in H<sub>2</sub>O at 100°), m. 193-6°. 1-iso-Am, m. 168-70°. 1,1-Dimethylbiguanide-HCl (140 g. from 100 g. Me<sub>2</sub>NH<sub>2</sub>·HCl), m. 235°. 1,1-Diethylbiguanide-H<sub>2</sub>SO<sub>4</sub> (6 g. from 14 g. Et<sub>2</sub>NH<sub>2</sub>·HCl), decomp. 202°. 1,1-Diallylbiguanide-HCl (2.5 g. from 5 g. (C<sub>3</sub>H<sub>5</sub>)<sub>2</sub>NH<sub>2</sub>·HCl), very hygroscopic, gradually m. 100-10°. 1-Crotylbiguanide sulfate, m. 165-8°, is obtained in 2.5 g. yield from 3.5 g. C<sub>4</sub>H<sub>7</sub>NH<sub>2</sub>·HCl which in turn is obtained with boiling Ba(OH)<sub>2</sub> from 7 g. *N*-crotylphthalimide, m. 76°, b<sub>12</sub> 178-80° (12 g. from 20 g. C<sub>4</sub>H<sub>7</sub>-Br and C<sub>6</sub>H<sub>5</sub>(CO)<sub>2</sub>NK in xylene at 180°). 1-Isoamyl-ethylbiguanide sulfate (3.0 g. from 5 g. C<sub>5</sub>H<sub>11</sub>NH<sub>2</sub>·HCl), m. 153-4°. Hexenylbiguanide sulfate (12 g. from 20 g. of the amine-HCl), decomp. 226°. 1-*p*-Methoxyphenylbiguanide-HCl (15 g. from 12 g. MeOC<sub>6</sub>H<sub>4</sub>NH<sub>2</sub>·HCl), m. 235°. Guanyllthiurea carbonate (I) was obtained in 90-100 g. yield from three 40-g. portions of NCNHC(:NH)NH<sub>2</sub> in H<sub>2</sub>O satd. at 0° with H<sub>2</sub>S, heated 10 hrs. at 70-80° and again alternately satd. with H<sub>2</sub>S and heated 7 times more and finally filtered and satd. at 0° with CO<sub>2</sub>. Guanyll-S-ethylthiurea-HBr (II) (50 g. from 100 g. I with EtBr on the H<sub>2</sub>O bath), decomp. 166°. 1-β-Hydroxyethylbiguanide sulfate (2.6 g. from 3 g. HOCH<sub>2</sub>CH<sub>2</sub>NH<sub>2</sub> and II in H<sub>2</sub>O), decomp. 148°, isolated as the Cu salt. 1-β-Mercaptoethyl acid sulfate (1 g.

from 10 g.  $\text{HSCH}_2\text{CH}_2\text{NH}_2 \cdot \text{HCl}$ ), decomps.  $201^\circ$ . *Ethylenedibiguanide sulfate* (1 g. from 2 g.  $(\text{CH}_2\text{NH}_2)_2$  with II in  $\text{H}_2\text{O}$ ), decomps.  $300^\circ$ . *Hexamethylenedibiguanide acid sulfate* (3 g. from 12 g.  $\text{H}_2\text{N}(\text{CH}_2)_6\text{NH}_2$ ), sinters  $195^\circ$ , decomps.  $205\text{--}10^\circ$ . *Decamethylenedibiguanide sulfate* (15 g. from 22 g. of the diamine), m.  $115^\circ$ , decomps.  $122^\circ$ . The hexamethylenediamine-HCl, m.  $248^\circ$ , was obtained (by W. HILTNER) in 45% yield from adipic dinitrile with Na and alc., and *decamethylenediamine-HCl* (by J. KOLLWITZ) in 60% yield from sebacic dinitrile. C. A. R.

**Crystalline tetraacetyl- $\alpha$ -glucose.** HANS H. SCHLUBACH AND IRENE WOLF (WITH P. STADLER). *Ber.* 62B, 1507-9(1929); cf. C. A. 22, 4106.—When  $\beta$ -acetochloroglucose (I) in  $\text{Et}_2\text{O}$  is shaken with  $\text{Ag}_2\text{CO}_3$  with addn. of a little  $\text{H}_2\text{O}$  at intervals the Cl is so slowly replaced by HO that the *tetraacetyl- $\alpha$ -glucose* (II), formed primarily, isomerizes to an equil. mixt. from which no cryst. product can be isolated. By using 10 cc. of the purest  $\text{Me}_2\text{CO}$ , freshly distd. after standing for months over  $\text{CaCl}_2$ , and 0.1 cc.  $\text{H}_2\text{O}$  and shaking 1.5 hrs. with 4 g. dry  $\text{Ag}_2\text{CO}_3$ , 1.1 g. cryst. II can be obtained from 5 g. I. II seps. from  $\text{Et}_2\text{O}$  in needles, m.  $107\text{--}8^\circ$ , mol. wt. in camphor 330,  $[\alpha]_D^{20}$   $138.9^\circ$  ( $\text{CHCl}_3$ ,  $c$  0.8964),  $139.4^\circ$  (96% alc.,  $c$  0.746) changing to  $83.1^\circ$  in 14 days (instantly on addn. of a drop of  $\text{NH}_4\text{OH}$ ). C. A. R.

**Sulfur sugars and their derivatives. XIV.  $\alpha$ -Glucothiose.** WILHELM SCHNEIDER AND HERBERT LEONHARDT. *Ber.* 62B, 1384-9(1929); cf. C. A. 22, 4108.—By using larger amts. of Na  $\beta$ -glucothiosate S. and L. have now been able to obtain the  $\alpha$ -pentaacetylglucothiose (I) in pure form; this on sapon. with NaOMe yielded the cryst. Na  $\alpha$ -glucothiose,  $\text{C}_6\text{H}_{11}\text{O}_5\text{SNa} \cdot 2\text{H}_2\text{O}$  (II). The rotation of the free glucothiose was detd. by adding an equiv. of mineral acid to the  $\text{H}_2\text{O}$  soln. of II; if the acid was present in slight excess the rotation fell in about 5 days to a const. value somewhat higher than that reached from the  $\beta$ -glucothiose side, possibly because of the presence in the  $\alpha$ -salt of a small amt. of the  $\alpha$ , $\alpha$ -diglucosyl disulfide produced by oxidation by the air. The Na salts of the 2 thioglucoses in faintly acidified soln. are smoothly and quantitatively oxidized to the disulfides by I. Below are the values for  $[\alpha]_D$  at about  $20^\circ$  for the  $\alpha$ - and  $\beta$ -derivs., resp., in  $\text{H}_2\text{O}$  (except the pentaacetates which were measured in  $(\text{CHCl}_3)_2$ ): Na salt 141.8°, 15.5°; glucothiose ion 183.8°, 20.2°; free thiose, initial, 212.8°, 16.5°; free thiose, final, 76.8°, 58.4°; pentaacetate 132.4°, 10.0°; disulfide 530.8°,  $-149.3^\circ$ . I (2.5 g. from 120 g.  $\beta$ -salt worked up in 15 g. portions), m.  $128\text{--}9^\circ$ . II, sinters on rapid heating at  $100^\circ$ , m.  $129\text{--}30^\circ$  (decompn.); the anhyd salt becomes yellow at  $130^\circ$  and m.  $155^\circ$  (decompn.). The Na content can be detd. by titration with Me orange but towards phenolphthalein the thiose behaves as a weak acid. In  $\text{H}_2\text{O}$  the salt is quite stable if the air is excluded. C. A. R.

**Relations between rotatory power and structure in the sugar group. XX. Two isomeric crystalline compounds of  $d$ -mannose with calcium chloride.** J. K. DALE. *J. Am. Chem. Soc.* 51, 2788-95(1929); cf. Hudson and Isbell, C. A. 23, 3901.— $\beta$ -Mannose (20 g.) and 32 g.  $\text{CaCl}_2 \cdot 2\text{H}_2\text{O}$  in 28 cc.  $\text{H}_2\text{O}$ , on standing at room temp. give 28 g. crude *mannose- $\text{CaCl}_2 \cdot 4\text{H}_2\text{O}$*  (I), m.  $101\text{--}2^\circ$  (cor.) after crystn. from  $\text{H}_2\text{O}$ ; the  $\text{H}_2\text{O}$  is lost at  $100^\circ$  after 19 hrs.; this may also be obtained from vegetable ivory through the mannose sirup, 100 g. ivory giving 114 g. I. I shows an unusual course of mutarotation and an initial sp. rotation (about  $-30^\circ$  or for the mannose constituent,  $-60^\circ$  in  $\text{H}_2\text{O}$ ); in MeOH the rate of change is slower and at  $20^\circ$  and  $5^\circ$  the initial sp. rotations are  $-34^\circ$  and  $-33^\circ$  or for the mannose constituent,  $-68.6^\circ$  and  $-60.5^\circ$ , with a final equil. value of  $4.4^\circ$  which indicates that the sugar constituent of the double compd. is a new form of mannose. The extrapolated initial rotation given above shows a value for the mannose portion in good agreement with that previously called by Hudson for a  $\beta$ -mannose of a 1,5-ring structure. Evapn. of I in EtOH on the  $\text{H}_2\text{O}$  bath gives the compd.  *$\beta$ -mannose- $\text{CaCl}_2 \cdot 2\text{H}_2\text{O}$*  (II), m.  $150\text{--}00^\circ$  (cor.); this may also be obtained directly from vegetable ivory or  $\beta$ -mannose. The final sp. rotation,  $6.73^\circ$ , and the extrapolated initial sp. rotation,  $-9.0^\circ$ , indicate that this is a compd. of  $\beta$ -mannose. II on acetylation gives 60% of the  $\beta$ -pentaacetate; I gives a sirupy gum, from which only a few crystals of the acetate sepd. The prepn. and study of compds. of the sugars with salts appear to offer a promising method for the discovery of new cryst. forms of the sugars. C. J. WEST.

**Trityl ethers of mannose. A new tetraacetylmannose.** BURCKHARDT HELFERICH AND JOSEPH F. LEBTE. *Ber.* 62B, 1549-54(1929).—Application of the "trityl" method to mannose for the prepn. of a tetra-Ac deriv. led to results entirely analogous to those obtained with glucose.  *$\beta$ - $d$ -Mannose 6-trityl ether* (I) (1.2 g. from 5 g.  $d$ -mannose in  $\text{C}_6\text{H}_5\text{N}$  at  $0^\circ$  with 1 mol.  $\text{Ph}_3\text{CCl}$ ), hydrated crystals, melts quite indefinitely even when anhyd. (begins to sinter about  $140^\circ$ , m. clear  $160\text{--}70^\circ$ ),  $[\alpha]_D^{17} -2.0^\circ$  ( $\text{CHCl}_3$ ).

$[\alpha]_D^{10}$   $-3.7^\circ$  ( $C_6H_5N$ ), slowly but strongly reduces hot Fehling soln., gives in  $C_6H_5N$  with  $Ac_2O$  a mixt. of the  $\alpha$ - and  $\beta$ -tetraacetyl derivs., better prepd. without isolating the free I:  $\beta$ -compd. (II) (21% from anhyd. mannose in abs.  $C_6H_5N$  allowed to stand 36 hrs. at room temp. with 1 mol.  $Ph_3CCl$ , then 1 hr. at  $0^\circ$  and 24 hrs. at room temp. with  $Ac_2O$ , dropped into much  $H_2O$ , washed repeatedly by decantation, dried in the air and recrystd. from hot alc. + 1% petroleum ether), m.  $204-6^\circ$ ,  $[\alpha]_D^{23}$   $-2.6^\circ$  ( $CHCl_3$ ); concn. of the mother liquors yields 20.5% of the  $\alpha$ -compd., m.  $130.5-1.5^\circ$  (an apparently isomorphous form, m.  $123-4^\circ$ , was also obtained),  $[\alpha]_D^{23}$   $73.4^\circ$ . 1,2,3,4-Tetraacetyl- $\beta$ -D-mannose (III), from II in cold  $AcOH$  with  $HBr-AcOH$ , m.  $135.5-6.5^\circ$  (cor.),  $[\alpha]_D^{20}$   $-22.5^\circ$  ( $CHCl_3$ ), shows no mutarotation, dissolves to the extent of about 2% in  $H_2O$ , the rotation of the soln. (kept in ordinary glass) changing in the course of several days from  $-15^\circ$  through a max. ( $-40^\circ$  to  $-45^\circ$ ) back to a final value of  $-13^\circ$ ; with  $Ac_2O$  in  $C_6H_5N$  it gives 20% of pentaacetyl-D-mannose, m.  $116^\circ$ ,  $[\alpha]_D^{22}$   $-24.1^\circ$  ( $CHCl_3$ ); with  $POCl_3$  in  $C_6H_5N$  at  $-20^\circ$  it gives tetraacetyl- $\beta$ -D-mannose-6-chlorohydrin, m.  $142-3^\circ$ ,  $[\alpha]_D^{12}$   $-7.6^\circ$  ( $CHCl_3$ ), slowly but strongly reduces hot Fehling soln., loses its Cl only slowly with  $AgNO_3$  and concd.  $HNO_3$  at  $95^\circ$ . Di[tetraacetyl- $\beta$ -D-mannose-6] sulfite, prepd. from III in the same way that diacetone-mannose 1-chlorohydrin was obtained from diacetone-mannose (C. A. 23, 107) and thus indicating that in III it is the 6- and not the 1-HO group which is free, m.  $173-5^\circ$ ,  $[\alpha]_D^{12}$   $-33.1^\circ$  ( $CHCl_3$ ). C. A. R.

**Shifting of the solution equilibrium between  $n$ - and  $h$ -galactose.** HANS H. SCHLUBACH and VILMA PROCHOWNICK. *Ber.* 62B, 1502-7(1929).—By a combination of the optical and isolation methods, S. and P. have shown that the equil. between the different forms of galactose in  $C_6H_5N$  is shifted in favor of the  $h$ -form by increase in temp. If the equil. soln. is heated the rotation changes from  $[\alpha]_D$   $55^\circ$  at  $20^\circ$  to  $32^\circ$  at  $90^\circ$  and acetylation at various temps. and isolation of the  $\beta$ -pentaacetyl- $h$ -galactose (I) shows that the content of  $h$ -sugar increases proportionately with the temp. Riiber and Minnaas calcd., from a study of the mutarotation of galactose, that a 10% soln. in  $H_2O$  at equil. at  $20^\circ$  contained 6.6, 27.4 and 66.0% of the  $\alpha$ - $n$ -,  $\alpha$ - $\beta$ - $h$ - and  $\beta$ - $n$ -forms, resp., while S. and P. find in cold  $C_6H_5N$  about 10, — and 71% and in boiling  $C_6H_5N$  —, 23.4 and 41.6% of the  $\alpha$ - $n$ -,  $\beta$ - $h$ - and  $\beta$ - $n$ -forms, resp. These are min. values, as the I can never be quantitatively isolated from the sirups and the content of the individual components cannot be calcd. from the rotation of the residual sirup since there are 4 possible components (it is quite certain that the  $\beta$ - $h$ -galactose is in equil. with the  $\alpha$ -form). As the result of this work, I has become a readily available substance; it can be obtained in more than 20% yield within 2 days. C. A. R.

**Some organic acids of sugar-cane molasses.** E. K. NELSON. *J. Am. Chem. Soc.* 51, 2808-10(1929).—The acids of molasses were found to be  $HCO_2H$ , about 0.1%;  $AcOH$ , 0.2%; acetic acid, 0.8%; lactic acid, 0.05%, and small quantities of malic and citric acids. Citric acid has not been previously reported as a constituent of sugar cane molasses. C. J. WEST

**Synthesis of sucrose.** AMÉ PICTET and HANS VOGEL. *Ber.* 62B, 1418-22(1929).—In view of the difficulty experienced by Zemplén and Gerecs in attempting to repeat the synthesis of sucrose (C. A. 23, 4195), P. and V. describe their method in greater detail than in their 1st paper. C. A. R.

**Strange course of the solubility of calcium hydroxide in sucrose solutions of low concentration.** PAUL FUCHS. *Ber.* 62B, 1535-8(1929).—When varying amts. (0-25 cc.) of 10% sucrose soln. were made up to 25 cc. with  $H_2O$ , treated with 50 cc. of  $N$   $NaOH$ , then with 25 cc. of somewhat more than 2  $N$   $CaCl_2$ , allowed to stand 5 min. with frequent shaking and filtered and the  $Ca(OH)_2$  remaining in soln. was titrated with  $N$   $HCl$  and methyl orange, the following relation between the sucrose concn. and amt. of dissolved  $Ca(OH)_2$  (both expressed in g./100 cc. filtrate) was found: 0.00, 0.304; 0.10, 0.452; 0.20, 0.545; 0.30, 0.671; 0.40, 0.785; 0.50, 0.871; 0.60, 0.913; 0.70, 0.943; 0.90, 0.926; 1.20, 0.911; 1.40, 0.893; 1.50, 0.882; 1.60, 0.900; 1.70, 0.904; 2.10, 1.193; 2.50, 1.559. At sucrose concns. of 0.00 to 0.70 and of 1.50 to 2.50 the dissolved  $Ca(OH)_2$  increases with the sucrose concn. and between these points the curve obtained by plotting the sucrose concn. against the dissolved  $Ca(OH)_2$  can be used for the analysis of sucrose solns., but the intermediate section of the curve passes through both a max. and a min.: the max. and min. correspond each to 2 different sucrose concns. and points between the max. and min. to 3 different concns. The type of the curve recalls the pressure-vol. curve calcd. from the van der Waals equation for non-ideal gases slightly below the critical temp. and it would be interesting to det. whether it undergoes the same changes in form as the pressure-vol. curve when the

temp. is changed. The cause of the peculiar course of the  $\text{Ca}(\text{OH})_2$  soly. curve may be purely chem., however. Thus, while the curve shows that 1.75 g sucrose/100 cc. holds as much  $\text{Ca}(\text{OH})_2$  in soln. as 0.75 g., when to 17.5 cc. of the 10% sucrose soln. + 7.5 cc.  $\text{H}_2\text{O}$  + 50 cc.  $N$   $\text{NaOH}$  the  $\text{CaCl}_2$  was rapidly added with shaking from a buret the pptd.  $\text{Ca}(\text{OH})_2$  at first immediately redissolved and only after 18.0 cc. of the  $\text{CaCl}_2$  had been added was a permanent ppt. formed quite suddenly; on the other hand, with 7.5 cc. sucrose soln. and 17.5 cc.  $\text{H}_2\text{O}$  a permanent turbidity appeared with less than 1 cc.  $\text{CaCl}_2$  soln.

**Chemistry of high molecular organic substances.** K. H. MEYER. *Z. angew. Chem.* **42**, 76-7 (1929).—A reply to Staudinger (*C. A.* **23**, 2155). In dispersion of highly polymerized substances groups or parts of the chains of indefinite size are present. The assocn. of mol. groups as micelles in soap is not exceptional as Staudinger asserts but similar to the behavior of tannin in water, substantive dyes, higher hydrocarbons, and fatty acids in phenol, lower fatty acids in water. Staudinger's views have been anticipated by Póányi and by Herzog. Later views of H. (*C. A.* **19**, 3179) are indorsed.

B. C. A.

**Constitution of sinistrin.** HANS H. SCHLUBACH AND WERNER FLÖRSHEIM. *Ber.* **62B**, 1491-3 (1929).—The belief that the synthetic difructose anhydride thought to be the basic substance of inulin (*C. A.* **23**, 1393) occurs in nature has been verified by a study of Schmiedeberg's sinistrin from *Scilla maritima*. By extn. of the fresh bulbs with cold  $\text{H}_2\text{O}$ , pptn. of the dissolved protein and fractional pptn with alc. there are obtained in good yields 2 sugars: sinistrin A, more easily sol. in alc.,  $[\alpha]_D^{20} -25.3^\circ$  ( $\text{H}_2\text{O}$ ,  $c$  1.2080), mol. wt. 305-10, and sinistrin B,  $[\alpha]_D^{20} -30.6^\circ$  ( $\text{H}_2\text{O}$ ,  $c$  1.1640), mol. wt. 670. With  $\text{Me}_2\text{SO}$ , the A compd. takes up 3 Me groups to each fructose anhydride unit with formation of a substance (I) whose mol. wt. corresponds to a product consisting of about 10 trimethylfructose anhydride units and in its other properties resembling methylated inulin in many respects. Cleavage with  $(\text{CO}_2\text{H})_2$  readily yields a 3,4,6-trimethylfructose  $< 2.5 >$  identical with that obtained by Haworth and Learner from inulin and by S. and Elsner from their synthetic hexamethyldifructose anhydride. Sinistrin A is therefore di-*h*-fructose anhydride, probably identical with that obtained from the synthetic di-*h* fructose and from the difructose anhydride prepd. by Vogel and Pictet from inulin by heating with glycerol. Sinistrin B is supposed to be the analogous tetra-*h*-fructose anhydride. I, mol. wt. 2020,  $[\alpha]_D^{20} -41.5^\circ$  ( $\text{CHCl}_3$ ,  $c$  0.9496).

C. A. R.

**Nature of inulin.** HANS H. SCHLUBACH AND HORST ELSNER. *Ber.* **62B**, 1493 (1929); cf. preceding abstr.—If all the known substances having the compn. of a hexose anhydride,  $(\text{C}_6\text{H}_{10}\text{O}_5)_x$ , and a weak *l*-rotation and yielding chiefly fructose on hydrolysis are arranged in the order of decreasing soly. in  $\text{H}_2\text{O}$  (fructose anhydride, difructose anhydride, sinistrin A,  $\beta$ -levulin,  $\beta$ -levulan, sinistrin B, levulin, triticin, graminin, inulenin, inuloid, pseudoinulin inulin), their mol. wts. increase and their rotations decrease (become more strongly negative) in the same order. Assuming that the basic substance of all these compds. is the same, *viz.*, fructose anhydride  $< 1.2 >$   $< 2.5 >$  (I), as has been proved for the 1st and last members and is rendered very probable for the middle members by their occurrence and properties, this would seem to be a polymeric homologous series like Staudinger's polyhydroxymethylenes. In order to simplify the nomenclature of these compds. and to bring out their relationship to each other it is proposed to call I *levan*. Sinistrin A would then be *dilevan*, sinistrin B *tetralevan*, inulin a mixt. of *polylevans*. As indicated by numerous reports in the literature and shown by further examples in the present paper, in prep. inulin the results of fractionation are greatly influenced by the stage of polymerization of the raw material and this in turn varies greatly not only with the plant species from which the raw material is obtained but also with the time of the year when the plant is worked up; before the beginning of the period of vegetation the more easily sol. lower polylevans increase at the expense of the higher polymers and in the fall the latter predominate. Inulin may be built up in 2 ways: dilevan (*h*-difructose anhydride  $< 1.2' >$   $< 2.1' >$ ) associates to structures of high mol. wt., or there is formed a chain of *h*-fructose residues joined alternately through an O bridge between the 2nd C atom of 1 residue and the 1st C atom of the next residue. The abundant, in part contradictory, evidence for and against each view does not make it possible to det. which is correct. Nor is this picture of the make-up of inulin complete. Numerous investigators have pointed out that inulin always contains small and varying amts. of ash, chiefly phosphoric and silicic acids, the interpretation of the significance of which encounters the same difficulties as in the case of starch. Moreover, Tanret concluded, from the lower

ing of the rotation of inulin on acid hydrolysis, that it contains 1 glucose to every 12 fructose residues and actually isolated cryst. glucose from pseudoinulin, although Bourquelot and Bridel were unable to detect glucose, with emulsin in MeOH, in inulin hydrolyzed with *Aspergillus niger*. S. and E. have now shown its presence in 3 ways: (1) triacetylulinin cautiously hydrolyzed with AcBr·AcOH·HBr, debrominated with Ag<sub>2</sub>CO<sub>3</sub> and acetylated with Ac<sub>2</sub>O·H<sub>2</sub>SO<sub>4</sub> gave α-pentaacetylglucose; (2) the same product was obtained directly from triacetylulinin with Ac<sub>2</sub>O·H<sub>2</sub>SO<sub>4</sub>; (3) the reducing power of inulin hydrolyzed with very dil. H<sub>2</sub>SO<sub>4</sub> (0.05 N) was detd. according to Willstätter-Schudel and compared with the total reducing value according to Bertrand; the results indicated an aldose content of about 8%, in good agreement with Tanret ( $1/13 = 7.7\%$ ). This does not prove, of course, that glucose is present preformed in inulin, as part of the *h* fructose may rearrange into glucose at the moment it is set free, although a similar expt. with sucrose gave no evidence of such a rearrangement. Staudinger found that in the β-polyhydroxymethylenes the end HO group is esterified by H<sub>2</sub>SO<sub>4</sub> and in the γ-comps. it is etherified by alc.; it is possible that in inulin the end HO group of the fructose chain is combined with a glucose residue through the reducing group of the latter.

ALBERT L. HENNE

**Conversion of the naphthenic acids into naphthenes.** GUST. KOMPPA (with O. ROUTALA AND J. M. KANERVA). *Ber.* 62B, 1562–70 (1929).—A no. of yrs. ago K. undertook to convert naphthenic acids by modern mild methods of reduction into their corresponding hydrocarbons in order to det. whether these acids are really CO<sub>2</sub>H derivs. of naphthenes present in the same petroleum. Large quantities of the crude acids from Baku petroleum were accordingly freed of neutral impurities and converted into the Me esters, the tedious fractionation of which had just been finished when Zelinskii's paper on the same subject appeared (*C. A.* 18, 2148). As, however, he did not obtain undecanaphthenic acid (I) in pure form, K. investigated those fractions (*b* 227–45°) of his Me esters which should contain the I. Most careful fractionation of the Me esters gave no homogeneous product nor even "main fractions," and while sapon. and fractionation of the free acids *in vacuo* gave a main fraction *b*<sub>3</sub> 147–8°, this proved to be a const. boiling mixt. of decanaphthenic acid and I from which no cryst. amide, anilide or toluidide could be obtained. Fractionation of the chlorides finally yielded a homogeneous product from which the pure Me and Et esters of I and I itself were obtained. Reduction of the Et ester by the Bouveault-Blanc method gave undecanaphthenol (II), converted through the chloride (III) into an undecanaphthene (IV) which was undoubtedly identical with the hendecanaphthene isolated, although apparently not in as pure form, by Markovnikov and Oglobin from Baku naphtha. Chloride of I, *b*<sub>3</sub> 106.5–8°. Et ester, *b*<sub>733</sub> 247–8.5°, *d*<sub>4</sub><sup>20</sup> 0.92356, *n* 1.44818, 1.44579, 1.45369, 1.45801 for D, α, β and γ at 20°, *E*<sub>S</sub> –0.075, –0.081, –0.079, –0.107, –1.0650, –4.920% for D, α, β, γ, β-α and γ-α, resp. Me ester, *b*<sub>733</sub> 236–7°, *d*<sub>4</sub><sup>20</sup> 0.93528, *n* 1.44984, 1.44758, 1.45535, 1.45983, *E*<sub>S</sub> –0.081, –0.081, –0.087, –0.106, –2.0750, –5.040%. I, *b*<sub>733</sub> 271–2°, *d*<sub>4</sub><sup>20</sup> 0.9707, *n* 1.46237, 1.46021, 1.46820, 1.47292,

$EE = -0.069, -0.058, -0.069, -0.082, -2.270, -4.57\%$ . IV, from III in alc. with Na, b.  $183.5-4.5^\circ$ ,  $d_4^{20}$  0.81284,  $n$  1.44834, 1.44597, 1.45431, 1.45940,  $EE$  0.009, 0.002, 0.029, 0.051, 5.290, 4.62% (M. and O.'s product b.  $180-5^\circ$ ,  $d_0$  0.8119).  
C. A. R.

The action of cyclohexane and its derivatives on organic compounds in the presence of aluminum chloride. DANIEL BODROUX. *Ann. chim.* [10], 11, 511-82 (1929).—The dehydration of cyclohexanol with  $H_3PO_4$  yields *cyclohexene* (I), b.  $83-4^\circ$ ,  $d_{21}$  0.809,  $n_D^{20}$  1.445; mol. refractivity 26.97. B. has found it more convenient to use I than its halogen derivs. in the prepn. of condensation products with aromatic hydrocarbons. I,  $AlCl_3$  (II) and the hydrocarbon are reacted at room temp., using  $CS_2$  to complete soln. when necessary. I, II and benzene yield 70% of crude *cyclohexylbenzene* (III), b.  $238-40^\circ$ ,  $d_{16}$  0.947,  $n_D^{16}$  1.528, mol. refractivity 52.07, and *1,2-diphenylcyclohexane* (IV), m.  $169-70^\circ$  (from alc.-PhH). B. regards IV as having been formed by the rearrangement of *cyclohexylbiphenyl*, resulting in turn from the dehydrogenation of the by-product *phenyldicyclohexane*. I, II and toluene yield 62% of a mixt. of *o*- and *p*-*cyclohexyltoluene* (V), b.  $255-61^\circ$ ,  $d_{16}$  0.935,  $n_D^{16}$  1.527, mol. refractivity 57.07. I, II and *p*-xylene yield 33% of *2-cyclohexyl-1,4-dimethylbenzene*, b.  $261-3^\circ$ ,  $d_{16}$  0.936,  $n_D^{16}$  1.529, mol. refractivity 61.94, and *dicyclohexyldimethylbenzene*, m.  $156-7^\circ$  (from alc.-PhH). I, II and *m*-xylene yield 56% of *5-cyclohexyl-1,3-dimethylbenzene* (VI), b.  $266-8^\circ$ ,  $d_{16}$  0.931,  $n_D^{16}$  1.525, mol. refractivity 61.83. VI was identified by the prepn. of *2,4,6-trinitro-5-cyclohexyl-1,3-dimethylbenzene*, m.  $117-8^\circ$ . I, II and mesitylene yield 21% of *2-cyclohexyl-1,3,5-trimethylbenzene* (VII), b.  $283-4^\circ$ ,  $d_0$  0.946,  $n_D^0$  1.535, mol. refractivity 66.33. I, II and cymene yield a mixt. of the 2 isomers of *cyclohexyl-1-methyl-4-isopropylbenzene* (VIII), b.  $279-85^\circ$ ,  $d_{24}$  0.916,  $n_D^{24}$  1.517, mol. refractivity 71.34, and *methylidicyclohexylbenzene* (IX), b.  $210-20^\circ$ . B. regards the formation of IX to have been due to the formation of *dicyclohexylcymene*, with the subsequent removal of the iso-Pr group by the action of II. I, II and  $Ph_2$  yield *cyclohexylbiphenyl*, m.  $75-6^\circ$  (from alc.), a liquid isomeric mixt. of *cyclohexylbiphenyl* which partially solidifies at  $0^\circ$  (combined yields 54%), b.  $238-40^\circ$ ,  $d_{27}$  1.017,  $d_{14}$  1.028,  $n_D^{27}$  1.5915,  $n_D^{14}$  1.598, mol. refractivity 78.40, and *dicyclohexylbiphenyl*, m.  $205-6^\circ$ . I, II and  $CH_2Ph_2$  yield 27% of *cyclohexyldiphenylmethane*, b.  $252-7^\circ$ ,  $d_{20}$  1.005,  $d_8$  1.029,  $n_D^{20}$  1.571,  $n_D^8$  1.587, mol. refractivity 81.69, and *p-benzylbiphenyl*, m.  $85^\circ$  (from alc.), resulting from the dehydrogenation of *p-cyclohexyldiphenylmethane*. I, II and *bi-benzyl* yield a solid *cyclohexylbibenzyl*, m.  $68-9^\circ$  (from alc.) and a liquid isomeric mixt. of *cyclohexylbibenzyl*, which partially solidifies at  $0^\circ$ , b.  $240-4^\circ$ ,  $d_{10}$  0.994,  $d_{21}$  0.992,  $n_D^{10}$  1.564,  $n_D^{24}$  1.561, mol. refractivity 86.27. B. calls attention to the fact that in the liquid products, the disparity between the calcd. mol. refract. and that found decreases as successive  $-CH_2-$  groups are interposed between the Ph groups. This is in accord with the findings of others on similar compds. I, II and  $C_{10}H_8$  yield 19% of a liquid isomeric mixt. of *cyclohexylnaphthalene* (X), which partially solidifies at  $0^\circ$ , b.  $341-7^\circ$ ,  $d_{17}$  1.025,  $d_{20}$  1.021,  $n_D^{17}$  1.603,  $n_D^{20}$  1.597, mol. refractivity 70.29, a solid *p-cyclohexylnaphthalene* (XI), m.  $31^\circ$  (by evapn. of a MeOH soln.), and *dicyclohexylnaphthalene*, m.  $151-2^\circ$ . XI may be obtained in 29.5% yield by a modified procedure. XI yields a *picrate*, m.  $100-1^\circ$  (from alc.), oxidized with  $HNO_3$  to  $\beta$ - $C_{10}H_7CO_2H(?)$ , m.  $181-2^\circ$ , and, dehydrogenated by heating to  $230^\circ$  with pulverized  $S$  to  $\beta$ - $C_{10}H_7Ph$ , m.  $101-2^\circ$ . I, II and tetrahydronaphthalene yield *cyclohexyltetrahydronaphthalene* (XII), b.  $329-35^\circ$ ,  $d_{16}$  0.991,  $d_{20}$  0.9855,  $n_D^{16}$  1.553,  $n_D^{20}$  1.5498, mol. refractivity 69.13. XII, considered by B. to be an isomeric mixt., on dehydrogenation yields only a small quantity of  $\beta$ - $C_{10}H_7Ph$ . The cyclohexyl radical is attached to the unsatd. ring, since there is no action between I, II and cyclohexane or decahydronaphthalene at room temp. B. calls attention to the fact that the disparity between the calcd. mol. refractivity and that found is greater in X than in XII, which is in accord with the disparities found for  $C_{10}H_8$  and tetrahydronaphthalene. Bodroux (*Thesis, Paris, 1898*) has shown that all H atoms and all secondary or tertiary side chains are replaced by Br in the presence of  $AlBr_3$ . On bromination, III yields  $C_6Br_6$ , V yields  $MeC_6Br_5$ , VII yields

tribromomesitylene, and X and XI yield hexabromonaphthalene. I does not react with guaiacol, and gives a resinous product with  $\alpha$ -naphthol. I, II and phenol yield cyclohexyl chloride,  $b_{758}$  143–4°,  $d_{25}$  0.999,  $n_D^{25}$  1.466, mol. refractivity 32.84, 12% of *p*-cyclohexyl ether,  $b_{758}$  247–9°,  $d_{25}$  0.999,  $n_D^{25}$  1.527, mol. refractivity 54.16, 4% of *p*-cyclohexylphenol (XIII), m. 130–1°, and 15% of *o*-cyclohexylphenol (XIV), m. 56–7°. XIV on alkylation yields 82.7% of methyl *o*-cyclohexylphenolate (XV),  $b_{749}$  267–8.5°,  $d_{18}$  1.007,  $n_D^{18}$  1.5365, mol. refractivity 58.89, or 88% of ethyl *o*-cyclohexylphenolate,  $b_{756}$  276–8°,  $d_{21}$  0.976,  $n_D^{21}$  1.5223, mol. refractivity 63.78, or 88% of propyl *o*-cyclohexylphenolate,  $b_{758}$  292–4.5°,  $d_{21}$  0.966,  $n_D^{21}$  1.5198, mol. refractivity 68.58, or 79.5% of butyl *o*-cyclohexylphenolate,  $b_{758}$  305–7°,  $d_{23}$  0.955,  $n_D^{23}$  1.5137, mol. refractivity 73.12. XIII on alkylation yields 62.7% of methyl *p*-cyclohexylphenolate (XVI), m. 57–8° (from dil. alc.), or 92% of ethyl *p*-cyclohexylphenolate, m. 41–2° (from dil. MeOH), or 87% of propyl *p*-cyclohexylphenolate, m. 36° (from dil. MeOH), of 92% of butyl *p*-cyclohexylphenolate, m. 29° (from dil. MeOH). I, II and anisole yield XVI and XV. I, II and carvacrol yield 12.9% of carvacrol cyclohexyl ether,  $b_{758}$  305–10°,  $d_{16}$  0.966,  $n_D^{16}$  1.5215, mol. refractivity 73.19, and 18% of an isomeric mixt. of cyclohexylcarvacrol,  $b_{762}$  315–25°. The actions of 1-methyl- $\Delta^3$ -cyclohexene (XVII), menthene (XVIII), and 1-phenyl- $\Delta^1$ -cyclohexene (XIX) on aromatic hydrocarbons in the presence of II, were studied in a similar manner. XVII, prepd. by the dehydration of 1-methylcyclohexan-4-ol in 90% yield,  $b_{762}$  104–5°,  $d_{17}$  0.804,  $n_D^{17}$  1.422, mol. refractivity 31.58, vapor d. 3.35. XVII, II and benzene yield 12.2% of dimethyldicyclohexylbenzene,  $b_{20}$  230–5°,  $d_{22}$  0.962,  $n_D^{22}$  0.533, mol. refractivity 87.10 and 33% of an isomeric mixt. of methylcyclohexylbenzene (XX),  $b_{764}$  247–51°,  $d_{21}$  0.918,  $n_D^{21}$  1.512, mol. refractivity 56.85. XX on bromination yields  $\text{MeC}_6\text{Br}_5$  (from the cyclohexyl radical) and  $\text{C}_6\text{Br}_6$ . XVII, II and *p*-xylene yield 19% of an isomeric mixt. of methylcyclohexyl-*p*-xylene,  $b_{756}$  275–85°,  $d_{24}$  0.927,  $n_D^{24}$  1.522, mol. refractivity 66.48. XVII, II and  $\text{CH}_2\text{Ph}_2$  yield an isomeric mixt. of methylcyclohexyldiphenylmethane,  $b_{20}$  238–48°,  $d_{23}$  1.01,  $n_D^{23}$  1.574, mol. refractivity 86.26. XVIII is obtained by the dehydration of menthol in 92% yield,  $b_{758}$  165–7°,  $d_{18}$  0.807,  $n_D^{18}$  1.451, mol. refractivity 46.08, vapor d. 4.87. XVIII, II and benzene yield 22% of an isomeric mixt. of menthyl benzene,  $b_{90}$  194–210°,  $d_{24}$  0.9145,  $n_D^{24}$  1.5008, mol. refractivity 70.35. XIX, prepd. according to Brazidec (Bull. Soc. Chem. [4], 17, 101), with II and benzene yields diphenylcyclohexane (?),  $b_{20}$  267–300°. The analysis is correct, but the mol. wt. detd. in PhH, and the b. p. are both much too high.

T. H. RIDER

**Comparative stability of isomers in relation to their absorption spectra (aromatic allyl and isoallyl derivatives).** MME. RAMART-LUCAS AND MLLÉ. AMAGAT. *Compt. rend.* 188, 638–40 (1929); cf. C. A. 22, 2717.—A study of stable isomeric formation by means of absorption spectra data. The isoallylphenyl derivs. have a band nearer the visible than the normal allyl derivs. Allyl derivs. are converted by heating into the isoallyl derivs:  $\gamma$ -Phenylpropanol gives, on dehydration, allylbenzene at low temp. and isoallylbenzene at higher temps. New compds. prepd. include: 3-anisylpropanol,  $b_{15}$  160°, m. 26°; phenylurethan, m. 67°; 3-piperonylpropanol,  $b_{13}$  180°; phenylurethan, m. 97°.

WALLACE R. BRODE

**Comparative stability of isomers in relation to their absorption spectra (dehydration of glycols, isomerization of oxides of ethylene).** MME. RAMART-LUCAS AND F. SALMON-LEGAGNEUR. *Compt. rend.* 188, 1301–3; cf. preceding abstr.—A study was made of the absorption spectra of isomeric diphenyldimethylethylene glycols. When heated they dehydrate and undergo a pinacol-pinacolin rearrangement, forming compounds with absorption bands near the visible, provided CO or  $\text{CO}_2$  are not split out.  $\text{Ph}_2\text{C}(\text{OH})\text{C}(\text{OH})\text{Me}_2$  gives with  $\text{Ac}_2\text{O}$  and traces of  $\text{H}_2\text{SO}_4$   $\text{Me}_2\text{CPhCOPh}$ , and with concd.  $\text{H}_2\text{SO}_4$  1,1- $\text{Ph}_2\text{CMeCOMe}$ .  $\text{PhMeCH}(\text{OH})\text{CH}(\text{OH})\text{MePh}$  yields with either of the above reagents,  $\text{Ph}_2\text{CMeCOMe}$ .

WALLACE R. BRODE

**Preparation of symmetrical trichloroaniline and of tetrachloroquinone from aniline in hydrochloric acid solution.** J. ERDELYI. *Magyar Chem. Folyóirat* 35, 15–6 (1929); *Chimie & industrie* 22, 87.—Prepn. of sym.  $\text{C}_6\text{H}_2\text{Cl}_3\text{NH}_2$  by direct chlorination is rendered difficult by formation of resins and coloring matter, which was avoided by working in concd. HCl, as follows: dissolve 5 g.  $\text{PhNH}_2$  in 100 cc. concd. HCl, pass  $\text{Cl}_2$  gas until diln. with  $\text{H}_2\text{O}$  no longer produces turbidity, filter and dil. with 5–6 vols.  $\text{H}_2\text{O}$ . The ppt., recrystd. from alc., m. 76.5°. Yield 1 g. Tetrachloroquinone, which has already been prepd. by oxidation of  $\text{PhNH}_2$  in HCl by means of  $\text{KClO}_3$ ,  $\text{Na}_2\text{Cr}_2\text{O}_7$

and *aqua regia*, can also be prepd. by means of other oxidizing agents, but only in HCl. 1 g. PhNH<sub>2</sub> in 100 cc. of 20% HCl was treated at boiling temp. with (a) solid MnO<sub>2</sub>, (b) solid KMnO<sub>4</sub>, (c) NaOCl soln., (d) Cl + ClO<sub>2</sub> (prepd. from KClO<sub>3</sub> + H<sub>2</sub>SO<sub>4</sub> (not HCl)), (e) Cl + O<sub>2</sub>; after cooling all the solns. turned yellow and deposited a brown powder or yellow scales which, after drying, subliming and recrystg. from AcOH m. (a) 280°, (b) 284°, (c) 287°, (d) 288.5°. Expts. in 20% H<sub>2</sub>SO<sub>4</sub>, HNO<sub>3</sub> and NaCl soln. were unsuccessful.

A. PAPINEAU-COUTURE

**Catalytic reduction of nitro compounds.** M. BUSCH AND KARL SCHULZ. *Ber.* 62B, 1458-66(1929).—Palladinized CaCO<sub>3</sub> (1%) was used as the catalyst and N<sub>2</sub>H<sub>4</sub> as the source of H. The reductions were generally carried out in boiling 5% alc. KOH, 0.5 of the catalyst being added at the beginning and the rest in 2-3 portions during the operation. The amt. of catalyst quite materially affects both the qual. and the quant. course of the reaction. The nature of the solvent has a marked influence, the reduction being far more energetic in MeOH than in EtOH. Thus, while PhNO<sub>2</sub> in EtOH under certain conditions gives Ph<sub>2</sub>N<sub>2</sub>O almost exclusively, in MeOH under the same conditions is obtained PhN:NPh. This effect of the solvent evidently is related to the dielec. const., for EtOH properly dild. with H<sub>2</sub>O behaves like MeOH. Nitro compds tending to tautomerize into pseudo acids are much more readily and extensively reduced, generally directly to the amine *o*- and *p*-O<sub>2</sub>NC<sub>6</sub>H<sub>4</sub>OH yielded the aminophenols without increasing the amt. of catalyst, as did also the *m*-compd. in MeOH. Of the nitrosulfonic acids, the *m*-compd. yielded the amino acid almost exclusively. Similarly, *o*- and *p*-O<sub>2</sub>NC<sub>6</sub>H<sub>4</sub>NH<sub>2</sub> gave the phenylenediamines, as did the *m*-compd. in MeOH, while in EtOH it gave the azoxy compd. Under the same conditions Ph<sub>2</sub>N<sub>2</sub>O is almost quant., PhN:NPh about 50% reduced to PhNHNHPh, while the latter is almost unclanged. In the nitrotoluenes the position of the Me group materially influences the degree of hydrogenation which increases in the order *o* → *m* → *p*, the 3 isomers giving in alc. azoxy-, azo- and a mixt. of azo- and hydrazotoluene, resp. In MeOH *o*-O<sub>2</sub>NC<sub>6</sub>H<sub>4</sub>Me gives *o*-toluidine in excellent yield, the *m*-compd. a mixt. of hydrazotoluene and toluidine, and the *p*-isomer azo- and hydrazotoluene and toluidine. In the halonitrobenzenes the nitro group is first attacked; the formation of azoxy derivs. is greatly repressed (only with *p*-BrC<sub>6</sub>H<sub>4</sub>NO<sub>2</sub> was (BrC<sub>6</sub>H<sub>4</sub>)<sub>2</sub>N<sub>2</sub>O obtained as chief product, because of its slight soly. in alc.); in EtOH the azo compds. predominate while in MeOH haloanilines and even PhNH<sub>2</sub> itself are also formed; the latter was the chief product with *o*-BrC<sub>6</sub>H<sub>4</sub>NO<sub>2</sub>.

C. A. R.

**Amine oxidation. XII. Hydrazyls:  $\alpha,\alpha$ -diaryl- $\beta$ -benzoylhydrazyls.** STEFAN GOLDSCHMIDT AND JOS. BADER. *Ann.* 473, 137-62(1929); cf. *C. A.* 21, 3052— $\alpha,\alpha$ -Diphenyl- $\beta$ -acylhydrazyls are a class of radicals with bivalent N (cf. G., *C. A.* 18, 2139); in soln. they are in equil. with their dimol tetrazans. Unsym. diarylhydrazines being difficult of prepn.,  $\alpha,\alpha$ -diaryl- $\beta$ -acylhydrazines were prepd. by the Tafel-Gattermann reaction (*Ber.* 25, 413, 1075), which consists in the action of Cu(OAc)<sub>2</sub> or CuCl<sub>2</sub> on sym. acylphenylhydrazines. The reaction is explained by the following series of reactions.  $Ar_1NHNHCOR \rightarrow (Cu^{++})Ar_1N:NCOR \rightarrow$  (hydrolysis)  $RCO_2H + Ar_1N:NH \rightarrow$  (oxidation)  $ArN:NX \rightarrow (Ar_1NHNHBz) Ar_2N(N-NAr_1)NHBz \rightarrow (Cu) Ar_1Ar_2NNHBz$ . Among the proofs of this series of reactions are: In the prepn. of (*p*-BrC<sub>6</sub>H<sub>4</sub>)<sub>2</sub>NNHBz with CuCl<sub>2</sub> there is formed a considerable amt. of *p*-BrC<sub>6</sub>H<sub>4</sub>Cl; addn. of a diazonium salt or an arylhydrazine salt (which yields a diazonium salt with Cu<sup>++</sup>) increases the yield; hydrazines, with Ar<sub>1</sub> and Ar<sub>2</sub> in the same mol may be obtained from Ar<sub>1</sub>NHNHBz and Ar<sub>2</sub>NHNH<sub>2</sub>, HCl or from Ar<sub>2</sub>NHNHBz and Ar<sub>1</sub>NHNH<sub>2</sub>. HCl. *p*-BrC<sub>6</sub>H<sub>4</sub>NNHBz (5 g.) in 100 cc. EtOH with 10-15 g. Cu(OAc)<sub>2</sub> gives 20-30% of  $\alpha,\alpha'$ -di-*p*-bromophenyl- $\beta$ -benzoylhydrazine (I), m. 235°;  $\alpha,\alpha'$ -di-*p*-nitrophenyl deriv. (II), deep yellow, m. 276°;  $\alpha,\alpha'$ -di-*p*-anisyl deriv. (III), m. 228° (from  $\alpha$ -*p*-anisyl- $\beta$ -benzoylhydrazine (IV), m. 139-40°);  $\alpha$ -phenyl- $\alpha'$ -*p*-bromophenyl deriv. (V), m. 198-9°, prepd. in the 2 ways given above;  $\alpha$ -phenyl- $\alpha'$ -*p*-anisyl deriv. (VI), very sensitive to oxidation, especially in soln.;  $\alpha$ -phenyl- $\alpha'$ -*p*-tolyl deriv. (VII), m. 171-2°;  $\alpha$ -phenyl- $\alpha'$ -*p*-nitrophenyl deriv. (VIII), light yellow, m. 172-3°. These hydrazines are oxidized by K<sub>2</sub>Fe(CN)<sub>6</sub> or PbO<sub>2</sub> in alk. soln. to hydrazyls which, except in the case of III (which is exclusively monomol. in soln.) are in equil. with the dimol tetrazans; the equil. can be detd. by titration with C<sub>6</sub>H<sub>5</sub>(OH)<sub>2</sub> or (PhNH)<sub>2</sub>. The follg. values were found for *K*: II in CHCl<sub>3</sub> at 0°,  $6 \times 10^{-7}$ ; VIII in CHCl<sub>3</sub> at -18.5°,  $8.3 \times 10^{-8}$ ; I in PhMe at -18.6°,  $1.45 \times 10^{-8}$ ; V in PhMe at -18.5°,  $3.3 \times 10^{-8}$ ; Ph<sub>2</sub>NNHBz in PhMe at -18.1°,  $1.15 \times 10^{-8}$ ; VII in PhMe at -18.5°,  $4.3 \times 10^{-8}$ ; (*p*-MeC<sub>6</sub>H<sub>4</sub>)<sub>2</sub>NNHBz in PhMe at -18.5°,  $1.7 \times 10^{-8}$ ; VI in Me<sub>2</sub>CO at -18.6°,  $3.5 \times 10^{-8}$ . These values are correct within  $\pm 5\%$ . Values are also given for the disson. energy in cal. calcd. from the formula  $U = 4.571 (\log K_2 - \log K_1) T_1 T_2 / T_2 - T_1$  for

the N-N linkage in the tetrazans; it varies from 7000 to 18,000; the solvent has a considerable influence; e. g., tetraphenyldibenzoyltetrazan gave the following values: PhMe, 9800-10,500; Me<sub>2</sub>CO, 7700-8200; CHCl<sub>3</sub>, 5200-5900; Et<sub>2</sub>O, 9100-10,100. It appears that with an increase in the dissocn. const. there is a decrease of the heat of dissocn.

C. J. WEST

**A new group of hydrazomethylenes.** M. BUSCH AND WALTER SCHMIDT (WITH PAUL BOHRISCH AND OTTO LUSCH). *Ber.* 62B, 1449-57 (1929).—The properties of the dark red compd C<sub>12</sub>H<sub>10</sub>ON<sub>4</sub> obtained from PhNHNHCSNHPH (I) and HNO<sub>3</sub>, for which the "isotetrazolone" structure formerly assigned to it is not in harmony with its intense color, agree best with the structure II (R = R' = Ph) of a 1-phenylazo-2-phenyl-1,3-endoxyhydrazomethylene. On very mild reduction it gives NH<sub>3</sub>, PhN NCONH<sub>2</sub> and PhNHNHCONHPh (III); while (NH<sub>4</sub>)<sub>2</sub>S thus gives III, however, H<sub>2</sub>S and NH<sub>4</sub>SH give I. Hydrolysis with mineral acids gives PhN:NCONHPh and N<sub>2</sub>, not N<sub>2</sub>O as might have been expected; the cleavage is quite a complicated process, as indicated by the formation of considerable amts of resinous products. The 1-phenylazo-1,3-endoxyhydrazomethylene (IV), obtained from PhNHNHCSNH<sub>2</sub>, is a yellow, unstable, amphoteric substance, which can be isolated as either the K or the HCl salt, both colorless. In alc. soln. the II rearrange into colorless, non-basic isomers to which are assigned the structure of 1,4-dialkyl-3,5-endoxytetrazoles (V). The new ring system is very stable. The di-Ph compd. (VI) is not attacked by concd HCl up to 220° but above that temp. seems to decomp. instantaneously, the sealed tube being generally shattered. On cautious heating in a test tube the VI distills as a colorless oil which solidifies but on superheating it decomps. explosively with evolution of flames. Nascent H attacks it with difficulty; long boiling with Zn and HCl finally results in rupture of the ring with formation of NH<sub>3</sub>, PhNH<sub>2</sub>, NH<sub>2</sub>CONHPh and small amts. of PhNHNH<sub>2</sub>. Neither IV nor the II in which R' is an aliphyl radical undergo the rearrangement into the V. When the lemon-yellow HCl salt of II (R = R' = Ph) is recrystd from EtOH Et<sub>2</sub>O it seps. in colorless needles of the mono-HCl salt immediately decompd. by H<sub>2</sub>O into the red base. VI, m. 156°, shows faint violet-blue fluorescence in Et<sub>2</sub>O, mol. wt. in PhOH 236. 1-Phenylazo-2-*vic-m-xyl*yl-1,3-endoxyhydrazomethylene, orange, m. 101°; tetrazole (V), m. 174°. 1-*vic-m-xyl*ylazo-2-phenyl-1,3-endoxyhydrazomethylene, orange-red, m. 191-2°, changes in Et<sub>2</sub>O-AcOH into *vic-m-xyl*ylazocarboxanilide, brown-red, m. 124.5°; tetrazole, m. 122-3°. IV, m. 60-2°; HCl salt, m. 189-90°; B<sub>2</sub> deriv., m. 166°; K salt, begins to turn brown 110°, m. 185-90° (decompn.). The following additional II and V, resp., were prepd. (1st substituent = R, 2nd = R'): *p*-tolylphenyl, blood-red, m. 127° (salts, lemon-yellow), m. 158°; *o*-tolylphenyl, garnet-red, m. 99°, m. 117°; *di-o*-tolyl, dark brown-red, m. 62°, m. 128°; phenyl- $\alpha$ -naphthyl, red-brown, m. 125°, faintly yellowish, m. 160°;  $\alpha$ -naphthylphenyl, red, m. 90° (HCl salt, ochre-yellow), m. 177-8°; phenyl- $\beta$ -naphthyl, red-brown, m. 89-90°, yellowish, m. 213-4°; phenyl-ethyl, light yellow, m. 45° (HCl salt, colorless), —; phenylallyl, lemon-yellow, m. 43° (HCl salt), —; *p*-tolylallyl, greenish yellow, m. 59° (HCl salt), —.

C. A. R.

**The action of phenylhydrazine on the aromatic dithio acids.** HENRI WUYTS. *Bull. soc. chim. Belg.* 38, 195-204 (1929).—H<sub>2</sub>NNHPh (I) is allowed to react with acids of the RCS<sub>2</sub>H type: in general a salt is formed first, which evolves H<sub>2</sub>S to yield a thiohydrazide, RCSNHNHPh, which eliminates S to yield a hydrazone, RCH:NNHPh. Dithiobenzoic (II), dithio-*o*-toluic (III), dithio-*p*-toluic (IV) and dithio- $\alpha$ -naphthoic (V) acids have been prepd. from the suitable Grignard derivs. and CS<sub>2</sub>. II and I give a salt only below -30°: at room temp., H<sub>2</sub>S is evolved: at 85° the transformation into the hydrazone is complete. III and I give a salt at room temp.: the latter heated at 80° gives a mixt. of *o*-MeC<sub>6</sub>H<sub>4</sub>CSNHNHPh, m. 116-8°, sol. in alkali, little sol. in Et<sub>2</sub>O, and *o*-MeC<sub>6</sub>H<sub>4</sub>CH:NNHPh, m. 105-6°. IV and I give a salt only at low temp., at higher temps., a mixt. of thiohydrazide (not purified sufficiently) and *p*-MeC<sub>6</sub>H<sub>4</sub>CH:NNHPh, m. 110-2° is obtained. V and I give a salt which m. (decompn.) about 100°.  $\alpha$ -C<sub>10</sub>H<sub>7</sub>CSNHNHPh m. 150-2°;  $\alpha$ -C<sub>10</sub>H<sub>7</sub>CH:NNHPh m. 79.5-80°.

ALBERT L. HENNE

**Organic compounds of arsenic. VI. Electrolytic reduction of some arylarsonic acids.** K. MATSUYAMA AND H. NAKATA. *Mem. Coll. Sci. Kyoto Imp. Univ.* A12,

63-8(1929); cf. C. A. 22, 1337.—Electrolytic reduction by the method previously described but using Pt, Ni and Cu cathodes did not affect the  $\text{AsO}_3\text{H}_2$  group. 4,3- $\text{HO}(\text{O}_2\text{N})\text{C}_6\text{H}_3\text{AsO}_3\text{H}_2$  yielded 3,3'-azoxy-4,4'-dihydroxyphenyl-1,1'-diarsonic acid, darkens 210°, decomps. without melting, and 4,3- $\text{HO}(\text{H}_2\text{N})\text{C}_6\text{H}_3\text{AsO}_3\text{H}_2$ , with only traces of the arsine. 3,4- $\text{O}_2\text{N}(\text{H}_2\text{N})\text{C}_6\text{H}_3\text{AsO}_3\text{H}_2$  with a Cu cathode yielded 3,4- $(\text{H}_2\text{N})_2\text{C}_6\text{H}_3\text{AsO}_3\text{H}_2$ , darkens 140°, m. 158° (decompn.). Further investigation of the effect of varying concns. of HCl was made. With a Hg cathode  $p\text{-H}_2\text{NC}_6\text{H}_4\text{AsO}_3\text{H}_2$  yielded  $p\text{-ClH}_2\text{NC}_6\text{H}_4\text{AsH}_2$  (cf. Fichter and Elkind, C. A. 10, 1038) or  $(\text{ClH}_2\text{NC}_6\text{H}_4\text{As})_2$ , according as the concn. of acid was above or below 8 N.  $p\text{-HOC}_6\text{H}_4\text{AsO}_3\text{H}_2$  yielded  $p\text{-HOC}_6\text{H}_4\text{AsH}_2$  or  $(p\text{-HOC}_6\text{H}_4\text{As})_2$  at concns. below or above 4 N, resp. B. C. A.

**Possible interchange of radicals on heating a mixture of an R'X and an RMgX compound.** HENRY GILMAN AND HAROLD L. JONES. *J. Am. Chem. Soc.* 51, 2840-3 (1929).—In connection with rate studies, series of mixts. contg. an R'X and an RMgX compd. have been heated to det. whether there is an interchange of radicals. No such interchange was observed with the systems: PhBr and  $\text{PhCH}_2\text{MgCl}$ ,  $\text{PhCH}_2\text{Cl}$  and  $\text{PhMgBr}$ , PhBr and  $\text{Ph}_2\text{CMgCl}$ ,  $\text{Ph}_2\text{CCl}$  and  $\text{PhCH}_2\text{MgCl}$  and  $\text{Ph}_2\text{CCl}$  and  $\text{PhMgBr}$ .  $\text{Ph}_2\text{CCl}$  and  $\text{PhMgBr}$  give 47% of  $p\text{-PhC}_6\text{H}_4\text{CHPh}_2$ , m. 111-2°. C. J. W.

**Acyl derivatives of *o*-aminophenol.** V. R. E. NELSON AND H. S. ROTHROCK. *J. Am. Chem. Soc.* 51, 2761-4(1929); cf. C. A. 22, 1339.—A study is reported of the diacyl derivs. of  $o\text{-H}_2\text{NC}_6\text{H}_4\text{OH}$ , using the Bz group against a series of carbalkoxy groups. The carbalkoxy group is able in most cases to displace the Bz group from the N. When, however, there is a large difference in the wts. of the 2 groups, as in the case of  $\text{CO}_2\text{Me}$  and Bz groups, the Bz group is able to displace the lighter group completely, though the reverse takes place when the next heavier group ( $\text{CO}_2\text{Et}$ ) is used. No evidence of differences in the action of normal and iso-acyl groups when used against the Bz group is observed with *n*- and iso- $\text{CO}_2\text{Bu}$  groups and with *n*- and iso- $\text{COBu}$  groups. *o*-Valerylaminophenol, m. 79° (90% yield); isovaleryl deriv., m. 100.5-2°; *Me o*-hydroxycarbamate, m. 122-3°. *o*-Carbobotoxyaminophenyl benzoate, m. 62.5° (63% yield); isocarbobotoxy deriv., m. 85.5-5.8° (60%); valeryl deriv., m. 73-4° (45%); isovaleryl deriv., m. 96-7.5° (29%); *o*-benzoylaminophenylmethyl carbonate, m. 128° (78%); *o*-benzoylaminophenyl valerate, m. 103.5-4.5° (36%); the isovalerate, m. 113.5-7° (35%).

C. J. WEST

**Action of nitrosodimethylaniline on apiole.** A. QUILICO AND M. FRERÏ. *Gazz. chim. ital.* 59, 273-9(1929).—In a further attempt to explain the mechanism of the reaction between aromatic NO bases and unsatd. aliphatic compds. (cf. Q., C. A. 23, 378), the reaction between  $\text{ONC}_6\text{H}_4\text{NMe}_2$  (I) and apiole (II) was investigated. II was of particular interest because, unlike other allyl derivs., it does not form a nitron with PhNO. The reaction between I and II is very slow, and even at 80-90° the yield of cryst. substances is even lower than with safrole. In the present case the cryst. portion is a mixt. of compds. which can best be sepd. by their differing soly. in EtOH. The first of these is obtained, by repeated crystns. from EtOH, in the form of minute yellow crystals which m. 90-100° and which behave like a Schiff base. It dissolves readily in acids, giving intense red solns. from which there seps. almost immediately by hydrolysis a grayish white substance, while in the filtrate is dimethyl-*p*-phenylenediamine. The grayish compd. contains no N, reduces alk.  $\text{KMnO}_4$ , and has all the properties of an aldehyde. Except for a small difference in the m. p. (140°) all indications point to its being identical with the aldehyde, m. 137°, which was obtained by Alessandri (cf. C. A. 20, 1067) from II and PhNO, and to which he justifiably assigned the formula  $(\text{MeO})_2(\text{CH}_2\text{O})_2\text{C}_6\text{HCH:CHCHO}$ , i. e., apioleacrylic aldehyde. It combines readily with  $p\text{-O}_2\text{NC}_6\text{H}_4\text{HNHNH}_2$  in AcOH, yielding a phenylhydrazone,  $(\text{MeO})_2(\text{CH}_2\text{O})_2\text{C}_6\text{HCH:CHCH:NNHC}_6\text{H}_4\text{NO}_2$ , bright red, m. 268°. Boiled with alc.  $\text{NH}_4\text{OH}$ , the Schiff base forms an oxime,  $(\text{MeO})_2(\text{CH}_2\text{O})_2\text{C}_6\text{HCH:CHCH:NOH}$ , m. 166°. The oxime of Alessandri (*loc. cit.*) m. 172°, and probably the 2 oximes are stereoisomeric. It is also probable in view of this latter reaction that the Schiff base has the constitution;  $(\text{MeO})_2(\text{CH}_2\text{O})_2\text{C}_6\text{HCH:CHCH:NC}_6\text{H}_4\text{NMe}_2$ , which is furthermore in conformity with the results obtained with safrole. A peculiarity of the compd. is its great sensitivity to acids, which easily decomp. it into its constituent parts, contrary to the usual behavior of Schiff bases of the type  $\text{RCH:CHCH:NR}$ , which often give cryst. salts with acids. The part only slightly sol. in EtOH in the original reaction is a mixt. of azo- and azoxydimethylaniline, the sepn. of which is very difficult (cf. Ber. 30, 2946 (1897)). Even after repeated crystns. from xylene, microscopic examn. shows the product to be a mixt. of the brown azo and the yellow azoxy compd. Addn. of a drop of dil.  $\text{H}_2\text{SO}_4$  dissolves the brown azo compd. to an intense red soln., leaving the azoxy compd., while AcOH dissolves the former to a green soln. The formation of the azoxy

compd. makes it very probable that the mechanism of the reaction with I is the same as with PhNO. The azo and azoxy compds. have been obtained simultaneously in many reactions where NO<sub>2</sub> compds. have been reduced in an alk. medium (cf. Bamberger, *Ber.* 33, 3624(1900); *C. A.* 20, 2153; Bigiavi, *Rend. accad. Lincei* VIII, Series 6, 167(1928)), the reaction probably being the Cannizzaro reaction, thus:

$\text{RNHOH} \rightarrow \text{RNH}_2 \rightarrow \text{RNO} \rightarrow \text{RN:NR} + \text{H}_2\text{O}$ . Repeating the expt. with safrole, it was found that the formation of the azo compd. is facilitated by high temps.

C. C. DAVIS

A characteristic color reaction of quinone on the atomic grouping  $\text{E}^{(-)}\text{CCH}_2\text{C}^{(-)}\text{E}$ . W. KESTING. *Ber.* 62B, 1422-4(1929); cf. *C. A.* 23, 387.—The formation of intensely colored compds. from  $\text{CH}_2(\text{CN})_2$  with *p*-benzoquinone,  $\alpha$ - and  $\beta$ -naphthoquinone and their derivs. is a special case of a very characteristic color reaction of these quinones with compds. contg. the at. grouping  $\text{EC}^{(-)}\text{CH}_2\text{C}^{(-)}\text{E}$  (E = plurivalent element). When a trace each of such a compd. and of 1 of the quinones in a suitable solvent (e. g., alc.) is treated with a few drops of NH<sub>4</sub>OH or alkali and shaken the whole soln. instantly becomes an intense blue, the color varying somewhat with the quinone used but being independent of the substance reacting with the quinone. The reactive grouping must be present in an open chain. Fluorene and Ph<sub>2</sub>CH<sub>2</sub> do not give the reaction, nor do indene and phloroglucinol (the latter gives an orange-red color, probably produced by a reaction of a different kind). The reaction takes place only if the solvent is a substance capable of exhibiting basic properties (H<sub>2</sub>O, alc., glycerol, C<sub>6</sub>H<sub>5</sub>N, Me<sub>3</sub>NH, NH<sub>4</sub>OH, alkali) and in such a solvent (or an indifferent solvent contg. enough of a basic substance) the reaction occurs only when the  $p_H$  is above a definite value, varying for the different substances. Thus  $\text{CH}_2(\text{CN})_2$  and  $\text{NCCH}_2\text{CO}_2\text{Et}$  react with *p*-benzoquinone and  $\alpha$ -naphthoquinone in H<sub>2</sub>O or alc. but  $\text{AcCH}_2\text{CO}_2\text{Et}$  and  $\text{CH}_2(\text{CO}_2\text{Et})_2$  react only after addn. of small amts. of NH<sub>4</sub>OH or an alkali. Anthraquinone and its derivs., phenanthrenequinone and anthradiquinone do not give the reaction. Positive results have been obtained with all the substances contg. the reactive group thus far tested ( $\text{BzCH}_2\text{CO}_2\text{Et}$ ,  $\text{NCCH}_2\text{CONH}_2$ ,  $\text{CH}_2\text{Ac}$ ,  $\text{BzCH}_2\text{Ac}$ , in addn. to those mentioned above).

C. A. R.

Does *o*-nitrobenzaldehyde exist in two tautomeric forms? I. YA. POSTOVSKII. *J. Russ. Phys.-Chem. Soc.* 61, 719-22(1929).—According to Tanasescu (*C. A.* 21, 533; 22, 951) *o*-nitrobenzaldehyde presents itself in the 2 tautomeric forms (I) and (II) which are in equil., but Arndt (*C. A.* 21, 1640, 2897; 22, 2932; 23, 90) contested the existence of this tautomerism. As very valid arguments were presented in favor of both theories, P. undertook to investigate the matter by using Sugden's method of parachor detn. The formula  $P = M/D \cdot \gamma^{1/4}$  was applied, and the d., surface tension and capillary const. of pure *o*-nitrobenzaldehyde were detd. By calcul., the parachor corresponding to formula I is 312.2, that of formula II is 294.0. The exptl. results obtained in the temp. interval of 50–100° show parachor values of from 307.69 to 308.70, which evidently correspond to formula I. Thus the tautomerism does not take place, except perhaps to a very insignificant extent, between 50° and 100°. This, however, does not exclude the possibility of tautomerism in solns., e. g., in chem. reactions.

BERNARD NELSON

Stereochemical research in the benzalacetophenone series:  $\alpha$ -bromo- $\beta$ -alkoxybenzalacetophenones. Ethylenic isomerism and polymorphism. CHARLES DUFRAISSE AND ALFRED GILLET. *Ann. chim.* 11, 5-21(1929).—Heating  $\text{PhCOCHBrC(OMe)}_2\text{Ph}$  at 220–40° removes a mol. of MeOH and gives  $\alpha$ -bromo- $\beta$ -methoxybenzalacetophenone in the form of a mixt. of isomers: A, m. 102°, and B, m. 72°. The latter is dimorphous and can be obtained in the forms B<sub>a</sub>, m. 64–5°, and B<sub>g</sub>, m. 71–2°. A is very sensitive to the action of heat and acids and is transformed to B by them. Partial transformation of A to B takes place under the influence of direct or diffused sunlight, elec. light or the Hg arc.  $\alpha$ -Bromo- $\beta$ -ethoxybenzalacetophenone was obtained in 3 cryst. forms:  $\alpha$ , m. 65°,  $\beta$ , m. 73° and  $\gamma$ , m. 76°. Attempts to transform this compd. into isomers similar to the MeO deriv. were unsuccessful, although a new compd., m. 84–5°, was obtained but not in sufficient amt. for analysis.  $\alpha$ -Bromo- $\beta$ -propoxybenzalacetophenone, m. 50–1°, was prepd. by a similar method in only 1 form.

R. C. ROBERTS

Condensations of piperonal with various pinacolins. E. PACE. *Atti acad. Lincei*

[6], 9, 778-82(1929).—The prepn. of various pinacolins by the reaction of Mg alkyls on  $\text{Ac}_2\text{O}$  was described (cf. *C. A.* 23, 1615). Piperonal has been condensed with  $\text{Me-COCMe}_2$  by dissolving these in 50 cc. EtOH, adding 50 cc. 6%  $\text{Na}_2\text{CO}_3$ . A yellow oil seps. when 50 cc.  $\text{H}_2\text{O}$  is added. Recrystd. from  $\text{Et}_2\text{O}$  and EtOH piperonal-methyl *tert*-Bu ketone. seps. in birefracting, biaxial needles, m.  $98^\circ$ , d. 1.0765. Similarly prepd., piperonalethyl *tert*-amyl ketone, m.  $106^\circ$ , d. 1.08830. Piperonalpropyl  $\alpha,\alpha$ -dimethylbutyl ketone, m.  $117^\circ$ , d. 1.0928. A. W. CONTIERI

Some derivatives of perillaldehyde. B. RUTOVSKII AND A. KOROLEV. *Trans. sci. chem.-pharm. Inst.* (Moscow) 1928, 153-6; *Chem. Zentr.* 1928, 11, 2355.—The prepn. of some derivs. of perillaldehyde (I) is described. *Perillaacrylic acid* (II) is obtained by condensation according to Perkin (*Ber.* 10, 68) and Knoevenagel (*Ber.* 31, 2602). The Me, Et and iso-Am esters were prepd. The Et ester was also obtained according to Erdmann and Claisen (*Ber.* 23, 976) by action of  $\text{AcOEt}$  on I in presence of Na. *Perillydeneacetone*, *diperillydeneacetone* and *perillydeneacrolein* were obtained by condensation of I with  $\text{Me}_2\text{CO}$  and  $\text{AcH}$  in presence of 10% NaOH soln. *2-Phenyl-4-perillydeneoxazolone* (III) (by heating on the water bath of equimol. amts. of I and  $\text{BzNHCH}_2\text{CO}_2\text{H}$  in presence of water-free  $\text{AcONa}$  in  $\text{Ac}_2\text{O}$ ), m.  $137-8^\circ$  (yield 65-70%), golden yellow crystals with a silky luster from  $\text{AcOH}$ , slightly sol. in EtOH,  $\text{Et}_2\text{O}$ , PhH and petroleum ether.

G. SCHWOCH

X-ray investigations of optically active compounds. I. A proof of molecular asymmetry in optically active phenylaminoacetic acid. GEORGE L. CLARK AND G. ROBERT YOHE. *J. Am. Chem. Soc.* 51, 2796-2807(1929).—An x-ray examn. by the rotation and powder diffraction methods has been made of the *d*-, *l*- and *dl*-forms of  $\text{Ph-CH}_2\text{NH}_2\text{CO}_2\text{H}$ . The power of the rotation method is shown by the fact that a straightforward crystal structure analysis was possible although no crystallographic or optical data were available. The *d*- and *l*-forms are shown to crystallize in the orthorhombic system, upon Bravais lattice  $\Gamma_0$ , space group  $\text{C}_{2v}^2$ . The unit cell contg. 4 mols. has the dimensions  $a = 15.2$ ,  $b = 5.05$ ,  $c = 9.66$  A. U. The vol. of this cell is  $742$  A.  $\text{U}^3$ . The d. of the crystals is 1.30. The fact that the space group  $\text{C}_{2v}^2$  admits of no mol symmetry confirms the classical theories of van't Hoff and Le Bel connecting mol asymmetry with optical activity. It has not been found possible to distinguish between the *d*- and *l*-forms by means of x-ray diffraction methods. The crystal form of the *dl*-modification differs from that of the optically active forms. C. J. WEST

Anodic behavior of substituted acetic acids. I. Diphenylacetic acid. H. KATAGISHI, Y. GINBAYASHI AND M. MATSUI. *Mem. Coll. Sci. Kyoto Imp. Univ.* 12A, 57-62(1929).—On electrolysis between Pt electrodes of a soln of  $\text{Ph}_2\text{CHCO}_2\text{K}$  of concn not less than about 35% and acidified with  $\text{H}_2\text{SO}_4$  or  $\text{HCl}$ ,  $\text{Ph}_2\text{CHOH}$  and a little  $\text{Ph}_2\text{CHCO}_2\text{CHPh}$  are formed with evolution of  $\text{CO}_2$ . Pb catalyzes the formation of alc., but not of ester. If an a. c. is employed, the total yield and also the relative amt. of ester are increased. B. C. A.

Ring tension and radical formation. III. G. WITTIG AND M. LEO. *Ber.* 62B, 1405-10(1929); cf. *C. A.* 23, 133.—The object of these studies is to introduce 2 radical centers as adjacent members in ring systems in order, on the one hand, to det. the attraction from member to member in strained rings and, on the other, to investigate the dissocn. tendency of the ethane union. For this purpose have been prepd. biradicals of the type  $\text{Ph}_3\text{CC}_6\text{H}_4(\text{CH}_2)_n\text{C}_6\text{H}_4\text{CPh}_2$ . In those hitherto prepd.  $n$  was 1 or 2. The

prepn. of the trimethylene homologs met with insuperable difficulties; all attempts to obtain  $\text{CH}_2(\text{CH}_2\text{C}_6\text{H}_4\text{Bz})_2$  by introducing 2 Bz radicals into  $\text{CH}_2(\text{CH}_2\text{Ph})_2$  failed. Bromination of *p*- $\text{BzC}_6\text{H}_4\text{Me}$  gave a product (I), m.  $112^\circ$ , while Bourcet obtained a compd., m.  $96.6^\circ$ . Since I on oxidation gave *p*- $\text{BzC}_6\text{H}_4\text{CO}_2\text{H}$ , the Br could not have been on the nucleus and this is probably another case of dimorphism, often observed in the  $\text{Ph}_3\text{CO}$  series. With  $\text{CNNa}(\text{CO}_2\text{Et})_2$  I smoothly yielded *di-Et bis*[*p*-benzoylbenzyl]-malonate (II), sepg. in 2 dimorphous forms, depending on the conditions of crystn. Sapon. and decarboxylation of II gave resinous products and it was therefore treated with  $\text{PhMgBr}$ ; from the product was isolated, under the proper conditions, a crystal glycol [ $\text{Ph}_2\text{C}(\text{OH})\text{C}_6\text{H}_4\text{CH}_2\text{C}(\text{CO}_2\text{R})_2$ ] (III) forming in  $\text{Et}_2\text{O}$  with  $\text{HCl}$  a sol. dichloride

(IV). Dehalogenation in the usual way with "Naturkupper C" under N yielded a light brown soln. whose color did not in the least resemble that of the radicals previously prepd. The tetramethylene biradical (V) was prepd. with no particular difficulty.  $\alpha,\delta$ -Bis[*p*-benzoylphenyl]butane (VI) was smoothly obtained by the Friedel-Crafts method from  $(\text{CH}_2\text{CH}_2\text{Ph})_2$  and  $\text{BzCl}$  and converted into the corresponding glycol (VII) and dichloride (VIII). Dehalogenation of VIII gave a V, forming yellow solns. with greenish fluorescence, which obeyed Beer's law. The observations made on the 4 homologous biradicals show, on the whole, that in the 1st two the position of the (very broad) absorption band corresponds to monomeric  $(\text{PhC}_6\text{H}_4)_2\text{C}$  while in the last two it corresponds to the moderately dissociating  $(\text{CPh}_3)_2$ . This distinction is also brought out in models; intramol. union of the free radical-ends is impossible in the mono- and dimethylene compds. but in biradicals with a longer methylene bridge the ring tension permits of such a union. *p*-Benzoylbenzyl bromide (I), from *p*- $\text{PhCOC}_6\text{H}_4\text{Me}$  at  $150^\circ$  and 1 mol.  $\text{Br}_2$ , m.  $112^\circ$ . II (25 g. from 40 g. I), needles, m.  $103\text{--}4^\circ$ , or leaflets, m.  $108\text{--}9^\circ$ ; on long standing under the solvent the needles change into the leaflets, and from a satd. soln. either form can be obtained by seeding. Di-Et bis[*p*-(diphenylhydroxymethyl)benzyl]malonate (III) (2.6 g. from 10 g. II), m.  $173.5\text{--}4.5^\circ$ , sol in concd.  $\text{H}_2\text{SO}_4$  with deep orange color. VI, m.  $150^\circ$ ; yield, 50%.  $\alpha,\delta$ -Bis[*p*-(diphenylhydroxymethyl)phenyl]butane (VII) (1.6 g. from 2 g. VI), m.  $140\text{--}5^\circ$ . VIII, m.  $159\text{--}61^\circ$ , sol. in hot AcOH with a greenish yellow color which disappears on cooling.  $\alpha,\delta$ -Bis[*p*-(diphenylmethyl)phenyl]butane (V), mol. wt. in freezing  $\text{C}_6\text{H}_6$  1209 (indicating assocn. between the mols. of the V); shaking the  $\text{C}_6\text{H}_6$  soln. with O and evapg. the solvent leaves a yellow solid, m.  $150\text{--}60^\circ$ , contg. 92.1% C and 7.4% H. C. A. R.

**Composition of asarone oil.** I. GERÖ. *Chem. Folyóirat* 34, 103–12, 115–20 (1928).—Asarone oil was prepd. from the roots of *Asarum europaeum* by distn. with steam. Five fractions were made at 20 mm. pressure. The fraction b.  $144\text{--}50^\circ$  consists chiefly of a compd.  $\text{C}_{11}\text{H}_{16}\text{O}$ , the O being bound as an ether. The fraction b.  $155\text{--}63^\circ$  is probably a mixt. of a sesquiterpene with a sesquiterpene alc. Other fractions contain asarylaldehyde, asarone, a compd. with compn. of diasarone, but with another structure.

S. S. DE FINÁLY

#### Mercuration of aurin and attempts to mercurate some other triphenylmethane dyes.

FRANK C. WHITMORE AND G. J. LBUCK. *J. Am. Chem. Soc.* 51, 2782–4 (1929).—Pararosaniline acetate (5 g.) and 2 g.  $\text{Hg}(\text{OAc})_2$  in 500 cc.  $\text{H}_2\text{O}$  contg. 1 cc. AcOH, refluxed 3 hrs., 3 g.  $\text{Hg}(\text{OAc})_2$  added and the mixt. refluxed for 5 hrs., give triacetoxymercuripararosaniline acetate, dark brown, sparingly sol. in  $\text{H}_2\text{O}$ ; NaI gives NaHgI, NaOH and the free base. The base of malachite green gives a small yield of a diacetoxymercuri compd.; no org. Hg deriv. was obtained with crystal violet or *N*-phenylmethyl violet. Aurin (48 g.), 58 g. 90%  $\text{Hg}(\text{OAc})_2$ , 240 g. AcOH and 760 cc. 90% AcOEt, refluxed 6 hrs., give 83 g. (91%) of the acetoxymercuri deriv. (I), red powder; using 19.3 g. aurin, 6 g.  $\text{Hg}(\text{OAc})_2$ , 300 cc. 95% EtOH and 12 cc. AcOH, there results the diacetoxymercuri deriv., bright red; 14.5 g. aurin, 32 g.  $\text{Hg}(\text{OAc})_2$ , 300 cc. 95% EtOH, 50 cc.  $\text{H}_2\text{O}$  and 15 cc. AcOH give 22 g. of the triacetoxymercuri compd. (II), black. Heating I with EtOH for 48 hrs. gives II, but the product is dark red, not black. II and NaCl give the trichloromercuri compd., also obtained by heating I with NaCl in EtOH for 3 days. C. J. WEST

**Mercurated terephthalic acid.** FRANK C. WHITMORE AND LLOYD L. ISENHOUR. *J. Am. Chem. Soc.* 51, 2785–7 (1929).—*p*- $\text{C}_6\text{H}_4(\text{CO}_2\text{H})_2$  (34 g.) and 44.7 g.  $\text{Hg}(\text{OAc})_2$  in NaOH and AcONa, refluxed 240 hrs., give 102 g. of material, which was extd. with concd.  $\text{NH}_4\text{OH}$  and  $\text{H}_2\text{O}$  (2:1), the ext. pptd. with AcOH, the ppt. taken up in hot satd.  $\text{Na}_2\text{CO}_3$ , pptd. with  $\text{CO}_2$ , again extd. with satd. (20%) AcONa and  $\text{H}_2\text{O}$  (1:2) and pptd. with AcOH, giving 18 g. of anhydro-2-hydroxymercuriterephthalate (I); with  $\text{PCl}_5$  in  $\text{CHCl}_3$  this yields an acid chloride (II) which gives with BuOH 70% of di-Bu 2-chloromercuriterephthalate, readily crystd. from EtOH or BuOH and affording a convenient method of purification. II and dry  $\text{NH}_3$  in  $\text{CHCl}_3$  give 90% of 2-chloromercuriterephthalate;  $\text{PhNH}_2$  gives the anilide, brown, amorphous, does not m.  $300^\circ$ . I and Br in NaBr give 2,1,4- $\text{BrC}_6\text{H}_3(\text{CO}_2\text{H})_2$ , m.  $299^\circ$ . I is also obtained by heating 40 g. *p*- $\text{C}_6\text{H}_4(\text{CO}_2\text{Et})_2$ , 57.5 g.  $\text{Hg}(\text{OAc})_2$  and 2 cc. AcOH at  $117^\circ$  for 70 hrs. The purification of the mercurated BzOH is also described. The salts of I are only slightly less hydrolyzed than those of the mercurated BzOH. C. J. WEST

**A peculiar case of "pinacolin" rearrangement.** HANS KLEINFELLER AND FRANZ ECKERT. *Ber.* 62B, 1598–1600 (1929).— $\text{Bz}_2$  and  $(\text{BrMgC})_2$  in cold  $\text{CHCl}_3$  give 1,2,5,6-tetraphenyl-3-hexin-2,5-diol-1,6-dione [ $\text{BzCPh}(\text{OH})\text{C}(\text{Ph})_2$ ], m.  $154^\circ$ , quantitatively decompd. by hot aq. NaOH into BzOH and  $[\text{PhCH}(\text{OH})\text{C}(\text{Ph})_2]$ , m.  $145^\circ$ , which, when refluxed with satd. alc. HCl, loses  $\text{H}_2\text{O}$  and undergoes a "pinacolin" rearrangement.

yielding 1,2,2,6-tetraphenyl-3-hexin-1,5,6-trione,  $\text{PhCOCPh}_2\text{C}:\text{CCOCOPh}$ , yellow, m.  $213^\circ$ , mol. wt. (Rast-Carlsohn) 412; trioxime, m.  $237^\circ$ . C. A. R.

**Oxidation of benzoin to diketones with iodine.** BEN B. CORSON AND ROBERT W. McALLISTER. *J. Am. Chem. Soc.* 51, 2822-5(1929).—Various analogs of benzil can be prepd. by I oxidation of alk. solns. of the corresponding benzoin. A mechanism involving stilbene diolate is suggested. Benzoin (21 g.) in 500 cc. MeOH and 7.5 g. Na in 100 cc. MeOH, heated to  $50^\circ$  for 0.5 hr. and stirred while compressed air is passed through, give 2 g. benzil and 12 g. BzOH; in N atm., however, 90-5% yields of benzil were obtained. Furoin gives 80% of furil; substitution of Br for I causes a drop in yield of 20-30%; in this reduction the MeONa should be barely in excess. The frequently described delicate color test with alc. alkali is shown to be applicable to certain benzoin but not to others. The procedure suggested is to add to a 10 cc. test tube 1 cc. of MeONa (4 g. Na in 50 cc. MeOH), then 0.1 cc. satd. benzil soln. and then from 0.02 to 1 cc. of the MeOH soln. of benzoin to be tested. With this a pos. color test is given by 0.0002 g. of benzoin and a weak test with 0.0001 g. The color test can be applied to furoin and benzofuroin; piperoin or anisooin give no color with MeONa. Simple sugars are similar to benzoin but levulose does not respond to the color test, nor does butyoin. This test is much more sensitive than the Fehling test for benzoin. It is suggested that the color is indicative of tervalent C. C. J. WEST

**$\alpha$ -Chloronaphthalene.** IV. The chlorination of naphthalene in solution. P. FERRERO AND M. FEILMANN. *Helv. Chim. Acta* 12, 583-603(1929); cf. C. A. 23, 1896.—The optimum conditions found for the chlorination of  $\text{C}_{10}\text{H}_8$  (I) in soln. were 256 g. I, 0.5% I, 450 g.  $\text{PhCl}$ ,  $126-8^\circ$ , and sufficient Cl to give an increase in wt. of 66-8 g. The yield of  $\alpha\text{-C}_{10}\text{H}_7\text{Cl}$  is 81% on I used, 92% on I consumed. 6-7% polychlorides is formed. The use of  $\text{CCl}_4$  as an inert solvent gives more unreacted I and higher chlorides. A no. of inert solvents were tried. The nature of the solvent directly influences the reaction, and the results depend on the relative affinities of the solvent and I for Cl. The lower the proportion of solvent, the more nearly results approach those obtained without a solvent. Large increases in inert solvent favor chlorination of the solvent. FREDERICK C. HAHN

**The octalin from the tertiary decalol.** S. S. NAMETKIN AND E. GLAGOLEVA. *Ber.* 62B, 1570-3(1929).—See C. A. 23, 4465. C. A. R.

**The limiting concentration of sulfuric acid necessary for sulfonation (of hydrocarbons); actual means of maintaining it.** ANON. *Rev. gén. mat. color.* 33, 177-83 (1929).—Work of different investigators is reviewed. References are given. Limiting values for the mono-, di- and trisulfonation of  $\text{C}_{10}\text{H}_8$  are given for different temps. Equations are given by means of which the amt. of acid required for a sulfonation may be calcd., if this limiting value is known for the compd. in question. Details of sepg. a  $\text{SO}_3\text{H}$  acid from a reaction mixt. are given. Details of sulfonation by means of  $\text{SO}_3$  in  $\text{CHCl}_3$  are given. The concn. of aq.  $\text{H}_2\text{SO}_4$  in a sulfonation mixt. below the theoretical is lowered sometimes by labile combination of  $\text{SO}_3$  with the hydrocarbon as well as by the water formed in the reaction. T. G. HAWLEY, JR.

**Anthrahydroquinone-1,5-dicarboxylic dilactones.** ROLAND SCHOLL AND LOTHAR WANKA (with HERBERT HÄHLE AND WALTER LEONHARDT). *Ber.* 62B, 1424-33(1929); cf. C. A. 23, 4695.—Anthraquinone-1,5-dicarboxylic acid (I) and, insofar as they have been tested, its 4,8-disubstituted derivs. yield the hydroquinone dilactones with Cu and concd.  $\text{H}_2\text{SO}_4$  so readily that this is the best method of obtaining these dilactones. The latter are red cryst. compds. very stable toward aq. alkalis but hydrolyzed with relative ease by hot alc. alkalis. The hydrolysis proceeds by stages, yielding first the blue alk. solns., sensitive to air, of the lactone carboxylic acids, which in the free state are red, and then the red alk. solns., also sensitive to air, of the di- $\text{CO}_2\text{H}$  acids. The lactone acids are also obtained when the quinonedicarboxylic acids are treated with Cu and  $\text{H}_2\text{SO}_4$  a shorter time than is necessary for their conversion into the hydroquinone dilactones. Anthrahydroquinone-1,5-dicarboxylic dilactone (II) is obtained in 2.4 g. yield (crude product) from 2.5 g. I in 25 cc.  $\text{H}_2\text{SO}_4$  stirred 20 min. with 2.5 g. Cu powder. 4,8-Dichloro-1,5-bisacetylaminanthraquinone, from 1,5-AcNHC<sub>6</sub>H<sub>4</sub>(CO)<sub>2</sub>C<sub>6</sub>H<sub>3</sub>NHAc in AcOH-Ac<sub>2</sub>O-NaOAc at  $80^\circ$  with Cl, yellow, does not m.  $300^\circ$ , hydrolyzed by moderately concd.  $\text{H}_2\text{SO}_4$  at  $100^\circ$  into the 1,5-diamino compd., red, m.  $305^\circ$ ; 60 g. of this gives by the Sandmeyer method 45 g. (crude) 1,5-dinitrile, silvery leaves (pale brown in transmitted light) from  $\text{PhNO}_2$ , does not m.  $360^\circ$ , sol. in the higher-boiling solvents with yellow to red-brown color, forms a green alk.  $\text{Na}_2\text{S}_2\text{O}_4$  vat. 1,5-Dicarboxylic acid (III) (9 g. crude product from 15 g. crude dinitrile boiled with  $\text{H}_2\text{SO}_4$ ), yellow needles with AcOH of crystn., weather readily, decomp. about  $250^\circ$ ; di-Et ester, obtained through the chloride (prepd. with  $\text{SOCl}_2$ ) (21 g. from 20 g. of the acid), m.  $154^\circ$ .

**Hydroquinone dilactone** (3.2 g. (crude) from 4.8 g. of the quinone acid), dark red, insol. in aq. NaOH. **4,8-Di-PhO deriv.** of I, (12.5 g. (crude) from 15 g. of III with PhOH and powd. KOH at 140–50°), dark yellow, begins to decomp. 273°, forms a red alk.  $\text{Na}_2\text{S}_2\text{O}_4$  vat. **Dichloride** (11.5 g. from 12.5 g. of the crude acid with  $\text{PCl}_5$  in boiling  $\text{C}_6\text{H}_6$ ). **4,8-Bis-*p*-nitrophenoxy deriv.** of I (0.1 g. from 0.1 g. of the di-PhO acid dissolved in boiling concd.  $\text{HNO}_3$ ), m. 325–6° (decompn.) sol. in  $\text{NH}_4\text{OH}$  with yellow, in NaOH with orange-red color. The di-PhO acid refluxed with Zn dust in concd.  $\text{NH}_4\text{OH}$  yields **4,8-diphenoxanthracene-1,5-dicarboxylic acid**, yellow, m. 344–5°, sol. with yellow color in concd.  $\text{H}_2\text{SO}_4$  and converted at 70–80° into a colorless  $\text{SO}_3\text{H}$  acid. **4,8-Bis-*p*-tolylloxy deriv.** of I, (0.25 g. from 0.5 g. of III with *p*-cresol and powd. KOH at 100°), orange-yellow, darkens 280°, blackens about 317°, sol. in  $\text{H}_2\text{SO}_4$  with brown-red color changing (with formation of a  $\text{SO}_3\text{H}$  acid) to dark green at 40–50°, forms a red alk.  $\text{Na}_2\text{S}_2\text{O}_4$  vat. **4,8-Di-PhO deriv.** of II (0.15 g. from 0.3 g. of the quinone acid), brown-red needles with Cu luster. **4,8-Di-PhO deriv.** of III (0.15 g. from 0.3 g. of the quinone acid), brown-red needles with Cu luster.

**4,8-Bis-*p*-tolylmercapto deriv.** of I (2.5 g. from 1.8 g. of III), orange-yellow, m. 308°, decomp. 310°, sol. in  $\text{H}_2\text{SO}_4$  with blue color; **deriv.** of II (0.5 g. from 1 g. of the quinone acid), dark red. **4,8-Di-PhNH deriv.** of I, dark violet needles with metallic luster, m. 320° (effervescence), sol. in cold  $\text{NH}_4\text{OH}$  but in alkalis only on heating (with blue-red color), in  $\text{H}_2\text{SO}_4$  almost without color. the soln. becoming blue at 80°; with  $\text{NaOH-Na}_2\text{S}_2\text{O}_4$  it forms a yellow-red vat sensitive to air, with  $\text{NH}_4\text{OH-Na}_2\text{S}_2\text{O}_4$  a yellow vat quite stable to air. III splits off  $\text{CO}_2$  when heated with  $\text{PhNH}_2$  and the above di-PhNH acid must therefore be prepd. through its *di-Et ester* (obtained by boiling the ester of III with  $\text{PhNH}_2$ ), violet. **4,8-Di-PhNH deriv.** of II (0.9 g. (crude) from 1 g. of the quinone acid), red leaves with Cu luster, m. 348°, sol. in  $\text{H}_2\text{SO}_4$  with red color changing to blue at 100°. **4,8-Di-*p*-toluidino deriv.** of I, dark violet needles with Cu luster, m. 312–3° (decompn.), sol. in  $\text{H}_2\text{SO}_4$  with pale blue-green color changing to dark blue at 70–80°; the acid is prepd. through its *di-Et ester*, m. 248°. **Deriv.** of II, dark violet crystals with metallic luster. C. A. R.

**Benzanthrone.** ARTHUR LÖTTRINGHAUS AND HEINRICH NERESHEIMER. *Ann.* **473**, 259–89 (1929).—No suitable explanation has been advanced for the formation of benzanthrone (I) discovered by Bally (*Ber.* **38**, 194 (1905); *C. A.* **5**, 3248); the following expts were undertaken to supply this; the original should be consulted for the discussion and formulas proposed for intermediate products. **Bz-1-Bz-1'-dibenzanthronyl** (II), dark yellow, m. 412–4°, concd.  $\text{H}_2\text{SO}_4$  gives a carmine red soln with an intense brick-red fluorescence. Heating 10 g. II with 50 g. KOH and 50 cc. MeOH at 115–20° for 2 hrs. gives dibenzanthrone (III). I (75 g.), added to a melt prepd. from 300 g. KOH and 180 g. EtOH at 95–100° and heated several hrs. at 100–5°, gives a small quantity of the 2-HO deriv. of I, a phenolic impurity (removed by heating the mixt. with *p*-MeC<sub>6</sub>H<sub>4</sub>SO<sub>3</sub>Me in C<sub>6</sub>H<sub>5</sub>Cl<sub>3</sub> and Na<sub>2</sub>CO<sub>3</sub> at 195°) and 80% of 2,2'-dibenzanthronyl (IV), light yellow, m. 320–1°, the concd.  $\text{H}_2\text{SO}_4$  soln. is red, without fluorescence. The formation of this compound depends upon the alc. used; with iso-PrOH, it takes place at 10–5°, with an optimum temp. of 30–5°; with EtOH, 70–5°; with MeOH, about 85°. With  $\text{PhNHNa}$  and  $\text{PhNH}_2$  at 40–5°, the yield is about 50%; the by-product in this case appears to be the *anilino deriv.* of I, brown needles with bluish metallic luster, m. 215°, since with 50% KOH at 250° it gives the 2-HO deriv. of I. The 6-Me deriv. of I (10 g.) and KOH in MeOH, heated 5 hrs. at 100–5°, give 6.5 g. of the 6,6'-*di-Me deriv.* of IV, greenish yellow, m. 357–8°; the concd.  $\text{H}_2\text{SO}_4$  soln. is brick-red without fluorescence. Similarly, the 6-Cl deriv. of I gives the 6,6'-*di-Cl deriv.* of IV, yellow, m. 407–8°. IV (25 g.), added to a melt of 250 g. KOH and 20 g. AcONa at 240° and heated 2 hrs. at 245–50°, gives nearly quant. III; the ring closure can also be carried out with 80%  $\text{H}_2\text{SO}_4$  contg. a little Hg salt at 200° but the product contains S compds. Heating the 6,6'-Me<sub>2</sub> deriv. with the KOH melt at 230° for 2 hrs. gives quant. the 6,6'-*di-Me deriv.* of III, which differs from III in that it is less sol. in high-boiling org. solvents and that it dyes cotton a deeper blue. The 6,6'-Cl<sub>2</sub> deriv., heated with 80%  $\text{H}_2\text{SO}_4$  and a little HgSO<sub>4</sub> at 190°, gives the 6,6'-*di-Cl deriv.* of III, dark blue needles; the concd.  $\text{H}_2\text{SO}_4$  soln. is bluish violet, the dye bath is reddish violet; the boiling  $\text{PhNO}_2$  soln. is bluish red with a red fluorescence. The 2-NH<sub>2</sub> deriv. of I, through the diazo reaction, gives 82% of 2-chlorobenzanthrone (V), yellow, m. 204–5°, sublimes at 1–2 mm. and 240–60°; the concd.  $\text{H}_2\text{SO}_4$  soln. is golden yellow without fluorescence. Stirring an equimol. mixt. of 23 g. I and 26.5 g. V with a soln. of 7 g. Na in 450 g.  $\text{PhNH}_2$  at 11–2° for 2 hrs. gives 50% of IV; if the V is omitted, only traces of IV are formed. A mixt.

of V and the 6-Me deriv. of I, treated in the same way, gives 32% of the 6-Me deriv. of IV, golden yellow, m. 329–30°, which is very similar to IV in properties. In the same way V and the 6-Cl deriv. of I give the 6-Cl deriv. of IV, m. 313–4°. 2,6-Dichloroanthraquinone (139 g.), 4100 g. 98%  $\text{H}_2\text{SO}_4$ , 415 g.  $\text{H}_2\text{O}$  (added at 130–5°), 75 g. Cu bronze and 75 g.  $\text{C}_6\text{H}_5(\text{OH})_3$ , heated 0.5 hr. at 130–5°, give 66% of 2,6-dichlorobenzanthrone (VI), yellow, m. 234°; with I and PhNHK it gives the 6-Cl deriv. of IV. The 6-Me deriv. of IV with KOH at 240–50° gives the 6-Me deriv. of III, whose soly. is between that of III and its 6,6-Me<sub>2</sub> deriv. The relative yields of III and isodibenzanthrone (VII) obtained from I with KOH and MeOH, EtOH or iso-PrOH are shown for temps. of 100–220° in the form of curves; the 2 products may be sepd. by the difference in soly. of the hydrogenated compds.; dihydro-VII is practically insol. in 4% NaOH. Bz-1-Chlorobenzanthrone (VIII) and I in PhNHNa and PhNH<sub>2</sub> give 46% of 2-Bz-1'-dibenzanthronyl (IX), pale yellowish green, m. 331–2° I (100 g.) and 66 g.  $\text{HNO}_3$  (87%) in 850 g.  $\text{PhNO}_2$  give 83 g. Bz-1-nitrobenzanthrone, yellow, m. 244–5°; reduction with Na<sub>2</sub>S gives the  $\text{NH}_2$  deriv., reddish brown, m. 239–40°, transformed, through the diazo reaction, to the F deriv. (X), yellow, m. 194–5° (63% yield); with I and PhNHNa this gives IX in about the same yield as the Cl deriv. VIII and the 6-Me deriv. of I with PhNHNa give 50% of the 6-Me deriv. of IX, yellowish brown, m. 371–2°, while VIII and the 6-Cl deriv. of I give the 6-Cl deriv. of IX, pale yellow, m. 375–6°, IX and KOH-EtOH at 130° give quantitatively VII; the yield with PhNHNa is nearly as good. In the same way, the 6-Me deriv. of IX gives the 6-Me deriv. of VII; the 6-Cl deriv. was also prepd. in this manner; these 2 resemble VII. X (49.6 g.) added to 11.4 g. Na in 400 g.  $\text{PhNH}_2$  at –5° (N atm.) and stirred 3–4 hrs. at 0–2° gives 36% of Bz-1-fluoro-2-Bz-1'-dibenzanthronyl, golden yellow, m. 350–2°; alc. KOH at 110–25° gives VII quantitatively.

C. J. WEST

The naphthoisoindigotins. A. WAHL AND J. LOBECK. *Compt. rend.* 188, 1683–5 (1929); cf. C. A. 4, 1296.—The reactions leading to the formation of isoindigotin (I) and its derivs. are applied in the  $\text{C}_{10}\text{H}_7$  series.  $\alpha$ -Naphthoisoindigotin (II) may be obtained directly by condensation of oxindole and  $\alpha$ -naphthoisatin (III) in the presence of a HCl-HOAc mixt. or with the intermediate formation of mononaphthoisatin (IV) when  $\text{NH}_3$  or  $\text{C}_6\text{H}_5\text{N}$  is used as condensing agent (C. A. 18, 1296). Reduction of III with Zn and HOAc yields the leuco base, the Ac deriv. of which m. above 300°.

When II is heated with an excess of  $\text{H}_2\text{SO}_4$ , the disulfonic acid (V) is formed. This acid yields cryst. Na, K, Ba, Ca and Ag salts.  $\beta$ -Naphthoisoindigotin and its derivs. are formed in an analogous manner. Treatment of III with  $\text{H}_2\text{S}$  yields dinaphthodithioisatin (VI) (C. A. 19, 1862) which decomps. when heated in boiling  $\text{C}_6\text{H}_5\text{N}$ , NaOH,  $\text{NH}_4\text{OH}$  or  $\text{Na}_2\text{CO}_3$ , to dinaphthoisoindigotin (VII) and naphthoxindole; the benzylidene deriv. m. 241°. Although VI has the expected chem. properties its mol. contains 3 atoms of S instead of 2, perhaps due to impurity. Treatment of VII with  $\text{H}_2\text{SO}_4$  yields the disulfonic acid (VIII). The di- $\text{SO}_3\text{H}$  acid of I dyes wool bright orange but the color is easily removed by washing. The dyeing color of V is dark violet and is somewhat resistant to washing, while VIII dyes dark blue and is quite fast. There is, thus, an increase in both shade and fastness with increase in complexity of structure.

I. M. LEVINE

Polynuclear aromatic hydrocarbons and their derivatives. IV. Naphthophenanthrenes and their quinones. E. CLAR. *Ber.* 62B, 1574–82 (1929); cf. C. A. 23, 3915.—It was shown in the 1st paper that  $\alpha$ - $\text{MeC}_6\text{H}_4\text{COCl}$  and phenanthrene give a mixt. of  $\alpha$ -toluylphenanthrenes consisting chiefly of  $\alpha$ -tolyl 9-phenanthryl ketone (I). By

condensation with loss of  $H_2O$  the ketone mixt. gives a mixt. of hydrocarbons, the main component of which is 1,2,3,4-dibenzanthrene (II), undoubtedly formed from I. Next to the most reactive 9,10-positions in phenanthrene, the 2-position, in the *p*-position to the diphenyl union, is the one which the  $MeC_6H_4CO$  group is most likely to enter in the Friedel-Crafts reaction, forming *o*-tolyl 2-phenanthryl ketone (III) which on condensation could, theoretically, yield both [naphtho-2',3':1,2-phenanthrene] (IV) and [naphtho-2',3':2,3-phenanthrene] (V). The latter reaction seems little probable in view of the results obtained in the condensation of di-*o*-toluylbenzenes, which showed that the formation of angular hydrocarbons is always favored. The V actually found in the hydrocarbon mixt. is probably produced, not from III but from *o*-tolyl 3-phenanthryl ketone (VI). The V was not isolated in pure form from the hydrocarbon mixt. itself but its presence was shown by the formation of a pure 1,2-benzo[anthraquinono-2',3':3,4-phenazine] (VII) identical with a product obtained in another way. 2-Methyl-3- $\alpha$ -naphthoyl-5,6,7,8-tetrahydronaphthulene (VIII) and the 3- $\beta$ -isomer (IX), readily obtained from 2-methyl-5,6,7,8-tetrahydronaphthalene with  $\alpha$ - and  $\beta$ - $C_{10}H_7COCl$ , both yield pure V, with loss of  $H_2O$  and H, when heated with reduced Cu. Traces of impurities, not detectable by analysis, depress the m. ps of the naphthophenanthrenes extraordinarily; sometimes 20 recrystns. are required to obtain a max. m. p.; the faintly yellow II, previously described, when repeatedly purified through the picrate became almost colorless and the m. p. was raised from 196–7° to 205°. Unlike II, IV and V react only with a very large excess of picric acid, forming very unstable brown-red picrates which immediately decomp. when the excess of picric acid is washed away with  $C_6H_6$ . With the amt. of  $CrO_3$  theoretically required for the formation of the diquinones, IV and V give mixts of the mono- and diquinones; that both are produced from the same hydrocarbon is shown by the fact that oxidation of the hydrocarbon obtained by reducing the monoquinone again gives a mixt. of mono- and diquinones and that the mono- can be further oxidized to the diquinones. With an excess of  $CrO_3$  the IV and V can be oxidized directly to the diquinones. If the hydrocarbon distillate prepd. as described in the 1st paper is crystd. from xylene there is obtained 10 g. of a cryst. product consisting chiefly of IV with some V; 20 recrystns. gives pure IV, very faintly greenish yellow leaves, m. 293–4° (sealed capillary), sol. in concd.  $H_2SO_4$  with red color changing through red-violet and violet-blue to blue-green. 1,2-Phthalyl-

(IV)

(V)

(VII)

phenanthrene from the hydrocarbon fraction m. 275–80° with  $CrO_3$  in boiling AcOH, yellow, m. 269–70°, sol. in concd.  $H_2SO_4$  with blue color changing to brown, forms a red vat in alk.  $Na_2S_2O_4$ . At the same time is formed 1,2-phthalylphenanthrenequinone (X), golden yellow, m. 355°, sol. in  $H_2SO_4$  with brownish orange-red color, gives in boiling  $C_6H_5N$  with excess of  $N_2H_4 \cdot H_2O$  the dark leuco deriv. of the azine; the latter, obtained by recrystg the leuco compd from  $PhNO_2$ , seps. in light brown needles, do not m. 375°, sol. in  $H_2SO_4$  with red-violet color, form a dark green vat. With  $o$ - $C_6H_4$  ( $NH_2$ ) in boiling AcOH, X gives 1,2-benzo[anthraquinono-2',1':3,4-phenazine], faintly yellow, m. 350°, sol. in  $H_2SO_4$  with light brown color, forms a blood-red vat, sublimes at about 300° in *vacuo* in  $CO_2$  in moss-green needles. VIII, m. 142–3°, b<sub>12</sub> 265°, sol. in  $H_2SO_4$  with orange-yellow color, IX, m. 103–4°. V, yellow, m. 263–4°, sol. in  $H_2SO_4$  with violet-red color changing through dirty brown to olive-green, shows strong yellow luminescence in the anal. quartz lamp, forms solns. with green fluorescence, is oxidized by  $CrO_3$  in AcOH to 2,3-phthalylphenanthrene, faintly yellow, m. 272–3°, sol. in  $H_2SO_4$  with blue color changing to red on moderate diln., forms a red-brown vat, and 2,3-phthalylphenanthrenequinone (XI), orange-yellow, m. 318°, sublimes about 300°, sol. in  $H_2SO_4$  with orange-red color, forms a brown-yellow vat, forms in hot AcOH with a little  $PhNHNH_2$  a brown-red quinoxaline, m. about 375° (gas evolution), sol. in  $H_2SO_4$  with dirty green-brown color. VII, from XI in boiling AcOH with  $o$ - $C_6H_4$ -

( $\text{NH}_3$ )<sub>2</sub>, faintly yellow, m.  $373^\circ$ , sol. in  $\text{H}_2\text{SO}_4$  with light brown color, sublimes about  $300^\circ$  *in vacuo* in golden yellow needles. C. A. R.

**Carotenoids. II. Determination of the degree of saturation of polyenes by means of iodine chloride and perbenzoic acid.** RUDOLF PUMMERER, LUDWIG REBMANN AND WILHELM REINDEL. *Ber.* 62B, 1411-8 (1929); cf. C. A. 22, 2950.—In connection with the exact detn. of the no. and nature of the double bonds in rubber and gutta-percha, the authors have studied the applicability of the Wijs CII method to various systems. As already reported the consumption of CII by carotene reaches a const. value of 11.3-11.4 mols. in 20 hrs. In lycopin 12 of the double bonds react in 20 hrs., the 13th only in 5-6 days and only if at least a 2.8-fold excess of the reagent is used; further increase in the excess of reagent or time of reaction has no effect, the max. value reached after 10 days being 13.14. When the reaction is complete the excess of CII can be titrated in the usual way without difficulty, no liberation of CII or of I from the addn. product taking place. With  $\text{BzO}_2\text{H}$  only 12 double bonds react. With xanthophyll 9.7, 10.3 and 11.0 double bonds react in 1, 3 and 7 days, resp. Isoprene again gives incorrect results if at least twice the calcd. amt. of reagent is not used; with a 2-fold excess 1.94 and 1.97 double bonds react in 1 and 14 days, resp. With  $\text{BzO}_2\text{H}$  at  $0^\circ$  it takes up only 1 atom of O. Bixin consumes 6 mols. CII and takes up 6 atoms O with  $\text{BzO}_2\text{H}$ .  $\omega,\omega'$ -Diphenyloctatetraene adds 3.6 mols. CII and with  $\text{BzO}_2\text{H}$  takes up 3.2-3.3 atoms of O. *dl*- and *d*-Limonene take up 2.2-2.3 mols. CII and with  $\text{BzO}_2\text{H}$  about 1.6 atoms of O. In general, in aliphatic hydrocarbons, even with long conjugated chains, the no. of double bonds can be detd. with a large excess of CII allowed to react a long time but not with  $\text{BzO}_2\text{H}$  at  $0^\circ$ . Measurements (by GÜNTHER SCHEIBE) of the absorption of carotene, xanthophyll and lycopin gave very similar curves. The main band of xanthophyll (2 max. with  $\log k = 5.2$  and  $5.1$ ) shows somewhat stronger extinction than that of carotene (5.0); the secondary band ( $\log k = 4.3$ ) is almost identical in both compds. In xanthophyll the absorption is shifted about  $5\text{m}\mu$  toward the ultra-violet. In lycopin the extinction of the main and secondary bands is somewhat stronger than in carotene and shifted toward the longer wave lengths; measurements farther in the ultra-violet revealed a 3rd band. C. A. R.

**Sterols in yeast.** HEINRICH WIELAND AND MITIZO ASANO. *Ann.* 473, 300-13 (1929).—A sterol mixt. (150 g.) from the mother liquors of the prepn. of ergosterol (I) from yeast is benzoylated in 450 cc. pure  $\text{C}_6\text{H}_5\text{N}$  with 150 cc.  $\text{BzCl}$ , giving 170 g. of a mixt., which crystd. from 1.5 l.  $\text{AcOEt}$  gives 54 g. of a fraction (II), sinters  $135^\circ$ , m.  $155^\circ$ , and on concn. to one-half of the vol., a 2nd fraction (III) of 50 g., m.  $136^\circ$ . II on recrystn. from  $\text{AcOEt}$  gives 42 g. I benzoate (IV) and III gives 17 g. IV. All the mother liquors from IV, concd. to one-half, give 34 g. of a fraction (V), m.  $110-36^\circ$ , and on evapn. to dryness, 22 g. of a final fraction (VI), m.  $90-100^\circ$ . Repeated crystn. of VI from  $\text{Me}_2\text{CO}$  finally gives the benzoate, m.  $126-8^\circ$ , clears  $138^\circ$ ,  $[\alpha]_D^{23} 36.4^\circ$  (0.1085 g. in 5 cc.  $\text{CHCl}_3$ ), of zymosterol,  $\text{C}_{27}\text{H}_{44}\text{O}$  (cf. Maclean, C. A. 22, 1985), m.  $108-10^\circ$ ,  $[\alpha]_D 47.3^\circ$ ; Ac deriv., m.  $104-6^\circ$ ,  $[\alpha]_D^{24} 33.5^\circ$ . Crystn. of V from  $\text{Me}_2\text{CO}$ ,  $\text{MeEtCO}$  and finally dioxan gives the benzoate, m.  $144-6^\circ$ ,  $[\alpha]_D^{25} 34.7^\circ$  (0.085 g. in 5 cc.  $\text{CHCl}_3$ ), of fecosterol,  $\text{C}_{27}\text{H}_{44}\text{O}$  (VII), m.  $161-3^\circ$ ,  $[\alpha]_D^{25} 42.1^\circ$  (0.1152 g. in 5 cc.  $\text{CHCl}_3$ ); Ac deriv., m.  $159-61^\circ$ . The  $\text{Me}_2\text{CO}$  mother liquor of VII, repeatedly recrystd. from  $\text{Me}_2\text{CO}$ , gives the benzoate, m.  $130-1^\circ$ ,  $[\alpha]_D^{24} 37.0^\circ$  (0.1146 g. in 5 cc.  $\text{CHCl}_3$ ), of ascosterol,  $\text{C}_{27}\text{H}_{44}\text{O}$ , m.  $141-2^\circ$ ,  $[\alpha]_D^{20} 45.0^\circ$  (0.0253 g. in 2 cc.  $\text{CHCl}_3$ ). Recrystn. of II and III from  $\text{AcOEt}$  gives IV and also the benzoate, m.  $173-5^\circ$ ,  $[\alpha]_D^{24} -50.6^\circ$  (0.1254 g. in 5 cc.  $\text{CHCl}_3$ ), of neosterol,  $\text{C}_{27}\text{H}_{44}\text{O}$ , m.  $164-5^\circ$ ,  $[\alpha]_D^{24} -105.0^\circ$  (0.0943 g. in 5 cc.  $\text{CHCl}_3$ ); Ac deriv. m.  $173-4^\circ$ . The color reactions of these compds. are given for Salkowski's reagent ( $\text{CHCl}_3 + \text{H}_2\text{SO}_4$ ), Tortelli-Jaffe's reagent ( $\text{Br-CHCl}_3\text{-AcOH}$ ), Liebermann-Burchard reagent ( $\text{Ac}_2\text{O} + \text{H}_2\text{SO}_4$ ) and Rosenheim's reagent ( $\text{Cl}_3\text{CCO}_2\text{H}$ ). Ergosterol and neosterol and fecosterol and ascosterol cannot be distinguished from each other by these color reactions. C. J. WEST

**Conversion of hydrocarbons with aluminium chloride.** I. G. FARBENIND. A.-G. Brit. 306,437, Oct. 20, 1927. Hydrocarbons sol. in liquid  $\text{SO}_2$  and liquid at ordinary temps. are converted into hydrocarbons of lower b. p. range (up to  $200^\circ$ ) and with a high content of benzene and toluene, by treatment with anhyd.  $\text{AlCl}_3$ , preferably at temps. above  $100^\circ$  and while stirring and passing an inert gas such as  $\text{N}_2$  or  $\text{HCl}$ , through the mixt., with or without increase in pressure. Metallic Al and  $\text{HCl}$  may be used conjointly.

**Catalytic reduction of organic compounds.** A. O. JAEGER (to Selden Co.). Brit. 306,471, Feb. 21, 1928. Catalysts such as those described in Brit. 304,640 (C. A. 23, 4709) are used for the reduction of oxides of C or org. compds. contg. O such as ketones, aldehydes, acids, esters, alcs. or ethers, etc. Oxides of C may be reduced to  $\text{CH}_2\text{O}$ ,  $\text{MeOH}$  or  $\text{CH}_4$ , or, in the presence of alk. stabilizers which cause condensation, to higher alcs., ketones, acids such as propionic and butyric acids and hydrocarbons of a petroleum character. Ketones may be reduced to secondary alcs. and aldehydes to primary alcs. Various other reductions also are described and the reducing gas may be  $\text{H}$  or various hydrocarbons, etc.

**Catalytic production of alcohols, etc.** SOC. L'AIR LIQUIDE, SOC. ANON. POUR L'ÉTUDE ET L'EXPLOITATION DES PROCÉDÉS G. CLAUDE. Brit. 306,512, Feb. 22, 1928. In the catalytic production of oxygenated org. compds. such as alcs., an inert gas such as  $\text{N}$  or an excess of  $\text{H}$  is introduced into the gas mixt. before reaction, and with a gas mixt. of suitable compn. the production of  $\text{NH}_3$  may be combined with that of oxygenated org. compds. An example is given of the production of  $\text{MeOH}$  and  $\text{NH}_3$  from a mixt. of  $\text{CO}$ ,  $\text{N}$  and  $\text{H}$ . An arrangement of app. is described.

**Hydroaromatic amines.** I. G. FARBENIND. A.-G. Brit. 306,414, Feb. 18, 1928. A phenol or hydrogenated phenol such as  $\text{PhOH}$  or cyclohexanol is treated with  $\text{NH}_3$  or an amine such as  $\text{PhNH}_2$  in the presence of  $\text{H}$  and a hydrogenation catalyst such as  $\text{Ni}$ .

**N-Methylsulfites of secondary alkylarylamines.** I. G. FARBENIND. A.-G. (Max Boskmühl and Adolf Schwarz, inventors). Ger. 476,663, July 1, 1922. Addn. to 421,505. N-Methylsulfites of secondary alkylarylamines are prepd. by acting on the amine with  $\text{HCHO}$  and bisulfite. Thus, N-phenyl-2,3-dimethyl-5-pyrazolone-4-ethylaminomethylsulfite is prepd. by the action of  $\text{HCHO}$  and  $\text{NaHSO}_3$  on 1-phenyl-2,3-dimethyl-4-ethylamino-5-pyrazolone. Other examples are given. Cf. C. A. 23, 3715.

**Complex compounds of aromatic p-diamines with sulfur dioxide.** RICHARD WOLFFSTEIN (to I. G. Farbenind. A.-G.). U. S. 1,726,252, Aug. 27. An aromatic p-diamine such as p-tylenediamine or p-phenylenediamine is treated with  $\text{SO}_2$  while excluding water, to form a compd. which is stable in the air.

**Hydroxyalkylamines.** I. G. FARBENIND. A.-G. Brit. 306,563, Aug. 24, 1927. See Fr. 650,574 (C. A. 23, 3232).

**$\alpha$ -Anthraquinonyl ketones.** GEORG KRÄNZLEIN, HEINRICH VOLLMANN and KARL WILKE (to General Aniline Works). U. S. 1,725,927, Aug. 27. By causing chromic acid to act in glacial acetic acid soln. at an elevated temp. upon a benzanthrone in which at least one of the H atoms in the Bz-1 and Bz-2 positions is substituted by a radical of the group including alkyl, aryl, acyl, aroyl, nitrile and carboxyl, the Bz-ring is split up and  $\alpha$ -anthraquinonyl ketones are formed. In this manner there is obtainable by the oxidation of, for instance, Bz-1-phenylbenzanthrone the 1-benzoyl-anthraquinone, by the oxidation of Bz-1-benzanthronylbenzanthrone (Bz-1-Bz-1'-dibenzanthronyl) the hitherto unknown benzil of the anthraquinone series (diphthaloylbenzil) and by the oxidation of Bz-1-hydroxy-Bz-2-phenylbenzanthrone the mono-phthaloylbenzil which is also not yet known. Furthermore, by a moderate oxidation of the Bz-1-methylbenzanthrone the hitherto unknown 1-acetylanthraquinone is obtained. Numerous details and examples are given.

**Ethers of 2-amino-4-nitro-1-hydroxybenzene.** CHEM. FABRIK VORM. SANDOZ. Ger. 479,831, Dec. 20, 1925. Hydroxyalkyl ethers of 2-amino-4-nitro-1-hydroxybenzene are prepd. by treating 2,4-dinitrophenoxyethanol or -propanediol with alkali sulfides or polysulfides. An example is given.

**Alkylisopropylenephenols and alkylcoumaranes.** CHEMISCH FABRIK AUF ACTIEN VORM. E. SCHERING and H. JORDAN. Brit. 306,051, Aug. 15, 1927. These compds. are obtained by the thermal decompn. of condensation products prepd. from m- and

*p*-cresol and aliphatic ketones, as described in Brit. 273,684 (C. A. 22, 1982) in the presence of catalytic material contg. a metal hydrogenation catalyst, a metal phenolate, a porous material such as fuller's earth, diatomite or silica gel, or a metal hydrogenation catalyst carried on porous material, or mixts. of such catalytic materials. Various details and examples are given.

***N*-Substituted cyanoformylides.** DEUTSCHE GOLD-UND SILBER-SCHNEIDAN-STALT VORM. ROESSLER. Brit. 306,450, Feb. 20, 1928. Compds. of the general formula  $\text{ArRN}-\text{COCN}$  in which Ar represents a substituted or unsubstituted aromatic residue and R a substituted or unsubstituted aromatic or aliphatic residue which may be connected to the former residue, are prepd. from the corresponding formic acid chlorides by treatment, in pyridine, with HCN at ordinary or higher temps. Examples describe the conversion of *N*-methyl- and ethylanilidocarbonyl chlorides to the corresponding nitriles and the use also of various other starting materials.

**Indoles.** I. G. FARBENIND. A.-G. Ger. 479,283, Nov. 11, 1926. See Brit. 303,467 (C. A. 23, 4484).

**Lactones.** SOC. ANON. M. NAEF ET CIE. Brit. 306,352, June 26, 1928. See Fr. 657,971 (C. A. 23, 4483).

**Acenaphthene derivatives.** G. T. MORGAN and H. A. HARRISON. Brit. 305,754, Dec. 8, 1927. 2-Nitroacenaphthene is made by nitrating acenaphthene under anhyd. conditions and sepg. the product from the mother liquor (which contains 4-nitroacenaphthene). Anhyd. diacetylorthonitric acid may be used as nitrating agent. 2-Aminoacenaphthene is obtained by reducing 2-nitroacenaphthene (suitably with Na hydrosulfite). Cf. C. A. 23, 1353.

**Thiazole derivatives of 1,4-naphthoquinone.** WILHELM HERZBERG and GERHARD HOPPE (to General Aniline Works). U. S. 1,726,265, Aug. 27.  $\beta,\beta$ -Naphthothiazole-3,8-diones may be obtained by condensing 2-amino-3-mercapto-1,4 naphthoquinone with an aldehyde. The yellow thiazole derivs. are sol. in concn.  $\text{H}_2\text{SO}_4$  with a yellowish color. They yield with  $\text{Na}_2\text{S}_2\text{O}_4$  in the presence of a strong alk. agent a vat, from which cotton is dyed yellow tints.

**Aromatic polynitroamino compounds.** WILLIAM H. BENTLEY and WILLIAM BLYTHE & Co. Ger. 480,343, Nov. 12, 1926. See Brit. 263,552 (C. A. 22, 92).

**Aliphatic acids.** I. G. FARBENIND. A.-G. Brit. 306,097, Feb. 15, 1928. Concn. of acids such as propionic, butyric and isobutyric acids is effected by distg. them with halogenated hydrocarbons, such as  $\text{C}_2\text{H}_2\text{Cl}_2$ ,  $\text{C}_2\text{HCl}_3$  or  $\text{CHCl}_3$  (the added liquid being suitably returned to the still until the water has been removed, after which the halogen compd. is sepd. from the concd. acid by distn.). Cf. C. A. 23, 605.

**Haloalkylarylcarboxylic acids.** HENRI C. J. H. GELISSEN. Ger. 480,362, Apr. 28, 1925. Haloalkylarylcarboxylic acids with the halogen in the alkyl group are prepd. by treating substituted or non-substituted aromatic peroxides with halogenated aliphatic hydrocarbons. Thus, benzoyl peroxide is heated in a reflex condenser with  $\text{CCl}_4$  to give trichloro-*p*-toluic acid. Other examples are given.

**Concentrating acetic acid and similar acids.** HOLZVERKOHLE-INDUSTRIE A.-G. Brit. 306,105, Feb. 16, 1928. In effecting concn. of acids by forming acid salts and then heating these salts, salt mixts. are used which are wholly or in part molten during the subsequent heating stage. Alkali metals or alk. earth metal acetates or other aliphatic acid salts such as butyrates corresponding to the acid being concd. are suitable. Various details are given. Cf. C. A. 23, 4230.

**Barbituric acid derivative.** LES ÉTABLISSEMENTS POULENC FRÈRES. Ger. 481,129, Feb. 3, 1922. The condensation of esters of butylethylmalonic or butylethylcyanoacetic acid such as ethyl butylethylmalonate with urea produces butylethylbarbituric acid, m. 127-128°.

**Barbituric acid and pyrazolone derivative.** CHEM. FAB. VORM. SANDOZ. SWISS 131,927, Dec. 3, 1927. Mol. equivs. of a salt of isobutylallylbarbituric acid and a salt of 1-phenyl-2,3-dimethyl-4-dimethylamino-5-pyrazolone are allowed to combine. The product m. 87-89°.

**A colorless fused product from barbituric acid and pyrazolone derivatives.** SCHERING KAHLEBAUM A.-G. Ger. 481,392, July 17, 1925. Dialkylbarbituric acid and 4-dimethylamino-1-phenyl-2,3-dimethyl-5-pyrazolone are melted in mol. proportions and allowed to cool in an atm. of indifferent gas to prevent oxidation.

**Compounds of dialkyl- and arylalkylbarbituric acid.** F. HOFFMANN-LA ROCHE & Co. A.-G. Ger. 479,669, May 23, 1925. A dialkyl- or arylalkylbarbituric acid and 1-phenyl-2,3-dimethyl-5-pyrazolone are melted in mol. proportions or mixed in a suitable solvent with excess of the acid. Thus, isopropylallylbarbituric acid and 1-phenyl-2,3-dimethyl-5-pyrazolone are dissolved in 92% alc. On cooling an addn

product contg. 1 mol. of each, m.  $94^{\circ}$ , is obtained. Other examples are given. Cf. C. A. 23, 2989.

**Compounds of yohimboic acid.** F. HOFFMANN-LA-ROCHE & Co. A.-G. Swiss 132,448, Feb. 8, 1928. The acid is subjected to the action of alkylating agents. In the example, the acid is boiled with allyl alc., giving the allyl ester.

**Acenaphthene carboxylic acid.** I. G. FARBENIND. A.-G. (Wilhelm Eckert, inventor). Ger. 479,916, July 25, 1928. See Brit. 274,894 (C. A. 22, 2170-1).

**Quinolinecarboxylic acids.** SCHERING-KAHLBAUM A.-G. (Max Dohrn and Albrecht Thiele, inventors). Ger. 481,179, April 1, 1927. Halogen substituted quinoline-carboxylic acids are prepd. by the action of aliphatic keto acids or their esters on halogen substituted isatin. Thus, acetoacetic ester is added to an alk. soln. of 5,7-dibromo-isatin to produce 6,8-dibromo-2-methylquinoline-3,4-dicarboxylic acid, m.  $207-208^{\circ}$ . Other examples mention 6-iodo-2-methylquinoline-3,4-dicarboxylic acid, m.  $235-237^{\circ}$ , and 6,8-dibromoquinoline-2,4-dicarboxylic acid, m.  $258-260^{\circ}$ .

**Sulfonic acids.** I. G. FARBENIND. A.-G. Brit. 306,052, Sept. 14, 1927. Sulfonic acids are prepd. from unsatd. aliphatic or hydroaromatic hydrocarbons or their substitution products by treating them (1) with sulfonating agents in the presence of such compds. as form with the sulfonating agents addn. products of the oxonium, ammonium or sulfonium type, or (2) with esters of chlorosulfonic acid. In "(1)," compds. such as  $\text{Et}_2\text{S}$ , ethyl ether,  $\text{EtOAc}$ ,  $\text{MeOAc}$ , diethylene oxide or pyridine (or substances furnishing such compds.) may be used. Various examples and details are given. Cf. C. A. 23, 4581.

**Sulfonic acids.** I. G. FARBENIND. A.-G. (Karl Dachlauer and Emil Thiel, inventors). Ger. 478,332, April 8, 1926. Addn. to 476,906 (C. A. 23, 3716). Aromatic sulfonic acids are prepd. by the action of  $\text{MeOH}$  or  $\text{EtOH}$  and chlorosulfonic acid or fuming  $\text{H}_2\text{SO}_4$  on aromatic hydrocarbons. Examples are given.

**Aniline.** JOSEPH W. BRITTON and WM. H. WILLIAMS (to Dow Chemical Co.). U. S. 1,726,170, Aug. 27. Reaction between a monohalogenated benzene such as  $\text{PhCl}$  and aq.  $\text{NH}_3$  is effected in the presence of a cuprous compd. such as  $\text{Cu}_2\text{O}$  or  $\text{Cu}_2\text{Cl}_2$  and the aniline oil formed is sepd. from assocd. aq. soln. of Cu compds. and the latter are causticized and the ppt. thus produced is used in further conduct of the first step of the process. U. S. 1,726,171-2-3 describe similar processes of making various arylamines such as aniline, toluidine, naphthylamine or aminoanthraquinone.

**Acetylene.** AKT.-GES. FÜR STICKSTOFFDÜNGER. Brit. 306,042, Feb. 14, 1928. The quantity of water added to carbide is restricted to that necessary to keep the temp. in the generator below  $100^{\circ}$  while producing a substantially dry  $\text{Ca}(\text{OH})_2$ . The carbide is kept in motion and the water may be supplied as a finely divided spray or as steam mixed with  $\text{C}_2\text{H}_2$ . An app. is described.

**Isobutyl alcohol.** I. G. FARBENIND. A.-G. (Martin Luther and Rudolf Wietzel, inventors). Ger. 479,829, Dec. 25, 1923. Isobutyl alcohol is prepd. by the catalytic hydrogenation of a mixt. of  $\text{CO}_2$ ,  $\text{MeOH}$  and O-contg. org. compds. and fractionating the product. Thus, a mixt. of  $\text{CO}_2$ ,  $\text{MeOH}$  and O is hydrogenated under pressure by the aid of a contact mass of Cr, Mo or W. The product is dissolved in alkali to remove unchanged  $\text{MeOH}$ . The rest of the  $\text{MeOH}$  is removed by adding  $\text{HCOOH}$  and distg. off the  $\text{HCOOMe}$ . The fraction of the distillate between  $80^{\circ}$  and  $125^{\circ}$  is 75% isobutyl alcohol. Other examples are given.

**Vinyl alcohol.** CONSORTIUM FÜR ELEKTROCHEMISCHE INDUSTRIE G. M. B. H. (Wolf-ram Haehnel and Willy O. Herrmann, inventors). Ger. 480,866, July 20, 1924. Derivs. of polymerized vinyl alc. are prepd. directly from the polymerized alc. Thus, polymerized vinyl acetate is prepd. by heating a soln. of the polymerized alc. in  $(\text{Ac})_2\text{O}$  with dry  $\text{AcONa}$ . An elastic mass of partially butylated polymerized vinyl alc. is obtained by heating the alc. with butyric acid. Other examples are given.

**Liquefaction of tribromoethylalcohol.** I. G. FARBENIND. A.-G. (Karl Schranz and Siegfried Jaeger, inventors). Ger. 479,520, Dec. 17, 1927.  $\text{CBr}_3\text{CH}_2\text{OH}$  is liquified by treating it with  $\text{AmOH}$ . Cf. C. A. 23, 1217.

**Phenylpropanolmethylamine.** I. G. FARBENIND. A.-G. (Friedrich Stolz, inventor). Ger. 481,436, May 31, 1927. Phenylpropanolmethylamine is prepd. by diazotizing *p*-aminophenylpropanolmethylamine with 1 mol. of nitrite in acid soln. and reducing the product.

**Dipthaloylbenzoin.** I. G. FARBENIND. A.-G. (Berthold Stein, inventor). Ger. 481,291, Dec. 24, 1925. Dipthaloylbenzoin is prepd. by treating a soln. of  $\alpha$ -methyl-anthraquinone or its derivs. and substitution products, in conc.  $\text{H}_2\text{SO}_4$ , with oxidizing agents such as  $\text{MnO}_2$  or  $\text{PbO}_2$ , at temps. over  $60^{\circ}$ .

**Bornyl and isobornyl acetates.** L. SCHMIDT. Brit. 306,385, Feb. 18, 1928. Pinene

is heated to the b. p. with a mixt. of 3 mol. proportions of  $\text{Ac}_2\text{O}$  and 1 mol. proportion of  $\text{H}_3\text{BO}_3$  or smaller proportion of the  $\text{Ac}_2\text{O}$  and  $\text{H}_3\text{BO}_3$  may be used with subsequent addn. of glacial  $\text{HOAc}$ . Brit. 306,387 specifies removal of B compds. from similar reaction mixts. when the ester content is constant and adding small quantities of an org. or inorg. acid as catalyst.  $\text{H}_3\text{PO}_4$ ,  $\text{HNO}_3$ ,  $\text{H}_2\text{SO}_4$ ,  $\text{HCl}$  or oxalic, benzenesulfonic, or toluenesulfonic acids may be used. Addnl. heating at relatively low temps. produces an ester content increase of 15-20%.

**2-Mercaptobenzothiazoles.** I. G. FARBENIND. A.-G. Brit. 306,492, Feb. 21, 1928. o-Nitrochlorobenzene or a homolog, analog, or substitution product is heated with an alkali metal hydrosulfide,  $\text{NH}_4\text{HS}$  or an alk. earth metal hydrosulfide, the reaction mixt. is cooled,  $\text{CS}_2$  is added, and the mixt. is reheated. The hydrosulfide used may be mixed with the corresponding sulfide and the process is carried out in the presence of water or an inert solvent such as alc. or a mixt. of these, and almost quantitative yields are obtained. Several examples are given.

**2,3-Diaminoanthraquinone.** SOC. ANON. POUR L'IND. CHIM. À BÂLE. Ger. 480,848, June 22, 1922. To prepare 2,3-diaminoanthraquinone, 2-amino-3-bromoanthraquinone is heated to 175-180° in an autoclave under pressure with 28%  $\text{NH}_3$  soln. in the presence of a catalyzer such as  $\text{CuSO}_4$  salt.

**Triacetonepinacone.** I. G. FARBENIND. A.-G. (Richard Leopold, inventor). Ger. 480,034, June 23, 1925. Triacetonepinacone and 2,6-dimethylheptane-2,4,6-triol are obtained by dissolving triacetonedialcohol in water, satg. with  $\text{CO}_2$  and treating with Na-amalgam. The amalgam is added gradually so that the soln. is never alk. The pinacone deriv. which seps. is filtered off washed and dried. The triol is obtained from the filtrate by adding  $\text{KOH}$ .

**Proline and similar compounds.** JOSEPH KAPFHAMMER. Ger. 479,731, Apr. 25, 1926. Proline, hydroxyproline and similar nitrogenous compds. are obtained from animal and vegetable exts. by hydrolyzing and adding ammoniumdiamminechromium cyanide. The ppt. is dissolved in water or alc. and heavy metal salt soln. added to ppt the complex Cr compds. formed. The proline is obtained from the filtrate by evapn. Examples are given.

**1-Phenyl-2,3-dimethyl-4-dimethylamino-5-pyrazolone.** I. G. FARBENIND. A.-G. Ger. 479,348, Dec. 20, 1927. Addn. to 469,285. 1-Phenyl-2,3-dimethyl-4-dimethylamino-5-pyrazolone is prepd. by treating an acidified aq. suspension of 1-phenyl-2,3-dimethyl-4-nitroso-5-pyrazolone with  $\text{HCHO}$  or its polymers, and  $\text{H}_2$  in presence of a Pt or Ni catalyzer, under high pressure.

## 11—BIOLOGICAL CHEMISTRY

PAUL E. HOWE

### A—GENERAL

FRANK P. UNDERHILL

**Denaturation of proteins. VII. Denaturation versus coagulation.** H. WU. *Chinese J. Physiol.* 3, 1-6(1929).—After flocculation, denatured egg-albumin differs from coagulated egg-albumin in its soly. in acids, alkalis, or in concd. carbamide soln. Denatured egg-albumin differs from the native protein in not being coagulated by alc. or by shaking. Therefore, probably, denaturation is not a step in the coagulation of protein but the essential step in denaturation is hydrolytic fission, while in coagulation it is mol. condensation. **VIII. Effect of denaturation and coagulation on acid- and base-binding power of proteins.** H. WU AND T. T. CHEN. *Ibid* 7-27.—A soln. of denatured egg-albumin contg. sufficient acid to be on the acid side of the isoelec. point has a  $pH$  greater than a soln. of the native protein contg. the same quantity of acid. Similarly a soln. of denatured egg-albumin contg. alkali has a lower  $pH$  than a soln. of native protein contg. the same quantity of alkali. Similar results are obtained with serum-globulin and hemoglobin. The greater buffering action of denatured as compared with native protein may be due to hydrolytic fission during denaturation. Coagulated protein has less buffering action than native protein. This may be due to mol. condensation during coagulation, but other possible explanations are given. **IX. Liberation of non-protein substances on denaturation and coagulation of proteins.** *Ibid* 75-9.—Highly purified egg-albumin was heated at 100° for 15 min. with various quantities of acid or alkali. The cooled and neutralized solns. were filtered from protein which had been coagulated or denatured and flocculated. Any conalbumin pptd. by further heating for 15 min.

was removed by filtration. The filtrates were tested by the phenol reagent and  $\text{Na}_2\text{CO}_3$ ; at the isoelec. point there was no liberation of chromogenic substances on heating, but on either side of this point there is some liberation, much more on the alk. than on the acid side. B. C. A.

**Action of  $p_{\text{H}}$  on striated muscles.** S. GOLDBERGER. *Atti accad. Lincei* 9, 812-6 (1929).—Isolated, striated muscles of frog were used. These were held in Ringer soln. and the  $p_{\text{H}}$  was varied by adding either 0.1 N HCl or 0.1 N NaOH, the  $p_{\text{H}}$  value being detd. by means of the Hellige colorimeter. A current was then passed through the muscle and min. and max. excitability as well as the height of the contraction measured. For  $p_{\text{H}}$  5.8-9.0 the max. contraction is the same even after 120 min.; for  $p_{\text{H}}$  = 4.7-3.2 it drops to less than 0.5 in 120 min. A. W. CONTIERI

**Alkaline reserve of sea water.** R. MARGARIA. *Atti accad. Lincei* 9, 816-20 (1929).—To study the effect of injection of sea water in animals, its alk. reserve has been measured by measuring the amt. of  $\text{CO}_2$  it will absorb under various pressures of  $\text{CO}_2$ . The amts. vary from 6.52 (cc.  $\text{CO}_2$ /100 cc. water) at a pressure of 0.774 mm. of  $\text{CO}_2$  to 13.3 at a pressure of 51.6 mm. of  $\text{CO}_2$ , or  $p_{\text{H}}$  varies from 7.5 to 6.2; i.e., absorption of  $\text{CO}_2$  from the animals blood is a negligible factor when studying the effect of injections of sea water in animals. A. W. CONTIERI

**Chemical constitution and musk odor.** MARSTON T. BOGERT. *Am. Perfumer* 24, 235-8, 357-8 (1929).—A discussion of the mol. structure and synthesis of substances possessing the musk odor, in connection with the chem. constitution and odor of the higher cyclanones. W. O. E.

**Investigations in the blood group.** W. PFANNENSTIEL. *Arch. Pharm.* 267, 489-502 (1929).—An address. W. O. E.

**Liberation of iodine from iodides by solutions in oil of cholesterol and ergosterol irradiated by sunlight.** ÉMILE ROUSSEAU. *Compt. rend.* 189, 37-9 (1929).—Solns. of cholesterol (I) and ergosterol (II) in (live oil (0.5%) were very carefully prepd. to exclude air and other oxidizing agents. Solns. of iodides were added and the mixts. placed in quartz tubes and exposed to sunlight. I was liberated in an amt. proportional to the time exposed. The oxidizing ability of II was 1.5 times as great as that of I and 10 times as great when exposed to sunlight as when irradiated by rays from a Hg arc light—3650 Å. U. or mixt. of 3650, 3341 and 3132 Å. U. I. M. LEVINE

**Oxidizing action of sunlight on a solution of zymosterol in oil.** ÉMILE ROUSSEAU. *Compt. rend.* 189, 173-4 (1929); cf. preceding abstr.—The procedure of irradiating sterols by sunlight and measuring the effectiveness by the amt. of  $\text{I}_2$  liberated from a KI soln. mixed with it is applied to an olive oil soln. of zymosterol. This sterol is about 50% as effective as the cholesterol used which may contain some of the powerful ergosterol. I. M. LEVINE

**The photographic effect produced by sterols after exposure to ultra-violet rays.** J. CLUZET AND KOFMAN. *Compt. rend.* 189, 45-7 (1929).—Sterols, when irradiated by ultra-violet rays, affect a photographic film. Theoretically, this effect may be produced by rays emitted by the irradiated substance or by gases formed as a result of the irradiation. The expts. of C and K. support the latter idea. The wave length of the rays absorbed by the sterols are 2800-3000 Å. U. According to Stokes law the wave length of emitted light should be greater than that absorbed, yet sheets of quartz or cellophane which are transparent to light of 2302 and 2805 Å. U. prevent the passage of these rays, for when these substances are interposed between the sterol and the film the latter is unaffected even after 12 days. The activity is also decreased or lost after exposure to a temp. of 80° or to infra-red rays. On the other hand the photographic activity may be brought about by exposure to x-rays with a penetration equiv. to a 20 cm. spark or to the rays from 10 mg. of  $\text{RaBr}_2$ . I. M. LEVINE

**The photochemical activity of various sterols and the nature of their action.** L. HUGOUNENQ AND E. COUTURE. *Compt. rend.* 189, 47-9 (1929); cf. C. A. 23, 2728.—When exposed to diffused light the sterols in cod-liver oil (1) cholesterol (Bombyx) and beer yeast affect a photographic plate. The former loses its activity when placed in complete darkness for 2 months. The following sterols become active when exposed to sunlight for a month under a thin sheet of cellophane: those present in ox blood, in the fatty substance from the human brain and powd. ergot of rye. Sunlight intensifies the activity of 1. Among the sterols inactive after exposure to sunlight are those present in ox brain, egg, herring and bile calculi. When subjected to the action of a Hg vapor lamp for 0.5 hr. at a distance of 60 cm. the results were similar. Only 1 showed the same activity when the photographic plate was placed 3 mm.-6 cm. from the sterol. The activity is accelerated when the substance is heated to 40° in the presence of an oxidizing

agent as  $\text{MnBO}_2$ . A sheet of transparent quartz prevents the activity. Indole and skatole upon exposure to sunlight acquire photochem. activity as do the sterols, besides becoming resinified. That the action of sunlight or other radiation is chem. is shown by the fact that the sterols become yellow and there is evolved at ordinary temp. a volatile, heavy substance which reduces ammoniacal  $\text{AgNO}_3$  and which reacts positively to Schiff's reagent, signifying the presence of an aldehyde. Active  $\text{O}_2$  is also present since  $\text{I}$  is liberated from a soln. of  $\text{KI}$  acidified with 15%  $\text{H}_2\text{SO}_4$ .  $\text{H}_2\text{O}_2$  has never been detected. It is believed that some sterols form ozonides due to the presence of double bonds.

I. M. LEVINE

**Oxidation-reduction systems of biological significance. IV. Comparative study of the complexes of cysteine with metals of the iron group.** L. MICHAELIS AND E. S. GUZMAN BARRON. *J. Biol. Chem.* 83, 191-210(1929); cf. *C. A.* 23, 2729.—At  $\text{pH}$  7 to 8  $\text{Ni}$  gives a Bordeaux red complex with cysteine both in the presence and absence of  $\text{O}_2$ . A slightly olive-green cobaltous complex is obtained in the absence of  $\text{O}_2$  but the color is pink if there is a large excess of cysteine. The cobaltous complex is rapidly oxidized by air, org. dyes, or  $\text{K}_3\text{Fe}(\text{CN})_6$  to a brown complex in which the ratio of  $\text{Co}$  to cysteine is 1:3, and the amt. of  $\text{O}_2$  consumed is 0.5 mol. The amt. of  $\text{K}_3\text{Fe}(\text{CN})_6$  or phenolindophenol reduced by cobaltous cysteine is equiv. to the  $\text{O}_2$  consumption. The course of the potential shows 2 distinct steps of oxidation when cobaltous cysteine is titrated with  $\text{K}_3\text{Fe}(\text{CN})_6$ . The potential of pure cobaltous cysteine at  $\text{pH}$  7.5 practically matches that of the  $\text{H}$  electrode for the same  $\text{pH}$ . Cobaltous cysteine is one of the most powerful reductants at  $\text{pH}$  7.5 to 8. It gives a brown complex with cystine in the absence of  $\text{O}_2$ .  $\text{Co}$  and  $\text{Ni}$  are no catalysts for the oxidation of cysteine. The violet  $\text{Fe}$  complex of cysteine at  $\text{pH}$  7 to 8 corresponds to the oxidized form of the  $\text{Co}$  complex but is different insofar as it is labile, leading to the formation of cystine and making  $\text{Fe}$  a catalyst. The study of the  $\text{Co}$  complex is important because the end product of its oxidation is a compd. which is analogous to an intermediary compd. in the case of  $\text{Fe}$  and will permit the study of the intermediary state in the  $\text{Fe}$  catalysis.

A. P. LOTHIROP

**Purine substances and uric acid. I.** I. DAMAS. *Bull. sci. pharmacol.* 34, 282-96 (1927).—A survey of the purine compds and the chemistry of uric acid is given. Different methods of detn. of uric acid are described. The quickest method is that of Ronchèse, that of Kayser and Le Breton permits the detn. of both uric acid and xanthinic compds. **II.** *Ibid* 35, 111-23(1928).—The method of Ducung employs a soln. composed of equal parts of a 0.228% soln. of  $\text{CuSO}_4$  and an other one contg. 2.5%  $\text{Na}_2\text{S}_2\text{O}_8$  and 2.5% of Seignette's salt. One cc. corresponds to 1 mg. uric acid. In a soln. of uric acid exact results are obtained, but in normal urines, the results are exactly 50% higher. It is supposed, that in urines, 2 mols. of uric acid are combined with 1 mol. of a hypothetical substance that reacts with one  $\text{Cu}$ . In urines contg. urates, the uric acid is not present in that form. The methods of Folin and Wu, Grigaut, Guillaumin and Laudat for the detn. of uric acid in blood are described.

A. E. MEYER

**Contribution to the study of the purification of pepsin by application of its physico-chemical properties.** JACQUES PLÉ. *Rev. gen. colloides* 7, 193-201(1929).—The methods used have been described by Fuld and Levison (*C. A.* 2, 1156) and by Plé (*Doctorate Thesis, Univ. of Paris*, p. 26). Results obtained for the action of acetone on pepsin were: (1) In every case the wt. of ppt. obtained is slightly lower than the wt. of pepsin taken, because of a slight soln. of the pepsin ext. or of a component of that ext. in the acetone liquid. (2) At a  $\text{pH}$  of 1.03 the ppt. obtained is insol. and completely inactive, as if the acetone in very acid media causes an irreversible coagulation of colloidal pepsin. (3) At  $\text{pH}$  2.5, in the neighborhood of the isoelec. point of pepsin, the activity in pepsin units (the wt. of each ppt. multiplied by the French Pharm. no.,  $T$ , of the pepsin, the latter value being the wt. in g. of dried pork fibrin hydrolyzed by 1 g. of pepsin under defined conditions of time, acidity and temp.) is const. even at the end of 48 hrs. contact with acetone. (4) At  $\text{pH}$  3.6 and 4.7 there is a gradual decrease in activity; at  $\text{pH}$  5.4 the decrease is rapid for about 8 hrs., then gradual, then more rapid after 20 hrs. (5) At  $\text{pH}$  6 the activity is decreased 50% at the end of 1 hr. of acetone contact, while at  $\text{pH}$  7 the diminution in the same time attains 90%. (6) At  $\text{pH}$  2.5 the curve for the wts. of ppts. obtained shows a noticeable flexure between acetonic percentages of 50-70%; at 90% the wt. of pptd. pepsin is nearly equal to the original wt. taken. (7) The relation between acetonic percentage and pepsin units shows a rapid increase in the latter between percentages of 60 and 75%. (8) To obtain sol. ppts. it was necessary to cause the acetonic ppts. at  $-18^\circ$ . The ppts. obtained at  $+18^\circ$  were barely sol. (9) The flexure of the curve at 60% shows that there is a coeff. of partition between the ppt. and the remaining liquid. (10) The value of  $T$  (see above) for the original pepsin was 1000 and after treatment the value of  $T$  at 70-75% acetone was 1700. (11) The best

yield is obtained with an acetonic percentage of 75 (yield in pepsin units was 463) where the theoretical yield is 500 pepsin units. The flocculation should take place at  $p_H$  2.5. The results of the action of alc. on pepsin were: (1) The pepsin is best pptd. at a  $p_H$  of 2.5. (2) The values of  $T$  are, especially at  $p_H$  2.5, higher than the  $T$  values of the pepsin used initially. The pepsin units are relatively low with respect to the same procedure with acetone. (3) There is not complete inactivity between the alc. and pepsin in very acid media. (4) The wts. of pepsin ppts. obtained by the addn. of abs. alc. are lower than the wts. obtained with acetone. (5) At a temp. of  $18^\circ$  the ppts. are nearly all insol. and show proteolytic activities much lower than the acetonic ppts. (6) If the temp. is lowered to  $-18^\circ$ , the alc. ppts. dissolve readily and the proteolytic activity exceeds 2000 for a pepsin whose initial  $T$  value was 1000. (7) Acetone is preferable as a flocculating liquid for the purification of pepsin since the wts. of the ppts. formed are about twice as great as with alc. pptn. The results of Fenger and Andrew (C. A. 21, 2706) are confirmed. The results obtained by P. are illustrated graphically. The following method is proposed by P. for the purification of a pepsin of  $T = 1000$ . Dissolve 1 g. of pepsin, at  $18^\circ$ , in 6 cc. of distd.  $H_2O$ , add 1.2 cc. of  $N HCl$ ; add sufficient distd.  $H_2O$  to make the total vol. equal to 10 cc. The  $p_H$  of the soln. is 2.5. Add 30 cc. of pure anhyd. rectified acetone; centrifuge the mixt., decant the supernatant liquid, dry the pepsin in a vacuum. Its  $T$  value will be increased at least  $3/4$  of its initial value, the yield being about 55%  
A. J. MONACK

**Black pigments of adrenaline and natural melanins.** G. GALLERANI. *Arch. ital. biol.* 80, 1-8(1928).—Hydroxytyrosine obtained from plants has not been demonstrated in animal tissues just as the dopa-oxidase has not yet been isolated. Neither have the black granules of dopa been obtained from cellular elements which commonly give rise to melanins. The pigmentation of the skin is due to pyrrole compds. Exts. of melanotic tumors blacken pyrrole and pyrrole blackens these tumors both *in vivo* and *in vitro*. The enzymes from melanotic tumors do not alter tyrosine but do affect *p*-hydroxyphenylethylamine. Melanogen obtained by Eppinger from melanosarcoma patients produces reactions in the urine which are similar to those following the administration of pyrrole derivs. Following administration of dopa the urines give alcatonic reactions due to phenol but not pyrrole compds., and furthermore do not show the spectrophotometric peculiarities of melanuria. Upon injection of hydroxytyrosine into rabbits the urines show a much greater absorption than normally in the region of least refrangibility of the spectrum and lesser absorption in the region of greater refrangibility. On the contrary, after the injection of pyrroles, quinone-pyrrole black or of adrenaline treated with  $Cl$ -water and exposed to ultra-violet radiation the spectrophotometric findings are just the reverse. Adrenaline oxidizes very readily, especially in alk. medium and thus loses its sympathico-mimetic action. In Addison's disease it is supposed that there is a preponderance of the pigment over the unoxidized adrenaline.  
S. MORGULIS

**Studies on the behavior of amylase in the presence of crude starch.** GIULIO RAFAELI. *Arch. ital. biol.* 80, 161-6(1928).—The electrolyte  $NaCl$  is necessary for the fixation of salivary amylase by crude starch.  $Ca$  is not indispensable for the fixation.  
S. MORGULIS

**Enzyme reaction.** MARIO CAPOCACCIA. *Arch. ital. biol.* 80, 196-205(1928).—Pos. results with the serum enzyme reaction are described in a great variety of exptl. and chemical conditions provided the ninhydrin test is performed with the antigen which had undergone preliminary digestion with pepsin- $HCl$  to the albumose stage. Similar pos. results were obtained even when tissues previously fixed with formaldehyde were employed.  
S. MORGULIS

**Chemical characterization of the serum proteins.** H. K. BARRENSCHEEN and LUISE MESSINER. *Biochem. Z.* 209, 251-62(1929).—Careful treatment of serum proteins with  $H_3PO_4$ , according to Rimington's method shows that the globulins take up much more of the acid than the albumins. Similar results are obtained when the serum proteins are methylated according to the Kossel-Edlbacher procedure, but the results by the methoxy method are much higher. The methylimide values for globulins, except the pseudoglobulins, are considerably lower than those for the albumins. Proteins methylated with dimethyl sulfate can also be phosphorylated. The combination with the  $H_3PO_4$  is assigned a significance on the assumption that it takes place with the free  $OH$  groups of the oxy-amino acids which can thus be detd. in the protein mol.  
S. MORGULIS

**Studies on the increase of lichenase and cellulase.** V. A note on the enzymes of barley malt of Pringsheim. GEORG OTTO. *Biochem. Z.* 209, 276-89(1929).—Ways are described for increasing the activity of lichenase and cellulase. S. MORGULIS

**The influence of hydrogen-ion concentration on the salt flocculation of serum**

proteins. II. D. v. KLOBUSITZKY. *Biochem. Z.* 209, 304-11(1929); cf. C. A. 19, 3277.—The flocculation of serum albumin and serum globulin purified by electrodialysis was studied with satd. NaCl solns. at different  $p_H$  values. Unlike the whole serum, these serum proteins flocculate only below the isoelec. point. Pseudoglobulin mixed with euglobulin is stable at the isoelec. point. The flocculating effect of NaCl is closely dependent on the H-ion concn. The results speak against the dehydration hypothesis.

S. MORGULIS

Studies on the decomposition of gelatin by acetic anhydride. Isolation of acetylated compounds from partially dehydrated polypeptides. IV. The decomposition of proteins and of their derivatives. A. FODOR AND CHASUVA EPSTEIN. *Biochem. Z.* 210, 24-41(1929); cf. C. A. 22, 431, 23, 618.—The tripeptide deriv. resulting spontaneously from the action of  $Ac_2O$  on gelatin or gelatin peptone is a dehydrated glycypropyl-alanine or glycyhydroxypropylalanine. Upon splitting off the glyccoll prolyl- or hydroxypropylalanine results.

S. MORGULIS

The combination of curare with certain proteins and dyestuffs and the dependence of this process upon the  $p_H$ . V. M. KARASSIK, ANNA PETRUNKINA AND MICHAEL PETRUNKIN. *Biochem. Z.* 210, 70-5(1929).—Gelatin and brain proteins having a high  $p_H$  combine with curare. They become colored and poisonous while the curare soln. itself loses much of its toxicity and color. If the protein has a low  $p_H$  it remains colorless and innocuous, while the curare soln. retains its golden-yellow color and toxicity. The ability of Congo red to detoxicate curare is due, at least partly, to the  $SO_3$  groups. This property is also shared by other dyes of the same group, by germanin and to a much smaller degree also by the non-colloidal naphthionic acid.

S. MORGULIS

The hemolytic action of some decomposition products of lecithin, lecithides and phosphatides. I. Products of intermediate hydrolysis. HUGO MAGISTRIS. *Biochem. Z.* 210, 85-119(1929).—Through the action of cobra venom and bee poison products of intermediary hydrolysis were obtained from egg lecithin as well as from various lecithides and phosphatides of plant and animal origin, and these were investigated from the standpoint of their hemolytic effect. Lysolecithin and lysocephalin were obtained from egg lecithin and sepd. The former crystallizes from hot pyridine in fine needles which are very hygroscopic. It is easily sol. in  $CHCl_3$ , glacial acetic acid, pyridine, MeOH and EtOH but is insol. in ether, petr. ether or acetone. In  $H_2O$  it swells strongly and finally dissolves. Analyses show that it is a choline ester of palmityl glycerolphosphoric acid. It exerts a hemolytic action up to a diln. of 1:26400. The lysocephalin can be obtained as flat, transparent and non-hygroscopic needles from hot  $CHCl_3$ . It is not easily sol. in pyridine or glacial acetic acid while in ether, acetone and petr. ether it is insol. It m.  $212.6^\circ$ . It is hard to prep. in pure condition and it seems probable that freed from lysolecithin it has no hemolytic action. Lytic products were also prepd from various animal lecithides. Cephalin from the brain was acted upon by cobra venom. The resulting lysocephalin was not very pure and its hemolytic effect disappeared in a diln. 1:2000. A small quantity of lysolecithin was obtained as by-product and this exerted a much stronger hemolytic action. The suggestion is made that only such split products of lipid having choline in the mol. have a hemolytic effect, while the slight action of those products contg. the amino-ethyl alc. group depends only on contamination with the former. Lysosphingomyelin prepd from brain sphingomyelin with poison obtained from bees has a very slight hemolytic action. In this case only lignoceric acid but no cerebronic acid nor base is set free by the enzyme. Cobra venom hydrolyzes pancreatic lecithin to lysolecithin which is still active hemolytically in a diln. of 1:7200; from horse brain lecithin a product is formed active in a diln. of 1:6100. Lecithin from the testes yielded lysolecithin with bee poison which could not be easily crystd. but was hemolytically active in a diln. of 1:7700. All these preps. of lysolecithin were considerably less effective than that made from the egg yolk lecithin. This lower activity is attributed to protein and carbohydrate impurities. The prepn. of hemolysins from native phosphatides obtained by dialyzing vegetable material (peas) against distd.  $H_2O$  was also undertaken, but these were very weak in action because of much contamination. Lysolecithin was prepd. from a variety of plant lecithides (MeOH-benzene extn. of oat seeds, Möystad and soy beans. All show very slight hemolytic action. Radiation of egg lecithin with ultra-violet, which causes the splitting off of choline, considerably reduces the hemolytic action of the lysolecithin prepd. Likewise, lysolecithin subjected to ultra-violet radiation loses much of its hemolytic action. The formation of lysolecithin in the hydrolysis of lecithin by the enzymes of venoms is not merely due to a splitting off of a fatty acid radical but to an actual rearrangement of the mol. It is suggested that the free OH of the choline group combines with the OH of the glycerol mol. which becomes free upon the splitting off of the fatty acid.

S. MORGULIS

**The mechanism of action of muscle-phosphatase, cozymase and of insulin.** J. BODNÁR AND BÉLA TANKÓ. *Biochem. Z.* 210, 143-74(1929).—Muscle powder obtained from pigeon breast muscle causes phosphorylation in the mixt.  $\text{Na}_2\text{HPO}_4 + \text{NaF} + \text{glycogen} + \text{muscle powder}$ . The amt. of  $\text{H}_3\text{PO}_4$  esterified by the muscle powder increases greatly with the phosphate concn.; 0.25 g. muscle powder esterifies at most 11.42 mg.  $\text{P}_2\text{O}_5$ . Juice obtained by boiling muscles has no effect on action of the muscle powder, from which it is concluded that the latter contains the max. amt. of cozymase. Muscle powder washed at room temp. with water loses very much of its  $\text{H}_3\text{PO}_4$ -esterifying capacity because of the loss of cozymase since the esterifying power can once again be appreciably raised by the addn. of boiled muscle juice. However, the loss of esterifying powder must partly also be due to the injury of the phosphatase itself. The boiled juice from yeast can likewise restore the lost esterification power of the dry muscle powder so that cozymase from both animal and vegetable sources acts similarly. Washing the muscle powder at  $0^\circ$  removes the cozymase but has a much less striking influence upon the phosphatase itself. The  $\text{H}_3\text{PO}_4$ -esterifying capacity of muscle powder is well preserved and even after 5 weeks only 20% is lost. On the contrary, the  $\text{H}_3\text{PO}_4$ -esterifying power of muscle pulp disappears very rapidly. Insulin has no effect on the  $\text{H}_3\text{PO}_4$ -esterifying activity of either fresh or dry muscle pulp muscle powder. It exerts no noticeable action even on cozymase-free muscle powder, the occasional increase of the phosphatase activity being attributed to the high phosphate content of the insulin.

S. MORGULIS

**The effect of trypsin on conjugated bile acids.** A. VON BEZNÁK. *Biochem. Z.* 210, 261-4(1929).—Trypsin does not split the glycocholic or taurocholic acids. They can therefore form combinations with fatty acids in the intestine preliminary to their absorption in the intestine.

S. MORGULIS

**Combination of conjugated bile acids with fatty acids and its significance for the resorption of fat.** II. Solubility and diffusibility. F. VERZÁR AND A. KÚTHY. *Biochem. Z.* 210, 265-80(1929); cf. *C. A.* 23, 3261.—The soln. of fatty acids in bile acids depends upon the formation of mol. and later of colloidal complexes. This has been demonstrated by nephelometric studies which showed that when the concn. of the bile acids exceeds a certain limit the fatty acids no longer give a clear soln. but form a turbid emulsion. This is much clearer and more stable than an ordinary fatty acid emulsion but nevertheless consists of large aggregates. Diffusion expts. at different concns. and  $p_{\text{H}}$  values show that actually in the more concd. solns. less of the fatty acids are diffusible. Fatty acids in combination with bile acids diffuse though more slowly than the bile acids alone. However, neither neutral fat nor fatty acids alone are diffusible. Similar results are obtained by ultrafiltration expts. The solns. are pptd. by cations and by positively charged colloids. It was possible to prep. 0.25% aq. solns. of oleic, stearic or palmitic acids together with bile acids in which, even at a  $p_{\text{H}}$  6.25, the fatty acids were largely diffusible. The significance of this fact for the intestinal absorption of fat is discussed. III. Surface tension. *Ibid* 281-5.—Changes in surface tension at different  $p_{\text{H}}$  values corroborate the finding that in neutral or slightly acid medium water-sol. complexes are formed from fatty acids and bile acids. These are characterized by low tension.

S. MORGULIS

**Malt amylase.** VI. Adsorption of amylase by blood charcoal and kaolin at different  $p_{\text{H}}$  values as manifested by the dextrin- and sugar-forming capacity. TH. SABALITSCHKA AND R. WEIDLICH. *Biochem. Z.* 210, 414-33(1929); cf. *C. A.* 23, 3242.—Blood charcoal adsorbs amylase poorly at  $p_{\text{H}}$  6.0-6.2 but much better at  $p_{\text{H}}$  3.2. Kaolin adsorbs amylase more effectively, and increases from  $p_{\text{H}}$  6.2 to 4.5 but decreases somewhat at  $p_{\text{H}}$  3.0. At  $p_{\text{H}}$  4.5 Merck's diastase is completely adsorbed by a four-fold quantity of kaolin. When adsorption is carried out at  $p_{\text{H}}$  6.2-4.5 and the enzymic activity is tested at the opt.  $p_{\text{H}}$  no change is observed in the dextrin and sugar-forming capacity, but this is injured when the adsorption is made at  $p_{\text{H}}$  4.0, and still more at  $p_{\text{H}}$  3.0, the dextrin-forming capacity suffering much more than the sugar-forming. If the adsorption is at  $p_{\text{H}}$  2.8 both amylase effects are practically destroyed.

S. MORGULIS

**Lactic acid formation from sucrose under pressure.** H. WOLFF. *Biochem. Z.* 210, 458-65(1929).—Sucrose treated under pressure with  $\text{CaO}$  yielded 73% of lactic acid; under similar conditions invert sugar yielded only 38%. The formation of formic acid was in the reverse order.

S. MORGULIS

**Further evidence of the desmolytic production of methylglyoxal by yeast.** CARL NEUBERG AND MARIA KOBEL. *Biochem. Z.* 210, 466-88(1929); cf. *C. A.* 23, 1427.

S. MORGULIS

**Influence of the production of fats upon the constitution of proteins.** TETSUTARO TADOKORO. *Sapporo J. Forestry and Agr.* 19, 199-204(1927).—Fats found in plants and

animals are formed chiefly from carbohydrates. The reductive deamination of proteins will form fatty acids. Since this reductive deaminating action is considered to be induced in animal and vegetable bodies, the fat-producing action of the plants and animals will have a great bearing upon the constitution of proteins found in them. When the isoelec. point of the protein shifts from the acid to the alk. region the sp. rotation increases and the fat content decreases. In rice the species that is rich in fat is also rich in albumin and globulin, while the oryzenin, which is the chief protein of rice, is more acidic in the species low in fat and protein. In the species with great fat-producing action the free amidic radical in the protein decreases, because the amino-acid addition reaction is not sufficient to meet the production of fat. Both in plants and animals the fat-producing action is greater in female than in male. K. SOMEYA

Light rays for therapeutic purposes (Brit. pat. 306,112) 4.

Cleavage products of albumin. SWIGEL POSTERNAK and THEODOR POSTERNAK. Swiss 132,234, Mar. 31, 1926. Addn. to 125,830. A Ca compd. of a P-contg. cleavage product of albumin is obtained by digesting egg yolk with pepsin in presence of a mineral acid, neutralizing with the salt of an org. acid, filtering and subjecting to a tryptic digestion in a weak alk. medium. The product is weakly acidified, and the filtrate treated with a heavy metal salt, producing cleavage products of albumin contg. P and Fe. These are treated with a Na salt, dissolved in alc., distd. in alc. and treated with a Ca compd.

## B—METHODS AND APPARATUS

STANLEY R. BENEDICT

pH of blood. GYULA HOLLÓ AND ISTVAN WEISS. *Bull. soc. chim. biol.* 10, 1372-5(1928).—A reply to criticisms by Bigwood (*C. A.* 22, 2182) of the author's method for the detn. of the pH of blood. B. C. A.

pH of blood. E. J. BIGWOOD. *Bull. soc. chim. biol.* 10, 1376-7(1928); cf. *C. A.* 22, 457.—While no objection is made to the method of Holló and Weiss (preceding abstr.) it is doubtful whether their method is more accurate than those of Cullen and Hastings B. C. A.

Graph for urine analysis. J. DÉCADE. *Bull. soc. chim. biol.* 10, 1343-4(1928).—In the graph described the acidity and normal total N, carbamide, uric acid,  $P_2O_5$  and NaCl contents are multiplied by a suitable factor so that each possesses an equal numerical value. Thus, when analyses of pathol. and normal urine are compared graphically, the deviations from the normal may be easily read. B. C. A.

Microchemical determination of sodium in biological liquids and tissues. P. GRABAR. *Bull. soc. chim. biol.* 11, 58-64(1929).—After oxidation of the org. matter by treatment with hot  $HNO_3$  in a silica flask, phosphates are removed from the residue as ferric phosphate and the Na is detd. by a modification of the U method of Blanchetière (*C. A.* 17, 3006). The av. error is within 1%. B. C. A.

Validity of determinations of "immediately reducing blood sugars." I. Determination of blood sugars. G. FONTÈS AND L. THIVOLLE. *Bull. soc. chim. biol.* 11, 146-51(1929).—A discussion of previously published work (*C. A.* 22, 2177, 2588). The addn. of yeast to plasma or to blood, stabilized with oxalic acid, results in complete elimination of the reducing sugars. II. Total amount of fermentable sugar of the blood. *Ibid* 152-8.—Deproteinization of laked blood or of blood plasma with tungstic acid affords a filtrate which contains only fermentable sugars; if  $Hg(NO_3)_2$  or  $Zn(OH)_2$  is used, a varying proportion of the sugar is found to be unfermentable. It is suggested that the two last-named reagents displace reducing, unfermentable substances from the proteins. III. Absence of influence of disulfides and thiol compounds on sugar determinations by the phosphomolybdic acid and potassium permanganate method. *Ibid* 159-67.—Although in some circumstances large amts. of S compds. interfere in the detns. of sugars by the phosphomolybdic acid and  $KMnO_4$  method (*C. A.* 21, 2712) the amts. present in blood exert no detectable influence. B. C. A.

Titrimetric microchemical estimation of phosphorus in serum and in cerebrospinal fluid. KURT SAMSON. *Klin. Wochschr.* 8, 1029-30(1929).—See *C. A.* 23, 3943.

Apparatus in current use in bacteriological laboratories. ALFREDO SORDELLI. *Anales asocn. quim. Argentina* 16, 234-46(1928).—A study of thermostats. E. M. S.

## C—BACTERIOLOGY

CHARLES B. MORREY

**Factors affecting the growth of surface colonies of bacteria.** P. K. BATES. *Abst. Thesis Mass. Inst. Tech.* No. 3, 39-40(1929).—The area of a bacterial colony on an agar surface increases at a rate characteristic of each species. Growth is greater in a humid than in a dry atm., and in a neutral than in an acid medium, and is inhibited by a lack of O. The character of the colonies varies with the concn. of the agar gel and with the temp.; at 25°, growth is slower than at 37°, but much larger colonies are formed.

B. C. A.

**Formation of citric and oxalic acids by *Aspergillus niger*.** S. KOSTYCHEV AND V. CHESNOKOV. *Planta, Abt. E Z. wiss. Biol.* 4, 181-200(1927).—Formation of citric acid is favored by acidity, and of oxalic acid by alkalinity, of the medium. In young cultures citric acid is not formed so long as N is utilized from the nutrient soln. Citric acid is considered to be necessary for the synthesis of amino acids

B. C. A.

**The effect of tin on *B. tuberculosis* in vitro.** NUNO DOS SANTOS. *Compt. rend. soc. biol.* 101, 383-4(1929).—SnCl<sub>2</sub> added to peptone cultures in dilns. of 1:5000 to 1:50,000 had no effect on colony development, morphology or staining reactions of *B. tuberculosis* (human).

B. C. BRUNSTETTER

**The antiseptic value of sulfur dioxide.** FRANCISCO L. P. MONTEIRO. *Compt. rend. soc. biol.* 101, 387-8(1929).—Of the pathogenic organisms tested under exptl. conditions simulating practical disinfection methods, *B. anthracis* and *B. dysenteriae* Shiga proved resistant.

B. C. BRUNSTETTER

**Culture media containing the growth factors for microorganisms.** ANDRÉ L. SERGENT. *Rev. hyg. méd. prév.* 51, 467-72(1929).—Numerous formulas of media are given, some without and some contg. growth-promoting exts. from bacteria, mushrooms, fungi, vegetables, meat and plant substances.

C. R. FELLERS

**The bactericidal action of human milk.** F. SCHLAEPI. *Schweiz. Z. Gesundheitspflege* 8, 373-506(1928); *Rev. hyg. méd. prév.* 51, 545-6.—Very detailed expts. definitely proved the bactericidal property of human milk. At 10-13°, the action lasted for 60 hrs.; at 17-23°, the action was less marked; at 30-37°, no bactericidal action was noted. Staphylococci and *B. coli* were used in the tests. Fresh and preserved milk had nearly equal bactericidal values.

C. R. F.

**Detailed differentiation of bacteria by means of a mixture of acid and basic dyes at different pH values.** ALEXANDER V. TOLSTOUHOV. *Stain Tech.* 4, 81-9(1929).—A mixt. of methylene blue and eosin Y can be used for satisfactory differential staining of bacteria at or above pH 3. Below pH 3, the eosin Y stains bacteria only a very pale pink, i. e., the eosin is present as undissolved color acid, and for this reason not enough eosin is in soln. to stain bacteria. The substitution of acid fuchsin for eosin Y improved the staining at low pH values (to 0.8). The polar bodies of the colon group consist of more alk protein than the body of the bacteria itself. On the contrary, the polar bodies of *B. diphtheriae* are more acid than the bacterial bodies. The differentiation of bacteria by the Gram stain depends chiefly on the varying stability of the compd. formed (Gram-pos. or Gram-neg. bacteria plus gentian violet and I) in the presence of such org. solvents as EtOH and acetone.

C. R. FELLERS

**The influence of carbon monoxide on infection.** L. KANDIBA. *Zentr. ges. Hyg.* 18, 710(1928); *Wasser Abwasser* 25, 285.—Cats, white mice and rats were infected with streptococci and staphylococci and injected with tetanus toxin and exposed to varying concns. of CO. Results showed a definite lowering of resistance with increased CO poisoning in the animals.

C. R. FELLERS

**A chemical study of type III pneumococci.** ARTHUR STULL. *J. Biol. Chem.* 82, 641-50(1929).—N, P, S, Cl, ash and volatile matter were detd. in virulent type III pneumococci dried at 55°. The sol. specific substance isolated from the culture medium after removal of the pneumococci was shown to be related to the latter bacteria. Ten fractions, one of which was the sol. specific carbohydrate, were sepd. from the dried bacteria. When tested by the precipitin reaction, only the sol. specific carbohydrate showed specific pptn.

ARTHUR GROLLMAN

**The metabolism of diphtheria bacilli and of the diphtheroids.** F. SILBERSTEIN AND F. RAPPAPORT. *Wiener med. Wochschr.* 79, 460-1(1929).—The O consumption and CO<sub>2</sub> production of the diphtheria bacillus, the pseudo-diphtheroid bacillus and the xerosis bacillus were detd. The results vary with the different bacterial species.

A. G.

**Note on anaerobiosis and the use of alkaline solutions of pyrogallol.** HUGH NIZOL. *Biochem. J.* 23, 324-6(1929).—Even such a weakly alk. soln. of pyrogallol as the modification of Rockwell's soln. (see Stitt's Practical Bacteriology, 83(1927)) used

in this work is capable of evolving CO when the soln. is used as an absorbent of oxygen.

BENJAMIN HARROW

Some enzymes in *B. coli communis* which act on fumaric acid. BARNET WOOLF. *Biochem. J.* 23, 472-82(1929).—Considerable quantities of fumarase are present in *B. coli communis*. The three reversible changes involving fumaric acid—those to succinic, malic and aspartic acids—are catalyzed by distinct enzymes. BENJAMIN HARROW

Symbiosis among lactic microbes. HENRIETTE LANDAU. *Natuurw. Tijdschr.* 11, 115-7(1929).—*Oidium lactis* has practically no influence on the lactic bacteria; its presence in milk has no effect on the souring time.

ALBERT L. HENNE

Urea solutions. Culture media for microbes. A. J. J. VANDEVELDE. *Natuurw. Tijdschr.* 11, 118-22(1929).—Heating to 100° causes a partial hydrolysis of  $\text{CO}(\text{NH}_2)_2$ ; the no. of OH ions, after sterilization, is markedly increased. Heating at 120° has a much stronger effect.

ALBERT L. HENNE

Trypanocidal action of some derivatives of anil and styryl quinoline. C. H. BROWN-ING, J. B. COHEN, S. ELLINGWORTH AND R. GULBRANSEN. *Proc. Roy. Soc. (London)* B105, 99-111(1929).—Use was made of mice and 3 strains of *T. brucei*. Trypanocidal action apparently depended upon the presence in each of the nuclei of basic groups or acylamino groups; the action was most marked when one nucleus contained a free basic group, the other nucleus an acylamino group; this was especially true of the styryl series. The anil quinolines had but little trypanocidal action as a rule, while the styryl quinolines usually were far more effective. When 2(*p*-acetylamino styryl)-6-acetylaminoquinoline methochloride was administered to rabbits, it rapidly imparted its characteristic color to the urine, and was recovered from the urine with retention of its trypanocidal action; hence it was excreted, in part at least, in an active form in the urine. The prepn. of a no. of these compds. is described.

JOSEPH S. HEPBURN

Tetanus. VIII. The positive limit of oxidation-reduction potential required for the germination of spores of *B. tetani* in vitro. P. FILDES. *Brit. J. Exptl. Path.* 10, 151-75(1929); cf. *C. A.* 22, 442.—On exclusion of air, culture media develop a reducing intensity which can be measured by Clark's indicators of oxidation-reduction potential. The rapidity and extent of this change depend upon the constitution of the medium and upon  $p_H$ . The period required for the germination of spores of *B. tetani* (lag) in a suitable medium at 38° depends mainly on the time required for this medium to reach a suitable reducing intensity. Within limits,  $p_H$  does not affect the lag of *B. tetani* except through its effect upon the reducing intensity of the medium. The greater the reducing intensity of the medium the shorter the lag and, conversely, the slighter the reducing intensity the longer the lag, until a zone of reducing intensity is reached at which germination is not observed to occur at all. This zone may be measured and expressed in terms of oxidation-reduction potential. At each  $p_H$  it approximates to the zone of complete reduction of thionin, i. e., at  $p_H$  7.0 it approximates to oxidation-reduction potential + 0.01 v. If spores are placed under conditions in which the oxidation-reduction potential is more pos. than this, they do not germinate. IX. The oxidation-reduction potential of the subcutaneous tissue fluid of the guinea pig; its effect on infection. *Ibid* 197-204.—The oxidation-reduction potential of the subcutaneous tissue fluids and of the peritoneal fluid of the normal guinea pig is more pos. than the oxidation-reduction potential required for germination of spores of *B. tetani* and to this fact chiefly is ascribed the failure of tetanus spores to germinate when inoculated into these animals. The germination of spores which takes place naturally in tetanus or which is experimentally induced is due to the production in the tissues of an adequately neg. oxidation-reduction potential. The main conclusions relating to *B. tetani* may be applied in principle to all anaerobic organisms and it is possible that the oxidation-reduction potential enters into some of the pathologic relations of strictly aerobic organisms.

HARRIET F. HOLMES

The oxygen requirements of *B. pestis* and *Pasteurella* strains. H. SCHÜTZE AND M. A. HASSANEIN. *Brit. J. Exptl. Path.* 10, 204-9(1929).—A difficulty in initiating the growth of plague and *Pasteurella* cells lying widely scattered on agar plates has been observed and regarded as due to the O sensitivity of those organisms. This difficulty can be overcome by the addition to the culture medium of such substances as blood,  $\text{Na}_2\text{SO}_4$ , or sterilized broth culture of a variety of bacteria or by placing the plates under anaerobic conditions. It is suggested that the substances just mentioned act as reducing agents and that the substances contained in broth cultures of these particular bacteria are enzymic in nature, as they are rapidly destroyed under anaerobic conditions between 70° and 80°.

HARRIET F. HOLMES

Observations upon electric charge in certain bacteriologic problems. H. C. BROWN AND J. C. BROOM. *Brit. J. Exptl. Path.* 10, 219-25(1929).—A simple modification of the Northrop microcataphoresis cell is described. Its construction is such that it can be

**Cataphoretic behavior of rough and smooth variants of the typhoid-paratyphoid group** was studied. In a series of several hundred observations the migration rate of the rough variant in a total concn. of Th nitrate of the order  $10^{-3.5}$  N is considerably greater than that of the corresponding smooth form under the same conditions. The thrombocytolytic or adhesion reaction may be correlated with the enhanced toxic action of negatively charged colloids in presence of immune serum. It is possible that the use of negatively charged colloids would offer the possibility of a more definite test for the presence of antibodies in trypanosomiasis, spirochetosis or *Leishmania tropica* infections than the adhesion reaction in its present form.

HARRIET F. HOLMES

**The antibacterial action of cultures of a *Penicillium*, with special reference to their use in the isolation of *B. influenzae*.** A. FLEMING. *Brit. J. Exptl. Path.* 10, 226-36 (1929).—A certain type of *Penicillium* produces in ordinary nutrient broth a powerful antibacterial substance. The active agent is readily filtrable and the name "penicillin" has been given to filtrates of broth cultures of the mold. Penicillin loses most of its power after 10-14 days at room temp. but can be preserved longer by neutralization. The active agent is not destroyed by boiling for a few min. but in alk. soln. boiling for 1 hr. markedly reduces the power. Autoclaving for 20 min. at  $115^{\circ}$  practically destroys it. It is sol. in alc. but insol. in ether or  $\text{CHCl}_3$ . The action is very marked on the pyogenic cocci and the diphtheria group of bacilli. Many bacteria are quite insensitive, e.g., the coli-typhoid group, the influenza bacillus group and the enterococcus. The isolation of Pfeiffer's bacillus of influenza is very easy when penicillin is used. Penicillin is non-toxic to animals in enormous doses and is non-irritant. It is suggested that it may be an efficient antiseptic for application to, or injection into, areas infected with penicillin-sensitive microbes.

HARRIET F. HOLMES

**Some aspects of intestinal bacteriology in relation to health.** LEO F. RETTGER. *Am. J. Pub. Health* 19, 771-6 (1929).—The relationship of *B. acidophilus* to dental caries is also discussed briefly.

J. A. KENNEDY

**Antigenic and metabolic studies of *Bacillus typhosus*.** CORNELIA M. DOWNS. *Univ. of Kansas Sci. Bull.* 16, 5-89 (1926).—Part I deals with a study of the antigenic differences exhibited by 32 strains of *B. typhosus* and the relation of such antigenic differences to any cultural peculiarities present. Part II deals with the effect of H-ion concn. on the metabolism of these same strains, their dextrose metabolism and viability, and the correlation of these reactions with their antigenic characters. There is a bibliography of 162 references.

J. A. KENNEDY

**Studies on *Bacillus pyocyaneus*.** NOBLE P. SHERWOOD, T. L. JOHNSON AND IDA RADOTINCKY. *Univ. of Kansas Sci. Bull.* 16, 91-9 (1926).—Practically all strains of *B. pyocyaneus* have the ability to utilize dextrose although alk. products may obscure this phenomenon. They were consistently neg. in mannitol, arabinose and dulcitol, and pos. in saccharose. The authors' results as well as those of DeBord (cf. *C. A.* 17, 1656) and Downs (cf. preceding abstr.) emphasize the limitations of H-ion detns. as an indication of sugar utilization. The Fildes strain was the only one of the 22 strains studied that showed acid production in litmus lactose broth. It also produced the max. H-ion concn. in fresh meat infusion dextrose broth, reaching a  $p_H$  of 5.0 in 2 weeks. Six of the strains showed an acid reaction after 2 weeks. The remaining 16 strains developed  $p_H$  values ranging from 7.0 to 8.0 at the end of 14 days. The initial reaction was  $p_H$  7.0. These results might not hold if the initial H-ion concn. was decidedly different. Animal charcoal added to dextrose broth apparently adsorbs the pigments. All strains produced indole. Eleven strains blackened Pb acetate. Only one strain reduced  $\text{NO}_3$ . All strains produced HCN, as did also a strain of *B. fluorescens liquefaciens*. Efforts to produce high-titred immune sera were not very successful; a titer of 1-5000 was the max. obtained. Cross agglutination expts. gave irregular results. A bibliography of 19 references is appended.

J. A. KENNEDY

**The bactericidal effect produced by the growth of intestinal bacilli in peptone water containing glucose and other sugars.** MACKENZIE DOUGLAS. *J. Trop. Med.* 32, 101-5 (1929).—If glucose-peptone water is inoculated with *B. coli communis*, left to incubate until the soln. is sterile and then reinoculated, the organism still lives 4 to 5 days. Repetition of this procedure several times causes death in less and less time until finally 10 cc. of the fluid will kill a full agar slant. This bactericidal action is practically specific. Expts. were made also with *B. typhosus*, *B. paratyphosus* A and B, *B. ceylonensis* A, *B. dysenteriae* Shiga, Flexner and Y, *B. proteus* 19. FRANCIS KRASNOW

***Proteus ammoniae*.** THOMAS B. MAGATH. *J. Infectious Diseases* 43, 181-3 (1928).—An organism capable of quickly transforming urea into  $\text{NH}_3$  and believed to be the etiologic agent in incrustated cystitis was studied as to its fermentative abilities for the

purpose of properly classifying it. From the results it is suggested that if the characteristics of the genus *Proteus* be modified so as to include occasional organisms that ferment sucrose, which this organism does, the *B. proteus ammoniae* can be placed in the proteus group. JULIAN H. LEWIS

**Replacement of potassium by other elements in culture media.** C. H. BOISSEVAIN. *J. Infectious Diseases* 43, 194-9(1928).—K or Rb, in a minimal concn. of 0.001% KCl or 0.002% RbCl, is necessary for the growth of acid-fast bacteria on a modified Long synthetic medium. No other metals can be substituted. Continuous exposure to x-rays for 168 hrs. does not kill smegma bacilli and does not favor their growth. Among the Gram-positive organisms, only a soil bacillus not previously described grew freely on the synthetic medium; it needed the same amt. of K as the acid-fast bacteria. Among the Gram-negative organisms examd., *B. coli* and *B. paratyphosus* B grew freely on the synthetic medium; they did not need K. JULIAN H. LEWIS

**Method of staining flagella.** EMIL WEISS. *J. Infectious Diseases* 43, 228-31 (1928).—AcOH is added to young cultures to make a concn. of 5%; a drop of this suspension is allowed to dry untouched; stain first with a basic dye and then an acid dye. Useful contrastive stains were satd. gentian or crystal violet and acid green; Loeffler's methylene blue or aq. thionine blue and acid fuchsin; brilliant green and acid fuchsin or acid violet; carbolfuchsin and acid green. This method is also useful for the demonstration of degenerated or phagocytosed bacteria. JULIAN H. LEWIS

**Studies on the metabolism of the abortus-melitensis group. IV. Effect of various concentrations of carbon dioxide.** JAMES G. McALPINE AND CHARLES A. SLANETZ. *J. Infectious Diseases* 43, 232-40(1928); cf. C. A. 22, 4565.—Bovine strains of *B. abortus*, acclimated to aerobic conditions, are markedly stimulated in growth by 5 to 10% CO<sub>2</sub>. This amt. of CO<sub>2</sub> had a more or less inhibitory action on porcine and human strains of *B. abortus*. The difference in the two types of reactions is not due to changes in pH concn. Total exclusion of CO<sub>2</sub> makes all members of the abortus-melitensis group inert and unable to proliferate. JULIAN H. LEWIS

**Chemical and bacterial inhibition of gas formation in bacterial cultures.** MITSUTERU ISHIKAWA. *J. Infectious Diseases* 43, 311-20(1928).—Subcarbonate, subgallate and subnitrate of Bi, Bi(NO<sub>3</sub>)<sub>3</sub>, NH<sub>4</sub> benzoate, Na benzoate, K<sub>2</sub>Cr<sub>2</sub>O<sub>7</sub>, KClO<sub>3</sub>, NH<sub>4</sub>NO<sub>3</sub>, NaNO<sub>3</sub>, NaF, NaIO<sub>3</sub> and Na salicylate definitely suppress the formation of gas, not only from carbohydrates by single cultures of gas-producing bacilli and 3 types of associative cultures (a gas-forming with an acid-producing organism, an aerogenous bacillus with a proteolytic organism, and gas-forming and acid-producing organisms with a proteolytic bacterium), but also from NaCHO<sub>2</sub> by pure cultures of aerogenous bacteria. The inhibitory effect of the paratyphoid bacillus on gas production of the colon bacillus appears to depend, partly at least, on a deficiency of proper nitrogenous substance apparently resulting from the metabolic activity of the paratyphoid bacillus. JULIAN H. LEWIS

**Influence of iodide on bacterial decomposition of nitrogenous substances.** MITSUTERU ISHIKAWA. *J. Infectious Diseases* 43, 321-6(1928).—KI and KIO<sub>3</sub> exert an inhibitory effect on the formation of NH<sub>3</sub> by cultures of proteolytic organisms and on the production of amino acids by the proteolytic bacteria-free enzyme. In this effect, KI has practically no demonstrable selective action; different bacteria are affected almost equally by the presence of the iodide. The liberation of NH<sub>3</sub> from urea by urea-splitting bacteria, cultured or washed, is decreased under the influence of KI, apparently through an inhibitory effect on the activity of the enzymes. JULIAN H. LEWIS

**Comparison of glycerol and brilliant green bile for treatment of feces for isolation of typhoid organisms.** LEON C. HAVENS AND CATHERINE RIDGWAY. *J. Infectious Diseases* 43, 345-8(1928).—About 10 times as many typhoid bacilli must be present for pos. results when 30% glycerol is used as an enrichment medium as when brilliant green bile is used. The organisms disappear rapidly in glycerol while there is only a slight decrease in their no. after 48 hrs. when brilliant green is used. JULIAN H. LEWIS

**Brilliant green enrichment methods in the examination of feces for organisms of the enteric group.** RUTH GILBERT AND MARION COLEMAN. *J. Infectious Diseases* 44, 21-6(1929).—The superiority claimed by Havens (cf. preceding abstract) for brilliant green bile enrichment media over 30% glycerol is not confirmed. JULIAN H. LEWIS

**Production of histamine, tyramine, bronchospastic and arteriospastic substances in blood broth by pure cultures of microorganisms.** KARL K. KOEHLER, MILTON THEO. HANKE AND MARY S. SHEPPARD. *J. Infectious Diseases* 43, 363-77(1929).—Of 223 microorganisms of the American Type Culture Collection, histamine was produced from histidine only by a few strains of the colontyphoid group. Tyrosine was converted into tyramine by a few streptococci. The faculty for producing very active

but unidentified arteriospastic and bronchospastic substances is highly developed in the colontyphoid group, while members of other groups produce them only occasionally.

**The metabolism of *Leishmania tropica*.** A. J. SALLE AND CARL L. A. SCHMIDT. *J. Infectious Diseases* 43, 378-84(1928).—The analytic data indicate that the metabolism of *Leishmania tropica* does not differ essentially from that of many bacteria. J. H. L. LEWIS

**The proteus hemolysin.** JOHN F. NORTON, ELIZABETH VERDER AND CATHERINE RIDGWAY. *J. Infectious Diseases* 43, 458-60(1928).—The production of an agent which is lytic for red blood cells is characteristic of the proteus group of bacteria. The agent is heat labile, is formed during the first few hrs. of growth in a culture. The agent is destroyed by phenol disinfectants, is absorbed by a Berkefeld N filter and is neutralized by both homologous and heterologous antisera.

**The use of pectin in fermentation tests.** ELIZABETH MCCOY AND W. H. PETERSON. *J. Infectious Diseases* 43, 475-9(1928).—Pectin used for fermentation tests must be carefully purified to free it of adherent carbohydrate. Organisms that cause retting under natural conditions may not ferment pectin in the lab. when pure cultures are used.

**A hemolytic substance in pneumococcus culture broth.** G. M. SICKLES AND J. M. COFFEY. *J. Infectious Diseases* 43, 490-5(1928).—Young cultures of various strains of pneumococci grown on different kinds of media produce a substance which has a lytic action on red blood cells. This hemolytic substance is absorbed from the culture broth by sheep red cells, guinea-pig leucocytes, animal charcoal and alumina. It is thermolabile and is destroyed by heating for 1/2 hr. at 55°. Its activity is lessened by standing at cold room temp. and, in a shorter time, at 37°. Normal horse serum has an inhibitory action on the hemolytic power while pneumococcus immune serum has a much more marked effect.

**Studies on botulinus toxin. V. Influence of nitrogenous and lipid compounds on the potency of botulinus toxin.** E. WAGNER SOMMER AND H. SOMMER. *J. Infectious Diseases* 43, 496-506(1928).—Botulinus toxin incubated at 37° in neutral salt soln. rapidly deteriorates in 24 hrs. to 90-99% of its original potency. The deterioration is retarded in acid and accelerated in alk. media. The addn. of serum causes an immediate increase in toxicity which may show a further rise on incubation. Witte's peptone acts similarly but to a lesser degree. Diln. in a 25% aminoid soln. greatly stabilizes the toxin. Lecithin slightly increases the initial titer of the toxin. No effect was observed with Na stearate and Na oleate. Na ricinoleate caused rapid though not immediate inactivation of the poison.

**A poison produced by *Bacterium enteritidis* and *Bacterium aertrycke* which is active in mice when given by mouth.** SARAH E. BRANHAM, LUCILLE ROBEY AND LOIS A. DAY. *J. Infectious Diseases* 43, 507-15(1928).—Boiled or autoclaved broth cultures or Berkefeld filtrates of broth cultures of paratyphoid bacteria killed 40-100% of the mice fed with these preps. The feeding of autolyzed, boiled or autoclaved suspensions of the washed bacteria had little, if any, effect. The extremely long incubation period of this toxic action differentiates it from the violent acute toxic symptoms observed in man after eating foods contg. these bacteria.

**Extracellular production of toxin by *Clostridium botulinum* type B.** C. N. STARK, J. M. SHERMAN AND PAULINE STARK. *J. Infectious Diseases* 43, 565(1928).—Bacteria-free filtrates of type B *Cl. botulinum* showed a marked increase in toxin content when they are allowed to act on sterile unskimmed milk. This is believed to be the result of the action of the enzymes of the organisms on the casein of milk. Glucose inhibition of extracellular toxin-producing enzymes of *Cl. botulinum*. *Ibid* 566-8.—The extracellular enzymes of *Cl. botulinum* responsible for the extracellular formation of toxin are not produced as readily in the presence of glucose as in its absence. Toxin produced in glucose broth is more stable than that formed in media without carbohydrate. Destruction of diphtheria toxin by bacteria. *Ibid* 569-70.—*B. coli*, *B. cereus*, *B. vulgaricus*, *Pseudomonas pyocyaneus* and *Cl. sporogenes* have the power to destroy diphtheria toxin when grown in its presence.

**Acid agglutination optimum in the *Brucella* group.** F. E. ECKER AND M. SIMON. *J. Infectious Diseases* 44, 62-4(1929).—The acid agglutination optimums of 4 strains of *Br. melitensis* and *abortus* were identical.

**The action of bacteria on fat. I. Relative merits of various differential plating media for lipase-producing organisms.** ROY H. TURNER. *J. Infectious Diseases* 44, 126-33(1929).—Five groups of differential plating media for lipase-producing bacteria were compared for sharpness of differentiation, sensitivity, inhibition of bacterial growth and tendency to give false reactions. Those media which depended on gross disintegra-

tion of tallow or globules of cottonseed oil emulsion for differentiation were found to lack sharpness of differentiation, to be low in sensitivity, but did not inhibit growth of organisms studied and gave no false reactions. The development of clear zones may be greatly facilitated by using fats made up of short-chain fatty acids or by adding bile to the medium. Those media which depend on H-ion indicators for differentiation were found lacking in sensitivity, probably because of the little effect which the higher fatty acids have on  $p_H$ , and they gave false positive reactions in the presence of fermentable carbohydrates. The Nile blue sulfate medium gave remarkable sharpness of differentiation and high degree of sensitivity, but inhibited the growth of certain organisms. The meaning and mechanism of fading zones are discussed; they do not seem to indicate the formation of lipase. II. A microscopic study of emulsion of oil in an agar medium. *Ibid* 134-41.—The course of events during the action of a strain of lipolytic bacteria on the globules of fat in a thin layer of agar medium contg. Nile blue sulfate, observed microscopically and photomicrographically, are described as follows: A globule of oil, well removed from a bacterial colony, becomes blue in consequence of the staining of unsatd. fatty acids, oleic and linoleic, split by diffusible lipase. Part of the fatty acids are converted into soaps. There is a diffusion into the agar surrounding the globule of blue staining material, probably mixts. of these same fatty acids and their sol. soaps. If near the colony, this material quickly becomes decolorized and disappears; if further away, this happens slowly. Marked shrinkage of the globule occurs; it usually takes a crescentic shape, probably due to surface activity of the remaining lipid material, which no longer fills the cavity in the agar. Shrinkage of some globules is accompanied by protrusion of a bundle of doubly refractile crystals of the solid fatty acids or their derivs. Crystals formed in the agar well removed from visible globules of oil are probably derived from lipid material which existed in soln. or colloidal suspension.

JULIAN H. LEWIS

An improved technic for the comparison of antiseptics by yeast fermentation. SARAH E. BRANHAM. *J. Infectious Diseases* 44, 142-9(1929).—A simple device for quantitatively collecting  $CO_2$  produced by fermenting yeast is described and used to compare the relative action of antiseptics on the fermentation by yeast.

JULIAN H. LEWIS

Studies in bacterial metabolism. LXXXVII. The significance of certain reactions induced by resting bacteria. ARTHUR I. KENDALL AND MITSUTERU ISHIKAWA. *J. Infectious Diseases* 44, 282-91(1929); cf. *C. A.* 22, 4621.—The reduction of methylene blue by "resting bacteria" in the presence of certain carbohydrates is precisely paralleled by the fermentation of these same carbohydrates in cultural media inoculated with identical strains of proliferating bacteria. It is inferred that resting bacteria, therefore, initiate changes in substrates which they, as proliferating bacteria, would subsequently use for their energy requirements. The initial changes thus induced in substrates are not assocd with the proliferation of the organisms; they occur under conditions of time, temp and environment which preclude growth. The substrate, thus initially altered, is conceived of as in a state peculiarly adapted to rapid utilization for energy. The high degree of specificity of this preliminary change in various carbohydrates resides in the hereditary chem. architecture of the microbial protoplasm. It seems to be manifested at the surface of the microbe. The reactions induced by "resting bacteria" will not ordinarily supplant cultural reactions; the technic is more complex and cumbersome.

JULIAN H. LEWIS

The chemistry of the lipoids of tubercle bacilli. III. Preparation and properties of phthioic acid. R. J. ANDERSON. *J. Biol. Chem.* 83, 169-75(1929); cf. *C. A.* 21, 3923 —Phthioic acid is sepd. from the fatty acids obtained on hydrolyzing the phosphatide from the human type of tubercle bacilli as follows: The mixed acids are converted into Pb soaps which are extd. with  $Et_2O$ ; decompn. of the  $Et_2O$ -sol. Pb soaps yields liquid acids contg. oleic and phthioic acids; catalytic reduction converts the oleic into stearic acid, the Pb salt of which is insol. in  $Et_2O$ ; decompn. of the  $Et_2O$ -sol. Pb salt of phthioic acid with dil. HCl yields free phthioic acid. Yield of phthioic acid = 22.8% of the phosphatide taken;  $[\alpha]_D^{20}$  in alc. soln. is about 1.5 to 1.6°. The compn. and mol. wt. indicate that phthioic acid must contain at least 20 C atoms. It is a colorless oil which is miscible in all proportions with alc. and other org. solvents but insol. in  $H_2O$ . It possesses marked biol. properties, its intraperitoneal injection stimulating the proliferation of monocytes and epitheloid cells and causing the formation of massive tuberculous-like tissue and it is evident that the active principle of the phosphatide is assocd. with this new fatty acid and is always isolated with this fraction. A. P. L.

A quick transformation of hexosediphosphate into lactate under the influence of the typical lactic acid-forming *Delbrücki* bacilli. ALEXANDER TYCHOWSKI AND MARIA KOBEL. *Biochem. Z.* 209, 134-41(1929).—Hexosediphosphate is fermented to

lactate by a genuine lactic acid-forming organism with a practically 100% yield as is also the case with a non-phosphated sugar.

S. MORGULIS

**The biochemical properties of *Bacillus Frish* and other capsulated bacilli.** B. ELBERT. *Centr. Bakt. Parasitenk.*, I Abt., 112, 178-87(1929).—This is a detailed study of the acid- and gas-forming powers of the capsulated Friedländer group of bacilli. The Frish bacillus as a rule forms no gas from carbohydrates, does not attack lactose and produces acid but no gas from most polysaccharides and alcs. It does not attack Na tartrate, citrate, mucinate or amygdalin.

JOHN T. MYERS

**Comparison of the activity of heat- and yaten-killed dysentery bacillus vaccine.** ELISE GRASSMÜCK. *Centr. Bakt. Parasitenk.*, I Abt., 112, 232-43(1929).—Heat-killed vaccine and that killed by 0.25 to 2.0% yaten solns. had equal agglutinogenic power. Killing with yaten is simpler. The possibility of a non-sp. protective effect of yaten has not been studied.

JOHN T. MYERS

**Enrichment methods for the cultivation of typhoid, and paratyphoid bacilli from feces.** III. The sodium tetrathionate medium of Leon Miller. K. L. PESCH AND FRIEDRICH KORTENHAUS. *Centr. Bakt. Parasitenk.*, I Abt., 112, 397-400(1929).—It is the best enrichment medium known for these organisms in feces.

JOHN T. MYERS

**The causes of the weakening influence of glycerol on disinfecting agents.** GÜNTHER LODGE. *Centr. Bakt. Parasitenk.*, I Abt., 112, 401-11(1929).—Glycerol weakens disinfectants by decreasing the degree of disocn. In the case of phenol, glycerol ethers are formed. Lipoid soly. in glycerol may be a factor but it is not yet understood.

JOHN T. MYERS

**The influence of iron on the pigmentation of acid-fast bacteria.** GUILFORD B. REED AND CHRISTINE E. RICE. *J. Bact.* 17, 407-11(1929).—Yellow, brown or red pigmentation of acid-fast bacteria is related to the presence of Fe in the culture media. If citrate is present, Fe will not ppt., probably because of the formation of complex ions, if the  $pH$  is not greater than 8.0 and pigmentation results. Above  $pH$  8.0 the Fe is pptd. and no pigmentation occurs.

JOHN T. MYERS

**The germicidal action of halogen derivatives of phenol and resorcinol and its impairment by organic matter.** EMIL KLARMANN, VLADIMIR A. SHTERNOV AND JOHN VON WOWERN. *J. Bact.* 17, 423-42(1929).—Expts. on the disinfectant action of phenol, resorcinol and their halogen derivs. indicate a distinct relationship between constitution of the derivs. and impairment of disinfectant action by org. matter. The minute amts. of org. matter in the original culture will produce considerable impairment with certain derivs. It is assumed that additive compds. between the mols. of the disinfecting agent and certain free reactive groups in the org. matter or the protoplasm are formed, thus rendering the disinfectant less active, the degree of impairment being proportional to the stability of such additive compds.

JOHN T. MYERS

**Studies on carbon dioxide.** IV. The influence of gaseous environment on growth and toxin production of *C. diphtheriae*. WAYNE N. PLASTRIDGE AND LEO F. RETTGER. *J. Bact.* 18, 1-41(1929).—Aeration of broth cultures of *C. diphtheriae* with atms. contg. 3 to 10% of  $CO_2$  and 5 to 50% O caused increased growth and toxin production. Aeration with ordinary air or  $CO_2$ -free air contg. 10 to 50% O resulted in marked irregularity of growth and toxin production. The higher the O content of the atms. passed over the cultures the greater the irregularity in toxin content. The rate of destruction of toxin once formed was inversely proportional to the O tension in the culture flask. The optimum O content of the atm. for toxin production was 15 to 20%, and the  $CO_2$  5 to 10%. Under these conditions there was max. toxin production and no deterioration on prolonged incubation. The  $NH_3$  content of all cultures showed a sharp increase during the period of max. growth. In cultures aerated with ordinary air or  $CO_2$ -free air, this was followed by a gradual decline, while with increased  $CO_2$  tension there was a continuous increase for a 20-day period. The amino N increase in cultures grown in broth prep'd. from Difco-Bacto peptone was much less marked than in broth with Difco-proteose peptone, probably because the former had a dearth of protein derivs. capable of being split into amino acids by the peptolytic enzymes of *C. diphtheriae*. The proteose fractions of peptones are necessary for toxin production for other reasons than as a buffer. Increased  $CO_2$  tension prevents the usual destruction of bacterial cells after the period of max. growth.

JOHN T. MYERS

**Sodium chloride media for the separation of Gram-positive cocci from Gram-negative bacilli.** JUSTINA H. HILL AND EDWIN C. WHITE. *J. Bact.* 18, 43-57(1929).—Agar with a NaCl concn. of 2 to 20% and a  $pH$  of 6.0 exerts a marked inhibitory action on the growth of bacilli of the typhoid, paratyphoid, dysentery and colon groups, some species of *Proteus*, diphtheroids, *Pseudomonas* and anthrax. Gram-positive cocci

tolerated 20% NaCl well. A similar bacteriostasis occurs in salt broths but to a lesser extent.

A continuous method of culturing bacteria for chemical study. JOHN T. MYERS. *J. Bact.* 18, 59-67(1929).

Lactic acid bacilli in eugenic and non-eugenic media. CARLOS A. SAGASTUME AND JORGE GASCON. *Rev. facultad cienc. quim.* (Univ. La Plata) 5, Pt. 2, 99-109(1929).—A strain of lactic acid bacilli of the uric acid group, isolated by S. and G. from the human intestine, was found to lose its coagulating and acid-forming activity, and to change its microscopic appearance after successive transplantations in a medium of sterilized milk (I). Gorini (no ref.) reported such a case in which the activity was restored by inoculating milk with a broth culture, or by growing in a medium of I contg. a small amount of corrective, such as broth, blood, etc. S. and G. repeated the findings of Gorini, and tested various amino acids, glycosamine and peptone as correctives for the non-eugenic I. They found that broth ( $1/2$ ), tryptophan ( $1/1000$ ) and peptone ( $1/1000$ ) all increased the speed of coagulation and of acid formation, as well as the multiplication. They found that bacteria of their strain, which had lost its activity after transplantation in I, were short, articulated and granular, while after growth in a eugenic medium they were long, fine and homogeneous. They conclude that tryptophan, especially, is necessary for the cultivation of their strain, and point out the relationship between tryptophan and the natural products, skatole and indole.

Comparative bacteriological examination of American and Moravian barley. V. BERMANN AND H. WERTHEIM. *Wochschr. Brau.* 45, 564-5(1928).—The microorganisms that were found in the American barley and not in the Moravian were an anaerobic, gas- and spore-forming bacterium, an aerobic non-spore-forming bacterium and a mold of the *Mucor* type.

Biology of *Sarcina*. J. FUCHS. *Wochschr. Brau.* 46, 203-8, 213-5(1929).—Incomplete saccharification of the mash resulting in the weakening and partial autolysis of the yeast aids the development of *Sarcina*. The use of a barley rich in sol. proteins furnishes a good growing medium. There is no evidence of parasitism of *Sarcina* on, or symbiosis with, yeast.

Production of kojic acid from pentoses by *Aspergillus oryzae*. FREDERICK CHALLENGER, LOUIS KLEIN AND THOMAS K. WALKER. *J. Chem. Soc.* 1929, 1498-1505.—The following yields of kojic acid were obtained by the action of *A. oryzae* on pentoses: arabinose, 8 days, 2.5 g. per 100 g. sugar; 7 days, 1.4 g.; xylose, 7 days, 5.0 g.; 16 days, 2.1 g.; 8 days, 3.8 g.; glucose, 7 days, 3.8 g. No growth took place on pyromeconic acid, dimethylpyrone or Na comenat. Glucuronic acid supported growth but no comenic acid, kojic acid or hydroxypyrene derivs. could be detected. K H adipate soln. shows a fair growth but tests for kojic and citric acids were neg. up to the 16th day.

Role of carbohydrates in biological oxidations and reductions. Experiments with pneumococcus. RENÉ DUBOS. *J. Exptl. Med.* 50, 143-60(1929).—The reducing power of plain broth cultures of pneumococcus is largely dependent upon the presence of certain metabolites in the medium at the time when the reduction test is performed. The washed cells of pneumococcus are able to reduce the various indicators of oxidation-reduction potentials in the presence of glucose. The relative velocity of reduction of these indicators is detd. by the no. of cells used in the test the concn. of the dyes and their position in the oxidation-reduction scale. Oxidized thiol compds. (glutathione, cystine, oxidized thioglycolic acid) are likewise rapidly reduced by glucose in the presence of the washed cells of pneumococcus. This pneumococcus-glucose system is able to form peroxide under aerobic conditions. The power of washed cells of pneumococcus to reduce methylene blue in the presence of glucose is dependent on at least 2 constituents, one of which can be readily removed from the cell by washing. Sugar-free meat infusion will function instead of it. The other is inactivated more slowly by the process of washing and is destroyed by 10 min. heating at 55°. The inter-reaction between the glucose and the cell seems to result in a fundamental reaction in which 1 mol. of glucose becomes able to reduce rapidly 1 mol. of methylene blue. The significance of these observations is considered in relation to the nature and mechanism of the "activation" of metabolites, the prepn. of synthetic media, the phenomena of growth and the meaning of the expression "reducing power of a bacterial culture."

Germicidal action of hydroxy soaps. ARNOLD H. EGGERTH. *J. Exptl. Med.* 50, 299-313(1929).—The  $\alpha$ -HO soaps exhibit a high germicidal action toward certain organisms. As with other soaps, this action increases with mol. wt. to a max., then diminishes. The  $p_n$  affects the germicidal action as it does in other soaps. With the  $\alpha$ -hydroxy myristate and -palmitate, *Staphylococcus aureus* gives 2 distinct zones of germicidal

action at  $pH$  7.5. The effect of the HO group in satd. soaps is to increase the selective germicidal action, while in an unsatd. soap it diminishes it. Soaps offer a means of sepg. mixts. of organisms by selective germicidal action.

C. J. WEST

Methylene blue and bromocresol purple in differentiating bacteria of the colon-aerogenes group (DOMINICK, LAUTER) 14.

THOMAS G. PHILLIPS

Determination of the nitrogen fixation by legumes by means of the nitrogen-base ratio. ALFRED STORCK AND AUGUST RIPPEL. *Z. Pflanzenernähr. Düngung u. Bodenk.* 13A, 158-9(1929).—In a preliminary study, the authors seem to have established a relationship between the N utilized by a legume and the bases absorbed by the legume at different stages of growth.

R. M. BARNETTE

Provision of the oat plant with nitrogen and mineral nutrients as correlated with the number of crown roots. TH. CHIRIKOV. *Z. Pflanzenernähr., Düngung u. Bodenk.* 13A, 201-4(1929).—Analyses of the oat plant without crown roots, with 1-3 crown roots, 4-6 crown roots, etc., showed that the no. of crown roots det. the degree with which the plant is provided with N and mineral constituents. The plant is more completely supplied with these nutrients with the larger no. of crown roots.

R. M. BARNETTE

Influence of potassium upon the formation of fiber cell walls in fiber plants. FRIEDRICH TOBLER. *Z. Pflanzenernähr. Düngung u. Bodenk.* 13A, 208-13(1929).—The addn. of K is noticed most in the surface layers of the cell wall. With K addn. there was a swelling of the cell walls, a greater capacity to hold water and an increase in the thickness of the walls. This can be easily noted by microscopic anatomical studies. K gave a smoother surface, better spinning property and closer, more compact fiber. The K has an indirect effect in overcoming the undesirable effects of N on the fiber. The action is not directly correlated with increased K in the fiber but rather with an indirect effect in the increase in water, and the effect on the growth and structure of the cells and bundles. Flax, hemp, ramie and other fibers were anatomically examd.

R. M. BARNETTE

The desiccation and cold resistance of plants. E. V. BOBKOV AND R. A. POPOVA. *Z. Pflanzenernähr. Düngung u. Bodenk.* 14A, 24-37(1929).—By using the dilatometer method, the content of combined water was estd. for several varieties of winter wheat which had different degrees of cold resistance. From the detn., it was shown that winter rye and cold resistant winter wheat varieties have a higher content of combined water in the water-contg. tissues than non-resistant varieties.

R. M. BARNETTE

Physiological function of magnesium in plants. I. CANALS. *Bull. soc. chim. biol.* 11, 14-45(1929); cf. *C. A.* 23, 3003. —Crude preps. of invertase from brewers' yeast show a rough proportionality between their activity and their Mg content. Invertase pptd. from aq. soln. with alc. shows a low activity which is increased to a value below that of the original material by the addn. of  $MgSO_4$ . Activity is lower in the same sample at higher  $pH$  values. Electrolysis of aq. solns. of invertase, whether contg. sucrose or not, results in a partial migration of the Mg to the cathode; dialyzed invertase shows little variation in Mg content when subjected to electrolysis. From these results it is concluded that the invertase mol. contains Mg in a non-ionic form. When pea seeds are allowed to germinate and grow in solns. of appropriate salts, much less growth is observed if Mg is absent. If Ca ions are absent or if solns. of  $MgSO_4$  alone are used, Mg salts exert a toxic action. In these expts. and also in the growth of maize and lupins, Mg solns. show an appreciable effect at 0.001%, an optimum effect at 0.05%, and a toxic effect at 0.1%. Mg salts also possess a marked influence on the growth of *Saccharomyces kephir* and *Bacillus caucasicus*.

B. C. A.

Fixation of chondriosomes of the vegetable cell. M. MASCRÉ. *Compt. rend.* 188, 811-3(1929); cf. *C. A.* 22, 612.—While the chondriosomes of *Elodea canadensis* are dissolved by treatment with AcOH, a sufficient preliminary treatment with  $CH_2O$  inhibits the destruction.

B. C. A.

Coloration of living vegetable cells by neutral-red. GUILLIERMOND. *Compt. rend.* 188, 813-5(1929).—Concd. solns. of neutral-red cause a flocculation of the colloids of the vacuoles of yeast cells and coloration of the vacuole without death of the cell.

B. C. A.

Iodine liberator from Laminaria. H. D. KAY. *Nature* 123, 317(1929).—The liberation of I from KI by an acidified ext. of *Laminaria fronds* (Dillon, *C. A.* 23, 2465) might be due to the presence of iodate.

B. C. A.

Absorption of nutrients by the onion. M. KOZTOWSKA. *Roczn. Nauk Roln.* 20,

15-24(1928).—Two phases in the life of the onion are differentiated: that of absorption of mineral substances, and that of the transference of nutrient materials from the tops into the bulbs.

B. C. A.

**The immediate effect of change of light on the rate of photosynthesis.** TSI-TUNG LI. *Ann. Botany* 43, 787-801(1929).—*Ceratophyllum*, *Myriophyllum* and *Polamogelon* were used as exptl. plants and the rate of photosynthesis was detd. by counting the no. of bubbles given off by the submerged plant in unit time. Light of varying intensity was obtained by altering the distance between light source and plant material and the Wallace colored glass filters were employed to give variously colored lights. Change from white light to red, green or blue produces an immediate cessation of photosynthetic activity followed after 1-4 min. by increase to a rate which is const. for that particular light; return to white is followed by rapid return to a rate equaling or exceeding the normal for white light. The initial effect of progressively decreasing the intensity of the light was a decrease in photosynthetic rate lasting less than 1 min., followed by establishment of a new rate const. for the particular intensity. When the light was altered in color but gave the same amt. of available energy the rate of photosynthesis showed no change. There is initial inhibition upon changing from light of high available energy to light of lower available energy; initial acceleration occurs when the direction of the change is reversed. The results support the Warburg-Baly theory of surface action in photosynthesis. The splitting off of O may be a secondary reaction controlled by an enzyme and not a part of the primary photochem. reaction, and the degree of correlation between the 2 reactions may vary in different plants.

JOSEPH S. CALDWELL

**Studies on sugars. III. Galactose from *Gelidium pacificum* Okam.** YOSHISUKE UYEDA. *J. Soc. Chem. Ind. Japan* 32, 568-9(1929); Suppl. Binding 32, 175-6B(1929).—The av. compn. of sea weed "Tengusa" (*Gelidium pacificum*, Okam) was moisture 15.31, ash 3.35, galactose 18.52 and galactan 12.53%. From this material, 5% of galactose was obtained in crystal form, by first hydrolyzing with 5%  $H_2SO_4$  for 20 hrs., neutralizing with  $BaCO_3$ , filtering, evapg. the filtrate under reduced pressure, and purifying the soln. with alc. and evapg.

FUJIBAYASHI

**The chemical nature of allergens. III. Pollen of *Alopecurus*.** L. FARMER LOEB. *Klin. Wochschr.* 8, 926-7(1929); cf. *C. A.* 23, 677. If  $C_2H_5OH$  is added to an aq. ext. of the pollen of *Alopecurus* (to which certain hay fever patients give a reaction), a ppt is formed that contains all of the active substance. This ppt. loses its activity when it is subjected to proteolytic digestion. The active substance is either a protein, or is combined with a protein or is active only when it is combined with a protein.

M. H.

**Seed fats of the Umbelliferae. II. The seed fats of some cultivated species.** BRIAN C. CHRISTIAN AND THOMAS P. HILDITCH. *Biochem. J.* 23, 327-38(1929); cf. *C. A.* 22, 2766.—In 7 examples of umbellate seed fats, petroselinic acid (6<sup>6</sup>-octadecenoic acid) is present in all cases; varying quantities of palmitic, oleic and linoleic acids are also present.

BENJAMIN HARROW

**Carrageen (*Chondrus crispus*). IV. The hydrolysis of carrageen mucilage.** PAUL HAAS AND BARBARA RUSSELL-WELLS. *Biochem. J.* 23, 425-9(1929); cf. *C. A.* 16, 2710.—Mild hydrolysis of carrageen does not give rise to free sugars, but 2 ethereal sulfates are produced which can be sepd. by dialysis. Glucose is present in carrageen mucilage.

BENJAMIN HARROW

**Effect of partial decay on the alkali solubility of wood.** WM. G. CAMPBELL AND JAMES BOOTH. *Biochem. J.* 23, 566-72(1929).—The similarity of the effect on wood between acid hydrolysis and fungal decay of the brown rot type is so close as to warrant the conclusion that the latter type may be regarded as an acid hydrolysis.

B. H.

**Irreversible injury and carbon dioxide production from cells of *Nitella flexilis*.** P. A. DAVIES. *Bot. Gaz.* 87, 660-4(1929).—The rate of  $CO_2$  produced from the cells drops below the normal at the time when irreversible injury occurs. Cf. Haas, *C. A.* 13, 2903.

BENJAMIN HARROW

**New apparatus for the study of carbon dioxide assimilation, respiration, stomatal aperture and light intensity.** P. BOYSEN-JENSEN. *Planta, Abt. E. wiss. Biol.* 6, 456-72(1928).—An app. for the detn. of  $CO_2$  used during photosynthesis is described in detail. A known vol. of air is drawn through the system by means of  $H_2O$  flowing at a given rate from one 5 l. bottle to another. The difference in amt. of  $CO_2$  remaining in an air stream passed over leaves and one not passed over leaves is detd. by absorption with  $Ba(OH)_2$  and titration with  $HCl$ . The description of addnl. app. and methods are: Respiration is detd. by absorption of  $CO_2$  with  $Ba(OH)_2$  in a closed cylinder ( $10 \times 4$  cm.), the leaves resting on a perforated plate above the soln. Size of stomatal aperture is detd. by the pressure (cm. of Hg) necessary to infiltrate with  $H_2O$  leaves which have been

exhausted of air. Light intensity is detd. by means of Rhodamine B-paper for the red-yellow end of the spectrum which is regarded as most important in  $\text{CO}_2$  assimilation (blue end must be screened out).

**Process of formation of ethereal oil in the coriander plant.** A. E. HITCHCOCK. *Masloboino-Zhirovoe Delo* 1928, No. 12, 34-6.—Ethereal oil is formed by a series of reduction processes within the plant. This is complicated by secondary processes such as complex rearrangements in the course of formation of secondary alcs. from aldehydes, etherification of these alcs., and their dehydration with formation of cyclic hydrocarbons.

**New hypotheses concerning the action of potash in plant growth.** A. BRUNO. *Rev. vit.* 69, 60-2(1928).—B. suggests that  $\text{K}_2\text{O}$  may influence plant growth and especially carbohydrate formation as a result of a photoelec. effect originating in the radioactivity of K. The energy required in chlorophyll formation is supposed to be derived in part at least as the result of bombardment of K by solar rays and subsequent  $\beta$ -particle emission.

**The determination of manganese in plant materials by the periodate method.** JEHL DAVIDSON AND RUTH G. CAPEN. *J. Assoc. Official Agr. Chem.* 12, 310-1(1929).—In the  $\text{KIO}_4$  method for Mn in plant materials, the soln. must be free from reducing agents; the principal reducing agent in solns. of ashed plant materials is HCl, which is troublesome to eliminate completely. Practically the same results were obtained by dissolving the ashed material in  $\text{HNO}_3$ ,  $\text{H}_2\text{SO}_4$  or  $\text{H}_3\text{PO}_4$  instead of HCl; the differences in the results obtained were within the limits of exptl. error, but, if anything, better than with HCl.  $\text{H}_3\text{PO}_4$  proved the most suitable, as it developed the  $\text{KMnO}_4$  color in the shortest time;  $\text{H}_2\text{SO}_4$  was next in order, and  $\text{HNO}_3$  last. Addn. of  $\text{Fe}(\text{NO}_3)_3$  to the standard  $\text{KMnO}_4$  soln. is unnecessary in plant materials, but the addn. of  $\text{KIO}_4$  acts as an excellent preservative. The solns. should be guarded against alc. vapors and other volatile reducing substances.

**Chemical composition of Alaskan lichens.** G. C. SPENCER AND O. F. KRUMBOLTZ. *J. Assoc. Official Agr. Chem.* 12, 317-9(1929).—After a brief description of the biol. nature of lichens, a table of analytical results of 21 samples of Alaskan lichens is presented together with a bibliography of 4 references of non-grassy range feeds.

**The relationship of soil type to the calcium and magnesium content of green bean stems and leaves and their expressed juice.** J. F. FONDER. *Soil Science* 27, 415-32(1929).—The effect of crop growth upon the Ca and Mg content of the soil solns. and upon the  $p_{\text{H}}$  value of the soils was observed, and the relationships between these characteristics of the soils and the Ca and Mg content of the plants. Widely different amts. of Ca and Mg were found present in the various soil solns. before plant growth began but they were greatly reduced by the growing plants and were almost equal at the end of the growth period. The soil solns. with the highest concns. of Ca and Mg at the beginning of the growth period generally maintained a higher concn. during the growing period. No relationship appeared to exist between the Ca and Mg content of the soil solns. and either the  $p_{\text{H}}$  value or the texture of the soils. Marked variations were found in the amts. of Ca and Mg present in the green tissue and in the juice of both stems and leaves of bean plants grown on the different soil types. Greater increases in the Ca and Mg contents of the tissue and juice of stems and leaves generally occurred in early growth and near maturity than during the intermediate stages of growth. A decided correlation appeared to exist between the Cu content of the tissue and juice of both stem and leaves and that of the soil soln. A high Ca content in the soil soln. was associated with a high Ca content in the plants when the soils were of similar texture.

**Variations in the calcium and magnesium contents of pea plants on different soil types.** J. F. FONDER. *Soil Science* 28, 15-26(1929).—A study was made of the influence of the growth of field peas on the Ca and Mg contents of the soil solns., the reaction of the soil and on variations in the Ca and Mg content of pea stems and leaves and in their juice when obtained from plants grown on different soil types. Growing pea plants greatly reduced the amts. of Ca and Mg present in the different soil solns. They also tended to decrease the acidity of strongly acid soils and to increase that of alk. or nearly neutral soils. The Ca and Mg content varied greatly in the pea plants grown on the different soil types. On soils of similar texture and reaction, the amt. of Ca present in the pea plant varied directly with the amt. present in the soil soln. The Mg content

Mg increased in the tissue and juice of pea leaves. Greater amts. of Ca than of Mg were always present in the tissue and in the juice of pea stems and leaves. The Ca and Mg

content was higher in slowly growing plants than in those making a rapid growth.

**Acidity changes in stored legume seeds.** J. K. WILSON. *J. Am. Soc. Agron.* 21, 815-7(1929).—Seeds of different species of legumes, ranging from fresh seed to seeds 10 yr. old, were tested for acidity. In most cases there was a marked change in reaction. Usually older seeds of a given legume have a more acid reaction than fresh seeds.

J. J. SKINNER

**A study of the relations between chloroplast pigments and dry weights of tops in dent corn.** H. B. SPRAGUE AND J. W. SHIVE. *Plant Physiology* 4, 165-92(1929).—A close correlation appears to exist between the total quantity of chlorophyll contained in the leaves of the various strains of maize and their dry wt. of tops at successive harvests. Correlations also between total carotin content and dry wt., and between total xanthophyll content and dry wt. are close enough to be significant.

WALTER THOMAS

**Mosses and their subsoil.** ISTVÁN GYÖRFFY. *Földtani Közöny* 54, 45-56 (Hungarian), 166-73(German)(1925).—Mosses are of interest to geologists in 2 ways, as indicators of the chem. nature of rocks and as rock-formers. While many mosses are indifferent, some are largely restricted to substrata contg. certain elements. Thus *Mielichhoferia nitida* requires Fe and Cu; *Aloina stellata* indicates clay; and considerable numbers are Ca- or Si-loving. Reports of lime-loving mosses, as of other plants, on non-calcareous rocks such as granite are largely or wholly due to errors in identification of the rock. Supposed granites may contain much Ca-feldspar, amphibole, etc. Mosses are important in the deposition of travertine and limestone in running waters. They usually ext. CO<sub>2</sub> from the water, whereupon the CaCO<sub>3</sub> is pptd.

E. T. WHERRY

**The question of the soil-indicating mosses.** ÁDÁM BOROS. *Földtani Közöny* 55, 239-41 (Hungarian), 387-8 (German)(1926); cf. preceding abstract.—Mosses can be used as indicators only of the substratum in which they are rooted, and this may be quite different in character from the underlying rock, or even from the subsoil into which the roots of other plants extend. Differences in the moss-cover of 2 rocks may be due to phys. rather than chem. causes, as for instance, if one rock breaks up on weathering into flakes and the other into blocks. To call a plant Si-loving is certainly erroneous, because the Si in a rock does not act chemically on the plant.

E. T. WHERRY

**Fiber plants of the Crotalaria family (Ross) 25.** Course of the growth and the absorption of nutrients by the cotton plant (KUDRIN) 15. New method for determination of small quantities of nitrate in soils and plants (BLOM, TRESCHOW) 15. Vitamins and other constituents of citrus oils and related products (WILLMOTT) 17. Light rays for promoting plant growth (Brit. pat. 306,112) 4.

## E—NUTRITION

PHILIP B. HAWK

**Increase of hepatic proteins with a diet rich in proteins.** C. GAUTIER. *Bull. soc. chim. biol.* 11, 168-77(1929).—The expts. on frogs (*C. A.* 22, 2592) are repeated with the addnl. detn. of the liver-proteins by pptn. with 20% trichloroacetic acid. While the percentage protein content falls, the total amt. of protein increases 2-4 times in the animals receiving cheese.

B. C. A.

**Urinary elimination of ammonia in relation to different nitrogenous diets.** M. POLONOVSKI AND P. BOULANGER. *Bull. soc. chim. biol.* 11, 211-32(1929).—The ratio of ammoniacal N to total N of the urine appears to possess no relation to the N content of the diet. The constant of Hasselbalch (*C. A.* 10, 1760) possesses an approx. inverse relation to the  $pH$  of the urine.

B. C. A.

**Causes of alimentary hyperglucemia in carbohydrate feeding and deprivation.** F. SCHELLONG AND H. KRAMER. *Klin. Wochschr.* 7, 1726-9(1928).

B. C. A.

**Utilization of sulfur by animals.** H. R. MARSTON AND T. B. ROBERTSON. *Australia Inst. Sci. Ind. Bull.* 39, 5-51(1928).—A review of the literature dealing with S metabolism, compiled with the object of laying a foundation for research into the problem of the economic importance of S in wool production.

B. C. A.

**The toxicity of irradiated ergosterol preparations.** ARTHUR SCHREUNERT AND MARTIN SCHIEBLICH. *Klin. Wochschr.* 8, 983-4(1929).—The toxicity and the antirachitic properties of three irradiated ergosterol preps. have been quant. compared. The two effects are approx. parallel, indicating that the antirachitic mol. is also the toxic mol.

MILTON HANKE

**The milk of irradiated mothers.** H. HIRSCH-KAUFFMANN AND C. WIENER. *Klin. Wochschr.* 8, 984-5(1929).—Irradiation of the mother increases the quantity of milk

produced but does not produce a determinable difference in the chem. compn. of the milk. The vitamin C and D contents are definitely increased by irradiation. M. H.

**The specific dynamic action of liver.** R. NOTHAAS AND J. MULZER. *Klin. Wochschr.* 8, 1065-6(1929).—The specific dynamic action of liver is approx. identical with that of meat. An attempt is made to explain why Mark (C. A. 23, 1438) found liver to have very little specific dynamic action.

**Effect on vitamin B<sub>2</sub> of treatment with nitrous acid.** H. CHICK. *Biochem. J.* 23, 514-6(1929).—Vitamin B<sub>2</sub> is not destroyed by HNO<sub>2</sub>. BENJAMIN HARROW

**The antirachitic action of certain cholesterol lipides of the Bourgogne snail (*Helix pomatia*).** G. MOURIQUAND AND A. LEULIER. *Compt. rend.* 188, 1701-2(1929).—The cholesterol lipides of the *Helix pomatia* were studied for antirachitic activity because of the great Ca content of its blood and the ease with which it repairs its shell. The ingestion of one drop of a 0.1% soln. of a mixt. of cholesterol and lipides after irradiation cured a rachitic rat while 5 drops of nonirradiated material had no effect; neither did irradiated nor nonirradiated cholesterol. The lipides are not toxic and, thus, may be used therapeutically.

**The determination of the value of vitamin D preparations.** I. ARTHUR SCHEUNERT AND MARTIN SCHIEBLICH. *Biochem. Z.* 209, 290-303(1929).—See C. A. 23, 2743.

**The metabolism of sulfur. XVI. Dietary factors in relation to the chemical composition of the hair of the young white rat.** HOWARD D. LIGHTBODY AND HOWARD B. LEWIS. *J. Biol. Chem.* 82, 663-71(1929); cf. C. A. 23, 3957.—The cystine and S contents of the hair varied with the content of these substances in the diet and with the age of the rats. The cystine requirements for body-growth take precedence over the requirements for hair production.

Vitamins and other constituents of citrus oils and related products (WILLIMOTT) 17.

**KNAUR, HANS: Ergebnisse der Lipidstoffwechselforschung mit besonderer Berücksichtigung der Verhältnisse im Kindesalter.** Berlin: S. Karger. 164 pp. M. 7. Reviewed in *J. Am. Med. Assoc.* 93, 792(1929).

**SCHUEUNERT, ARTUR: The Vitamin Content of German Fruits and Vegetables. I. Fruits and Vegetables (in German).** Berlin: J. Springer. 37 pp. M. 2.40. Reviewed in *Nahrungsmittel-Industrie* 8, 622(1929).

## F—PHYSIOLOGY

E. K. MARSHALL, JR.

**Urinary elimination of ammonia and nitrogen. Some urinary constants. II.** E. RAFFLIN. *Bull. soc. chim. biol.* 11, 178-88(1929).—Chiefly polemical against Polonovski and Boulanger (C. A. 22, 2972). An account of the variation of the consts. with a no. of pathol. conditions is given. III. *Ibid* 189-97.—The effect of NaHCO<sub>3</sub>, NaCl, CaCl<sub>2</sub> and H<sub>2</sub>SO<sub>4</sub> on the urinary constants (C. A. 22, 3920) is studied. The substances cause a fall, little effect, an increase and little effect, resp., in the ratio ammoniacal N/total N. IV. *Ibid* 198-210.—A discussion of the effects of a no. of pathol. conditions on the urinary constants.

**Mathematical relationships of urinary characteristics.** L. LEMATTE AND E. KAHANE. *Bull. soc. chim. biol.* 11, 233-41(1929).—A discussion of the constants of Rafflin and Hasselbalch (cf. preceding abstr.).

**Seasonal influence on the respiratory combustion of the dog.** F. MAIGNON AND A. PAINVIN. *Compt. rend.* 188, 573-5(1929).—The amt. of O used in respiration by a fasting dog shows maxima in the spring and the autumn; on a meat diet the effect is similar but less pronounced.

**Caries investigations. A. Biochemistry of mixed human saliva. I. Dextrose content.** D. ENTIN AND A. A. SCHMIDT. *Deut. Monatschr. Zahnheilkunde* 1928, 177-88; *Chem. Zentr.* 1928, I, 2955; cf. C. A. 23, 3255.

**The question of the origin of urinary ammonia.** STANLEY R. BENEDICT AND THOMAS P. NASH, JR. *J. Biol. Chem.* 82, 673-8(1929).—Conclusions: Urinary NH<sub>3</sub> is of renal origin. Urea is probably its precursor. NH<sub>3</sub> plays no part in the neutralization of acids in the blood. "Satisfactory evidence is lacking that NH<sub>3</sub> is utilized for the intracellular neutralization of acids."

**The excretion of lead in urine.** HORACE MILLET. *J. Biol. Chem.* 83, 265-8(1929).—The excretion of Pb in the urine was detd. electrometrically. Cancer patients who had received injections of colloidal Pb<sub>2</sub>(PO<sub>4</sub>)<sub>2</sub> and those not treated with Pb showed

the same rate of excretion of Pb. There is a definite normal excretion of Pb in urine.

ARTHUR GROLLMAN

A previously undetected constituent of blood. E. W. ROCKWOOD, R. G. TURNER AND J. J. PFIFFNER. *J. Biol. Chem.* **83**, 289-97(1929).—After the acid hydrolysis of the blood of man, dog and rabbit, there is a previously undetected substance, reducing arsenophosphotungstic acid, which is provisionally named *substance Z*. It is also present in the muscle, kidney and liver of the dog and rabbit.

ARTHUR GROLLMAN

Endogenous uric acid and hematopoiesis. JOSEPH KRAFKA, JR. *J. Biol. Chem.* **83**, 409-14(1929).—During the hematopoietic activity following hemorrhage, there was a great increase in the excretion of uric acid by the Dalmatian coach hound.

ARTHUR GROLLMAN

The storage of manganese and copper in the animal body and its influence on hemoglobin building. R. W. TITUS AND J. S. HUGHES. *J. Biol. Chem.* **83**, 463-7 (1929).—Mn and Cu are stored in the body when added to the ration of rats and are effective in the utilization of Fe in hemoglobin building.

ARTHUR GROLLMAN

Composition of bone. VI. Effect of massive doses of irradiated ergosterol. BENJAMIN KRAMER, M. J. SHEAR AND MARGARET R. MCKENZIE. *J. Biol. Chem.* **82**, 555-7(1929).—The residual Ca:P ratio of the bones of rats was not affected by massive doses of irradiated ergosterol or by feeding cod-liver oil. Cf. *C. A.* **22**, 4328.

ARTHUR GROLLMAN

Fat excretion. VI. Excretion by Thiry-Vella fistulas. ROBERT W. ANGEVINE. *J. Biol. Chem.* **82**, 559-65(1929).—A considerable amt. of fatty material was formed and excreted through the intestinal loops of a Thiry-Vella fistula. The amt. excreted was independent of the diet.

ARTHUR GROLLMAN

Growth in infants from the standpoint of physical measurements and nitrogen metabolism. I. Creatinine. AMY L. DANIELS AND LUCEA M. HEJNIAN. *Am. J. Diseases Children* **37**, 1128-34(1929).—The phys. development of an infant may be more accurately measured by the increase in the amt. of creatinine excreted per cm of the body length than by the amt. excreted per kg. of the body wt. E. R. MAIN

The composition of growth in infancy. I. A premature infant. BENGT HAMILTON AND MARGARET MORIARTY. *Am. J. Diseases Children* **37**, 1169-76(1929).—The compn of the growth of a premature infant was studied by a detn. of the retentions of Ca, P, Na, K, Cl and N per kg. of gain in wt. The gain in wt. appeared to contain more Ca and P, but less Na, K, Cl and N than does the body at birth. It is suggested that there was a progressive loss of lime salts from the bones, an increase in the body fluids and a change in either the compn. or the relative mass of the cellular tissues. E. R. M.

Chemical investigations on the nature of the intraocular fluids. II. Magnesium, sodium and chlorine in the blood serum and in the aqueous and vitreous humor of the eye of the ox. EUGEN TRON. *Arch. Ophthalmol.* **118**, 713-22(1927); *Chem. Zentr.* **1928**, II, 1894; cf. *C. A.* **22**, 2954.—The vitreous humor in the ox contains Cl 0.44, Na 0.335 and Mg 0.001%. The same values were found for the aq. humor. The Na content equals that of serum, while the Cl value is 20% higher and the Mg value 33% lower than the resp. values in serum. III. Inorganic sulfur and phosphorus in the intraocular fluids and the blood serum of the ox. The intraocular fluids as the ultra-filtrate of the blood. *Ibid* **119**, 659-79; *Chem. Zentr.* **1928**, II, 1894.—The av. content of inorg. P in ox serum is 0.047 mg. and that of S is 0.027 mg. per cc. Aq. humor contains 0.028 mg. of inorg. P and 0.012 mg. S, while vitreous humor contains 0.01 mg. P and 0.014 mg. S per cc. The distribution of the ions in blood and intraocular fluid is discussed with regard to the Donnan equil. Since the diffusibility is not definitely known for Ca, sulfate and phosphate, a final decision cannot be made. It is highly probable, however, that the intraocular fluid is an ultra-filtrate of the serum, which view is supported by the fact that no ionic exchange occurs on dialyzing serum against intraocular fluid.

G. SCHWOCH

The liver glycogen content of different animals in the embryonic and newly born stages. II. The liver glycogen in the newly born stages. ICHIRO MARUYAMA. *Okayama-Igakkai-Zasshi* **39**, 1133-72; *Chem. Zentr.* **1928**, II, 1794.—The liver glycogen in newly born mammals is low and is sometimes absent directly after the birth. There exist great individual variations and also differences according to the species of animals. Hunger is not the cause of the glycogen loss. Administration of glucose directly after birth is without effect.

G. SCHWOCH

## H—PHARMACOLOGY

A. N. RICHARDS

**Adsorption of dyes by the serum in lead poisoning.** A. SEITZ. *Klin. Wochschr.* 7, 1234-5(1928).—Inhibition by serum of the diffusion of dyes is less marked in Pb poisoning.

..... (strongly absorbed), adrenaline, strophanthin, or pilocarpine (absorbed with difficulty) is inhibited by adsorption from the nutrient soln. or from the tissue by the above substances, in order of decreasing effect. Animal charcoal is more effective.

**Influence of ergotamine on the blood sugar of animals and man.** M. BUFANO AND A. MASINI. *Riforma med.* 43, No. 38, 21 pp.(1927).—Administration of ergotamine causes a fall in the blood sugar which is ascribed to diminished glycogenolysis in the liver.

**Influence of substances of the pilocarpine group on the gaseous exchanges of animals.** A. M. PREOBRAZHENSKII. *Russ. J. Physiol.* 12, 45-58(1929).—The excretion of CO<sub>2</sub> and water and the absorption of O in the rabbit are increased as a result of the injection of pilocarpine in doses from 1 mg. per kg. body weight. In large doses (10 mg. per kg.), this general increase is maintained, but the O absorption does not increase proportionately to the increased excretion of water and CO<sub>2</sub>. Arecoline in doses of 0.1-1 mg. gives results similar to those obtained with pilocarpine, but the general increase of all components with increasing dosage is more proportionately interrelated. With both drugs the excretion of water is the most marked. Physostigmine in doses of 0.1-1 mg. causes an increased excretion of CO<sub>2</sub> but the excretion of water and the absorption of O decrease.

**Connection between sodium chloride elimination and insulin administration in diabetes.** M. TINKER AND A. SAIDENBERG. *Russ. Klin.* 8, 223-35(1927).—In diabetes there is NaCl insufficiency, but retention of NaCl in the tissues is prevented by polyuria; excess of administered salt is retained, but the smaller the concn. of sugar in the urine, the greater is the NaCl concn. On administration of insulin the diminished urinary excretion of sugar is paralleled by an increase in the NaCl concn., but the water retention leads to NaCl retention in the tissues. The NaCl concn. in the blood is increased.

**Effect of hydrazine, hydroxylamine and aminoguanidine on the excretion of uric acid.** N. NIELSEN AND G. E. WIDMARK. *Upsala Läkarefor. Förh.* [2], 33, 327-33 (1927).—The uric acid excreted by normal rats was 7-8 mg. per kg. per day; the administration of hydrazine, hydroxylamine or aminoguanidine did not cause increased elimination of uric acid.

**The physiological and pharmacological relations of  $p_H$  to the heart.** T. KOMIYAMA. *Arch. exptl. Path. Pharmacol.* 139, 100-19(1929).—Acids and alkalis affect the heart reversibly or irreversibly according to their concn. The reversible effect involves only the contraction process. As acidity increases, contractility decreases until at  $p_H$  6 (in nutrient soln.) the heart comes to diastolic rest. An increase in alkali increases contractility. The heart is irreversibly contracted at  $p_H$  5, but complete recovery is possible after exposure to  $p_H$  12.0; 0.025 N NaOH causes irreversible contraction. The concn. of H or OH ions exerts its influence as regards its reversible effects on the cell membrane. The effect of  $p_H$  in combination with various neutral salts and with neurotropic bases is studied.

**Experiments on nerve-muscle preparations of frogs. The increase of toxicity of hydroquinone by the promotion of its oxidation (a contribution to the toxicology of aromatic compounds).** RICHARD LABES. *Arch. exptl. Path. Pharmacol.* 139, 120-8 (1929).—Conditions which favor the oxidation of hydroquinone (in solns. of 1:10,000) at the same time accelerate the injury to nerves of isolated nerve-muscle preps. At the same time or shortly after, the nerve and muscle are discolored.

**The pharmacology of the ester of brominated valeric acid.** ERICH RATH. *Arch. exptl. Path. Pharmacol.* 142, 162-5(1929).—The substitution of a Br atom in the acid half of isovalerylamlene hydrate resulted in much stronger hypnotic action (tested on fish and mice) than substitution in the alc. half.

**The cholagog action of sodium naphthoate and sodium hydroxynaphthoate.** ETIENNE CHABROL, R. CHARONNAT, M. MAXIMIN, J. PORIN AND M. E. PIETTRE. *Compt. rend. soc. biol.* 101, 254-6(1929).—In order to learn whether cinchopen deprived of N and a phenyl radical loses its cholagog property. Na naphthoate and Na hydroxynaphthoate

were injected intravenously in 1.1 g. doses into dogs with biliary fistulas. The flow of bile was more than doubled for 3-5 hrs. after injection. Replacement of the carboxyl radical of  $\alpha$ -naphthoic acid by the sulfonic acid radical resulted in a loss of cholagog action. The carboxyl radical is not the only factor for BzOH is also inactive.

B. C. BRUNSTETTER

The concentration of urea and ammonium salts, as affected by pilocarpine, in human saliva. Role of the salivary glands in the maintenance of the alkaline reserve. R. VLADESCO and MARIN POPESCO. *Compt. rend. soc. biol.* 101, 306-8(1929).—Injections of pilocarpine (0.006-0.010 g.) into humans decreased the concn. of urea and ammonia N in the saliva and increased the concn. of urea in the blood. V. and P. believe the salivary glands change urea into  $\text{NH}_3$  and consider them as important as the kidneys in maintaining the alkali reserve.

B. C. BRUNSTETTER

Physiological action of strontium. M. COMEL. *Atti accad. Lincei* 9, 663-5 (1929).—Sr hexahydroxypropionate injected intramuscularly in fowl produces, after about 15 injections, symptoms analogous to intoxication. The fowls eat voraciously, though losing weight as well as strength; the nervous system is affected till convulsions occur. Hunger increases, although the strength fails. Autopsy shows lesions only in the liver and heart; sometimes there is subcutaneous edema. Vitamin D seems to attenuate the symptoms of poisoning by Sr.

A. W. CONTIERI

Treatment of the epidemic Parkinsonian forms of encephalitis with glucose injections of sodium salicylate. A. LEQUIN. *Bull. gén. théor.* 179, 225(1928); *Quart. J. Pharm. and Pharmacol.* 2, 154.—L. advocates the daily injection, intravenously, for 12 consecutive days, of 20 cc. of 10% glucose-contg. soln. of Na salicylate. It is stated that the treatment is perfectly tolerated. Three courses are thus given, sepd by a 10 days' interval. L. asserts the method to be absolutely harmless. There is no general reaction such as shock. Locally venous obliterations need not be feared if the Na salicylate is pure, if the puncture is made into the vein, and if a glucose soln. not exceeding in strength 10% of Na salicylate is employed. The treatment may be prolonged, and it may be useful to employ some therapeutic adjuncts, such as stramonium.

H. L. D.

Toxic character of *Scrophularia nodosa* L. LUDWIG KROEBER. *Apoth. Ztg.* 44, 909(1929).

W. O. E.

Gold salts in the treatment of tuberculosis. A. LUMIÈRE AND A. GELIBERT. *L'Avenir médical* 1928, 165; *Rev. hyg. méd. prév.* 51, 534.—In general, favorable results were obtained.

C. R. F.

The treatment of human trypanosomiasis by "tryponarsyl." G. LEDENTU AND M. VAUCEL. *Bull. Soc. Path. Exot.* 22, 875-83(1928); *Rev. hyg. méd. prév.* 51, 531.—Tryponarsyl is similar in compn. to the American tryparsamide. In 25 cases under treatment during the first period of the disease, 4 were successful; the blood remained sterile for 5 months. In the second period of the disease, 13 cases were treated; 9 were treated successfully, 1 was relieved and 3 were failures. The tryponarsyl was administered intravenously at weekly intervals, dose 0.035-0.09 g. per kg. of body wt. Tryponarsyl is considered as effective as tryparsamide.

C. R. F.

Asphyxia due to oxygen want. K. KÖTSCHAU. *Arch. ges. Physiol.* (Pflüger's) 222, 510-5(1929).—Factors other than the O tension are concerned in asphyxial change when isolated tissues are oxygenated.

ARTHUR GROLLMAN

The effect of an experimental alkalosis on human metabolism. O. WUTH. *Klin. Wochschr.* 8, 969(1929).—The administration of 50 g.  $\text{NaHCO}_3$  to a healthy human subject leads to marked, generalized alkalosis and an increase in the metabolic rate from -3 to +14.

MILTON HANKE

The influence of thallium on lipid metabolism and on the tissues. A. BUSCHKE AND ANDREAS MÄRKUS. *Klin. Wochschr.* 8, 1122-3(1929).—Administration of Tl to rats leads to a decrease in the lipid content of the suprarenals, and of the skin. Other changes are described, but they have been described before. The action of Tl is reversible. A repair process begins promptly after the administration of the Tl salts is discontinued. The lipoids reappear in the skin and in the suprarenals; the alopecia disappears and the testicles assume a normal histological appearance. MILTON HANKE

Studies in carbohydrate metabolism. IV. Action of hydroxymethylglyoxal upon normal and hypoglycemic animals. WM. O. KERMACK, CHARLES G. LAMBIE AND ROBERT H. SLATER. *Biochem. J.* 23, 410-15(1929).—The lethal dose of monomeric hydroxymethylglyoxal (A) is 0.06 g., which is about 4 times the lethal dose of the unheated material. Depolymerization, therefore, considerably reduces the toxicity of (A). The depolymerized substance when administered in sublethal doses does not appear to cause the appearance of symptoms similar to those of insulin hypoglycemia.

**V. Effect of administration of dextrose and of dihydroxyacetone upon the glycogen content of muscle in depancreatized cats.** *Ibid* 416-21.—No evidence could be obtained that muscle glycogen was more readily formed from dihydroxyacetone than from dextrose in presence of the liver.

**Preliminary report on the toxicity of the fruit of *Melia azedarach* (Syringa berries).** BENJAMIN HARROW, D. G. STEYN AND M. RINDL. *Trans. Roy. Soc. S. Africa* 17, 295-308(1929).—The fruit of *Melia azedarach* Linn., commonly known as the China Berry, was given by use of stomach tubes to rabbits, dogs, sheep, goats and pigs. In all cases the fruit proved to be toxic. The symptoms produced were paralysis and narcosis. Death occurred through asphyxia. The poison was readily extd. by  $\text{Et}_2\text{O}$  and  $\text{CHCl}_3$ , and was thermostable. It seemed not to be an alkaloid, albumin or glucoside. Feeding of small quantities of tannic acid with the fruit had an inhibitory effect upon its activity, although the poison seemed not to have been pptd.

**The distribution of arsenic in the organism after intravenous injections of arsenious acid.** AMBROGIO MANTEGAZZA. *Biochim. terap. sper* 16, 153-9(1929).— $\text{As}_2\text{O}_3$  was injected intravenously into rabbits in amts. which killed the animals in  $\frac{1}{2}$  to one hr. after the injection. The organs were immediately analyzed for As by the Marsh method. The As administered was distributed as follows: muscles 16.66-17.94, liver 9.18-10.19, kidneys 1.83-3.12%, in the other organs (lungs, heart, spleen, brain, digestive tract and bones) less than 1%.

**Studies on the action of adrenaline, calcium and potassium on the isolated stomach of the frog.** E. CANTEL. *Boll. soc. ital. biol. sper.* 4, 348-9(1929).—Adrenaline 1:5,000,000 causes a diminution in the rhythmic activity of the stomach. In larger doses, 1:1,000,000, it causes arrest and diminution of the tone.  $\text{CaCl}_2$  and  $\text{KCl}$  increase in a varying degree the tone of the muscle depending on the condition of the tone itself, the more depressed the greater the efficiency. To obtain appreciable results a concn of the salts 0.6:1000 is required. If the salts are introduced immediately after the adrenaline, at a concn. of 0.9:1000, they suppress the action of adrenaline; if introduced before the adrenaline they arrest only the rhythmic contractions but not the diminution of the tone.

**The action of the anterior, posterior and whole extract of hypophysis on the  $pH$  of the blood.** E. IMPARATO. *Boll. soc. ital. biol. sper.* 4, 350 2(1929).—The subcutaneous injection of anterior lobe ext. produces an increase in alk. which becomes greater with increasing doses. The posterior lobe ext. produces an increase in acidity, less marked if injected subcutaneously, very marked if injected intravenously. The diminution in alk. reserve is more marked the greater the dose. An ext. of the whole hypophysis has no influence on the  $pH$  nor on the alk. reserve. With the posterior lobe ext. the diminution in  $pH$  is more marked  $\frac{1}{2}$  hr. after the injection; then it gradually rises until it reaches normal within 2 hrs.

**Studies on phlorhizin. II. The action of phlorhizin on the automatic contractions of the stomach.** P. S. ISRAEL. *Boll. soc. ital. biol. sper.* 4, 376-8(1929).—The immersion of the stomach in a soln. of phlorhizin in Ringer soln. (0.075%) immediately produces a marked diminution in the frequency and the height of contractions followed by a noticeable diminution of the tone. By washing out the phlorhizin with Ringer soln. the phenomenon is reversible except that after 15-20 min. the contractions were double or triple the original.

**The paralyzing action of magnesium and lithium.** MICHELE MITOLO. *Boll. soc. ital. biol. sper.* 4, 378-80(1929).—Mg is a poison which paralyzes the spinal cord, it causes a central depression only when it acts selectively on the sensory centers of the posterior horn (dorsal side) while it is inert for the motor center of the anterior horn (ventral side). Li is also a poison which paralyzes the spinal cord and has the same central seat of action as Mg, but similar to Ca, it has an intensity of action stronger than Mg.

**The treatment of typhoid fever with barium chloride.** K. ROUTKEVITCH. *Presse méd.* 36, 1046-8(1928).—Typhoid fever was successfully treated with  $\text{BaCl}_2$  in doses of 0.5 g. 3 times daily for 6-7 days. This treatment was repeated when 3-5 days had elapsed. R. cannot explain the mode of action of the  $\text{BaCl}_2$ .

**The treatment of diabetes insipidus by the nasal application of powdered posterior pituitary body.** ANDRÉ AND LUCIE CHOAY. *Presse méd.* 36, 1155-6(1928). A. E. MEYER.

**The use of organic phosphorus in therapy of children.** M. LA FERLA. *Semana méd.* (Buenos Aires) 36, 658-9(1929).—Three cases of rickets were successfully treated with a compd. (tonophosphan) contg. P and C in direct linkage.

**Relation between poisoning and the urine or serum amylase. I. The amylase of a normal urine or serum.** KISHI KAWAGUCHI. *Kyoto J. Med.* 25, 711-36(1928).—

K. measured the quantity and the fluctuation of the amylase in rabbit's urine and serum. Fresh rabbit urine is mostly transparent and acid in character. When the total quantity of urine is accumulated for a day it is usually neutral, d. 1.008-1.016. The amylase variation is parallel to that of the d., and the amylase value of a rabbit measured after making the sp. gr. 1.010 by diln. or concn. is almost const. throughout the year, the value being  $d_{30}^{38} = 16$ . It is only slightly affected by the variation of the serum amylase value. Hence K. compared the results of measurements taken by making the sp. gr. of the urine 1.010 by diln. The amylase in a turbid urine is removed by its adsorption on the suspended substance. No change in the amylase value is observed up to the point of the putrefaction of the urine or serum. The value is also unaffected by the addn. of a small quantity of xylene. **II. Relation between corrosive poisoning and the urine or serum amylase.** *Ibid* 737-63.—The amylase value of the urine of the rabbit affected by the poisoning with  $HgCl_2$ ,  $K_2Cr_2O_7$  and  $(CO_2H)_2$  decreases, while that of the serum amylase first decreases and then increases. In both cases the peroral poisoning causes a more gradual change, while the subcutaneous poisoning causes a very rapid change in the value. **III. The relation between serum poisoning and the amylase of the urine or serum amylase.** *Ibid* 844-58.—The CO poisoning first shows a slight decrease and then an increase, the increase being especially remarkable in a somewhat acute poisoning. The serum amylase value shows a similar change, but in acute poisoning it only shows a temporary increase. In acute  $KClO_3$  poisoning there is a marked decrease of the urine amylase and a slight decrease in the serum amylase. K. S.

**Toxicity of phenolphthalein.** DEVRIENT. *Therap. Berichte* 1928, No. 7; *Schweiz. Apoth. Ztg.* 66, 367-8(1928); cf. C. A. 16, 967; 17, 827.—Disturbances of kidney and liver functions are recorded. S WALDBOTT

## 12—FOODS

F. C. BLANCK AND H. A. LEPPER

**Chemistry of foods in 1928.** AD. STEINRUCK. *Fortschrittsber. Chem.-Ztg.* 53, 69-99(1929).—A review with bibliography. E. J. C.

**Recent advances in the low-temperature preservation of foodstuffs.** T. MORAN. *J. Soc. Chem. Ind.* 48, 245-51T(1929). E. J. C.

**A method for determining the soundness of grain.** K. MOHS. *Z. ges. Getreidek.* 15, 85-90; *Chem. Zentr.* 1928, II, 299-300.—The % of wheat kernels germinating in 48 hrs. at 15-18° was detd. For American wheat this was 90-95%, and for hard wheat 70-80%. The observation of Jago (1895) that wheat flour hinders the fermentation of beer yeast was confirmed. The toxicity was detd. by measuring the decrease in  $H_2CO_3$  given off by a certain quantity of yeast. Musty-smelling and bitter tasting flour was much more toxic than acid flour. The detn. of the kind of bacteria present is especially important. FRANCIS P. GRIFFITHS

**A study of the basic, bromate and blend baking formulas as means for determining wheat quality with particular reference to low-grade wheat of the crop of 1928.** R. K. LARMOUR AND A. G. MACLEOD. *Sci. Agr.* 10, 1-22(1929); cf. C. A. 23, 2505.—With frosted and unfrosted samples as well as various grades of wheat, the basic formula gave erroneous values with experimentally milled flours because frequently high-grade wheat flour failed to show its true value by this method. The results, when used in conjunction with those obtained by the action of 0.001%  $KBrO_3$ , are useful in revealing the direction and magnitude of response attributable to the bromate. This response is indicative of the quality of the flour under consideration. By the baking procedure commonly used, wheat of the lower grades, i. e., 4, 5 and 6, gives values equal to or superior to wheat of the high grades. Samples of grades 5 and 6 give av. lower flour yields with higher ash and darker color than the higher grades of wheat. A study of the capacity of the flour to "stand up" in a blend with very weak flour, taken as a measure of strength of wheat, showed (1) feed wheat is of little value; (2) grade 6 wheat averages very poor; (3) grade 5 is much superior to grade 6 but inferior to grade 4, which is in turn comparable in strength to that of the higher grades. Response of flours to the bromate formula gave fairly reliable data for predicting the behavior of the flour when baked in a blend. Results by the basic formula bear no relation to the behavior of the flour by the bromate or blend formulas, and for this reason the basic formula alone is regarded as unreliable for detg. the strength or quality of wheat. C. R. FELLERS

**Acetone-soluble substances in rye.** EIJI TAKAHASHI AND KIYOSHI SHIRAHAMA. *Sapporo J. Forestry and Agr.* 19, 105-23(1927).—Both the 60% acetone ext. [AC] and

the alc. ext. [AL] of rye give positive biuret, xanthoproteic, Millon, glyoxylic acid, concd.  $H_2SO_4$  and concd. HCl reactions, the reaction being more rapid in [AC] than in [AL]. The N, S and amidic N contents are the same in both, while the free amino acid content is greater in [AC] than in [AL]. There is a difference in the colloidal properties of the two, perhaps owing to the fact that  $Me_2CO$  acts as a more intense peptizer than EtOH, and the change in the colloidal structure causes the difference in the chem. reaction in the secondary manner. Thus, the more rapid color reaction of [AC] and the greater content in the free amidic N is due to the fact that the dispersity of [AC] is greater and hence the sp. surface area is larger with the consequent increase in the reaction velocity. Globulin, [AC], [AL] and glutelin were sepd. from rye; the surface-tension curves were constructed for the case when 0.01 N HCl soln. was added dropwise into their 0.02 N NaOH solns. Comparison of these curves with those for the mixt. of the proteins indicates that [AC] and [AL] are the same protein. K. SOMEYA

**Action of chlorine on wheat flour in treatment with gologas.** M. VUK AND A. GÖMÖRY. *Z. Untersuch. Lebensm.* 57, 177-91(1929).—Definite compds. are not formed with Cl and starch and no harmful influence on the flour could be detected. The Cl changes the balance between the gliadin and glutelin so that it becomes difficult to obtain the gluten by washing with water. The proportions of various amino acids in the gliadin and glutelin of untreated, chlorinated and over-chlorinated flours, resp., were detd. The greatest increases were in the quantities of amide N and glutamic acid, and to a lesser degree of aspartic acid and arginine. The  $H_2O$ -sol. N increased after chlorination. Glutamic and aspartic acids, in the form of glutamine and asparagine, are so united to other amides, mono- or di-amino substances that they are set free on treatment of flour with gologas and become sol. as free amino acids or their hydrochlorides. The Cl forms addn. products with the unsatd. glycerides of flour fat. Carotin is bleached by conversion to  $H_2O$ -sol. dicarotin. C. R. FELLERS

**Efficiency of pasteurization as a means of killing tubercle bacilli in milk.** SCHARR AND LENTZ. *Z. Fleisch-Milchhyg.* 37, 202-5; *U. S. Pub. Health Eng. Abstracts* E-856c, 32(1929).—Thirty min heating of milk at a temp. of 60-63° does not suffice to kill all tubercle bacilli. C. R. FELLERS

**The influence of the foot-and-mouth disease on the weight of cows and on the chemical composition of the milk.** JULIUS KARKLIN. *Fortschritte Landw.* 4, 476-8 (1929).—From analyses of the milk from 4 cows it was found that during the disease there is a decrease in sp. gr. and casein content, and an increase in fat, albumin and ash. The *n* of the butter fat is increased and the Reichert-Meißl no. decreased. L. P. M.

**Electrical conductivity of milk. I. Detection of abnormal milk from diseased cows.** J. KRENN. *Z. Untersuch. Lebensm.* 57, 148-77(1929).—Detn. of elec. cond. of milk is shown to be of great utility in the detection of milk from cows with diseased udders. Such milk has invariably a higher elec. cond. than normal milk because of its slightly higher NaCl content. C. R. FELLERS

**The significance of alkalis in milk.** F. E. NOTTBOHM. *Volksernährung* 3, 68; *Chem. Zentr.* 1928, 1, 2217.—The  $K_2O$  content of milk ash is approx. 25% and lies midway between the  $CaO$  and  $P_2O_5$  contents. Milk ash contains about 4% of  $Na_2O$ . In 100 cc. of normal milk there was approx. 27 mg. of  $Na_2O$  and 181 mg. of  $K_2O$ . The quotient  $K_2O/Na_2O$  is an excellent indication of neutralized milk. C. R. FELLERS

**Value of optical examination for the detection of watered milk.** KESAJI YOSHIOKA. *J. Pub. Health Assocn. Japan* 5, No. 4, 4-10(1929); *U. S. Pub. Health Eng. Abstracts* E-880b, 36.—The use of the *n* together with sp. gr. and fat detn. is recommended. A long series of tests shows low *n*s together with the other phys. and chem. data usually taken on milk samples, give addnl. weight to the probability of added water. C. R. F.

**Influence of neutral salts upon the alcohol coagulation of fresh milk.** KENTARO MITAMURA. *Sapporo J. Forestry and Agr.* 19, 1-36(1927).—Neutral salts in concns. 0.001 N to N increase the sensitivity of fresh milk to coagulation by alc. The sensitivity is greatest at concns. of 0.5-0.7 N with univalent and bivalent ions. The influence increases with valency of the cation. When the milk is dialyzed through a collodion membrane, the sensitivity to alc. coagulation becomes very weak, probably because of removal of milk-sol. salts. The  $pH$  of fresh milk (6.59-7.00) has no relation to the sensitivity towards coagulation by EtOH. The alc. coagulation which takes place when the fresh milk contg. a definite quantity of univalent, bivalent or polyvalent cations is mixed with solns. of univalent cations of various concns. is proportional to the total salt concn. M. concludes that the coagulation does not occur when the salts contained are in a certain equil., but occurs when this equil. is disturbed. K. SOMEYA

**Chlorine index of goat milk. Systems of rapid analysis.** J. M. CLAVERA AND D. GUEVARA POZO. *Anal. soc. españ. fís. quím.* (Sec. Téc.) 2, 14-22(1929).—The detn.

of the Cl index (g. Cl/l.) of goat milk by a rapid method (Weiss, C. A. 15, 3339; Siroc and Joret, C. A. 12, 1786) is recommended for control of its purity. Four quickly detd. values, which, with goat milk in Granada and Andalusia, are normally as follows:  $d_{4}^{20}$  1.029-1.032, fat 32-55 g. per l., ash 6.5-8.5 g. per l., Cl 0.9-1.25 g. per l., then suffice for the estn. of its quality, and the type of adulteration practiced, e. g., simple addn. of water or addn. of water, sucrose and salt may be readily diagnosed. B. C. A.

**The butter aroma.** C. B. VAN NIEL, A. J. KLUYVER AND H. G. DEX. *Biochem. Z.* 210, 234-51(1929).—Evidence is presented to show that characteristic aroma of butter is due to the presence of diacetylmethylcarbinol. S. MORGULIS

**Examination and evaluation of crayfish soups.** E. BAIER AND H. BARSCH. *Z. Untersuch. Lebensm.* 57, 224-34(1929).—Microscopic and organoleptic tests are described. Methods for the detection of artificial coloring matter in crayfish soups are described, involving extn. of the pigment with alc. and testing its affinity for wool, its reaction with concd.  $H_2SO_4$  and its behavior in ultra-violet light, in which solns. of the natural coloring matter show fluorescence and those of synthetic dyes do not. C. R. FELLERS

**Advances in the field of synthetic sweetening agents and related compounds in 1927 and 1928.** WALTHER HERZOG. *Fortschrittsber. Chem.-Ztg.* 53, 99-100(1929).—A review with bibliography. E. J. C.

**Honey ash.** F. E. NOTTBOHM. *Arch. Bienenkunde* 8, 32-52 sep.; *Chem. Zentr.* 1928, II, 115.—The ash of blossom and honeydew honey contains, resp.,  $K_2O$  30.50-50.78, 52.59-57.16;  $Na_2O$  5.54-10.03, 3.16-4.31;  $CaO$  2.12-8.00, 0.52-1.30;  $MgO$  1.50-2.17, 0.71-2.31;  $P_2O_5$  1.65-12.50, 6.64-9.51. C. R. FELLERS

**New use for Sterculia gum or Indian tragacanth.** W. PEYER, W. LIEBISCH AND K. ROSENTHAL. *Apoth. Ztg.* 44, 978-9(1929).—The use of this gum in the manuf. of ice cream is noted and its stiffening effects are compared with those of other com. gums (tragacanth, acacia, gelatin). W. O. E.

**Retardation of the ripening of pears by exclusion of oxygen.** F. KIDD AND C. WEST. *Nature* 123, 315-6(1929).—When pears are preserved in an atm. of  $N$  the macroscopic changes of "ripening" are almost completely inhibited. With shorter time of exposure, however, ripening subsequently takes place in air, the rate of ripening being a function of the concn. of  $O$  and of that of  $CO_2$  over a considerable range. B. C. A.

**Effect of fumigation by hydrogen cyanide on fresh fruits and vegetables.** P. BUTTENBERG. *Z. Untersuch. Lebensm.* 57, 204-11(1929).—HCN, 0.5% by vol., showed no effect on grapes, plums, shallots or onions; the effect on parsley and tomatoes is doubtful. Early potatoes do not stand the treatment but winter potatoes are more resistant. The germ layer may be destroyed if the winter potatoes are sprouted. HCN-fumigated potatoes sometimes show an injury similar to frost damage. Fresh Swedish turnips are less resistant to HCN than wintered turnips. Bananas, pears, apples, lemons, oranges, quinces, cucumbers, cabbage, carrots, radishes, lettuce, rhubarb, beets, turnips, celery, spinach and comfrey are more or less damaged. The injury may not appear for several weeks; hence, freshly fumigated fruits or vegetables may be consumed early. C. R. FELLERS

**Cacao beans and cocoa products.** VI. H. FINCKE. *Z. Untersuch. Lebensm.* 56, 312-34(1929); cf. C. A. 23, 2223.—In view of the specifications drawn up by the Verbande Dett. Schokolade-Fabrikanten, calcs. relative to the compn. of chocolate preps. are carefully checked. Addn. of coffee to chocolate does not necessitate modification of methods or calcs. The effect of fermentation on appearance, taste, odor and chem. compn. of cacao was studied. The fat of immature beans does not differ from that of riper beans. Fermentation does not affect the fat. It is probable that the theobromine in cacao exists partly free and partly in loose combination with tannin, from which it can be liberated by moistening the material with addn. of  $MgO$  as well as by treatment with dil.  $H_2SO_4$ . Certain Accra cacao butters possess unusually high unsatd. fatty acids of low m. p., probably oleic acid. C. R. FELLERS

**Loss of iodine and other inorganic substances from spinach in the usual cooking process.** A. MIERMEISTER. *Z. Untersuch. Lebensm.* 57, 235-9(1929).—In cooking 2 kg. of spinach in 3 l. of boiling water, a loss of 44% of the total mineral matter was found. The cooking water contained 15.8 g. of  $NaCl$ . The spinach was washed in distd. water after the cooking water had been poured off. On analyzing this loss, 50% was due to  $K_2O$  (57% of the total present). The cooked and washed spinach contained a considerable excess of inorg. bases over acids. One hundred g. of fresh spinach contained 0.044 mg. of  $I$ , of which 0.0035 mg. was lost in cooking. The  $I$  is organically combined and largely insol. Analytical methods are described. C. R. FELLERS

**Form and weight changes in potato tubers during storage.** GREISENROGER AND

NEUDECKER. *Fortschritte Landw.* 4, 473-6(1929).—Loss in wt. may reach 25% in 3 months at 25°. The amt. of loss is not correlated with size or shape of the tuber or condition of the skin.

**Rapid determination of the oil content of paprika.** J. DÖMÖTÖR. *Z. Untersuch. Lebensm.* 57, 239-40(1929).—A 2.5 g. sample is shaken for 60 min. with 40-60 cc. of Et<sub>2</sub>O. The solvent is decanted through 3 filter papers which have been previously wetted with Et<sub>2</sub>O. The filtrate is passed through the filters twice, both filters and residue being well washed with Et<sub>2</sub>O. The clear filtrate is carefully transferred to a tared flask, the Et<sub>2</sub>O evapd., the oil dried at 105° and weighed. The total time consumed for the detn. is approx. 4 hrs.

**The digestibility and food value of "vitamin fodder" when fed to calves.** H. EDIN. *Kgl. Landbruks-Akad. Handl. Tid.* 68, 164-83(1929).—The prepn. tested had the following compn.: dry substance 97.1%, which contained ash 2.8, crude protein 10.1, fats 68.1 and carbohydrates 16.0%. The fat consisted of 90.0% soy oil and 10.0% cod-liver oil. The feeding tests were made on calves, and the results indicated that the product was a poor substitute for milk.

**Press- and extraction-processes in the treatment of sunflower seed (for feeding-stuff).** ISTVÁN WEISER AND A. ZAITSCHEK. *Fortschritte Landw.* 3, 926(1928).—In expts. with sheep fed with the residue from the solvent-extn. of sunflower seed, the digestibility of protein and fat appeared satisfactory, but the crude fiber and N-free ext. not only showed poor digestibility itself, but markedly reduced the digestibility of hay mixed with it. The starch value of this residue was 35, the figure being higher if the proportion of husk was reduced during manuf. With goats the press-cake from sunflower seed gave much greater live-weight increase than the solvent-extd. material. For the production of a satisfactory feeding material the removal of husks followed by pressure-extn. is necessary.

**Beet-leaf drying (dried sugar-beet leaves as fodder).** O. EISENER. *Deut. Zucker-Ind.* 54, 493(1929).

**The feeding value of silage made from reed.** ARTHUR ZAITSCHEK. *Fortschritte Landw.* 4, 392-4(1929).—The digestibility of reed silage, using sheep as test animals, was detd. Results of analyses for various org. acids in the silage are given. L. P. M.

**The calcium and phosphorus content of some Quebec hays.** R. HOLCOMB. *Sci. Agr.* 10, 28-34(1929).—The Ca content of 9 timothy hays grown in Quebec ranged from 0.04 to 0.205%. Four clover hays varied from 0.950 to 1.227% Ca. The P content of 6 timothy samples varied from 0.08 to 0.17%, and the P content of 4 clover hays from 0.134 to 0.193%. The A. O. A. C. method for P proved unsatisfactory because of the large amt. of org. matter to be destroyed. The Mg(NO<sub>3</sub>)<sub>2</sub> fusion method was the only practicable one. Evapn. to dryness with HNO<sub>3</sub> or a HNO<sub>3</sub>-HCl mixt. resulted in a gummy mass of org. oxidation products. These gummy substances tended to foam over with resulting loss of the sample. The addn. of KClO<sub>4</sub> did not aid. A convenient and cheap const.-temp. bath is described.

**The combating of Equisetum palustre and methods of destroying its poison.** GERLACH. *Fortschritte Landw.* 4, 377-9(1929).—A meadow grass contg. 7-13% of E. palustre was quite toxic to cows. Silage made from this grass was still poisonous.

LAWRENCE P. MILLER

**Chemical composition of Alaskan lichens (SPENCER, KRUMBOLTZ) 11D.** Effect of various preparations on the growth of bakers' and brewers' yeasts (WILLIAMS, *et al.*) 16. Device for drying grass and grain (Swiss pat. 132,237) 1. Hg-vapor lamp for producing ultra-violet rays for treating foods (Brit. pat. 305,758) 4. Pasteurizing apparatus (Ger. pat. 480,028) 1.

HASELHOFF, E., AND BLANCK, H.: *Lehrbuch der Agrikulturchemie*. IV. Futtermittellehre. Berlin: Verlag von Gebrüder Borntraeger. 216 pp. Cf. C. A. 22, 3482.

KASTEN, HENNIG: *Abhandlungen d. Instituts f. Tierzucht u. Molkereiwesen an d. Universität Leipzig*. H. 20. Vergleichende Fütterungsversuche mit Albovin M und dem Ölkuchenmischfutter Agricola I. Krit. Untersuchungen über die Verfahren zum Nachweis von Milchverfälschn. Leipzig and Hannover: M. & H. Schaper im Komm. 101 pp. M. 6.

**Food products from nut kernels.** ELAM G. HESS (to Pecano Mfg. Co.). U. S. 1,725,801, Aug. 27. Minute flake-like particles of substantially uniform thickness are

sepd. from kernels of nuts and the particles are allowed to fall through the atm. into a loose mass.

**Bread.** D. FRAME. Brit. 305,845, March 7, 1928. Yeast is stimulated and grown in an emulsion of milk, egg yolk, malt ext. and treacle for about 15 min. and then mixed with meal, butter and salt to form a dough which is subdivided, proved for about 15 min. at 30° and then baked at about 200°. Fruit and vegetables may be added.

**Apparatus for cutting bread loaves for testing purposes.** ROBERT L. CORBY. U. S. 1,725,781, Aug. 27.

**Sterilizing milk, etc.** ROBERT RAFN. Ger. 480,452, Nov. 30, 1923. In sterilizing milk and other liquids in closed vessels practically full of the liquid, the vessels are rotated in a hot bath and the direction of rotation is changed suddenly at intervals.

**Milk-serum preparation (inoculated with lactic acid bacteria) for use in making bread, cakes and biscuits.** N. M. KRONBERG. Brit. 306,374, June 29, 1928. See U. S. 1,721,867 (C. A. 23, 4513).

**Preserving food, especially eggs.** HENRY EVERAERT. Ger. 480,250, April 26, 1924. The eggs, etc., are placed in autoclaves in a chamber cooled to 0°, and the air is withdrawn from the autoclaves, which are then put into communication with a vessel contg. a mixt. of CO<sub>2</sub> and N at superatm. pressure. Cf. Brit. 222,487 (C. A. 19, 1018).

**Preserving egg material.** A. DONNER. Brit. 306,013, Nov. 10, 1927. Egg yolks or whites are treated with about 1% of lactic or acetic acid or a mixt. of these acids, and a small proportion of an oil such as mustard oil also may be added; the product is sealed in a non-metallic container. NaCl also may be added.

**Preserving liquid egg material.** A. K. EPSTEIN. Brit. 305,844, March 6, 1928. In preserving egg material consisting mainly of yolk by freezing, a neutral edible salt, such as NaCl 2-10%, is added, sufficient to produce in the thawed product a viscosity greater than that of the untreated material when thawed. Na<sub>3</sub>PO<sub>4</sub> or NaNO<sub>3</sub> may be used and the quantity of salt is increased according to the proportion of egg white present.

**Curing and preserving meat.** M. M. HERIOT. Brit. 305,972, Nov. 11, 1927. Meat such as bacon and ham is treated with a preservative liquid *in vacuo*. Various details of app. and procedure are described. Cf. C. A. 23, 3031.

**Sterilizing and preserving fruit juices.** LEMMIE R. CLEVELAND (to National Academy of Sciences). U. S. 1,725,959, Aug. 27. Juices are clarified and treated with O under pressure for a sufficient time to inhibit growth of bacteria.

**Insipissated sugar fruits.** BERTHOLD GERNHARDT. U. S. 1,726,482, Aug. 27. Fruits are stewed with water in a closed vessel and treated in the same vessel, under high pressure of CO<sub>2</sub>, with a sugar soln. (produced by dissolving sugar in cold water and contg. 66% sugar).

**Paste rich in nutrient salts.** ELISE ROSENBAUM. Swiss 132,017, Nov. 7, 1927. A paste rich in nutrient salts is prepd. by leaving bran in contact with water until fermentation sets in, washing out the liquid and adding milk and malt ext. to the residue.

**Cattle feed.** HERAND ROBINSON (to Piercy Co.). U. S. 1,725,969, Aug. 27. See Can. 284,079 (C. A. 23, 562).

### 13—GENERAL INDUSTRIAL CHEMISTRY

HARLAN S. MINER

**The present and future state of our natural energetic resources.** F. M. JAEGER. *Mech. Eng.* 51, 675-8(1929). E. J. C.

**The cost of a modern chemical factory.** W. F. SCHAPHORST. *Ind. Eng. Chem., News Ed.* 7, No. 17, 1(1929). E. J. C.

**Chemical marketing methods.** CHARLES C. CONCANNON. *Chem. Markets* 25, 271-3(1929). E. J. C.

**How scientific research contributes to the welfare of labor.** ARTHUR D. LITTLE. *Chem. Markets* 25, 261-4(1929). E. J. C.

**Chemicals in aviation.** DONALD M. LIDDELL. *Chem. Markets* 25, 249-50(1929). E. J. C.

**Absorption of solvent vapors.** A. ALEŠ. *Chem. Listy* 23, 1-5(1929).—A review of methods used in industry for the recovery of volatile solvents. B. C. A.

**Separation of alcohols and phenols from oil mixtures.** H. SCHMIDT. *Chem.-Ztg.* 52, 898(1928).—The oil is heated at 80-100° under slightly reduced pressure with the theoretical quantity of boric acid to produce the borate B(OR)<sub>3</sub>. When no further

water distills over, the temp. is raised and the unchanged oil distd. under low pressure. The residual borate is then hydrolyzed with NaOH and the liberated alc. or phenol is recovered by distn. in steam. The method affords a rapid means of sepg. primary, secondary and tertiary alcs. from admixt. with one another; sufficient boric acid is first added to combine with the primary alc., and the unchanged mixt. of secondary and tertiary alcs. is distd. off under low pressure, treated with just sufficient boric acid to combine with the secondary alcs. and the process repeated.

**Measurement of fluids in pipe lines.** I. H. ESCHER. *Commonwealth Eng.* 17, 7-10(1929). B. C. A.

**Supersaturation in steam and its influence upon some problems of steam engineering.** C. F. POWELL. *Engineering* 127, 711-3, 779-80(1929). E. J. C.

**Commercial properties of bakelized asbestos.** ANON. *Electrician* 103, 161 (1929).—Chem. and phys. tests carried out on bakelized asbestos of Continental and English manuf. give results on which the following specification requirements are based: asbestos content between 45 and 65%; roughened and moistened surface shall just color red litmus paper; matter sol. in alc. not over 6%; no corrosion when taken to 25°F. in contact with polished Cu and after 3 hrs. removed to satd. atm. and allowed to remain there at atm. temp. for 12 hrs.; heat loss—max. of 2' for sheets up to 1/8" thick; should resist 330°F. for 12 hrs.; gain in water should not exceed 2' for sheets up to 1/8" thick.

**The resistance to flow of air at bends and in straight airways.** W. R. COOKE AND I. C. F. STATHAM. *Colliery Guardian* 138, 2295-7, 2403 6(1929). E. J. C.

**Aerosols—clouds, dust, fog and smoke.** WILLIS J. BRAY. *J. Chem. Education* 6, 1486-96(1929). The term aerosols is applied to disperse systems in which air is the dispersion medium. B. reviews the general properties of such systems and discusses their relation to dust explosions and the application of aerosols in warfare. L. F. A.

**A method for the rapid determination of dust in air.** I. C. McNAIR AND J. F. HIRST. *J. Soc. Chem. Ind.* 48, 127T(1929).—The method often employed for the detn. of dust in air consists of aspirating the air through a dried filter paper in a tared dust bottle and weighing the dust retained. The drying before and after sampling is lengthy and the results are likely to be erroneous. A new method is outlined, which is not only accurate, but which is extremely rapid.

**Chemical and physical properties of chemical warfare materials.** E. ENGEL. *Z. ges. Schuss-Sprengstoffe* 23, 321-5, 365-7, 402-7, 438-42(1928).—A summary is given of the phys. properties on which the effective utilization of chem. warfare materials depends. The data given for some of the more important include h. p., sp. wt. and vol., coeff. of expansion, vapor pressure, volatility and heat of evapn. The physics of cloud and fog formation is discussed, and a short account is given of the absorption of toxic vapors by activated charcoal.

**The prevention of ionization in impregnated paper dielectrics.** S. G. BROWN AND P. A. SPORING. *J. Inst. Elec. Eng.* (London) 67, 968-76, 985-6, 990-1(1929).—See C. A. 23, 3032.

**Some notes on thermal insulation.** E. A. COAD-PRYOR. *Brit. Clayworker* 38, 179-81(1929).—There are many forms of insulating material on the market varying considerably in mech. strength, in thermal cond. and in the max. temp. at which they can be used. The basis of most insulating materials intended for use at comparatively high temps. is some form of highly porous silica, usually a diatomaceous earth. A different type of insulating material is made from fireclay, the high porosity being obtained by mixing with the fireclay a carbonaceous material which burns out during firing. By judicious insulation it is possible to reduce the heat lost through furnace walls by 60 to 70%. This does not imply that the fuel consumption in the furnace will be reduced by anything like this amt. It is often overlooked that the application of insulation should go hand in hand with a considerable modification in the design of furnaces, regenerators, etc., to suit the new temp. equilibria which are set up.

**Electrical insulating papers for the manufacture of power cables.** T. N. RILEY AND T. R. SCOTT. *J. Inst. Elec. Eng.* (London) 67, 946 67(1929).—See C. A. 23, 3032.

**Discussion.** *J. Inst. Elec. Eng.* (London) 67, 977-85(1929). Reply. *Ibid* 986-90.

W. H. BOYNTON

**Welding in the chemical and process industries (WIKOFF) 9.** [Compositions for use in coating, impregnating or molding] from cashew-nut oil (U. S. pat. 1,725,793) 26.

**SCHNACK, EMIL: Festigkeitslehre auf Grund der Anschauung.** Leipzig and Berlin: B. G. Teubner. 134 pp.

**Table of Common Hazardous Chemicals.** Prepd. by Committee on Hazardous Chemicals and Explosives of the American Chemical Society and the National Fire Protection Assocn. Boston, 60 Batterymarch St.: The Natl. Fire Protection Assocn. 12 pp. \$0.15. Reviewed in *J. Chem. Education* 6, 1603(1929).

**Gas purification.** BERNHARD SÄGBARTH. Ger. 481,075, Oct. 12, 1926. Dust is removed from gases by a centrifugal device.

**Filtering suction gas.** E. F. J. WARNANT. Brit. 305,932, Feb. 11, 1928. The gas is passed through a very fine gauze cylinder of Ni, Ni-Cr, copro-Ni or the like. Various structural details are described.

**Compressed gases.** MERCER G. FARRAR (to Carbide & Carbon Chemicals Corp.). U. S. 1,726,018, Aug. 27. Formation of congealed condensate in the exit pipe of a holder contg.  $C_2H_2$  mixts. or other compressed gas is prevented by introducing into the holder a small proportion of a volatile substance freely sol. in water, e. g., MeOH.

**Compressed gases from liquid gases such as liquid air.** GRS. FÜR INDUSTRIEGASVERWERTUNG. Brit. 305,974, Nov. 24, 1926. Evolved gases not required for use are absorbed by gels cooled to the b. p. of the gas and the absorbed gas is recovered by subsequently heating the gel.

**Method of and means for charging pressure vessels with liquefied gas.** GRS. FÜR INDUSTRIEGASVERWERTUNG M. B. H. Ger. 480,816, Apr. 8, 1927.

**Drying air or other gases with silica gel.** GRS. FÜR INDUSTRIEGASVERWERTUNG. Brit. 305,975, Dec. 1, 1926.

**Gas mixtures.** I. G. FARBENIND. A.-G. (Curt Schönberg and Gerhard von der Bruck, inventors). Ger. 479,825, Dec. 4, 1925. Volatile org. substances are extd. from gas mixts. by washing with an oil such as liquid or dissolved triarylphosphate, e. g., tricresylphosphate.

**Measuring constituents in gas mixtures by the psychrometer method.** SIEMENS & HALSKE A.-G. Ger. 479,723, Apr. 18, 1924.

**Separation of mixed fluids.** FRIEDRICH BARTLING and FRANZ LAWACZECK. Ger. 480,213, Jan. 1, 1927. The mixt is circulated in an app. which separates the constituents by utilizing their different velocities of flow.

**Recovery of solvents.** RUDOLF OERTEL. Ger. 480,747, April 29, 1924. Volatile solvents are recovered by evapg. them in an air current to form a mixt. with a min. explosion point and a higher sp. heat than air.

**Sulfonating oils.** HERMANN BOLLMANN and BRUNO REWALD. Ger. 480,157, Dec. 25, 1927. Oils, preferably freed from constituents which solidify at low temps., are provided with an addn. of animal or vegetable phosphate before being sulfonated by concd.  $H_2SO_4$  in the usual way.

**System for drying substances while carried by heated gas currents.** N. TESTRUET, G. GRAM, O. SÖDERLUND and TECHNO-CHEMICAL LABORATORIES, LTD. Brit. 306,200, Nov. 21, 1927. An app. is described.

**Forming thin films from various materials by flotation of the surface on metallic mercury.** A. JOFFE. Brit. 306,078, Feb. 15, 1928. The formation of films for insulating, acoustic purposes, etc., is described.

**Wetting and emulsifying agents.** I. G. FARBENIND. A.-G. Brit. 806,116, Feb. 17, 1928. Triethanolamine or other amines which contain several org. radicals with OH groups are condensed with org. carboxylic, sulfonic or sulfonated carboxylic acids of high mol. wt. such as stearic acid. Various examples and details are given.

**Sterilizing by use of metals and metal compounds.** G. A. KRAUSE. Brit. 306,547, Feb. 24, 1928. Oligodynamically active metals such as Ag, Cu, Au, Ir, Tl and Sb or active compds. such as AgCl or alloys of the metals, for use in sterilizing liquids, are deposited with the application of heat on carriers such as ceramic materials, highly porous clay, silica gel, activated C, kieselguhr, asbestos, quartz sand, glass wool and metals such as iron, Al and Cu. Numerous details and examples are given. Cf. C. A. 23, 1702.

**Compressing soft powders, especially soap.** FRITZ KILIAN. Ger. 480,700, Aug. 11, 1927. The powders are compressed in molds and the pressure is maintained for a period of time and is then gradually released. Shaped products are so obtained in one operation. A press is described.

**Method of removing frost from cold-exchangers.** AUTOGEN-GASACCUMULATOR KRÜGL & HANSMANN G. M. B. H. Ger. 480,815, Dec. 20, 1927.

**Refrigerating.** CHICAGO PNEUMATIC TOOL CO. Ger. 478,658, Mar. 25, 1927. Addn. to 473,414 (C. A. 23, 3034).

**Refrigerating apparatus.** PLATEN-MUNTERS. REFRIGERATING SYSTEM AKTIE BOLAG. Ger. 479,670, Oct. 10, 1926. Details of the heat-absorbing system.

**Refrigerating machine.** RUDOLF WEIDMANN. Swiss 131,905, April 18, 1928. Details of construction are given.

**Refrigerating plant.** AKT.-GES. MASCHINENFABRIK ESCHER WYSS & CIE. Swiss 132,117, April 26, 1928. Details of arrangement.

**Refrigerating process.** CHICAGO PNEUMATIC TOOL CO. Ger. 480,867, Feb. 24, 1926. See U. S. 1,619,196 (C. A. 21, 1320-1).

**Refrigerating system.** SAMUEL C. CARNEY (to Shell Petroleum Corp.). U. S. 1,726,341, Aug. 27. In cooling a mixt. of hydrocarbon fluid such as is used in refrigerating, carrying entrained water vapor, a brine soln. is injected to lower the freezing point of the mixt., the mixt. is passed through a zone below the normal freezing point of water, and the hydrocarbon product is then sepd. from the soln.; the degree of concn. of the latter is raised to expel the dilg. water vapor which it carries and the soln. is returned to the system for recirculation. An arrangement of app. is described.

**Refrigerating apparatus of the continuous absorption type.** SIEMENS-SCHUCKERTWERKE A.-G. Brit. 306,506, Feb. 22, 1928. Structural feature.

**Absorption refrigerating machine.** SIEMENS-SCHUCKERTWERKE A.-G. (Edmund Altenkirch, inventor). Ger. 480,036, Feb. 23, 1928.

**Absorption refrigerating machines.** OSKAR KLEINDIENST. Ger. 480,604, Aug. 3, 1926. A method of and means for removing water from the evaporators are described.

**Refrigerating system of the compression type.** RANSOM W. DAVENPORT (to Chicago Pneumatic Tool Co.). U. S. 1,726,178, Aug. 27.

**Refrigerating apparatus of the compression type.** DELOS P. HEATH. U. S. 1,726,519, Aug. 27. Structural features.

**Regulating device for refrigerators.** OSCAR SIMMEN. Swiss 132,417, Feb. 10, 1928.

**Thermostatic device for controlling the flow of ammonia or other substances through refrigerating apparatus, etc.** HENRY A. HOESCHEN (to Baker Ice Machine Co.). U. S. 1,726,068, Aug. 27.

**Operation of a small refrigerator by cooling agent and dry gas.** CARL BAUMANN. Swiss 131,667, Mar. 16, 1928.

**Coating wires.** SIEMENS-SCHUCKERTWERKE A.-G. Brit. 306,122, Feb. 16, 1928. The process described in Brit. 304,192 (C. A. 23, 4757) is modified by causing the insulating material to be applied to the wire in the form of overlapping layers (suitably by nozzles, as the wire and nozzle are rotated at high speed with respect to each other). An app. is described. A plurality of nozzles may supply different insulating materials.

**Electric insulation.** J. A. CRABTREE and J. R. DOLPHIN. Brit. 306,249, Jan. 12, 1928. Dies used in molding insulators carry shields of refractory material such as asbestos, which may be pretreated with dil. HCl and may be impregnated with substances which, when heated, form a phenolic resin.

**Electrical conductor insulation.** JOHN H. WHITE (to Western Elec. Co.). U. S. 1,725,773, Aug. 27. Conductors such as telephone switchboard cables are provided with a non-waterproof insulating material such as cotton, which retains its insulating qualities under conditions where it is always warmer than the dew-point of the surrounding air; they are impregnated with a solid ester material such as cellulose acetate dissolved in acetone or other suitable solvent and free from electrolytic materials.

**Insulators from wood.** SIEMENS-SCHUCKERTWERKE A.-G. (Walther Estorff, inventor). Ger. 479,905, May 27, 1924. Before being soaked with paraffin, shellac, resin or linseed oil, the wood is soaked in electrolytic salt soln., dried and washed.

## 14—WATER, SEWAGE AND SANITATION

EDWARD BARTOW

**Supplementary water supply for Kingsport, Tenn.** H. F. WIEDEMAN. *Eng. News-Record* 103, 219-20(1929).—The original supply of Kingsport is impounded in a 175-million gal. reservoir, 6 miles from the city, which gives a static head of 622 ft. on the distribution system. Objectionable color and turbidity necessitated the construction of a filter plant, which was located directly below the storage dam. Following shortage of water in 1925 and 1926, an addnl. supply was developed from the South Fork of the Holston River, utilizing the head of the gravity supply for pumping. The old filter plant was abandoned and a new one constructed for treating both supplies.

consisting of an aerator, gravity mixing chamber, coagulation basin providing 8-hr. detention period, two 1-million gal. per day rapid sand filters and a 0.4-million gal. clear well. R. E. THOMPSON

**Sixty-second annual report of the Commissioners of Water Works in the City of Erie, Pa., for the year ending December 31, 1928.** 95 pp.—This report consists chiefly of extensive tabulations regarding financing, operation, etc., together with a brief description of the works. The estd. population served was 120,000 and the av. per capita consumption 191.4 gal. per day. The cost of supplying water, including collection, purification, pumping and depreciation, was \$21.553 per million gal. The av. no. of gal. pumped per lb. of coal was 310. The av. amts. of alum and hypochlorite used were 0.229 grains per gal. and 3.4 lb. per million gal., resp. Wash water averaged 1.58%. Of 302 one-cc. samples of raw water examd., 107 contained *B. coli*, while of 596 ten-cc. samples of treated water none contained the colon bacillus. R. E. T.

**The experimental filtration plant of Chicago, Illinois.** JOHN R. BAYLIS. *Munc. News and Water Works* 76, 89-95(1929).—A very complete exptl. filtration plant which was constructed to det. the cheapest and most efficient treatment for Chicago is described. The plant includes chem. soln. tanks, a dry-feed machine, mixing basins, settling basins, 12 filters, 2 clear water reservoirs, a wash water tank, wash water pumps, chlorinating machines, CO<sub>2</sub>-generating plant and labs. Two of the filters have surface areas of 100 sq. ft. each and the others each have 10 sq. ft. of surface area. The exptl. work includes filtration without chem. treatment, chem. treatment, removal of tastes and odors and chlorination. Pieces of lab. app. which have played an important part in these expts. and are not common to water labs. include a stirring machine and a lab. sand filter. The work so far has shown that the major problem is to handle the micro-organisms so as to produce practical filter runs. Some coagulant other than alum will have to be used part of the time. Filter rates greater than 125 million gallons per acre per day may also be used. C. C. RUCHHOFF

**Significance and methods for determination of filter-plant turbidities.** JOHN R. BAYLIS. *Munc. News and Water Works* 76, 156-9(1929); cf. *C. J.* 23, 4286. —Three instruments that were developed for measuring and controlling turbidity removal to a residual turbidity of 0.2 p. p. m. are described. The first is a submarine light which is placed near the bottom of the clear water reservoir under 6 ft. or more of water. This will show turbidities of 0.2 p. p. m. The floe detector described is installed on filter operating tables and is used to det. when flocculated material is passing the filter and washing is required. The turbidimeter which is illustrated is used for reading the low fine turbidities of 0.1-0.2 p. p. m. which are obtained when the water is slightly under treated. A recommended procedure for practice is to det. the total turbidity with the special turbidimeter and the floe turbidity with the floe detector. The fine turbidity is the difference between the total and the floe turbidity. An arbitrary limit of 0.2 fine and 0.05 floe turbidity is suggested. When the floe turbidity exceeds 0.05 the filters should be washed more often and when the fine turbidity exceeds 0.2 the coagulant should be increased. C. C. RUCHHOFF

**Effect of percolating water on concrete dams.** N. A. BOWERS. *Eng. News Record* 103, 212-3(1929).—Conclusions formed from observations on a no. of dams along the Pacific Slope are given and discussed. Leaching of Ca compds. and the resulting deterioration of the concrete are prevalent. The seepage water is in some cases supersatd. with salts dissolved from the concrete. In one dam a deposit of CaCO<sub>3</sub> 14 in. thick was found on the stairway of the inspection gallery. Percolation usually occurs at the joints between successive pours. A standard permeability test is urgently needed. Strength tests are not a reliable indication of permeability. R. E. T.

**Incrustations on wells and their chemical removal.** J. WIEGAND. *Gas u. Wasserfack* 72, 741-4(1929).—The brass or Cu screens on deep well pipes frequently become clogged with Cu sulfide formed by the H<sub>2</sub>S contained in the water, nearly closing the mesh. Treatment with HCl by the method given removes this material and restores the efficiency of the well. Al is the only metal which can be used to coat the screen to prevent this action. Other causes of well failure are given. R. W. RYAN

**Making surface water potable.** PERMIEN. *Gas u. Wasserfack* 72, 718-25, 751-4(1929).—Rapid sand filters are recommended, and these are described and numerous illustrations and sketches given, together with a discussion. Chlorination usually follows rapid filtration. R. W. RYAN

**Two laws for the purification of potable water.** N. MALISHEVSKII. *Gesundh. Ing.* 52, 569-71(1929).—Streeter has shown that a mathematical relation exists between the bacterial count in raw water "*R*" and filtered water "*E*," in the form of the equation  $E = (R)^n$ , where *C* and *n* are consts., characteristics of a given water work.

supply. Also, it has been shown that double application of a given water treatment gives better results than the corresponding treatment given in one application.

WAYNE L. DENMAN

**Purification of water supply in a country town.** A. GORDON GUTTERIDGE AND J. H. VARCOE. *Commonwealth Eng.* 16, 432-5(1929).—A report on the establishment of H<sub>2</sub>O purification for Shepparton, Victoria. The filter plant recommended for adoption is of the rapid sand type, comprising a mixing and aeration channel, a sedimentation basin of 78,000 gal. capacity, 4 filter beds of a total area of 450 sq. ft. and a clear H<sub>2</sub>O basin of 12,750 gal. capacity. Provision is made for extension of the plant to an additional 50% capacity, for addn. of coagulating chemical and for inclusion of a chlorination app.

J. A. KENNEDY

**Purification and sterilization of water by high chlorination.** RUDOLF ADLER. *Gas u. Wasserfach* 72, 675-8(1928).—Larger amts. of Cl than necessary to destroy bacteria will result in completely sterile water and the removal of organic Fe and Mn. The water should be filtered after chlorination. Excess Cl may then be removed by passing the water over active charcoal which converts the Cl to HCl. From time to time the charcoal must be washed with water contg. Na<sub>2</sub>CO<sub>3</sub> to remove org. materials from the surface, after which the excess of Na<sub>2</sub>CO<sub>3</sub> is destroyed by treating with CaCl<sub>2</sub>, forming CaCO<sub>3</sub>, which serves to neutralize the HCl formed from the free Cl. The C also removes phenols and the resulting water is very satisfactory.

R. W. RYAN

**Oligodynamic water purification by means of catalytic silver.** G. A. KRAUSE. *Gesundh. Ing.* 52, 500-5(1929).—Activated Ag (Katadyn) kills all known pathogens. Finely divided Ag is activated by metals below it in the electromotive series such as Pd and Au. Sterilization is effected by passing the water over Katadyn.

W. I. D.

**Some examples and precepts of water conditioning.** R. E. HALL. *Ind. Eng. Chem.* 21, 824-9(1929).—The use of a stable radical in place of the carbonate radical permits control by maintenance of a definite min. of alky., thus minimizing the requisite sulfate concn. It is essential that some substance other than CaSO<sub>4</sub> be the solid phase within the boiler. The treatment given a water cannot be arrived at by fixed rules but varies with the water. For some waters direct conditioning suffices while with other waters pretreatment by means of zeolite or lime soda softeners is necessary. O<sub>2</sub> and CO<sub>2</sub> are the gases usually eliminated from a water. At times, other gases such as NH<sub>3</sub> must be removed. NH<sub>3</sub> is best removed by means of Cl<sub>2</sub>. The analysis of a number of interesting deposits is given. One of them is unusual in that it contains 28.5% Na<sub>2</sub>SO<sub>4</sub> with but little CaSO<sub>4</sub> present. The addn. of anti-foaming material is successful if enough is used but when the amt. used drops below the allowable min. serious trouble results.

WAYNE L. DENMAN

**Sterilization of drinking water supplies in the state of Washington.** H. W. NIGHTINGALE. *The Thermometer. Wash. State Dept. Health* 2, No. 2, 3; *U. S. Pub. Health Eng. Abstracts* E-880a, 97. See C. A. 23, 3764.

C. R. FELLERS

**The removal of troublesome substances from drinking water by means of active and inactive charcoal.** K. W. JOTTEN, FR. SARTORIUS AND W. OTTEMEYER. *Gesundh. Ing.* 52, 529-34, 546-50(1929).—Chlorination is necessary in order to obtain a safe drinking water. In addn., the removal of taste, turbidity, etc., is essential. Charcoal is well adapted for the latter. Three kinds of carbon, wood charcoal, coke and ZnCl<sub>2</sub> activated A. K. T. charcoal of the I. G. Farbenindustrie, were found to absorb Cl, the coke being the poorest and the A. K. T. charcoal the best. Regeneration of the satd. adsorptive material is slight in the case of the simple wood charcoal and only imperfect with coke while with the A. K. T. charcoal it takes place to a considerable degree. The removal of phenol or rather chlorophenol in concns. of 1.100.000 to 1.1.000.000 is very much more difficult than dechlorination. Wood charcoal and coke even with very small grains and long retention showed very little action. The active charcoal is much better. The rate of flow for a chlorophenol soln. of 1.100.000 concn. with 50 g. of charcoal is 12 min. per l.

WAYNE L. DENMAN

**Preammoniation at Springfield, Illinois.** CHARLES H. SPAULDING. *J. Am. Water Works Assoc.* 21, 1085-40(1929).—The addn. of NH<sub>3</sub> in advance of Cl in water purification not only eliminates tastes and odors but increases the efficiency of chlorination. When lime is used or where the pH is high, this efficiency is reduced. Full details of this specific case are given.

D. K. FRENCH

**The influence of temperature upon the chlorine in water.** G. W. SCHMIDT. *Arch. Hyg.* 101, 290-6(1929).—The ability of distd. water, tap water, solns. of org. substances and sewage to bind Cl increases with the temp. at which the detn. is made. E. R. M.

**Nitrates in drainage water.** F. T. PERITURIN. *Trans. Inst. Fertilizers* 1927, No. 45, 65-103; *Wasser u. Abwasser* 26, 122(1929).—The amt. of nitrate washed out of soils

depends upon soil moisture and fertilizer treatment. The greatest losses of  $P_2O_5$ , Ca and nitrates resulted from the use of stable manure. C. R. FELLERS

**Softening municipal water supplies by zeolite.** J. T. CAMPBELL AND D. E. DAVIS. *J. Am. Water Works Assoc.* 21, 1035-53(1929).—An unusually complete survey of 2 installations near Pittsburgh for softening Ohio River water. As a zero hardness is not desired, the units are allowed to operate beyond their point of exhaustion. The treatment was found to be cheaper than the use of lime and soda-ash, and more satisfactory. D. K. FRENCH

**Sampling boiler water for testing and guidance of treatment.** S. C. PAGE. *Universal Eng.* 50, No. 1, 25-7(1929).—A simple layout makes it possible to make competent test of boiler fluid. E. I. S.

**Zeolite-deconcentrator combination for boiler water purification.** ELWOOD W. SCARRITT. *Ind. Eng. Chem.* 21, 821-3(1929).—In this method of feed water treatment, the NaOH and  $Na_2CO_3$ , produced in the boiler from zeolite softening, was used for softening raw feed water. Enough zeolite-softened water was used to ppt. the hardness and to maintain a NaOH content of 200-250 p. p. m. The sludge is removed by sedimentation in the deconcentrator. In this way, the 2 chief defects of zeolite softening, accumulation of sol. Na salts and the concn. of NaOH, are prevented. Furthermore, the reduction in NaCl consumption, reduction in blow down with its saving in fuel, and the maintenance of a correct sulfate-alky. ratio without the use of  $H_2SO_4$ , acid salts or  $Na_2SO_4$  makes the method effective in reducing operating expenses. WAYNE L. DENMAN

**Recent developments in boiler-feed water treatment.** SHEPPARD T. POWELL. *J. Am. Water Works Assoc.* 21, 1063-6(1929).—Progress in steam engineering has brought new problems. Many important investigations are now being carried on regarding foaming, corrosion and the mechanism of scale deposition. The problems of non-condensable gases and acid steam, as well as the possible disocn. of steam, are raised. D. K. FRENCH

**Silicic acid in boiler-feed water.** K. BRAUNGARD. *Wärme* 52, 277-80(1929).—General discussion. C. R. FELLERS

**Chemical proportioning of internal feed-water treatment.** E. M. PARTRIDGE. *Ind. Eng. Chem.* 21, 819-21(1929).—Two systems of internal treatment are used. In the first an excess of chemicals ( $Na_2CO_3$ ,  $Na_3PO_4$ , etc.) is used while in the second the added chemicals are insufficient completely to ppt the hardness. Org. material is relied on to keep the carbonate hardness in soln. or in suspension long enough to allow it to mix with the sulfate scale, softening it and causing it to decompose under boiler conditions. The org. material is usually tannin. As commonly used by railroads this process is called wayside treating. WAYNE L. DENMAN

**Prevention of pitting in locomotive boilers by exclusion of dissolved oxygen from feedwater.** C. H. KOVL. *J. Am. Water Works Assoc.* 21, 1013-23(1929); cf. C. A. 22, 3474.—In the discussion there was described a device, used in European locomotives and not difficult to install, which had been very successful in removing gases, thus reducing corrosion and scale deposition, as well as the tendency to foam. D. K. F.

**Ultramicroscopic studies of colloids in water.** C. H. CHRISTMAN. *J. Am. Water Works Assoc.* 21, 1076-80(1929).—This is a preliminary report on work involving colloidal color and suspended matter and its removal with coagulants. At the present time our knowledge is uncertain. An ultramicroscope is used and the effect of a positive elec. force on negatively charged colloids is observed. The colloidal theory is outlined as related to this investigation. D. K. FRENCH

**The bacteriological and chemical standards employed in water analysis.** W. JAMES WILSON. *J. State Med.* 37, 439-43(1929). J. A. KENNEDY

**Influence of radioactivity of water on the biological and biochemical action of the cells of lower and higher organisms.** J. STOKLASA. *Strahlentherapie* 20, 324-32(1928); *Wasser u. Abwasser* 26, 31-2.—A great increase in the richness of the flora and fauna occurs in moderately acid radioactive waters contg. at least 10 mg. of  $O_2$  per l. An accelerated development of green algae and N-assimilating bacteria occurs not only in water, but in radioactive soils and rocks as well. S. recommends baths in radioactive water contg. sufficient amts. of  $O_2$  for accelerating enzyme activity in humans. Living cells have a selective adsorption capacity for rays of the several radioactive elements. C. R. F

**Methylene blue and bromocresol purple in differentiating bacteria of the colon-aerogenes group.** JOHN F. DOMINICK AND CARL J. LAUTER. *J. Am. Water Works Assoc.* 21, 1067-75(1929).—With Standard Method lactose broth as much as 3 days may elapse before definite knowledge of the quality of a water is gained. By using

certain dilns. of methylene blue and bromocresol purple, definite results can be obtained in 24 hrs. and in many cases in as short a time as 12 hrs. Considerable data are given.

**The Cladotrix dichotoma and allied organisms as a cause of an "indeterminate" taste in chlorinated water.** B. A. ADAMS. *Water and Water Eng* 31, 327-9(1929).—The presence or past presence of *Cladotrix dichotoma*, or of certain streptothrix, may give rise to a mold-like taste in  $H_2O$ . The taste is due to volatile products given off by these organisms. Chlorination, especially with small doses, accentuates the taste and may even produce one when none is detected in the untreated  $H_2O$ . None of the chemicals usually employed in  $H_2O$  treatment is completely effective in preventing or removing this taste.

D. K. FRENCH

J. A. KENNEDY

**The automatic formation of a protective film from cold water in iron pipes.** II. Some investigations of the iron rust-lime coating. J. TILLMANS, P. HIRSCH AND K. SCHILLING. *Gas u. Wasserfach* 72, 689(1929); cf. C. A. 23, 1973.—A method of detg. the lime content of the coating is given, which involves soln. by boiling with 10%  $AcOH$ , filtration if necessary, the addn. of an excess of  $NH_4$  oxalate to the boiling soln., followed by centrifuging in calibrated tubes, from which the percentage of Ca may be estd. or more accurate detns. made in the usual way with 0.01 N  $KMnO_4$  after washing by decantation. The formation of the rust layer hinders electrolysis by increasing the resistance between the metal and the soln. The  $CaCO_3$  crystals in the coating may be observed under the microscope by using polarized light. III. Determination of the "rust protection hindering" excess carbon dioxide. *Ibid* 689-90.—The method of Luhrig of passing air through the soln. (cf. C. A. 21, 2158) is inaccurate. The  $CO_2$  content at which the water became aggressive was detd. by aerating to a greater or less extent several samples and detg. the content of free and combined  $CO_2$  and the loss or gain of combined  $CO_2$  when contacted with marble. This amt. naturally varied with different waters and examples are given.

R. W. RVAN

**The pollution of the sea bottom by the Schussen River and the possibility of its estimation by observation of protozoan forms.** A. WETZEL. *Internat. Rev. ges. Hydrobiol. Hydrographie* 19, 217-60(1928); *Wasser u. Abwasser* 26, 31.—By sampling waters at the mouth of rivers and examg. the types and character of the protozoan fauna, a good indication of the extent of sewage pollution may be obtained.

C. R. F.

**Pollution of the Lahn River in Marburg.** KAPPELLER. *Arch. Hyg. Bakt.* 101, 81-94(1929); *Wasser u. Abwasser* 26, 22.—The  $O_2$  demand and  $O_2$  content of water are good indications of sewage pollution. Other important tests are total bacteria per cc., and detn. of  $NH_3$ .

C. R. F.

**The contamination of a well which feeds into the Savona water system lines, with ammonia and nitrites from an industrial establishment.** CANALIS, et al. *Jg. moderna* 21, 161-8(1928); *Wasser u. Abwasser* 25, 276.—The well which had delivered water of excellent quality for 27 yrs. suddenly became contaminated with tar,  $NH_3$  and nitrites from effluent of a nearby newly built mfg. plant. Recommendation: A protective zone of 100 m. in diam. around wells should be kept free from polluting agencies.

C. R. F.

**Calculations for laying out a sewage system.** G. INHÜSEN. *Der Städt. Tiefbau* 6, 90-3(1929); *Wasser u. Abwasser* 26, 20.—Particular emphasis is laid on the laying of mains and pipe network.

C. R. F.

**A new sewer-cleaning apparatus.** FR. GERLACH. *Der Städt. Tiefbau* 6, 97-8(1929); *Wasser u. Abwasser* 26, 21.—The app. consists of a brush provided with axially arranged rinsing tubes or openings. The app. is effective in cleaning out slime and sand with a min. of rinse water.

C. R. F.

**Sewage works operation at Worcester, Mass.** I. Grit chambers and bar screens. ROY S. LANPHEAR. *Eng. News-Record* 103, 124-6(1929); cf. C. A. 22, 3249.—The sewage works of Worcester, which have a capacity of 28 million gallons daily, consist of a 2-compartment grit chamber, a 2-bar screen with 2-in. openings, 12 double Imhoff tanks, 4 pairs of dosing tanks, 13.56 acres of trickling filters, 4 final settling basins and a 23-acre sludge-drying area. The sewage flow averaged 23.79 million gallons per day in 1928. The grit chambers and bar screens and their operation during 1928 are discussed. The material removed by the grit chambers averaged 4.05 cu. ft. per million gallons and the cleaning cost was \$.75 per cu. yd. of material removed. The screenings are disposed of by burying. Screen operation cost was \$.216 per million gallons. II. Imhoff tanks and sludge-drying beds. *Ibid* 180-3.—The Imhoff tanks provide a detention period of 2.1 hrs. at rated capacity, actual detention in 1928 being 2.5 hrs. Sedimentation capacity is equiv. to 1.34 and the sludge compartments 2.54 cu. ft. per capita. Grease is skimmed from the tanks, discharged on to waste land and burned. In 1928,

17.4 million gallons of sludge was produced contg. 6.21% of dry solids. The sludge storage period is 8-12 weeks. The  $p_H$  value of the fresh sludge is below 7; alk. fermentation raises the  $p_H$  during digestion to 7 and 7.2. The area available for sludge drying is equiv. to 4.9 sq. ft. per capita. The cost of Imhoff tank operation in 1928 was \$1.73 per million gallons. III. Dosing tanks, sprinkling filters and settling tanks. *Ibid* 222-4.—The rate of sprinkling filter operation is usually under 3 million gallons per acre per day. The filtering medium is crushed stone, 10 ft. in depth. Continuous operation give the best results. The detention period in the final settling tanks is 1.4 hrs. The cost of operating the sprinkling filters in 1928 was \$0.85 per million gallons and the settling tanks \$1.29. The total plant operating cost was \$6.56 per million gallons or 26¢ per capita contributing. Perfect stability of the Blackstone River, into which the effluent is discharged, has prevailed since 1927. R. F. THOMPSON

Economical utilization of the sedimentation chamber of a two-storied treatment to plant. LEINER. *Gesundh. Ing.* 52, 601-7(1929).—Criticism of an article by Preuss (*C. A.* 22, 2019; 23, 2776), also comment by F. G. Kloiber of New York. W. L. D.

The estimation of the phosphate ion in relation to contamination of sewage, river water and swimming-pool water. E. REMY. *Arch. Hyg.* 101, 366-8(1929).—The concn. of phosphate ion in sewage, river water and swimming-pool water does not indicate the degree of their contamination. E. R. MAIN

Gas production of the treatment plant at Stuttgart based on results from two years' operation. MATER AND SOHLER. *Gesundh. Ing.* 52, 497-500(1929).—The yield of gas per capita per year is 3 cu. m. The av. compn. is:  $CO_2$  25.4, O 0.9,  $CH_4$  49.5,  $H_2$  9.1, N 14.1 and  $H_2S$  0.02% and the av. heating value is 7500 8000 cal.  $H_2S$  is removed by iron oxide. After purification, the gas is mixed with the city gas. The gross yearly revenue is 70,000 M. and the net profit, after depreciation and interest on invested capital has been deducted, is 34,000 M. WAYNE L. DENMAN

The significance of atmospheric polarization in the estimation of degree of purity of air. CHR. JENSEN. *Zentr. ges. Hyg.* 18, 674(1928), *Wasser u. Abwasser* 25, 288.—A general survey with no definite conclusions. C. R. F.

The detection and determination of urea in water and its decomposition by bacteria and chlorine. A study of the chlorination of swimming-pool water. HANS WETTE. *Arch. Hyg.* 101, 222-33(1929).—The amt. of urea present gives no definite indication of the degree of contamination of the water of swimming pools, but may be used to approximate the degree of purification realized during the process of chlorination. The urea may be removed either through the action of free Cl or through the action of bacteria. E. R. MAIN

Paints for the pool. C. P. McCORD. *Hygiene* 6, 485-6(1928); *J. Am. Water Works Assoc.* 21, 846(1929).—Care should be taken in selecting paints for the swimming pool, as some absorb Cl readily. D. K. FRENCH

Qualitative and quantitative investigations on industrial wastes in Ivanovo-Vosnesensk. A. LEVIN. *Gig. i. Epidem.* (Russia) 7, 18-24(1928) (French summary); *Wasser u. Abwasser* 26, 24.—The wastes from cotton bleaching, dyeing, spinning and weaving plants contg. only twice their vol of river water are considered. Pptn by lime gave best results in the purification expts. Results were judged by the decrease in oxidizability of the effluent. C. R. F.

The treatment of waste from beet-sugar plants. M. GEVMEYER. *Gesundh. Ing.* 52, 443-6(1929).—The waste from such a plant is very high in org. matter. Much of this may be removed by means of mech. clarifiers and separators. This applies especially to the washing water, etc. The cooling water is used for the beet washing. Chlorination tends to prevent the exhaustion of dissolved O in streams into which the waste flows. WAYNE L. DENMAN

The effect of sugar factory waste water on streams. MATSCHKY. *Zentr. Zucker ind.* 37, 520-2(1929).—The slight differences in the O content of the water above and below the factory indicate little, if any, harmful effects. J. F. LEBTE

The waste from paper mills in Pommern. MÖLLER. *Fischereizeitung Neudamm* 31, 623(1928); *Wasser u. Abwasser* 26, 31.—Paper mill, brewery and sugar refinery wastes are thought responsible for much of the damage to fish in Pommern. C. R. F.

Synopsis of waste purification from coke plants and related industries. A REICH. *Der Stadt. Tiefbau* 1929, 59-63; *Wasser u. Abwasser* 26, 25-6.—The ore wash water from blast furnaces contains fine dust particles and dirt which are pptd. in a settling tank, the water being used again. The cooling water contains gas and carried-over flue dust, and is purified for re-use in 2 or more shallow aerating basins. The blast furnace waste waters contain, besides much dust, such poisonous substances as  $CN$ . The water is conducted to a pit or tank in which hang full sacks of  $FeSO_4$ . Neutraliza-

tion is effected by NaOH addn. followed by slight acidification by  $H_2SO_4$ . Sometimes the wastes are purified by the addn. of milk of lime by the use of a patented process (Steuer system). Coke plant waste water contains sol. gases and coke particles; the latter are pptd. in settling tanks. Phenols may be extd. with  $C_6H_6$  and the phenol recovered by neutralization with NaOH or by distn. Another method of reclaiming phenol is to treat the water with an excess of  $NH_3$  and heat to  $98^\circ$  to form ammonium phenolate, which is decompd. by NaOH. Still a third method of purification is the biol. method whereby phenol in dil. concns. serves as a suitable medium for bacterial growth. An Emscher filter or aeration chamber treated with activated sludge is recommended for carrying on the treatment.

C. R. F.

The phenol waste liquor problem (PRÜSS) 21.

**The Purification of Swimming Bath Water.** Revised and enlarged ed. London: The Paterson Engineering Co., Ltd. Reviewed in *Chem. News* 139, 120(1929).

**Apparatus for softening water.** JEAN SCHNEEBELI. Swiss 132,327, Mar. 1, 1928. The app. has a device at the bottom for collecting the Ca ppt.

**Apparatus for softening water by reagents in solution.** WILSON L. McLAUGHLIN and HERROLD L. McLAUGHLIN (to A. J. Miller). U. S. 1,726,082, Aug. 27. Structural features.

**Apparatus for softening water by use of treating solutions.** WILSON L. McLAUGHLIN and HERROLD McLAUGHLIN. U. S. 1,726,083, Aug. 27. Structural features.

**Apparatus for aerating water.** IGINIO PRONIO. Swiss 132,039, Mar. 3, 1928. App. for satg. water with  $CO_2$  is described.

**Purifying feedwater.** E. BRUCHHAUS. Brit. 305,848, March 9, 1928. The water is preheated by steam and vapor from a second heater, treated with reagents, then heated up to steam temp. in the second heater with fresh steam, and filtered. An app. is described.

**Apparatus for deaerating boiler-feed water by spraying it in a vacuum chamber.** G & J WEIR, LTD., and J SIM. Brit. 306,257, Jan. 21, 1928.

**Treating feedwater for boilers, condensers, etc.** DONALD W. KENT. U. S. 1,725,925, Aug. 27. The water is subjected to the action of a stream of gas such as H or N to replace O dissolved in the water with a gas inert in respect to formation of scale and contg. H, and the stream of gas used is recirculated for treatment of addnl. supplies of water. O is removed from the circulating stream by combustion with H, and fresh supplies of gas are added to make up for the loss by combustion and solu. An app. is described.

**Preventing incrustation in boilers.** A. HEINRICH. Brit. 306,145, Feb. 17, 1928. The boiler is connected to earth and the upper part of the boiler is connected to metallic points projecting into the air or to an aerial wire preferably extending parallel to power wires in the neighborhood.

**Waste-water purification plant.** WILHELM WURL. Ger 479,711, July 13, 1926. Details.

**Purifying sewage.** F. A. DALLYN. Brit. 305,717, Nov. 11, 1927. Sewage or the like is treated with a floe (such as hydrates of Fe and Al) which will absorb molecular O to effect the adsorption of foreign substances, coagulation of certain substances and oxidation and dispersion of org. matter. O and Cl also may be added.

## 15—SOILS, FERTILIZERS AND AGRICULTURAL POISONS

J. J. SKINNER

**The ultimate natural structure of soils.** GEORGE J. BOUYOUCOS. *Soil Science* 28, 27-37(1929).—When soils in the natural dry state are placed in an excess of  $H_2O$  they disintegrate into particles of various sizes. Shaking vigorously does not decrease the size of these particles. The size into which the granules slake naturally seems to be stable and in equil., and a large amt. of force is required to reduce this size. The hydrometer method will measure the size of these particles, constituting the ultimate natural structure of soils.

A. L. MEHRING

**Influence of different nitrogen carriers on the structure of soils.** H. LATHER. *Z. Pflanzenernähr. u. Düngung* 12A, 227-51(1928).—The detrimental influence of  $NaNO_3$  on the soil by increasing the degree of dispersion was noted in short-time expts.

The action of  $\text{Ca}(\text{NO}_3)_2$  was not definitely detd. though in the presence of carbonate its desirable pptg. or flocculating action no doubt was manifested.  $(\text{NH}_4)_2\text{SO}_4$ , in the short period of observation and in the presence of carbonates, evidently formed  $(\text{NH}_4)_2\text{CO}_3$  which deflocculated the soil colloids. Subsequent oxidation of the  $\text{NH}_4$  salt to  $\text{HNO}_3$  resulted in flocculation of the finer particles. R. M. BARNETTE

A new physicochemical theory on the formation of humus, muck and oil. The role and interpretation of the biological factors in the process. JAN ŻÓŁCŃSKI. *Roczniki Nauk Rolniczych. I. Lesnych* 16, Sep. 48 pp.(1927); *Chem. Zentr.* 1928, I, 2443.—The biol. theory of humus formation is held untenable. Certain org. compds. formed under the influence of light, optically active rays from water and cyclic aromatic compds., behave like oxidases and peroxidases and decompose the N compds. C. R. F.

The distribution of the main soil types in Roumania. ROBERT MAYER. *Ernähr. Pflanze* 25, 324-7(1929). LAWRENCE P. MILLER

The vertical distribution of soil bases and acidity in some Illinois soils. HERBERT A. LUNT. *Soil Science* 28, 137-76(1929).—Soils from 8 widely sepd. sections of Illinois, representing as many soil types, were sampled by 3- or 4- in. strata and were subjected to the following tests and detns.: H-ion concn., Comber KCNS test, buffer action, Hutchinson-MacLennan and Hopkins Ca-requirement tests, total and exchangeable Ca and Mg.  $\text{NH}_4$  acetate soln. was found most suitable for replacement of Ca and Mg. In all cases the  $p_H$  values increased with depth, the increase being greatest in the Joliet soil whose subsoil is highly calcareous and least in the soils from the Mt. Morris and Oquawka fields. The Comber test agrees closely with the  $p_H$  values. The Oquawka sand was the most poorly buffered, whereas the Urbana, Joliet and Mt. Morris soils possess the greatest buffer capacity. The Hutchinson-MacLennan Ca-requirement data compare favorably with electrometric titration with  $\text{Ca}(\text{OH})_2$  to a  $p_H$  of approx. 7.0. Only in the southern soils does the Ca requirement as measured by the Hutchinson-MacLennan test increase with depth. These soils are characterized by a comparatively high total acidity, of which a very large proportion is exchangeable acidity and a small part is hydrolytic acidity. The  $p_H$  values vary with the total Ca content, with the exception of the Black clay loam at Hartsburg. This soil is immature and its Ca has not been leached out of the surface as it has in the older soils. In most instances the total Mg content in the surface horizon is approx. equal in amt. to the Ca in that horizon, but in the subsoils Mg has accumulated to a greater extent. The curves for exchangeable Ca and Mg follow those for total Ca and Mg. In the upper layers exchangeable Ca and Mg constitute a much greater portion of the total in the soils from Joliet, Mt. Morris, Urbana and Hartsburg than is the case of the Oquawka sand and the 3 southern Ill. soils. This is believed to be due to the greater age, higher rain fall and milder winters in the southern part. Applications of limestone reduced the H-ion concn. and increased the total and exchangeable Ca content of the surface layer in every case. In only the Oquawka sand was the influence of these applications observed below the A horizon. This influence was detected more readily by the  $p_H$  detn. than by any other. Natural soil variations were greater than any measurable influence of fertilizer applications. The correlation coeff. of crop yields with total and exchangeable Ca and with acidity in the A horizon is very high in the southern soils, but low in the northern soils. The H-ion concn. of the A<sub>1</sub> horizon of the southern fields and of 3 of the 5 northern fields was approx. identical although crop yields are considerably greater in the northern fields. It is believed that  $p_H$  value is not a primary factor in crop production so far as direct effect on crop growth is concerned. In the soils from Ewing, Toledo and Unionville, the chief chem. factors which limit crop growth are probably the presence of exchangeable acidity and the low percentage of exchangeable bases. In the Oquawka sand an insufficient amt. of available Ca appears to limit crop yields. In the other soils studied, none of the factors studied can be considered as limiting. 32 references are appended. A. L. MEHRING

Bavarian soils formed by the weathering of chalk. H. NIKLAS, R. PÜRCKHAUER AND H. POSCHENRIEDER. *Z. Pflanzenernähr., Düngung u. Bodenk.* 13A, 39-53(1929).—A brief description of the soils is given. The acidity or alk. of the soils described is not individual to the different soil groups, but they may be roughly divided into the acid tripoli soils and the neutral to alk., lime-contg. soils of the chalk sandstones (greensand, etc.). The P requirements of the chalk soils are for the most part very great. K is evidently present in sufficient quantities, apparently furnished by the greensand. A need for org. matter for increasing the water-holding capacity and other phys. properties of these soils is great. Fertilizer expts. point to the need of P. R. M. B.

Reaction and nutrient condition of some soil weathered from basalt in "Oberhessen." L. SCHMITT. *Z. Pflanzenernähr., Düngung u. Bodenk.* 13A, 242-52(1929) -

The soils weathered from basalt can easily exhibit an "exchange acidity," despite the large percentage of lime in the original rock. The content in available lime is not significantly higher (by the Meyer method) than that formed from rocks low in lime content. About 70% of these soils are low in  $P_2O_5$  while about 48% have a deficiency in potash. While it is usually conceded that basalt gives a nutritively fertile soil, still from the weathering under the "Oberhessen" conditions a soil is obtained which from field and Neubauer tests as well as reaction studies needs the application of lime,  $K_2O$  and  $P_2O_5$ .

R. M. BARNETTE

**Weathering of sandstone, limestone and basalt in the "red earth" area.** ADOLF REIFENBERG. *Z. Pflanzenernähr., Düngung u. Bodenk.* 13A, 53-66(1929).—The climate of the Mediterranean Sea area of Palestine is characterized by a winter rainy period with a summer dry period. The rain factor lies between 30 and 50. The original formations giving rise to the soils of Palestine are: (1) limestone, (2) basalt, (3) sandstone with relatively high  $CaO$  content. The soils formed show an alk. reaction caused by the large content of  $CaO$ , low content of humus and the presence of alkali carbonates. The soils are for the most part high in content of salts of the alk. earths and alkalies which remain in the soil upon the evapn. of the water brought to the surface by capillarity. A low content of humus caused by the high  $CaO$  content and acid conditions in the summer is a characteristic of the area. The small quantities of adsorptively satd. coagulated humus cannot have a protective action on the iron oxide sols. The humid conditions in the winter combined with the relatively high temps. bring about an energetic hydrolysis and soln. of the rock components. The soils show an increase in the sesquioxides and  $SiO_2$  in comparison with the original rocks. On the other hand, the alk. earths are washed out for the most part during the rainy months, while during the arid season there is a vertical movement upward. The movement of water gives rise to an *eluvial* horizon underneath and a *illuvial* horizon above. The low content in humus with a more or less high content of Fe causes the often-encountered light red color of the soils. A theory for the formation of the soils in the part of Palestine having the Mediterranean climate is given. The soils are briefly described: (1) "Red Earths" occur as typical soils in general only on limestone under the typical Mediterranean climate. They show a large increase of sesquioxides and  $SiO_2$  over the original lime rock. Their content in salts, alkalies and alk. earths is relatively high. Their red color is a result of a high Fe content and a low humus content. They have an alk. reaction and loamy feel. The colloidal  $SiO_2$  appears to play an important role as a protective colloid. (2) "Red Sands" result from lime-sandstone in much the same manner as "red earths." The individual soil particles are covered with a layer of some Fe compds. which indicates that the Fe must have previously been brought into soln. They are sandy soils with low adsorptive capacity and with a low content of alkalies, alk. earths and plant nutrients. They contain magnetic Fe concretions. (3) "Chocolate Brown Basalt soils" develop in much the same manner as the "red earths," with quite similar properties. Color is variable because of the content of  $FeO$  and different stages of its oxidation to  $Fe_2O_3$ .

R. M. BARNETTE

**A new method for the conservation of soil profiles.** K. SCHLACHT. *Z. Pflanzenernähr., Düngung u. Bodenk.* 13A, 426-31(1929).—By the use of a conserving medium which is a colorless condensation product of urea and formaldehyde, S. is able to conserve soil profiles for future study and comparison. The method which is described offers a quick and convenient method of collecting and comparing a no. of profiles. An addnl. advantage is the ease of transportation and low weight of the profiles thus taken. The condensation product penetrates wet soil readily.

R. M. BARNETTE

**The iodine question and agriculture.** W. GAUS AND R. GRIESSBACH. *Z. Pflanzenernähr., Düngung u. Bodenk.* 13A, 321-425(1929).—An extensive review of the literature concerning the distribution of I in nature and the significance of I to plants and animals together with an account of the expts. carried out by the I. G. Farbenindustrie Akt. at their expt. stations and in coöperation with other agencies. Conclusions: A stimulation and increased yield resulting from applications of small quantities of I as impurities in fertilizer salts cannot be expected from results to date. An improved quality of the plants cannot be established with certainty by application of I compds. in small quantities, apparently because of a sufficiency of the I in the soil, rain water, etc. Applications of I compds. in large amts. are distinctly detrimental as most halogens are. The question of deficiencies of I for plants and animals in localized areas does not appear important for Germany, and thus continued small addns. of I in fertilizer salts or as amendments to fertilizers does not appear to be important. The view that cultivated soils which have been in culture for hundreds of years are deficient in I does not appear to cause deficiencies of I in the agriculturally important plants grown on

these soils. The cultivated soils, with a high content of inorg. and org. adsorption materials, show an enrichment in I which is supplied from the atm. and rain water. The role of I in the plant is little understood and the necessity of I to plant growth is by no means experimentally detd. On the other hand, I appears necessary for man and for animals. Its presence is closely assocd. with the proper functioning of the thyroid gland, which secretes the I-contg. thyroxine. The question of the I relationship to goiter is still unsolved, though some relationship appears to exist. The suggestion that soils deficient in I be fertilized with I salts is not a soln. of the problem as often such soils do not give an enrichment of I in the plant. The I is for the most part present in the stems and leaves of plants, while in general, the fruit, seed and tubers of plants are eaten. These plant parts contain smaller quantities of I. It has been observed that I in org. combinations is more effective in treating goiter than inorg. forms. It appears that there is little basis for considering I or I-contg. fertilizer salts as agriculturally important for their I content.

R. M. BARNETTE

**Unsaturated soils.** NIL P. REMEZOV. *Z. Pflanzenernähr., Düngung u. Bodenk* 13A, 228-42(1929).—A review of the methods for detg. the lime requirements of acid soils in which the conclusion is reached that no one method is satisfactory and that a no. of factors, such as the fineness of the liming material, the plant to be cultivated, etc., must be weighed before practical recommendations from any of the numerous methods are of much value. The empirical field method seems best suited to give practical results. An extensive bibliography is given.

R. M. BARNETTE

**Degree of lime and potash saturation of soils.** A. GEHRING. *Z. Pflanzenernähr., Düngung u. Bodenk.* 13A, 1-17(1929).—The comparison of the Hissink and Gedroiz methods for detg. the replaceable CaO in a soil showed that the 2 methods gave comparable results with either 12.5 g. or 25 g. of soil. However, the Gehring-Wehrmann method for detg. the amt. of lime necessary to sat. a soil gave a higher adsorption of CaO when 12.5 g. of soil was used than when 25 g. was used. This difference is attributed to the increased amts. of  $\text{CaCO}_3$  formed when the larger amts. of soil (previously treated with CaO and  $\text{CO}_2$  passed through the suspension) are leached with NaCl, the Na ion replacing the Ca ion of the soil and the Ca forming  $\text{CaCO}_3$  which is more difficultly sol. The proportion of  $\text{Ca(OH)}_2$  soln. to soil had very little influence on the max. adsorption of CaO by the soil as long as sufficient  $\text{Ca(OH)}_2$  was used actually to sat. the soil. An alc. soln. of  $\text{Na}_2\text{SO}_4$  was a very satisfactory method of detg. the replaceable CaO of a soil as compared with the Hissink method. Fifty cc. of a  $\text{Na}_2\text{SO}_4$  soln. of known concn. plus 50 cc. of alc. were added to 10 g. of soil and the suspension was allowed to stand overnight. After filtration the sulfate remaining in soln. was detd. and the difference between the original sulfate content and content after contact with the soil which represented the sulfate which combined to form the insol.  $\text{CaSO}_4$  was used to calc. the CaO replaced. The degree of satn. in K agreed fairly satisfactorily with the response of crops to potash fertilization in the field.

R. M. BARNETTE

**Further investigations on the significance of the degree of saturation in potash for indicating the potash needs of soils.** A. GEHRING AND O. WEHRMANN. *Z. Pflanzenernähr., Düngung u. Bodenk.* 13A, 18-28(1929).—From the degree of satn. in K<sub>2</sub>O, the total degree of satn. in CaO and K, the relationship between the Neubauer detd. K and the degree of satn. in K, the authors believe they have found a method for indicating the K needs of a soil. No definite conclusions are drawn.

R. M. BARNETTE

**Acidity of mineral soils.** S. GOV, P. MÜLLER AND O. ROOS. *Z. Pflanzenernähr., Düngung u. Bodenk.* 13A, 66-91(1929).—The  $p_H$  value in KCl, the  $p_H$  value in water, the total acidity titrated to a  $p_H$  point of 7.7 and the easily activated soil acidity detd. by titration of a KCl suspension to a  $p_H$  value of 5 gives the total adsorption of a soil the total acidity of which includes the easily activated acidity (the "exchange acidity"), the difficultly activated acidity ("hydrolytic acidity"), the temporary acid condition ( $p_H$  in water), the greatest degree of acidity ( $p_H$  in KCl), the buffer value for the total acidity expressed as mg. NaOH which is necessary for the neutralization of 1 mg. H ion, the buffer value for the easily activated acidity ("exchange acidity") and the buffer value of the difficultly activated acidity detd. between  $p_H$  5 and 7.7 and for soils without "exchange acidity" between the lowest  $p_H$  point and 7.7.

R. M. BARNETTE

**Do soil samples become more acid upon drying?** B. AARNIO. *Z. Pflanzenernähr., Düngung u. Bodenk.* 14A, 37-9(1929).—From a series of measurements of the H-ion concns. of aq. suspensions of fresh and dried soils, A. maintains that drying increases the H-ion concn. of soil suspensions.

R. M. BARNETTE

**The alleged increase of the acidity of soil samples upon drying.** WIDAR BRENNER. *Z. Pflanzenernähr., Düngung u. Bodenk.* 14A, 39-42(1929); cf. C. A. 22, 4695.—The results of Aarnio (preceding abstr.) are explained upon the basis that the drying of the

soil samples was carried out in a closed thermostat where the gases could easily be absorbed by the soils. B. fails to find any significant effect of drying upon the  $pH$  value of soil suspensions.

**Acid content and lime requirement of our cultivated soils.** R. M. BARNETTE, R. BALKS AND MARIA BACH. *Z. Pflanzenernähr., Düngung u. Bodenk.* 13A, 93-118 (1929).—Detns. of the various forms of acidity and the degree of satn. in bases of a series of cultivated soils in comparison with the practical application of lime showed that the detns. were of only limited value in recommending the application of lime to be made, and that the tests in the field must be carried out sometimes 2-3 years before satisfactory results may be obtained. Physiologically alk. fertilizers are only partially effective in very acid soils in overcoming the undesirable effects of the excessively acid condition. In soils of low to medium org.-matter content (1 to 9%) with an increase in the degree of acidity there is a corresponding tendency of the "exchange acidity" to approach the "hydrolytic acidity." In soils with more than 9% org. matter the "hydrolytic acidity" was greatly in excess of the "exchange acidity." In mineral soils without org. matter the "exchange acidity" and the "hydrolytic acidity" were the same. With light sandy soils the total adsorptive capacity of the soil cannot be reached without detrimental effects on plant growth.

**Determination of the lime requirement of acid soils on the basis of laboratory and vegetation experiments.** A. KAUFMANN. *Z. Pflanzenernähr. Düngung* 12A, 156-75 (1928).—The chem. methods of detg. the lime requirements as given by D. J. Hissink, by A. Gehring, by K. K. Gedroiz and by E. W. Bobko and D. L. Askinasi showed no agreement in lime requirement values when used for 5 acid soils. The "exchange acidity," within certain limits, must be taken into consideration in the culture of both barley and oats, especially on light soils. The lime applications calcd. from the Daikuhara method or from the titration curves were not sufficient to bring about the highest yields in most cases. The quantities of lime calcd. from the A. Gehring method were sufficient to give max. yields. An increase of 55% in the application of lime as detd. by the D. J. Hissink titration method gave small increases. A decrease in the yield with 3, 6 and 9 times the amt. of lime as calcd. from the titration curves—was noted for only 1 soil (a loamy sand). Tests of the acidity at the end of the vegetation expts. showed that the lime requirements detd. by the Daikuhara and electrolytic titration methods were not sufficient completely to neutralize the soils. The neutral point was obtained by quantities of lime 3 times the amts. detd. by the titration curves. R. M. BARNETTE

**The comparative acid tolerance of some southern legumes.** G. JANSSEN. *Soil Science* 27, 469-92 (1929). The best growth of most legumes was produced at a soil reaction of  $pH$  6.0-6.8. When NaOH was used to change the reaction it destroyed the phys. properties of the soil but some plants, particularly sweet clover, seemed to grow better when NaOH was used to change the reaction than when  $Ca(OH)_2$  was used under similar H ion concns. This was particularly true when the soil was brought to a  $pH$  of 7.2 and 7.4. The following range of acid tolerance was noted among legumes when grown on soil, ranging from high to low acidity: seredella subterranean clover, vetch, bur clover, Austrian field pea, soy bean, Canadian field pea, crimson clover, Hubam clover and biennial white sweet clover. The results of the comparative legumes tested on sand cultures show the following gradient of tolerance of low to high acidity: red clover, vetch, seredella, California bur clover, spotted bur clover and velvet bean.

J. J. SKINNER

**Chemical soil analyses and molecular proportions.** K. UTESCHER. *Z. Pflanzenernähr., Düngung u. Bodenk.* 13A, 265-74 (1929), cf. C. A. 22, 4696.—A comparison of the method used at the Geol. Landes-Anstalt (heating 1 hr. on sand bath with 100 cc. of 1.15 sp. gr. HCl) with the method by the Int. Soc. of Soil Scientists (heating under reflux condenser with 10 times as much HCl, b.  $110^\circ$ ), on soils from Scotland. Results of the mol. proportions calcd. from the sol. Fe, Al,  $SiO_2$  and bases showed that the 2 methods gave the same results with the humid soils from Scotland as long as the soils did not contain easily decompd. silicates such as greensand, which have at the same time not been significantly weathered. The Geol. Landes-Anstalt method using a concd. HCl ext. can give valuable information regarding the weathered silicate complex which cannot be obtained with weaker reagents.

R. M. BARNETTE

**The gravimetric method for the determination of carbonates in the soil.** NORMAN A. CLARK AND EMERSON R. COLLINS. *Soil Science* 27, 407-14 (1929).—The gravimetric method for detg. soil carbonates has been improved by using ascarite and either dehydrite or  $P_2O_5$  as absorbents, by stirring instead of shaking and by using 1 to 10 HCl at room temp. At  $50^\circ$  the amt. of  $CO_2$  given off is slightly increased. Nineteen references are given.

A. L. MEHRING

**New method for determination of small quantities of nitrate in soils and plants.** JACOB BLOM AND CECIL TRESCHOW. *Z. Pflanzenernähr., Düngung u. Bodenk.* 13A, 159-90(1929).—The method is based upon the nitrating of 2,4-xyleneol, the distn. of the *o*-nitroxyleneols formed with steam and the colorimetric detn. of the nitroxyleneols in the distillate after the addn. of NaOH. About 0.05 mg. NO<sub>3</sub> may be detd. with an accuracy of 2%. Org. matter is destroyed before nitrating, by heating with permanganate and H<sub>2</sub>SO<sub>4</sub>. HNO<sub>3</sub> is not changed by this process and NH<sub>4</sub> salts are not oxidized while amino acids are split only very slightly with the formation of nitrates. The xyleneol method was used successfully in hundreds of plant and soil analyses with good results. R. M. BARNETTE

**Detection and determination of chlorate ion in soils.** F. MACH AND R. HERRMANN. *Z. Pflanzenernähr. Düngung* 12A, 189-98(1928).—The use of NaClO<sub>3</sub> for the destruction of weeds and undesirable vegetation has given rise to the question of possible effects of the chlorate ion on plant growth and the detn. of the chlorate ion in the soil. The authors describe expts. on the detection and detn. of the chlorate ion in soil. For the former, the authors use the I reaction. 200 g. soil is shaken with 500 cc. of distd. water. The filtrate is used. To 1 cc. of the filtrate of the soil ext. in a glass-stoppered flask, 25 cc. of distd. water, 25 cc. of HCl (sp. gr. 1.19) and 1 g. KBr are added and the flask is shaken several times. After 5 min. about 1 g. KI is added. Free I is liberated which imparts a yellow color; it may be detected in very small quantities with the aid of a starch soln. As another method, the authors added 2 cc. of 0.02 N AgNO<sub>3</sub> to 25 cc. of soil soln. (filtrate from 100 g. soil and 250 cc. water) and back titrated with 0.02 N KCNS. To the same quantity of soil soln., 5 cc. of 5-6% H<sub>2</sub>SO<sub>4</sub> is added and the mixt. placed on the water bath for 20-30 min., and then heated over an open flame until the H<sub>2</sub>SO<sub>4</sub> is expelled; after cooling and the addn. of HNO<sub>3</sub>, 2 cc. 0.02 N AgNO<sub>3</sub> is added and titrated back with 0.02 N KCNS. If the AgNO<sub>3</sub> is used to the extent of 0.30 cc. in the detn. after reduction, then the chlorate ion is present. For detn., the authors recommend AgNO<sub>3</sub>-KCNS titrations before and after reduction. The detrimental influence of chlorate ion on the germination of rye plants was established. R. M. BARNETTE

**Detection and significance of manganese dioxide in the soil.** W. O. ROBINSON. *Soil Science* 27, 335-50(1929).—The presence of a small quantity of MnO<sub>2</sub> in the soil causes the soil to decomp. H<sub>2</sub>O<sub>2</sub> so vigorously that the presence of MnO<sub>2</sub> in the soil can be established by the H<sub>2</sub>O<sub>2</sub> test. The test is not recommended for a detn. of MnO, on account of probable differences to be found in the size of the MnO particles in different soils. MnO<sub>2</sub> does not occur in the clay or colloidal fractions of soil. It occurs in the sands, but to a greater extent in the silt fraction. The detn. of the total Mn in the silts and sands is an approx. detn. of the MnO<sub>2</sub> in the whole soil. Concretionary and other deposits of MnO<sub>2</sub> in the soil are apparently formed through the agency of CaCO<sub>3</sub>. The presence of MnO<sub>2</sub> in the surface layers of soil is characteristic of certain soil series. These soils are characterized by a peculiar and unmistakable chocolate-brown color. J. J. SKINNER

**The practical routine procedure for the mechanical analyses of soils.** P. KÖTTGEN AND H. HEUSER. *Z. Pflanzenernähr., Düngung u. Bodenk.* 13A, 137-58(1929).—A practical method is given for carrying out the routine mech. analyses of the soil utilizing the pipet method. A horizontal tip to the pipet is recommended for the withdrawal of the suspension in the mech. analyses. A special cylinder with a horizontal offset is described. Glycerol is used as the dispersing medium for coarse particles. R. M. B

**The value of nitrification tests on soils representing extreme contrasts in physical and chemical properties.** W. V. HALVERSEN. *Soil Science* 26, 221-31(1928).—Consistent parallelisms of variations in nitrifying power are shown on heavy, well-buffered soils when the incubation period is 4 weeks. Very sandy soils of low org. content yield less consistent results and an incubation period of 2 weeks is preferable. Furthermore, less nitrogenous material should be added. (NH<sub>4</sub>)<sub>2</sub>SO<sub>4</sub> is recommended as a source of N. M. S. ANDERSON

**Composition of natural organic materials and their decomposition in the soil.** IV. The nature and rapidity of decomposition of the various organic complexes in different plant materials, under aerobic conditions. FLORENCE G. TENNEY AND SELMAN A. WAKSMAN. *Soil Science* 28, 55-84(1929).—The decompn. of corn stalks, rye straw, oak leaves and alfalfa plants was studied under aerobic and optimum moisture conditions at 25-7°. The nature and rapidity of decompn. vary with the chem. compn. of the material. Sugars, celluloses, hemicelluloses, fats and proteins decompose readily but lignins tend to accumulate. Under aerobic conditions, however, the total lignin content is reduced decidedly. The decompn. of org. matter contg. only 0.2-1.7% total

N is accompanied by an abs. increase in the crude protein content. This is due to syntheses by the organisms which decompose cellulose. The pentosans decay rapidly at first but tend to accumulate toward the end. The addition of sol. inorg. N salt hastens the decompn. of celluloses and hemicelluloses. The residues after 12-14 months possess all the properties of soil org. matter. This humus is composed chiefly of lignins, modified lignin complexes, proteins, hemicelluloses, a small amt. of cellulose and other org. compds. but is not in a state of equilibrium. The rate of change constantly decreases until it approaches that of the soil humus. Sixteen references are appended.

A. L. MEHRING

**The chemical composition of Florida Everglades peat soils, with special reference to their inorganic constituents.** HARALD E. HAMMAR. *Soil Science* 28, 1-11(1929).—Twenty-four representative soils from the Florida Everglades were analyzed, which are classified according to the native vegetation growing on them, namely, saw grass, elderberry and custard apple. The custard-apple and saw-grass soils represent 2 chemically distinct types, the former being a true muck, and the latter a true peat. The custard-apple soils are sedimentary in nature, and the saw-grass accumulative. The elderberry soil is not so distinct from this class.

for the custard-apple and saw-grass soils was 3.814 and 5.208%, resp., whereas the MgO content was 0.0881 and 0.0102%. The reaction of the custard-apple soil was acid, whereas elderberry and saw-grass soils were slightly acid to neutral. The acidity decreased upon increase in depth, whereas the Ca and Mg probably increased. The custard-apple and saw-grass soils contained 44.52 and 86.37 org. matter and 12.25 and 16.47% hygroscopic  $H_2O$ . The custard-apple soils have a higher natural fertility than the saw-grass soils, but the latter are rendered productive by the use of Cu and Mn salts. The poor fertility of the saw-grass soil is not due to the absence of the usual fertilizer constituents, N, P and K.

J. J. SKINNER

**"Coefficient of wilting" and other moisture values of soils.** P. I. ANDRIANOV. *Z. Pflanzenernähr. Düngung* 12A, 145-56(1928).—The different quantities of water held by the soil (corresponding to any particular method of evaluation) are related to one another in a regular manner. This conformity to a law shows that: (a) The quantity of the water held by the soil and detn. by any method is a characteristic of the soil, and the soil has a definite place among other soils. (b) The proportion of the quantities of water unequally held by the soil is less as the actual quantities of water increase.

R. M. BARNETTE

**Root development and soil moisture.** JOHN P. CONRAD AND F. J. VIEHMEYER. *Hilgardia* 4, 113-34(1923).—The root development of grain-sorghum plants in relation to soil moisture was studied. The use of the *moisture equiv.* for the reduction of moisture contents to a common basis is suggested. Variations in soil texture that are not interpreted by moisture equivs. may be great enough to make the results unreliable unless many samples are taken for the condition investigated. Moisture under rows of grain-sorghum plants is extd. in successive zones, and the extn. is progressive whenever no material addns. of moisture occur during the growing season. A correlation exists between the amt. of roots and the extent to which the soil has been dried by root activity. If the soil is wet at the beginning of the growing season to the full depth to which roots of plants would normally penetrate, subsequent addns. of water by rain or irrigation can have but little influence on the extent of the root system developed. A bibliography of 22 references is appended.

C. R. F.

**Daily and seasonal air and soil temperatures at Davis, California.** ALFRED SMITH. *Hilgardia* 4, 77-112(1923).—The installation of *elec. resistance thermometers* for detg. soil temps. at different depths is described. The surface 4 in. of a loam soil under black paper mulch was very much more moist than unmulched soil. A careful study of soil temps. and moistures is necessary for a proper interpretation of soil chem. and biol. data.

C. R. F.

**The influence of replaceable bases on the soil solution formation in mineralized soils.** F. MENCHIKOVSKY AND S. RAVIKOVITCH. *Soil Science* 27, 49-68(1929).—The exchangeable bases of 3 Palestine soil profiles are studied. A study of the distribution of the various cations shows Ca to be relatively higher near the surface and to decrease relatively with depth, while the proportion of Na is higher in the lower horizons than near the surface. The distribution of cations in aq. exts. shows a relationship between the exchangeable and  $H_2O$ -sol. bases. Variations in the proportions of soil and  $H_2O$  from 1-1 to 15-100 gives negligible variation in the proportions of the various bases.

Sol. phosphate and sulfate ions are absent in most cases. The bicarbonate and silicate ions extd. by  $H_2O$  increase with diln. Cations are distributed in the same percentage in all exts. In highly mineralized soils the compn. of the soil soln. is correlated with the exchangeable base in the soil colloidal complex, and to a certain degree these reflect the character of this complex.

M. S. ANDERSON

**Changes in the nitrate and sulfate content of the soil solution under orchard conditions.** E. L. PROEBSTING. *Hilgardia* 4, 57-78(1929).—With field plots at Davis, Calif., fruit trees and cereals influenced the soil soln. differently. Under trees, the nitrate content steadily increases during the growing season. This is contrary to the findings under cereals. Alfalfa behaved like cereals rather than trees, though the growing season corresponds more closely to that of trees. With the exception of alfalfa, nitrification exceeds utilization throughout the summer months. Soils depleted in chloride and nitrate ions are usually high in sulfates. The peach series of soils were higher in sulfates and lower in nitrates than the pear plots. It is possible that the bicarbonate relationship may explain the above findings. Considerable fluctuation was found in the concn. of all ions except  $H$ -ion concn., which was almost const. at  $pH$  7.0-7.2 in the top 3 ft. and 7.4-7.8 in the 3-6 ft. samples. The phosphate varied from 50 to 120 p. p. m. and nitrate from 130 to 500 p. p. m. of soil soln.

C. R. F.

**Soil reaction and growth of meadow plants.** KARL E. LANDGRAF. *Z. Pflanzenernähr., Düngung u. Bodenk.* 13A, 213-28(1929).— $H_2SO_4$  and  $NaOH$  were used to alter the acidity and alk. of the soil for studies with meadow plants in pots.  $H_2SO_4$  and  $NaOH$  increased the citric-acid-sol. N. The  $H_2SO_4$  lowered while  $NaOH$  increased the citric-acid-sol.  $P_2O_5$ .  $K_2O$  soly. was slightly decreased by both acid and alkali while the Ca was not significantly changed. The water capacity and the hygroscopicity increased under the influence of acid between  $pH$  4.4 and 4.7 and then decreased.  $NaOH$  also increased the water-holding capacity and hygroscopicity. *Festuca pratensis* showed (from a one-year test) 2 optimum growth points at  $pH$  4 and 7. The growth factors such as sol. nutrients seemed to influence the max. growth at these points. The optimum reaction range of the cell sap of *Festuca pratensis* lies between  $pH$  5.95 and 6.25. A large application of lime to a neutral to alk. soil was less effective in changing the  $pH$  of the cell sap than a smaller application. A physiologically alk. nutrient increased the  $pH$  value of the cell sap about 0.3 units. No relationship between the  $pH$  value of the soil and that of the cell sap could be ascertained. The reaction of the cell sap was dependent upon the pressure of definite ions in the nutrient medium. An extensive bibliography is given.

B. M. BARNETTE

**The absorption of phosphate from soil and solution cultures.** L. J. H. TEAKLE. *Plant Physiology* 4, 213-32(1929).—The absorption of the phosphate by wheat plants was studied in soil cultures and in flowing soln. cultures. In solns. contg. between 1.0 p. p. m. phosphate and 50 p. p. m. phosphate vigorous growth and tillering and high absorption of phosphate occurred; whereas small growth and reduced tillering and low absorption of phosphate took place between 0.05 p. p. m. phosphate and 0.1 p. p. m. phosphate. If a region of direct proportionality exists between absorption of phosphate and concn. of soil or culture soln., T. suggests that it will be between 0.1 p. p. m. phosphate and 1.0 p. p. m. phosphate—the range commonly occurring in soil solns. In the displaced soln. of the neutral and highly buffered soils studied, the concn. of the phosphate in the soil soln. was dependent on the nature of the solid phase rather than on the compn. of the soil soln. The compn. and buffer qualities of the expressed sap were reflected by the total absorption of phosphate. Phosphate was effective in buffering against alkali, but the concn. of phosphate has no observable effect against acid. An excess of base in the expressed sap suggested the presence of an org. anion.

W. T.

**Liming as factor in the mobilization of phosphoric acid in the podsol soils.** D. I. ASKINAZI AND S. S. YARUSOV. *Z. Pflanzenernähr., Düngung u. Bodenk.* 13A, 294-5 (1929).—See C. A. 23, 3533.

R. M. BARNETTE

**Is sulfur a limiting factor of crop production in some Utah soils?** J. E. GRAVES AND W. GARDNER. *Soil Science* 27, 445-57(1929).—An analysis of the Cache Valley soils shows that they contain from 252 to 1764 lb. of S per acre-foot of 3,600,000 lb. The av. S content of the soil analyzed was 903 lb. per acre-ft. Analyses of the water of 45 streams, which are used for irrigation purposes, showed them to carry from 3 to 676 lb. of S per acre-ft. of water. Six streams carried over 200 lb. and 34 streams carried less than 100 lb. Consequently, the quantity of S carried to the soil by irrigation water is often appreciable. The waters used on the soils of Cache Valley contain only small quantities of S. The pptn. was collected in 10 different localities in the valley. The av. annual quantity of S brought to the soil over a period of 4 years at

9 of the 10 stations varied from 6.4 to 12.1 lb., with an av. of 9.5 lb. The pptn. collected near the college campus had an av. annual S content of 32.7 lb. S-carrying salts increase the bacterial activities of the soil. This is especially pronounced in the case of N fixation. This may be due either to the direct action of the S as a food, to the microorganisms, or to an indirect action upon insol. nutrients. The conclusion is reached that S may become a limiting factor of crop production in some Cache Valley soils. The time required for this to manifest itself in diminished crop returns will vary with the soil, the specific irrigation water used and the crop grown upon the soil.

J. J. SKINNER

**Biochemical studies on the biological activity of sandy forest soils of the Hungarian plain.** D. FEHÉR AND R. BOKOR. *Biochem. Z.* **209**, 471-88 (1929).—Sandy forest soils are very favorable from the point of view of the C nutrition, the advantage probably being due to greater air capacity and more favorable  $O_2$  circulation. The bacterial flora is less numerous in the sandy soil but the numerical inferiority is compensated by the more intensive vital activity. The N metabolism shows certain essential variations. The total N content of sandy forest soil is less but the activity of nitrifying bacteria is much better because of the good conditions for aeration. As a result, sandy soil is considerably richer in nitrate N. The nitrifying bacteria are also numerically much more numerous than in the non-sandy forest soils. Furthermore, the water-sol. nitrogenous compds. are much more rapidly washed into sandy than loamy soils. The  $pH$  of the sandy soil is nearer the neutrality point which also contributes greatly to the intense bacterial activity.

S. MORGULIS

**Conduction of heat by sands.** FRANZ ROLL. *Z. Pflanzenernähr. Düngung* **12A**, 199-204 (1928). The conduction of heat by sands depends for the most part upon the degree of packing, the moisture content, as well as the particle size and temp. Formulas for the conduction of heat are given.

R. M. BARNETTE

**Statistical collections from the laboratory for soil investigation of the sugar factory of Greifsborg, Pomerania.** A. H. ERDENBRECHER. *Deut. Zuckerind.* **54**, 523-9 (1929).—E. summarizes the soil investigation of 1925-28, referring especially to N-fixing bacteria, CaO,  $P_2O_5$ ,  $K_2O$ ,  $pH$  and acid consumption. Methods are described, limits of accuracy of methods are stated, tables and curves given.

J. F. LEETE

**Does frost exert a "solubilizing" effect on the phosphate and potash of soils?** O. ENGELS. *Fortschritte Landw.* **3**, 96 (1928).—Exam. by Neubauer's method of soils frozen once, and repeatedly, showed little or no increase in root-sol. phosphate or K as a result.

B. C. A.

**An efficient soil tube jack.** C. A. TAYLOR AND HARRY F. BLANEY. *Soil Science* **27**, 351-3 (1929).—An instrument is described, which is valuable for obtaining sub-soil samples.

A. L. MEHRING

**Comparative investigations and experiments with different methods for determining the nutrient requirements of soils in phosphate and potash.** EUGEN BECKER. *Z. Pflanzenernähr., Düngung u. Bodenk.* **13A**, 274-93 (1929).—If proper regard is given to the degree of alk. of a soil, the Sigmund method using dil.  $HNO_3$  and adjusting the soil to a more or less const. reaction gives satisfactory agreement with the 1% citric acid method and the Neubauer method for detg. the soly. of  $P_2O_5$  and  $K_2O$  in soils. An extensive bibliography is given.

R. M. BARNETTE

**Soil reaction experiments with mustard and oats in connection with nutrient-requirement trials.** I. HELLER. *Z. Pflanzenernähr., Düngung u. Bodenk.* **8B**, 37-40 (1929). The importance of detg. of the effect of soil reaction, lime content and lime requirement on the growth of individual crops as a necessary complement to fertilizer-requirement expts. is emphasized.

B. C. A.

**Examination of the "effect factors" of the three principal nutrients of cultivated plants and of the determination of the nutrient content of soils according to Mitscherlich.** M. NOACK. *Kuhn-Arch.* **19**, 412-553 (1928). Numerous trials are recorded designed to exam. the alleged constancy of the "effect factors" as applied to different plants and to different forms of fertilizers. In many cases the nature of the fertilizer and the kind of crop did not markedly affect the "effect factors." There were, however, notable exceptions in which different crops indicated different contents of assimilable N and P in identical soils. The Mitscherlich "effect factor" for K in the presence of Na varied considerably.

B. C. A.

**Influence of nutrients on the value of bast-fiber plants (flax and nettle).** I. H. FABIAN. *Faserforschung* **7**, 1-56 (1928).—Lack or excess of K, N or P is unfavorable for the production of fiber. Diminution of fiber yield occasioned by N can be to a certain extent compensated by means of K. The most favorable fertilization for the pro-

duction of fiber is that which best stimulates growth, but does not afford the max. production of stem. B. C. A.

**Course of the growth and the absorption of nutrients by the cotton plant.** S. A. KUDRIN. *Z. Pflanzenernähr., Düngung u. Bodenk.* 13A, 91-3(1929).—The cotton plant was studied as to the fresh wt. of material produced, air-dried wt. of material produced, abs. dry wt. of material produced and chem. compn. at 5 stages of growth: (1) with the formation of the third leaf, (2) bud formation, (3) bloom stages, (4) the beginning of ripening, (5) the first harvest. The chem. studies showed a decrease of the relative amts. of N and ash constituents with increasing age. The largest amts. of N and  $P_2O_5$  were found in the blooms and seeds while the largest amts. of Ca and Mg were found in the leaves and stems. With increasing plant growth the N and ash constituents migrate from the vegetative organs to the generative. In the last stage of development investigated (the first harvest stage),  $\frac{2}{3}$  of the total N and  $P_2O_5$  compds. of the cotton plant were in the generative organs while the larger part of the Ca remained in the vegetative organs. The Mg in this stage was more or less equally divided in both classes of organs. Between the bud formation and bloom formation stages, the cotton plant absorbed the largest amts. of nutrients from the soil. During this time an increased absorption of Ca and N compared with  $P_2O_5$  and Mg occurred. The cotton plant has a high requirement for nutrients, but it so happens that the large quantities of these nutrients are not removed with the harvest of the cotton but are returned to the soil.

R. M. BARNETTE

**Nitrates in soil and plant as indexes of the nitrogen needs of a growing crop.** B. E. GILBERT AND J. B. SMITH. *Soil Science* 27, 459-68(1929).—The curves for soil and plant soln. nitrates in connection with 1928 crops of cabbage, tomatoes, celery and beets are given and attention is drawn to the influences of side-dressings of sol. N fertilizer upon these curves. Nitrate concns. both in soil and in plant solns. were maintained above previously designated suboptimum concns. throughout the greater part of the season and yields were uniformly greater than with lower N fertilization. Conclusion: Chem. and cultural methods should be used concurrently to secure a complete picture of N needs of crops. J. J. SKINNER

**Soil respiration and fertility.** E. H. REINAU. *Festschr. Stoklasa* 1928, 305-18.—The intensity of the assimilation of  $CO_2$  by green leaves from the air immediately surrounding them is such that practically the whole of the  $CO_2$  produced within the soil can be absorbed. The interchange of layers of air at the soil surface with higher layers is small. Hence the view is propounded that  $CO_2$  production in soils must control crop yields. B. C. A.

**Observations upon methods of cultivation.** J. F. RAVAT. *Rev. vil.* 69, 235-41 (1928).—The anomalous fact that unfertilized fields often produce higher crop yields than fertilized ones is explained upon the hypothesis that plants derive their essential food constituents primarily from disintegrated soil microorganisms. The microorganisms are supposed to be able to attack and utilize for their own nutrition the mineral constituents present in the soil but which are not directly assimilable by the plant. The beneficial effect obtained by the application of fertilizers is due to the increased no. and activity of the soil microorganisms rather than to any direct assimilation on the part of the plant. This is especially true where the applied fertilizing elements are available for only a short period of time compared to the life of the plant. R. believes the same beneficial effect may be obtained by the practice of methods of cultivation which tend to produce an environment more favorable to the soil microorganisms. K. S. MARKLEY

**Swedish fertilizer trials in 1927.** G. SUNDELIN, C. LARSON AND E. MANELL. *Medd. Centralanstalt försöksväsendet jordbruks.* No. 340; *Jordbruksavdel.* No. 69, 1.—Summaries of the results of numerous field trials are recorded and classified according to crop, soil type and reaction. B. C. A.

**Cold- and hot-fermented manure.** GERLACH AND SEIDEL. *Z. Pflanzenernähr., Düngung u. Bodenk.* 8B, 15-37(1929).—Published literature is critically reviewed. Hot-fermented manure has rather less dry wt. and total N but more water-sol. N than cold-fermented manure. The work of Krantz and Löhnis and Ruschmann on the fermentation process was not confirmed. The decompn. in soil of hot-fermented manure was slightly slower than with the cold-fermented product, and crop yields were rather lower. B. C. A.

**Hot fermentation of manure and weeds.** C. FRUWIRTH. *Fortschrille Landw.* 3, 832(1928).—The vitality of seeds surviving the hot-fermentation process for manure was examd. Daily addns. of weeds and manure were made to the stack in a concrete pit and seed samples inserted in fine-meshed packets. A small no. of seed germinated

after the "cold" fermentation of the ordinary yard manure, but in the hot-fermentation process none survived. Similar results were obtained with undigested seed entering the stack with the manure.

The action of the complete fertilizer "Nitrophoska" in comparison with other fertilizer combinations, according to newer and in part special investigations on this problem. O. ENGELS. *Fortschritte Landw.* 4, 418-21(1929).—Review. L. P. M.

The fertilizing action of several potash salts alone and as mixtures. H. LIESEGANG. *Z. Pflanzenernähr., Düngung u. Bodenk.* 14A, 62-5(1929).—KCl,  $K_2SO_4$ , and  $KNO_3$  were used alone and in combinations of 2 of the 3 salts as sources of K in sand cultures. There were no significant differences in plant yields except for a detrimental effect of relatively large applications of KCl. The earlier results of Hellriegel, whose studies showed a superiority of a combination of 2 of the salts over a single salt, were not substantiated under the conditions of the expt.

Fertilizer requirement of the onion. M. GÓRSKI AND M. KOZTOWSKA. *Rocz. Nauk. Rolnicz* 20, 1-14(1928).—The onion reacts chiefly to fertilization with K, that to N and phosphate being very small. Rye, oats and potatoes react chiefly to N; only potatoes reacted to K. The large K requirement of the onion is due to its small ability to utilize soil K.

The availability of nitrogenous fertilizers to rice. R. P. BARTHOLOMEW. *Soil Science* 28, 85-99(1929).—The efficiency of the following N compds. for rice compared to  $(NH_4)_2SO_4$  as 100 were, Leunasalpeter 96, a mixt. of cottonseed meal and  $(NH_4)_2SO_4$  96, urea 92,  $NaNO_3$  85.9, blood meal 87,  $NH_4$  phosphate 84.5, Ca cyanamide 69.5, a mixt. of cottonseed meal and  $NaNO_3$  66, cottonseed meal 61.5 and  $Ca(NO_3)_2$  59. Under proper conditions the first 6 seem well adapted for the production of rice.  $NH_4$  compds. such as  $(NH_4)_2SO_4$  and  $NH_4$  phosphate are more suitable, as rice seems to be affected less by the changes they produce and there is the probability that less N may be lost by denitrification. Physiologically basic fertilizers are not desirable as rice grows best under acid conditions. The production of nitrites due to denitrification was spasmodic and only in several cases were they found in quantities larger than several mg. per jar. Nitrites were found in jars which had received no nitrate N. The results do not support the contention that the production of nitrites from nitrates is the cause for the failure of nitrates to produce good yields of rice. N was lost, presumably as elemental N, from all forms of N whether it was in the  $NH_4$ , nitrate or org. form, but smaller quantities lost were from the  $NH_4$  compds.

Contribution to the question of the relative effectiveness of sodium nitrate, calcium nitrate, and Chile saltpeter. HUPPERT. *Fortschritte Landw.* 4, 452-7(1929).—From a large no. of tests it is concluded that these salts are equal in value as nitrogenous fertilizers.

The significance of ammonium citrate solubility for Thomas meal and Rhenania phosphate. A. WILHELMJ, H. KARST AND S. GERICKE. *Z. Pflanzenernähr., Düngung u. Bodenk.* 14A, 42-61(1929).—From vegetation expts., it appeared that the  $NH_4$  citrate soly. of Thomas meal and Rhenania phosphate has no relationship to their action on plant growth, in that the yields were not correlated with the  $NH_4$  citrate sol.  $P_2O_5$ . The citric acid soly. of Thomas meal and Rhenania phosphate gave a better correlation with the results of the vegetation expts. As the  $NH_4$  citrate sol.  $P_2O_5$  of both phosphates has no significance, the superiority of Rhenania phosphate over Thomas meal because of the higher content of  $NH_4$  citrate sol.  $P_2O_5$  in the former cannot be admitted. A superiority of the Rhenania phosphate over Thomas meal could not be detd. in the vegetation expts.

Fertilizer constituent test: phosphoric acid gives profitable increased yields on lowlands at Barcolod-Murcia Millsite. H. ATHERTON LEE, MARIANO G. MEDALLA, BASILIO DESEMBRANA AND PEDRO SENGSON. *Sugar News* 10, 260-3(1929).—In past years N was the only fertilizer constituent which gave increased yields in Negros cane fields. Recently, however,  $P_2O_5$  gave increased yields in the uplands. Plot tests in the lowlands of the Barcolod-Murcia district showed an increase in yield from the use of  $P_2O_5$ .

Laboratory methods for determining the form in which phosphate fertilizers should be applied to different soils. L. VON KREYBIG. *Z. Pflanzenernähr. Düngung* 12A, 176-88(1928).—A general discussion of the possible influences of the acidity or alk. of soil upon the soly. of superphosphate and rock phosphates, with a short discussion of the bacteriol methods for detg. the phosphate needs of a soil. R. M. B.

Sulfur and rock phosphate. A. KALUSHKII. *Z. Pflanzenernähr. Düngung* 12A, 217-26(1928).—By the application of S with rock phosphate, the  $P_2O_5$  of the rock phosphate is made available to plants. In sand cultures with millet, the best results were

obtained with equal amts. of S and rock phosphate, in which case the utilization coeff. of the  $P_2O_5$  of rock phosphate is the same as that of  $CaHPO_4$ . The proportions of rock phosphate and S may be broader and change with the soil type. The rock phosphate S fertilization has, in comparison with the  $CaHPO_4$ , an especially favorable influence on the yield of grain in its relationship to the weight of the entire plant. S not only may be applied with advantage with rock phosphate but also may be used alone on these soils which have a relatively large content of difficultly sol. P compds. or as a means of increasing the soly. of the  $P_2O_5$ . R. M. BARNETTE

**Active lime in basic slag and so-called disintegrated phosphates.** CH. BRIOUX AND EDO. JOUIS. *Compt. rend.* 189, 117-9 (1929).—Two g. of slag or disintegrated phosphate was mixed dry with lots of 1 kg. of acid soil, of known  $p_H$  and lime requirement, then the moisture content was brought to 20% and the  $p_H$  of the different lots detd. by the  $H_2$  electrode after 24 hrs., 2 days, 8 days, etc. From satn. curves there was calcd., according to the different  $p_H$  values, the corresponding amts. of active lime coming from the fertilizer used. For a soil of rather strong acidity, the variations in  $p_H$  observed 3 hrs. after mixing the fertilizer and soil correspond to amts. of active lime varying from 12 to 19%, which is very much higher than the quantity of free lime existing in the fertilizer. The silicates and silicophosphates of lime existing in the slag and the disintegrated phosphate decomp. rapidly in an acid soil in liberating the active lime. Their decompn. appears terminated for the soil considered, at the end of 8 days; after 3 weeks there is a reacidification. The amt. of active lime in the slag exceeds 30%. In an acid soil the decompn. of the silicates and silicophosphates of lime is hastened and distinctly favored by the proper acidity of the soil. E. F. SNYDER

**Action of silica.** O. LEMMERMANN. *Z. Pflanzenernähr., Düngung u. Bodenk.* 13A, 28-39 (1929).—A general review of the action of  $SiO_2$  on the growth of plants, particularly with reference to P fertilization. R. M. BARNETTE

**The tolerance limit of seedlings for aluminum and iron and the antagonism of calcium.** JOHN R. SKEEN. *Soil Science* 27, 69-80 (1929).—There is much evidence that when calcns. are made on a molar basis the toxicity of heavy metals is greater to plants than the toxicity of an equiv. amt. of free acid. The limits of tolerance of *Lupinus albus* and *Phaseolus vulgaris nanus* for Al and Fe and the antagonistic action of Ca to these elements are studied. At temps. from 17° to 21° in the same interval of time 0.35 p. p. m. Fe is toxic and lethal to *Phaseolus*, while 1.15 p. p. m. is lethal to lupins (cf. *C. A.* 23, 4495). *Phaseolus* just survives a concn. of 0.00003 M HCl while the same plant just survives an Fe concn. of 0.000004 M. The presence of Ca greatly reduces the toxicity of both Al and Fe. M. S. ANDERSON

**Investigations on chlorosis of fruit trees. II. The composition of leaves, bark and wood of current season's shoots in cases of lime-induced chlorosis.** T. WALLACE. *J. Pomology Hort. Sci.* 7, 172-83 (1928); cf. *C. A.* 21, 3218.—In Ca-induced chlorosis of apples, pears, plums and raspberries, affected leaves and bark show a higher percentage of ash in dry matter and less Ca and more K in the ash than do comparable healthy material. The ash of the wood of new chlorotic shoots was also higher than that from healthy shoots, but the Ca-K proportions were not materially altered in the ash. Green leaves show no consistent difference from chlorotic in Fe content, although the bark and wood of the latter usually contain more Fe. III. A chlorosis of plums due to potassium deficiency. *Ibid.* 184-98.—A certain type of chlorosis of plum trees develops under soil conditions conducive to leaf scorch in apples, gooseberry and other fruit trees and is believed to be due to K deficiency. Chlorotic foliage contains less ash and a low proportion of K but high proportions of Fe, Ca, Mg and K in the ash. The results in chlorosis due to K deficiency are exactly opposite to those when the chlorosis is due to excess of Ca in the soil. A. L. MEHRING

**Sugar beet parasites in 1927-8.** F. J. RAMBOUSEK. *Listy Cukrovar.* 47, 713-20 (1929); cf. *C. A.* 23, 290.—The occurrence and effects, and in some cases methods of combating, numerous insects and fungi are reported. FRANK MARESH

**Phosphate rock and superphosphate (GRAY) 18. Variations in the Ca and Mg contents of pea plants on different soil types (PONDER) 11D. The relationship of soil type to the Ca and Mg content of green bean stems and leaves and their expressed juice (PONDER) 11D. Alkali metal nitrates and Ca phosphate [with mixed fertilizer production] (Brit. pat. 306,048) 18.**

**Fertilizer.** SIEMENS & HALSKE A.-G. (Georg Eriwein, inventor). Ger. 479,832. Jan. 10, 1925. A fertilizer contg.  $COCl_2$  is produced by the combined action of  $CO$ , Cl and  $NH_3$ .

**Fertilizer.** R. E. SLADE and IMPERIAL CHEMICAL INDUSTRIES, LTD. Brit. 305,760, Dec. 13, 1927. A granular fertilizer is made by mixing a strong soln. or melt of  $\text{NH}_4\text{NO}_3$  with  $\text{CaCO}_3$  obtained as a by-product in the manuf. of  $(\text{NH}_4)_2\text{SO}_4$  from  $\text{CaSO}_4$  and  $(\text{NH}_4)_2\text{CO}_3$ . The mixt. is evapd. to dryness *in vacuo* at 50–100°.

**Fertilizers.** STOCKHOLMS SUPERFOSFAT FABRIKS AKTIEBOLAG. Brit. 306,103, Feb. 15, 1928. Two fertilizers, one consisting of Ca phosphate sol. in citric acid and the other of a mixt. or double salt of the compn.  $(\text{NH}_4)_2\text{SO}_4 \cdot 2\text{NH}_4\text{NO}_3$  and which may contain K phosphate, are prepd. from raw phosphate or phosphate-contg. materials by treatment with a mixt. of  $\text{H}_2\text{SO}_4$  and  $\text{HNO}_3$  followed by treatment with  $(\text{NH}_4)_2\text{CO}_3$  or  $\text{NH}_3$  and  $\text{CO}_2$ . Various details and modifications of procedure are described. Cf. C. A. 23, 4011.

**Storing sodium nitrate or other hygroscopic crystalline substances.** A. C. SCOTT. Brit. 305,721, Nov. 11, 1927.  $\text{NaNO}_3$  for use as fertilizer, or other materials are prevented from caking by admixture with a finely divided inert insol. silicate of laminated or fibrous structure such as asbestos, talc or mica.

**Fungicides.** I. G. FARBENIND. A.-G. (Karl Brodersen and Werner Ekt, inventors). Ger. 480,858, Nov. 23, 1923. Fungicides for use with plants or seeds comprise a highly dispersed heavy metal compd. and a halogen deriv. of humic acid. Thus, the product obtained by treating chlorinated lignite with  $\text{HNO}_3$  may be dissolved in excess of  $\text{Na}_2\text{CO}_3$ , treated with  $\text{CuSO}_4$  until a feeble alky. remains, and the mixt. evapd.

**Disinfectants and fungicides.** I. G. FARBENIND. A.-G. Brit. 305,943, Feb. 9, 1928. In prepg. a disinfecting, fungicidal or wood-preserving compn., a mercurized aliphatic hydrocarbon, unsubstituted or having an inactive substituent, such as Et mercuric bromide, is used as an active ingredient and fillers and wetting agents, etc., may be mixed with it.

**Composition for use on fruit trees, etc., to combat pests such as insects.** MARK B. PATTERSON (to Calif. Fruit Growers Exchange). U. S. 1,726,364, Aug. 27. A mineral oil compn. is dispersed in an emulsifying medium contg. pectin and water.

**Plant preservation.** SACCHARIN-FABRIK A.-G. VORM. FAHLBERG, LIST & CO. Ger. 469,202, Oct. 28, 1923. Animal and vegetable pests in the subcutaneous layers of plants are destroyed by application of Hg salts of aromatic or heterocyclic bases in powder or emulsion form. Examples are given.

**Vine wash.** MARIE VINCENT-RENTSCH. Swiss 131,744, Nov. 19, 1928. A wash for destroying vermin on vines is prepd. by digesting tobacco with garlic bulbs and adding mineral oil to the digest.

**Composition for destroying wood-worms.** PAUL LIPPKE. Ger. 480,001, Sept. 7, 1926. The compn. is prepd. in paste form and comprises (1) a mixt. of oils (neat's foot oil or linseed oil or a mineral oil with juniper oil), (2) a mixt. of suitable org. substances ( $\text{CCl}_4$  with  $\text{C}_2\text{H}_2\text{Cl}_4$  or *p*-dichlorobenzene, petroleum,  $\text{C}_{10}\text{H}_8$ , or naphthol) and (3) a mixt. of waxes (ceresin with montan wax). A resin,  $\text{PhNO}_2$ , and a coloring addn. agent may be included. An example is given.

**Cauterizing seed goods.** ALEXIS C. WOLF and WILHELM LANG. Ger. 479,750, Oct. 7, 1922. The cauterizing soln. contains a mixt. of at least 2 metallic or metalloid cyanides. Hg, Pb, Fe, As, Al, Cr and Mg cyanides are mentioned in examples. Disinfectants such as  $\text{PhOH}$ , pyridine and  $\text{K}_2\text{MnO}_4$  may be added.

## 16 THE FERMENTATION INDUSTRIES

C. N. FREY

**Influence of certain metals on acetous fermentation.** M. ROSENBLATT and M. MORDKOWITSCH. *Deut. Essigind.* 33, 281–2 (1929).—The accelerating and retarding effect of certain metals, notably Ni, Co, Fe and Mn, on acetous fermentation has been studied. The optimum concn. for these metals appears to be  $\frac{1}{100000}$ %. W. O. E.

**The development of the saccharification of cellulose and the production of wood spirits.** H. BAUSCH. *Z. angew. Chem.* 42, 790–1 (1929).—Early published work, industrial production and two recent patents are reviewed. The theoretical yield of EtOH is about 35 l. per 100 kg. of wood. The best yield yet obtained is 25 l. by the Prodor Co. on a small exptl. scale.

**Microchemical determination of alcohol and extract in saké.** Y. TOMIYASU. *J. Soc. Chem. Ind. Japan* 32, 288–94 (1929); Suppl. Binding 32, 85–7B (1929).

TOMODA

**Heat radiation from vinegar generators.** H. WÜSTENFELD and H. KREIPE.

*Deut. Essigind.* 33, 253-6(1929).—The heat radiated by vinegar generators of varying size and form of wood and stoneware was measured electrically. It amounted at a temp. difference of  $15^{\circ}$  between a normal thermometer and the interior to 4630 heat units over a 24-hr. period in the normal types of wood, to 7800 heat units on the av. in stoneware generators of similar size, to 5550 heat units in a "Moselfuder" and to 8600 heat units in a larger wooden generator (1.50 m. diam. and 2.40 m. high). From the values thus detd. the transmission value  $K$  was calcd. for each expt. In point of alc. formation this important heat radiation is dependent primarily on the material involved (wood or stoneware) and the thickness of wall. The results obtained have been tabulated.

W. O. E.

**Present status of oenological research.** L. SEMICHON. *Rev. vit.* 69, 309-13, 329-33, 348-50, 405-11(1928).—A review of the previous accomplishments and present status of oenological research in France, especially with respect to legal and regulatory improvements, oenotechnic, microbiology, physiology and chemistry involved in the production of grapes and the manuf. of wines.

K. S. MARKLEY

**The nitrogen question [in brewing].** J. H. OLIVER. *J. Inst. Brewing* 35, 191-200 (1929).—The amt. of sol. nitrogenous compds. in a wort made by mashing malt at approx.  $67^{\circ}$  increases as the concn. of the mash becomes greater and as the diastatic activity of the malt becomes higher. The N content of the wort is also augmented by the acidification of the mash, but the results under conditions of thick mashing, such as brewery mashers, are not so marked as with the  $10\%$  lab. mash (thin mashing), since the increased concn. of the salts and proteins of the thicker mashers exerts a greater buffering effect. The maltose content of the wort tends to be similarly influenced by the concn. of the malt mashers.

B. C. A.

**Studies on the significance of the hydrogen-ion concentration in distillery processes.**

III. W. DIEHAIR AND K. SICHERT. *Biochem. Z.* 210, 286-95(1929); cf. *C. A.* 23, 1985.—A  $pH$  3.9 is most favorable in the prepn. of the yeast fermentation mass, so that the added acid must be adjusted accordingly.

S. MORGULIS

**An investigation of cane molasses distillery slop, with special reference to certain organic acids.** E. K. NELSON AND C. A. GREENLEAF. *Ind. Eng. Chem.* 21, 857-9 (1929).—The slop had the following analysis: solids [in vacuo at  $100^{\circ}$ ] 51.22%, ash 12.65,  $CaO$  1.78,  $MgO$  0.47,  $Fe_2O_3$  and  $Al_2O_3$  0.15,  $Na_2O$  0.38,  $K_2O$  5,  $Mn_2O_3$  0.015,  $SiO_2$  0.10,  $P_2O_5$  0.21,  $SO_3$  0.37,  $Cl$  2.17,  $N$  1.43, ammonia  $N$  0.06, amino  $N$  0.3, pentoses 1.11, reducing substances 4.63. The volatile acids were acetic 0.9%, formic 0.3. The non volatile acids were succinic 0.5%, tricarballic about 1%, lactic 3, a small quantity of aconitic and a trace of citric. 0.6% glycerol was extd. Attempts to identify carbohydrates by means of  $C_6H_5NHNH_2$ , acetylation and pptn. with ammoniacal  $Cu$  were not successful.

C. N. FREY

**Mash distillation apparatus.** R. HUEBNER. *Apparatchau* 41, 124(1929).

M. C. ROGERS

**Preliminary heating of grapes used in fermentation of Burgundy wines.** I. FERRÉ. *Rev. vit.* 69, 5-11, 21-9(1928).—The incoming, whole grapes are heated to, and maintained at, a temp. of  $80^{\circ}$  for 4 to 5 min. by means of a portion of the must, which is preheated to a temp. of  $95^{\circ}$  to  $100^{\circ}$ . The must, after its use as a heat exchange medium, is returned to a heating reservoir and the grapes are mechanically removed and allowed to cool prior to pressing. Chem. analysis as well as color, bouquet and mellowness indicate that the wine made from grapes thus treated is superior to wine from untreated grapes.

K. S. MARKLEY

**Phosphates in wine-making.** H. ASTRAC. *Rev. vit.* 69, 165-70(1928).— $N$  and  $P$ , which are essential nutrients of the yeast during fermentation, are supplied as  $(NH_4)_2H_2PO_4$ , which in soln. and in conjunction with the added  $SO_2$  gas or bisulfites forms the triammonium salt.  $(NH_4)_2HPO_4$ , although now actually manufactured in Germany, is too unstable to be handled commercially.  $(NH_4)_2HPO_4$ , although available, is not used primarily because the wine-maker is ignorant of its existence and of its superior value and because it is more profitable for the chem. houses to supply the mono-salt. A. maintains that the wine-maker should be educated to specify the di-salt, which the chem. houses are willing to supply, if there is a sufficient demand for it.

K. S. M.

**The use of phosphates in wine making.** LUCIEN SEMICHON. *Rev. vit.* 69, 101-4 (1928).—S. discusses the use of  $NH_4$  phosphate either alone or mixed with sulfurous solns. in the making of wine, with particular reference to its effect upon the acidity, colloid and pectin content of the wine, yeast nutrition, zymase activity and intermediate products of the fermentation process.

K. S. MARKLEY

**Wine distillates and brandies.** E. RUFFIN. *Z. Untersuch. Lebensm.* 57, 243-4 (1929).—On theoretical considerations based on the law of Guldberg and Waage,

unadulterated wine brandy may contain much less than 100 mg. of ester in 100 cc. of alc. This is contrary to the findings of Büttner and Miermeister (*C. A.* 23, 2241). The necessity for tasting tests in evaluating these products is emphasized. C. R. F.

**Examination and evaluation of wine distillates and wine brandies.** H. WÜSTENFELD AND C. LUCKOW. *Z. Untersuch. Lebensm.* 57, 242-3 (1929).—Contrary to the findings of Büttner and Miermeister (*C. A.* 23, 2241), the necessity of tasting tests in evaluation of still wines and their distn. products is emphasized and the fixing of min. values is considered undesirable. The value of analytical data is admitted in conjunction with tasting tests on the individual fractions obtained by rectification. C. R. F.

**Sterilization of wine.** A. HUBERT. *Rev. vit.* 69, 333-6 (1928).—A discussion of the value of pasteurization, filtration and centrifuging as a preventative of "sickness" in wines made from grapes which have suffered from mildew, scale insect and hail injury. K. S. MARKLEY

**Metals in connection with wort and beer.** C. G. MATTHEWS. *J. Inst. Brewing* 35, 181-8 (1929).—The use of an Fe yeast press may introduce iron into the barm ale and give rise to an astringency. This tends to produce later an iron haze and an undesirable color when the barm ale is added to the brew in the fermentation vessel. Zn or galvanized containers dissolve in appreciable amt. and produce an unpleasant metallic effect on the palate. Cu can be safely used for mashing vessels, but may be corroded by fermenting worts with a consequent reduction in the amt. of yeast reproduction. The corrosion is more intense when the metal is scoured than when it is simply mopped over and allowed to form a natural film of oxide or sulfide. Cu, especially when of high purity, may become pitted at points where particles of foreign substances are situated, and which det. small galvanic cells. Cu alloys, such as gun-metal, are less subject to this action. Al of 99% purity is superior and is hardly attacked by fermenting wort, but is corroded by prolonged contact with water. Al vessels should, therefore, be kept dry if they have to remain empty for any length of time. Sn, which is seldom pure, is affected by drastic methods of cleansing and is likely to produce hazes. Stainless steel, Monel metal and, to a smaller extent, pure Ni appear suitable for all types of brewing vessels, but are relatively dear compared with Cu and Al. Although there is a tendency for a protective coating to form, pure Pb piping is attacked by beer. Pb alloys contg. 15% Sn are much more resistant. B. C. A.

**Studies on yeast fermentation under high gas pressures.** R. LIESKE AND E. HOFMANN. *Biochem. Z.* 210, 448-57 (1929).—At room temp. yeast fermentation ceases when the pressure of the formed CO<sub>2</sub> reaches 38-40 atm. At that point 1 mol. CO<sub>2</sub> per l. has been formed and about 40 g. alc. It is suggested that the inhibition of the fermentation is due to an accumulation of CO<sub>2</sub> and alc. If the yeast fermentation is allowed to proceed at an initial pressure of 90 atm. there is no effect observed, and even under 1000 atm. the fermentative process proceeds normally to about 50%. S. M.

**Effect of various preparations on the growth of bakers' and brewers' yeasts.** ROGER J. WILLIAMS, MARION E. WARNER AND RICHARD R. ROEHM. *J. Am. Chem. Soc.* 51, 2764-73 (1929). Six strains of yeasts (3 bakers' and 3 brewers') all showed a very marked stimulation of growth when varying quantities of yeast exts. were added to anaerated synthetic medium. All the yeasts failed to show an "optimum" concn. of yeast ext. either when an 18-hr or a 48-hr growth period was used. In every case when toxic materials were not present the largest crops were obtained when the most ext. was added. It appeared that a short growth period (18 hrs.) in most of the strains studied is much more easily adapted than a 48-hr. period for quant. studies on yeast nutrients, as in case of the latter, a very small dosage of active material may produce an inordinately large and irregular increase in the yeast crop. In spite of the uniformities noted above, each of the several different strains of yeast (so-called *Saccharomyces cerevisiae*) reacts more or less distinctively toward different "bios" preps., indicating possible deep-seated differences in the metabolic processes. The results show that the most concd. fraction (adsorbable by fuller's earth<sup>b</sup>) in conjunction with the unadsorbed residue stimulates 2 of the yeasts markedly, 0.00005 mg. effecting yeast no. 578, and has a varying though definite effect on the others. The same prepn. has little effect on 1 or 2 of the yeasts tested and uniformly has little effect on any yeast unless the "unadsorbed residue" is also present. The dosage indicated above is much smaller than that used by any other investigator. The effect of "α-bios" and "β-bios" and that of inositol on the 6 yeasts tested are of a lesser order and involve the presence of relatively large amounts of the substances, indicating that such activities as these preps. possess may be due to occluded or adsorbed impurities. C. J. WAST

The waste from [breweries] in Pommern (MÖLLER) 14. A method for determining the soundness of grain (MOHS) 12. Biology of *Sarcina* (FUCHS) 11C. Comparative bacteriological examination of American and Mahren barley (BERMANN, WERTHEIM) 11C. Pasteurizing apparatus (Ger. pat 480,028) 1.

**Fermentation.** ALFONS KRZYKAWSKI. Ger. 471,793, Nov. 1, 1927. Preps. are obtained from animal organs such as the heart and liver by fermenting with yeast.

**Refining alcoholic liquids containing wort and perfume.** I. G. FARBENIND. A.-G. (Eugen Bernhard and Albert Meyer-Küster, inventors). Ger. 479,728, Oct. 13, 1925. The liquids are subjected to the action of rapidly moving surfaces.

**Butyl acetonic fermentation of carbohydrates.** M. C. WHEELER and C. DEL. GOODALE (to Commercial Solvents Corp.). Brit. 306,138, Feb. 17, 1928. Fermentation is effected in a continuous manner in a series of connected fermenters while adding fresh mash to the first and removing fermented mash from the last fermenter of the series and transferring partially fermented mash from each preceding into the next succeeding fermenter. Various details of procedure are described.

**Gluconic acid.** HORACE T. HERRICK and ORVILLE E. MAY (to Government and People of U. S. A.). U. S. 1,726,067, Aug. 27. An aq. suspension or soln. of carbohydrate material such as starch, glucose or sucrose is inoculated with spores and mycelium of fungi such as *P. citrinum*, *P. divaricatum* and *P. luteum purpurogenum* for gluconic acid production.

**Yeast.** ALFRED POLLAK. Ger. 480,076, April 12, 1922. See U. S. 1,877,520 (C. A. 22, 3259).

## 17—PHARMACEUTICAL CHEMISTRY

W. O. EMERY

**Extracts of medicinal plants in pharmaceutical preparations.** F. DI STEFANS. *Ann. chim. anal. chim. appl.* 19, 107-9 (1929).—In many drugs where an ext. is called for the pulverize drug may be used. To det. whether this has been the case, has been difficult in most cases. However, the ext. contains only the active principle, whereas the drug itself contains the cellulose-bearing cellular structure, which can thus be used as an indication of the use of the pulverized drug. The cellulose was detd. by J. König's (*Chemie der Menschlichen Nahrungs und Genussmittel*, Vol. III, part 1, p. 453 (C. A. 14, 2040)) method. The content of cellulose of several common drugs is given. The technic followed is: Treat 3-4 g. of the substance with sulfolglycerol reagent (pure glycerol contg. 20 g. concd.  $H_2SO_4$  per l. and allow to digest in a Kjeldahl flask  $1\frac{1}{2}$  hr. Then cool to about 90° and add 100 cc. boiling  $H_2O$ , and filter through an alundum crucible, wash the residue with  $EtOH$  and  $Et_2O$ , then dry, place in a crucible and add 4-5 cc. of Schweizer's reagent, draw off the liquid after 5 min. by means of a suction filter and wash the residue with  $H_2O$ . Place the filtrate in a test tube and add dil.  $H_2SO_4$ . A flocculent ppt. indicates the presence of cellulose in the original drug. A. W. CONTIERI

**A dictionary of essential oils.** ANON. *Perfumery Essential Oil Record* 20, 322-32 (1929). E. J. C

**Assay of citronella.** FRANCIS D. DODGE. *Am. Perfumer* 24, 11 2 (1929). A method accurate enough for most technical purposes is the following: Into the usual cassia flask contg. 5 cc. sulfite soln. (about 33%) introduce 10 cc. of the sample (lava oil) contg. 30-40% aldehyde, shake well, then add 2 to 5 cc. 10% bisulfite soln. (free from  $SO_2$ ). Again shake thoroughly until the mixt. becomes soapy and shows a persistent froth. When this point is reached continue the addn. of bisulfite until 50-60 cc. have been used. The mixt. now contains the aldehyde addn. compd. partly as ppt. in a soapy soln. The ppt. gradually dissolves on standing and yields a nearly clear soln. with a supernatant layer of oil. When the soapiness no longer persists, fill the flask with bisulfite soln. Standing overnight or gentle heat will clarify the oil. For oils contg. more than 50% aldehyde more bisulfite will be required. For oils likely to be low in aldehyde, as the Ceylon product, the exptl. error is likely to be greater, in which case titration with phenylhydrazine may be more satisfactory. W. O. E

**Tinctura quillajae.** K. A. KARSMARK and L. KOPLER. *Arch. Pharm.* 267, 424-3 (1929).—Tinctures prepd. with spiritus dil. or tenuis contain about 5 times as much saponin as those made with concd. spirit. Tinctures made with spiritus tenuis less sediment than those with dil. spirit. For the prepn. of liquor carbonis detergens a tincture with dil. spirit is preferable. W. O. E

**Polarimetric drug investigations.** E. SCHROFF. *Süddeutsche Apoth. Ztg.* 69, 496-7, 504-6(1929).—A discussion of the reasons why estn. of the optical activity of drugs should be carried out wherever possible in the apothecary's lab. W. O. E.

**Decomposition of pharmaceutically important alkaloids in aqueous solution, especially on sterilization: solanaceous alkaloids, yohimbine, hydrastine and hydrastinine.** R. DIETZEL, F. SCHLEMMER AND R. FISCHER. *Arch. Pharm.* 267, 468-84 (1929).—Examn. of the spectra of atropine, hyoscyamine and scopolamine immediately after soln. in  $H_2O$  (concns. of 1, 0.1 and 0.001%) and after 1 hr. sterilization in steam, and comparison therewith of the spectra of tropic acid and of tropine show that the character of such spectra is detd. largely through the tropic acid and that such changes as were observed are apparently due to this acid. It was not, however, possible from the methods followed to det. the exact nature of the changes. Similar treatment of yohimbine, hydrastine and hydrastinine showed marked decompn. in the 2 former alkaloids, while hydrastinine proved to be a relatively stable substance. The results are graphically represented. W. O. E.

**Radiation in connection with essential oils and perfumery chemicals.** R. A. MORTON. *Perfumery Essential Oil Record* 20, 258-67(1929).—The importance of radiation to chemistry in general and to essential oils and perfume chemicals in particular is discussed. In this connection recent work on the photochem. production of vanillin from isoeugenol and eugenol is considered along with the photochemistry of certain essential oils, notably of wintergreen, almond, clove, pimento, thyme, cinnamon and cassia, celery, coriander, mustard, sage, sassafras and lemon. A bibliography of absorption spectra is appended. W. O. E.

**Vitamins and other constituents of citrus oils and related products.** STANLEY G. WILLIMOTT. *Perfumery Essential Oil Record* 20, 270-5(1929).—An exptl. study with comments on earlier work on the microscopic characters, origin of the constituents of citrus fruits, changes in acidity during ripening, vitamins of citrus products, European work, pigments and vitamin A, factors affecting vitamins in citrus fruits, citrus seed oils and other by-products. A bibliography is appended. W. O. E.

**Transparent emulsions of some essential oils.** WILLET F. WHITMORE AND RICHARD E. LINEHAN. *Ind. Eng. Chem.* 21, 878-80(1929).—Transparent emulsions can be prepd. by equalizing the refractive indices of the 2 phases at the same temp. Gelatin is the most efficient of the peptonizing agents examd., while gum arabic ranks 2nd; agar-agar and tragacanth proved unsatisfactory. The problem of graining may be solved by employing a mixt. of 2 pts. invert sugar and 1 pt. sucrose instead of straight invert sugar in the dispersion medium. The colloid mill is indispensable in the prepn. of the dispersion. W. O. E.

**Experatol.** W. WAGNER. *Pharm. Ztg.* 74, 1038(1929).—An aq. soln. of formalin 1, potash alum 8 and pine needle ext. 10%.

**Nicotine in tobacco.** A. HEIDUSCHKA AND F. MUTH. *Pharm. Zentralhalle* 70, 517-20(1929); cf. *C. A.* 22, 2800. Addnl. data are presented showing the amts. of nicotine in the smoke of a great variety of tobaccos, cigars and cigars. W. O. E.

**Succus juniperi inspissatus.** H. VALENTIN. *Pharm. Ztg.* 74, 1049-53(1929).—A large no. of com. and otherwise specially prepd. exts. have been examd. and the results obtained tabulated. W. O. E.

**Evaluation of aluminum acetate via the D. A.-B. 6.** H. LEPKE. *Pharm. Ztg.* 74, 1036-7(1929).—The examn. of a sample recently submitted is described. W. O. E.

**Evaluation of aluminum acetate via D. A.-B. 6.** FREITAG. *Pharm. Ztg.* 74, 1079-80(1929).—A commentary on the recent paper by H. Lepke (preceding abstract). W. O. E.

**Practical pharmacy. Impurities in aqua destillata.** HERMANN KUNZ-KRAUSE. *Apoth. Ztg.* 44, 1046(1929). A case is cited of an accidental contamination ( $PbSO_4$ ) of distd. water intended for soln. of KI. W. O. E.

**Tinctura hemostyptica, D. Ap.-V. 4.** WALTER MEYER. *Pharm. Ztg.* 74, 1037 (1929); cf. *C. A.* 23, 608. This ergot prepn. sponsored by the Ger. Pharm. Assoc. was found to possess little or no activity. W. O. E.

**Tinctura hemostyptica.** W. DENSEL. *Pharm. Ztg.* 74, 1021-2(1929).—A discussion of the prepn. as originally developed by Densel during the period of 1880-90. It is shown to be different from that sponsored by the Ger. Pharm. Assoc. and to which reference was made by W. Meyer (preceding abstract). W. O. E.

**Mercury salve.** RICHARD HOLDERMANN. *Pharm. Ztg.* 74, 1097(1929).—A procedure is outlined for prepg. this medicament variously termed: unguentum hydrargyri cinereum precipitatum and precipitated gray mercury salve. The pptn. of the Hg is best effected by treatment of  $HgCl_2$  in intimate suspension in vaseline oil, with alkaline

formalin. After washing the ppt. it is incorporated with the base, a mixt. of paraffin, vaseline and wool fat. W. O. E.

**Tablet manufacture.** F. GRAF. *Pharm. Ztg.* 74, 1066-7(1929).—A commentary on certain operations in the manuf. of medicated tablets. W. O. E.

**Production of sulfur oil.** F. CHERNITZUS. *Pharm. Zentralhalle* 70, 501-2(1929).—The manuf. of sulfur oil (distn. of the shale, refining and sulfonation of the distillates) of the ichthyol type is described. W. O. E.

**Detection of diethyl phthalate in spirit.** HENRYK SZANCER. *Pharm. Zentralhalle* 70, 502-3(1929).—A modified form of the Utz method is employed. Thus, a few drops of the brown reaction mixt. ( $\text{H}_2\text{SO}_4$  + sample + resorcinol) are added to about 500 cc. distd.  $\text{H}_2\text{O}$ , well mixed therewith, then treated with a few drops of official  $\text{NH}_4\text{OH}$  soln., whereupon the upper layer of liquid begins to fluoresce if diethyl phthalate is present. W. O. E.

**New method for the identification of true pine-needle extract, as also the calculation of the quantities of gas in bath preparations.** H. UHLMANN. *Süddeutsche Apoth. Ztg.* 69, 483(1929).—Dil. 1 drop of the sample in question in a test tube until just colorless and add a few drops of strong KOH or  $\text{NH}_4\text{OH}$  soln., whereupon the upper layer of a true ext. acquires a greenish brown color, which persists throughout the entire liquid on shaking. In further examn. prep. an exact 10% soln. of the ext., then shake 5 cc. thereof with a like amt. of  $\text{Et}_2\text{O}$ , and add 90% alc. (about 4-5 cc.) until the liquid seps. into 2 layers. On the addn. of a few drops of  $\text{NH}_3$  soln., the ethereal layer will (depending on the purity of the ext.) become dark to light green. Bark ext. colors brown, pure sulfite lye scarcely brown or not at all. Reasons for the appearance of this reaction are withheld for the avowed protection of honest manufcs. For the calcn. of gas quantities, a typical case (perborate) is given in detail. W. O. E.

**Pine-needle extract and pine-needle bath extracts.** P. BOHRISCH. *Pharm. Ztg.* 74, 1078-9(1929); cf. C. A. 23, 2245.—A discussion, notably in reference to the recent article of like title by Rojahn (C. A. 23, 4769) Appended thereto is a reply by Rojahn. W. O. E.

**Estimation of cinchophen in admixture with salicylic acid, acetylsalicylic acid and hexamethylenetetramine.** E. SCHULEK AND G. VASTAGH. *Pharm. Zentralhalle* 70, 533-7(1929).—The method of sepn. is based on the difference in soly. of cinchophen and salicylic acid (and aspirin, resp.) in water. The technic being somewhat involved, reference should be had to the original for a clear understanding of the various steps followed in effecting soln. and sepn. of the 2 acids involved, leading to the estn. of cinchophen. W. O. E.

**New salve base.** A. KARSTEN. *Pharm. Presse* 34, 365 6(1929).—The patented product in question called "Iegin" is a neutral ester closely related to the natural fats. It is wax-like, m.  $57^\circ$  and yields with 10 vols. of  $\text{H}_2\text{O}$  at  $70^\circ$  an immediate inseparable emulsion, stable even at the temp. of boiling  $\text{H}_2\text{O}$ . It is miscible with fats, oils, glycerol, aces., mucilage,  $\text{CH}_2\text{O}$ ,  $\text{TiO}_2$ , S, tar, alkali, etc., but not with electrolytes as NaCl, borax, salicylic acid, etc. It is recommended as a base for cold creams. W. O. E.

**Galénicals, their preparation, sophistication and value.** W. PEYER. *Süddeutsche Apoth. Ztg.* 69, 487-9, 493-5, 501-4(1929).—An address. W. O. E.

**Evaluation of pepsin and pepsin wine.** G. BÜMMING. *Apoth. Ztg.* 44, 904-6(1929).—A critical review of the official Ger. methods of standardization and evaluation, with some suggestions for their improvement. W. O. E.

**Different methods for the evaluation of pepsin.** W. BRANDRUP. *Apoth. Ztg.* 44, 993(1929).—Certain methods are discussed with particular reference to their suitability for the apothecary lab. Among those recommended for this purpose are (1) formal titration *via* Sørensen; (2) alkalimetric titration in alc. soln. *via* Willstätter and Waldschmidt-Leitz; (3) estn. of amino N *via* van Slyke; (4) Kjeldahl method combined with either one of the preceding. W. O. E.

**New medicaments and pharmaceutical specialties during the second quarter of 1929.** F. ZERNIK. *Süddeutsche Apoth. Ztg.* 69, 509-11(1929); cf. C. A. 23, 4297. A commentary. W. O. E.

**Isobutyric acid esters in perfumes.** ALFONS M. BURGER. *Riechstoffind.* 3, 16-8. *Chem. Zentr.* 1928, I, 2498.—Many fruit odors are due to isobutyric acid esters. The esters are widely used in the perfume industry. No new data are presented. C. R. F.

**Lavender.** ALBERT ELLMER. *Riechstoffind.* 3, 43-4, 56-7, 69-70, 82-3, 92-4. *Chem. Zentr.* 1928, I, 3005.—The manuf., properties and uses of lavender oil are outlined. Most of the oil originates in France, Spain, Italy and England. The oil is obtained by extn. with petroleum ether followed by steam distn. The usual yield

ein) as the indicator, until the violet soln. becomes colorless. One cc.  $N H_2SO_4 = 0.054$  g.  $Al(OH)(OAc)_3$ .

**An incompatibility of hydrogen peroxide.** M. SCHOOPS AND M. BOHRT. *Bull. acad. roy. méd. Belg.* [5], 9, 254-6 (1929).—On mixing one part of  $Me_2CO$  with 3 parts perhydrol (30%  $H_2O_2$ ) contg. 0.2%  $H_2SO_4$ , a white cryst. product is formed, which, under slight friction, violently detonates. It is insol. in  $H_2O$ , sol. in org. solvents; in dil.  $H_2SO_4$  it liberates I from KI; heated with dil. acids it disengages  $Me_2CO$ ; m. p. 92-7°. The authors believe it to be the triacetone cycloperoxide (*Ber.* 28, 2265 (1895)):

they warn against the danger thus presented by the mixt. of  $Me_2CO$  and acid  $H_2O_2$ .

**L. Braemer.** J. E. GEROCK; F. JADIN. *J. pharm. Alsace Lorraine* 55, 297-314 (1928).—Biography, with portrait, and list of publications; transactions anent B.'s retirement from the faculty of pharmacy, Strasbourg.

**Emile Reeb, 1843-1928.** J. E. GEROCK. *J. pharm. Alsace Lorraine* 56, 15-26 (1929).—Obituary, with portrait, and list of publications.

**Professor Louis Gautier (1878-1928)** Strasbourg. ANON. *J. pharm. Alsace Lorraine* 56, 26 (1929).—Brief obituary.

**A new molybdenum compound, the phospho-ceruleomolybdic conjugate of Denigès.** G. DENIGÈS. *Pharm. Acta Helv.* 3, 52-6 (1928).—Reply to Verda (*C. A.* 22, 2121). Results of new expts. with very many inorg. and org. reducing agents confirm D.'s original contention. V.'s failure to obtain an  $Et_2O$ -sol. blue compd. *A* in all cases is ascribed to his use of  $HNO_3$  instead of  $HCl$  or  $H_2SO_4$ . Reply. A. VERDA. *Ibid.* 56-9.—Admitting the merit of D.'s discovery, V. believes the conclusions to be too general. Formation of *A* depends on certain conditions of medium, acidity, absence of certain salts, e. g., of Hg, and the choice of reducing agent. Thus, the intensely blue color obtained with a not too concd.  $HNO_3$  soln. of Na phosphomolybdate by means of Zn dust is not sol. in  $Et_2O$ , while the same soln. reduced with Sn, Al or Cu yields *A*. The instability of *A* does not seem to depend so much on phenomena of oxidation as on those of hydration.

**The evaluation of rhubarb.** A. TSCHIRCH AND PAUL SCHMITZ. *Pharm. Acta Helv.* 3, 88-92 (1928).—The chem. evaluation of rhubarb giving comparable results is based on the detn. of (a) free anthraquinones (*A*), (b) total *A*, (c) *A* plus anthranols (anthrone). To det. *a*, leave air-dried powd. rhubarb in contact with slight excess of 0.1 *N* KOH for 24 hrs., and after diln. with  $CO_2$ -free  $H_2O$  titrate back with 0.1 *N* HCl, the drug color being the indicator changes from red to yellowish pink. To det. *b*, saponify the rhubarb by gently boiling for 1 min. with slight excess of 0.1 *N* KOH after 1 hr., titrate back with 0.1 *N* HCl. To det. *c*, add to powd. rhubarb perhydrol of known acidity; after 30 min. add 0.1 *N* KOH in slight excess, allow the corked vessel to stand for 23 hrs., add  $H_2O$ , boil for 1 min. and after 30 min. titrate back to light yellow. The limits suggested for *a*, *b* and *c* in terms of chrysophanic acid,  $C_{15}H_{10}O_6$ , are (a) 3.7-5.7%, (b) 4.23-8.56%, (c) 6.34-9.94%. These methods applied to 21 samples of rhizomes and roots of *Rheum palmatum* and *R. tanguticum* cultivated in Switzerland (cf. *C. A.* 18, 1365) and to 12 recent and 6 old samples of Chinese rhubarb for comparison gave the following av. results: Swiss: *a* 4.45, *b* 5.42, *c* 8.23%; Chinese, recent: 3.95, 5.83, 8.02%; old: 3.21, 4.69 and 7.29%. These results and the favorable physiol. test prove that rhubarb transplanted from Tibet-China and cultivated in Swiss valleys has an activity equal to that of the Chinese drug.

**Precipitation of carbohydrates and glucosides by alkaloidal precipitants.** J. ROSENTHALER. *Pharm. Acta Helv.* 3, 93-6 (1928).—The behavior of starches (0.4% paste), dextrin (10%), glycogen (0.5%), inulin (1, 10%), sugars, gum arabic (10%), tragacanth (0.5%), agar (0.25%), mucilages of Irish moss, flaxseed, marshmallow, squill, etc., toward  $HBr-Br$  (resp. 25-10%) (*B*), tannin (1%) (*T*), silicotungstic acid (10%) (*S*) and phosphomolybdic acid (*P*) is recorded. No ppts. are produced with inulin and sugars. Starches ppt. with *B*, *P* and *S* and become turbid with *T*; dextrin clouds with *T* at once, slowly with *B*, ppts. with *S*; agar faintly clouds with *T*, strongly with *B* and ppts. with *P* and *S*; flaxseed is pptd. with *T* and *S*, not pptd. with *B* and *P*. Of glucosides, arbutin, Me arbutin, salicin, coniferin and esculin, loganin, amygdalin and linamarin gave no ppts. A 5% aloin soln. was pptd. by *P* and *S*. The complex glucosides, e. g., convallamarin, digitalin, gitalin, strophanthin (Merck), are pptd. by *T*, *P* and *S*; purest *Gypsophila* saponin is pptd. by *P* and *S*, not by *T* or *R*.

With starches, a chem. explanation of the cause of pptn. is possibly the basic character of the bridging O in their mol., especially when the relative no. of "acid" OH groups in the mol. is diminished by polymerization, as in maltose anhydride (Karrer, C. A. 16, 1748).

**A peppermint oil from Canton Ticino.** L. ROSENTHALER. *Pharm. Acta Helv.* 3, 101-3(1928).—A sample from Capolago, of excellent quality in odor and tastes, met the Pharm. Helv. IV requirements, except that the menthol content was 47.8% instead of 50%. R. suggests that the future Pharm. Helv. omit the color tests for this oil, and instead adopt a value for  $[\alpha]_D^{20}$ ; this oil showed  $-22.42^\circ$ ; the Ger. Pharm. requires  $-20^\circ$  to  $-34^\circ$ . R. hopes that the menthol content can be raised to 50% by cultivation; if not, the Pharm. Helv. should adopt a min. standard of 47.5% so as not to exclude an excellent native oil from use in Swiss pharmacy.

**Pharmaceutical notes from Canton Ticino.** HARTMANN-RORDORF. *Schweiz. Apoth. Ztg.* 66, 513-7(1928).—A report on plantations of peppermint (cf. Rosenthaler, preceding abstr.), atropa belladonna, datura metel, etc., grown at Capolago, the local Expt. Sta. cooperating. An account is also given of the near-by mines of *ichthyl slate* and its local mfg. treatment. Cf. C. A. 19, 3556.

**Experiences with vioform and vioform gauzes in the Swiss army.** J. THOMANN. *Pharm. Acta Helv.* 3, 112-7(1928).—Vioform (cf. C. A. 8, 987, 2218; 21, 2050) has been successfully used in place of CHI<sub>3</sub> in the Swiss army since 1904, and is official in Pharm. Helv. Examn. of 5 old samples of vioform gauze (1904-1915) showed on drying at 103° 4.5-5.0% H<sub>2</sub>O and a vioform content of 4.60-4.80% (required 4.5-5.5%). All the samples had kept their sterile quality. To det. vioform in gauze, exhaust 2-3 g gauze in a Soxhlet app. with 0.5 N alc. KOH. dil. with 4 times the vol. of H<sub>2</sub>O and carefully neutralize with HNO<sub>3</sub>; added drop by drop; collect the pptd. vioform on a tared filter, dry at 90° and weigh. A list of 17 references is given.

**Galenic preparations of gentian root.** CH. BÉGUIN. *Pharm. Acta Helv.* 3, 117-22, 123-8(1928); cf. *Ibid.* 2, 196-206(1927) and C. A. 22, 1439.—A preliminary report on large-scale cooperative expts (cf. C. A. 22, 1215; *Pharm. Acta Helv.* 2, 227-8(1927)). In detg. whether stabilization was successful, the presence of (H<sub>2</sub>O-sol.) *gentiopicric acid* (A) in the exts. was testd. for by decompn. with emulsin by applying to the resulting (H<sub>2</sub>O-insol., EtOH-sol.) white, crystd. *gentiogenol* (B) the color test with H<sub>2</sub>SO<sub>4</sub> (C. A. 5, 3877). The blue color is not obtained with the brown, amorphous B resulting from acid hydrolysis of A. The test was strongly pos. in all exts. prepd. with boiling EtOH from *fresh roots*; it was neg. after pulping the root; pulping thus leads to a rapid, total destruction of A. Expts. with dried roots treated with boiling EtOH showed that roots dried rapidly (at 50-60°) gave a pos. test; those dried slowly (30-40°) gave a feeble or neg. reaction. Strangely, the whole root stabilized with alc. vapors no longer contained A, but when the root was cut transversely before stabilizing, the test was feebly pos. Suggestions for adoption and testing of stabilized exts. of Gentian in Pharm. Helv. are submitted. A list of 27 references is appended.

**Second international European Congress in Budapest on cultivation of medicinal plants.** H. FLÖCK. *Pharm. Acta Helv.* 3, 130-4(1928).—A report, including the mfg. treatment for paprika; also reference to extn. of *opium alkaloids direct from the whole, fresh poppy plant* by suitable solvents and subsequent purification. Details are thus far unknown.

**New method of extraction of ergot of rye.** H. GOLAZ. *Pharm. Acta Helv.* 3, 135-40(1928).—From defatted ergot successively ext. first the alkaloidal bases with Et<sub>2</sub>O (after treatment with NH<sub>4</sub>OH), then the amino bases; after titration both are converted into tartrates. Their combination will yield either a *fluid ext.* making a clear 1:1 mixt. with alc. or H<sub>2</sub>O (1 cc. of fluid ext. contg. 0.001 g. of total bases, equiv. to 1 g. defatted ergot) suitable for ingestion or injection; or a *dry ext.* (1 g. contg. 0.01 g. bases); or a *soln. of alkaloidal tartrates* may be prepd. (1 cc. contg. 0.001 g. alkaloids). The processes of extn. are given in minute detail. To insure completeness of extn. of the alkaloids, the ergotoxine color test is applied (cf. C. A. 21, 3710); similarly in extg. the amino bases, a *color scale* is used prepd. by dissolving, resp., 0.2, 0.4, 0.6, 0.8 and 1 mg. of the tartrate of synthetic *p*-(OH)C<sub>6</sub>H<sub>4</sub>CH<sub>2</sub>CH<sub>2</sub>NH<sub>2</sub> in 5 cc. H<sub>2</sub>O, adding 15 drops of Millon's reagent and boiling for 15 seconds. The amino bases are extd. with soln. of tartaric acid in 10% alc.; then the inert coloring matters and acid resins that are partly toxic are pptd. with 95% EtOH. The biol. acidity of the fluid ext. is adjusted to  $p_H = 4.5$  to about 4.8. The clinical tests of these preps. at Lausanne were very satisfactory, proving also that the synergic action of alkaloids and titrated amines, accompanied by mineral substances, etc., is not entirely analogous to the activity of an isolated alkaloidal salt.

**The oxidizing enzymes of gum arabic.** A. TSCHIRCH AND H. FLÜCK. *Pharm. Acta Helv.* 3, 140-6(1928).—The reagents best adapted for qual. and approx. quant. tests for oxidase and peroxidase in gum arabic are: (A) a 5% abs. alc. ext. of *guaiac wood*, (B) a 1% aq. soln. of *p*-phenylenediamine and (C) a 1% alc. benzidine soln. To 5 cc. of a 1% aq. gum soln. add 0.2 cc. of 3%  $H_2O_2$  (omitted in tests for oxidases), then the reagent (A 0.1 cc., or B and C 0.2 cc.); at the end of 10 min. observe the color, which is blue in A, violet to dull cherry-red with B, sky-blue and greenish blue lasting 10 min. with C, then changing to dull violet and grayish green. The results of the examn. of 10 samples are tabulated; intensities (marked by multiple +) are based on the weakest color in any series examd. The peroxidase reactions are faster and stronger than those of oxidase. A differentiates oxidase from peroxidase but poorly; C is not very sensitive towards oxidase, but is sensitive to peroxidase. B is sensitive and differentiates well between these enzymes, but as it colors  $H_2O$  red within 10 min., a blank test is necessary. C undergoes no autoxidation within 10 min. For pharmacopeial use, benzidine or guaiac, in the concns. stated, is recommended. To destroy the enzymes in the gum so as to render it inactive in pharmaceutical mixts., 2 methods are given: (a) Boil the mucilage for 10 min. to 1 hr., then evap.; the solid gives no test with C or A. (b) Pour 1:5 mucilage into 5 vols. of boiling 90% EtOH, then boil for 10 min. Sep. the finely divided gum by centrifuging. It is also neg. to C and A. S WALDBOTT

**Inactivation of the oxidizing enzymes of gum arabic.** H. FLÜCK. *Pharm. Acta Helv.* 4, 58-62(1929); cf. preceding abstr.—With a mucilage of gum inactivated by the 2 methods given, a brown coloration with benzidine was formed in 2 hrs. This color was not caused by oxidation; the gum so inactivated failed to oxidize morphine, as oxydimorphine (Bourquelot, 1903) could not be identified in the liquid sepd. by centrifuging from the few flocks formed. Heating dry gum to 120° (Tschirch) does not completely inactivate it. Viscosity of the mucilage is diminished by boiling the soln.; pptn. with boiling alc., or dry heat at 120° does not affect the viscosity. Addns. are made to the list of drugs attacked by the oxidases of gum arabic (Bourquelot, 1904). A 1 + 10 aq. soln. of gum is mixed with 3 cc. of 1% solns. to be examd.; the test was pos. when discoloration or clouding took place (starting on top.). Pos. tests were obtained with strychnine- $HNO_3$ , hydrastine-HCl, atropine- $H_2SO_4$ , morphine-HCl, codeine-phosphate, ethylmorphine-HCl, diacetylmorphine-HCl, cocaine-HCl, hyoscyamine- $H_2SO_4$ , digitalin, digitoxin and digitalin Merck. Neg. tests were given by caffeine and its citrate, theobromine, theophylline, quinine- $H_2SO_4$ , quinine-HCl, digitonin Merck and digitaligenin Cloetta. As to the min. quantity of  $H_2O$  at which the oxidases of gum arabic are still active, it was found that pill masses contg. 2%  $H_2O$  still show the test with benzidine. S. WALDBOTT

**Contributions to the pharmacchemistry of asafetida.** P. CASPARIS AND M. RAU-MANN. *Pharm. Acta Helv.* 3, 148-50, 163-82(1928).—The primary resin constituent of asafetida is the very unstable, colorless *ferulic ester of asaresinol* (16.57% of the drug). To obtain it, a method similar to that for prepg. ammoniacum (C. A. 22, 2437) was used, modified on account of the presence also of free *ferulic acid* (13.57%). The ester (A) is sol. in  $Et_2O$ , and is readily sapond., e. g., by a 5%  $Na_2CO_3$  soln. in the cold or by a 1% NaOH soln., yielding amorphous *asaresinol* (B) (11.57%), which is insol. in  $Et_2O$ , insol. in  $Na_2CO_3$ , but sol. in NaOH, showing it to be phenolic. A was found stable, however, toward  $(NH_4)_2CO_3$ , which enabled its sepn. from the free acid in  $Et_2O$  soln. B is sensitive to light and air and is the sole constituent of the drug to which its color changes are due. No formula is assigned to it, as it could not be crystd. nor any cryst. compd. be prepd. from it. Although B gives the phloroglucinol-HCl test, it is not coniferyl alc. (cf. C. A. 21, 183), since on oxidation it yields only traces of vanillin. This substance is absent in the fresh drug. The latter also contains 31% of gum insol. in acetone, and 1% of a grayish substance insol. in  $Et_2O$ . Neutral resins (*resene*) and essential oil (Semmler, 1891; 6.7%, Polasek, 1897) constitute 50.1% of the drug. A cryst. *asaresene* A,  $C_{20}H_{32}O_4$ , m. 172°, obtained by fractional pptn. of  $Et_2O$  solns. with ligroin, and cryst. *hydroasaresene* B,  $C_{20}H_{34}O_4$ , m. 155°, obtained by catalytic H addn. under pressure at ordinary temp., were isolated from resene in small quantities. S. W.

**Detection of sterculia gum (Indian tragacanth) in powdered tragacanth.** A. TSCHIRCH AND H. FLÜCK. *Pharm. Acta Helv.* 3, 151-3(1928); cf. Fuller, C. A. 6, 1339. Peyer, C. A. 19, 376 and *Apoth. Ztg.* 40, No. 53(1925).—Since detn. of the acid no (13.4-21.3 for sterculia gum, 2-4 for gum tragacanth) fails to detect less than 15% of admixt., a peroxidase test (cf. Rosenthaler, C. A. 18, 2943; 19, 702) is used by means of which 10% admixt. can be detected with certainty. To 20 cc. of a freshly and cold prepd. 1% soln. of tragacanth add 0.5 cc.  $H_2O_2$  and 0.5 cc. of a 1% alc. benzidine soln. and shake vigorously. Within 15 min., numerous blue flakelets appear if sterculia gum

is present; examn. of 15 samples of pure tragacanth in the same concn. showed at most only 2 flakelets within 15 min.

S. WALDBOTT

**Stabilized cola seeds, and fluidextracts of the stabilized drug.** K. SIEGFRIED. *Pharm. Acta Helv.* 3, 153-4 (1928).—Unstabilized powd. cola (Pharm. Helv. IV) contains 0.6-1% free caffeine; powd. cola seeds stabilized by 15 min. exposure to vapors of hot alc. are pink colored or almost white and contain only 0.05-0.2% free caffeine, which explains the difference in physiol. action between the two. The compn. of the stabilized powder is permanent. The fluidext. of dried unstabilized seed contained 0.2% free caffeine, which increased to 0.3%, but after months was 0.2% again because recombination with tannin had taken place. Fluidext. of stabilized cola had 0.1-0.2% free caffeine and remained unchanged for months. Hence, with fluidexts., differentiation between stabilized and unstabilized seeds used is difficult, although a decided difference in taste exists. Fluidext. prepd. from an Africa-dried cola contained about 1% free caffeine, but this content was permanent because the tannin had become partly insol. through excessive heat in drying.

S. WALDBOTT

**Salves and a new salve base.** H. GFELLER. *Pharm. Acta Helv.* 3, 154-63 (1928).—Historical review and discussion of requirements of a good salve base. *Astra fat* (A) (cf. *C. A.* 18, 2970) is a white, soft, hydrogenated peanut oil in which the I no. due to unsatd. acids is reduced from 95 to about 63. Its manuf. is described in detail. Consts.: fat 100%, H<sub>2</sub>O 0; refraction no. 52.7, sapon. no. 189.8 (1923), Reichert-Meissl no. 0.3, Polenske no. 0.9, I no. 66.6, acid no. 0.3 (0.2), m 39.0°. The fat is odorless, foams with H<sub>2</sub>O and does not become rancid as fast as hog fat (B) or cold cream (C). Salves contg. 10% KI were made with A, B and C; that with A was yellow at once, but the I content remained const. Those with B and C were white, but soon changed color. Addn. of 0.2% of Na<sub>2</sub>S<sub>2</sub>O<sub>3</sub> in each case caused A to remain white for 2 yrs., B and C to turn faintly yellow in 24 hrs., brown-red in 2 yrs. Testing fats A, B and C for rancidity (Tschirch and Barben, *C. A.* 18, 2970) after steam distn., A after 1 yr. showed no aldehydic reduction, faint reduction after 2 yrs.; B and C reduced faintly in 24 hrs., and 30 days, resp., and strongly after 1 yr. Clinical supporting results in dermatology are adduced, and literature of 11 references is appended.

S. WALDBOTT

**Is astra fat a suitable substitute for adeps suillus, Pharm. Helv. IV?** R. MAEDER. *Pharm. Acta Helv.* 4, 56-8 (1929), cf. preceding abstr. —In view of the appearance and keeping qualities of 10 ointments, opodeldoc, etc., of Pharm. Helv. prepd. with astra fat in place of hog lard, the question is answered in the affirmative.

S. WALDBOTT

**Arbutin.** III. L. ROSENTHALER. *Pharm. Acta Helv.* 4, 55-6 (1929); cf. *C. A.* 22, 1824. —Arbutin from 2 samples of leaves of *Arctostaphylos uva ursi* collected in Switzerland at altitudes of 1970 m. and 550 m. contained, resp., 30.9 and 31.3% Me arbutin. This again confirms the contrast in the compn. of Tyrol and Swiss-grown leaves to those growing in Spain and European Northern countries.

S. WALDBOTT

**The hydrocyanic acid question.** XXV. Detection of substances capable of uniting with hydrocyanic acid in hydrocyanic distillates. L. ROSENTHALER. *Pharm. Acta Helv.* 4, 62-3 (1929); cf. *C. A.* 22, 2438. —Distil off the HCN as usual, collect in well-cooled water; dissolve any insol. matter in EtOH and fill up to a definite vol. Then 2 methods are open: (1) Allow to stand for at least 24 hrs. In half the vol. det. total HCN by the Liebig-Denigès method; in the other half det. free HCN by the Volhard method. If combining substances, e. g., BzH, are not present, the 2 results will be identical. (2) In half the vol. det. free HCN at once, in the other half not earlier than after 24 hrs. In the presence of combining substances, the titration value is diminished. By both methods it is shown that the seeds of *Schleicheria trijuga* do not yield a distillate contg. any substance combining with its HCN. The distillate of samples of bitter almonds is titrated in parallel, as a contrasting example.

S. WALDBOTT

**Yeast as a medicament.** WALTER FISCHER. Thesis, Bern, 1927; *Schweiz. Apoth. Ztg.* 66, 343-4 (1928).—Historical notes on the medicinal uses of yeast are given. Yeast had a clinical effect on staphylo and streptomycosis in 80-90% of the cases treated. *In vitro*, no retardation by yeast in the growth of colon bacilli, staphylococci and streptococci could be proved. In cases of clinical treatment where vitamin content is essential, yeast should be administered in as fresh a state as possible; with the main clinical indications for the use of yeast, the state of life of the yeast cell is not essential for therapeutic efficiency.

S. WALDBOTT

**Introduction of biological assay of digitalis into the pharmacopeias.** M. TIFFENBAU. *Int. Pharm. Fed.; Schweiz. Apoth. Ztg.* 66, 465 (1928).—An address, with discussion. T. holds the biol. assay indispensable, a view not shared by Wasicky, who prefers chem. and phys. methods. T. considers the limit of moisture adopted for the

leaf (3%) too rigid, while admitting that 7-8% noted in com. samples render these unstable.

S. WALDBOTT

**The assay of medicinal mildly acting drugs.** WASICKY. *Schweiz. Apoth. Ztg.* 66, 466-9(1928).—Practical tests should be introduced, e. g., for saponin-bearing drugs, e. g., Kobert's hemolytic method (cf. C. A. 22, 478) or a foam test; for mucilage-yielding drugs, viscosity detns.; for bitter substances, tests depending on their chem. nature, e. g., for glucosides, the Bourquelot test; for lactones, lactone titration; for such drugs as *Herba absinthii* or *lignum quassiae*, tasting the bitterness of a dild. ext., with quinine as a standard.

S. WALDBOTT

**Note on recent studies of digitalis.** G. CONCI. *Officina. Schweiz. Apoth. Ztg.* 66, 470-3(1928). (In Italian).—The work of Meulenhoff (cf. C. A. 23, 2533) is reviewed. *Stabilization* of digitalis leaves by means of hot vapors of EtOH caused a notable increase of their activity. A summary is also given of the chapter on digitalis in R. Rapp's *Wissenschaftliche Pharmasie in Rezeptur und Defectur*, Berlin, 1927. S. WALDBOTT

**Action of disinfectants containing formaldehyde compared with that of cresol soap solution.** THOMANN. *Schweiz. Apoth. Ztg.* 66, 491-2(1928).—Exptl. results by Piorowski (*Z. Desinfekt. Gesundh.* 20, No. 9(1928)) on *ipsiform* (liquid K soap with about 15% HCHO and 30% soap) compared with *lysiform* and *liquor cresoli saponatus* (Germ. Pharm.) are recorded. Disinfectants contg. HCHO have an undoubted superiority, e. g., in anthrax (cf. Mueller, C. A. 18, 2788); but P.'s results again confirm the superiority of cresol soap soln. in disinfecting practice.

S. WALDBOTT

**Active principles and "ballast" substances of vegetable drugs.** L. KOFLER. *Schweiz. Apoth. Ztg.* 67, 73-5(1929).—Cinchona bark, rhubarb and opium are given as examples to show that the use of active principles sepd. from ballast is sometimes justified by a special medicinal objective; other objectives may, however, require the use of the whole drug. Often, as with astringent drugs, "ballast" substances are very important. Thus, e. g., tormentilla root contg. 20% tannin is used as an internal astringent. The tannin is liberated very gradually from its firm natural combination with ballast substances, while proprietary products such as tannigen tend to hydrolyze on mere keeping. Saponins often proclaimed as ballast seem to promote resorption of drugs and food (e. g., C. A. 21, 449). K. reports on expts. of fattening hogs by the aid of saponin (C. A. 22, 997). As a rule, a vegetable drug or its pharmacopeial prepn surpasses the corresponding specialty "freed from ballast."

S. WALDBOTT

Bayberry fat, and its optical activity (WALLRABE) 27. Refining alcoholic liquids containing wort and perfume (Ger. pat. 479,728) 16.

CRAVERI, C.: *Les essences naturelles* (extraction, caractères, emplois). Translated from the Italian by H. Tatu. Paris: Dunod. 602 pp. F. 70; bound, F. 80.

POLLAK, JAKOB: *Handbuch der biologischen Arbeitsmethoden*. Edited by EMIL ABDERHALDEN. Abt. 4. Angewandte chem. u. physikal. Methoden. Tl. 7c. Untersuchungs- und Forschungsmethoden der Methoden. H. 2. *Makrochemische Untersuchungsmethoden der Pharmazie*. (Lieferung 298). Berlin and Vienna: Urban & Schwarzenberg. pp. 193 to 871. M. 35.

*Die Riechstoffe und ihre Derivate*. Vol. I. Aldehyde der aliphatischen Reihe. Edited by ALFRED WAGNER. Vienna: A. Hartleben's Verlag. 404 pp. Unbound, M. 25.

**Derivatives of barbituric acid.** CHEM. FABRIK VORM. SANDOZ. Swiss 131,517 and 131,518, Nov. 11, 1927. Addns. to 122,692. Two new derivs. of isobutyl- $\alpha$ -propyl barbituric acid are prepd. by treating the acid with 1-phenyl-2,3-dimethyl-4-dimethylamino-5-pyrazolone (131,517) or with 1-phenyl-2,3-dimethyl-5-pyrazolone (131,518) in mol. proportions. The products melt at 107-108° and 93-94°, resp., and are used as *hypnotics*.

**Isobutyl- $\alpha$ -propylbarbituric acid.** CHEM. FAB. VORM. SANDOZ. Swiss 132,149, Nov. 29, 1927. This acid is prepd. by condensing isobutyl- $\alpha$ -propyldialkylmalonic ester with urea. The diethyl ester is mentioned in the example. The new acid m. 169-170° and is a powerful *hypnotic*.

**Derivative of benzoic acid.** F. HOFFMANN-LA ROCHE & Co. A.-G. Swiss 131,520, May 17, 1927. Addn. to 127,649. The compd. 2-hydroxy-5- $\beta$ -phenylethylbenzoic acid is prepd. by treating the Na salt of *p*- $\beta$ -phenylethylphenol with CO<sub>2</sub>. The compd. m. 156° and is used as a *disinfectant*.

**Quinoline carboxylic acid derivatives.** SOC. ANON. POUR L'IND. CHIM. A. BALB.

Swiss 131,926, July 15, 1927. A basic deriv. of a substituted quinolinecarboxylic acid is prep'd. by the action of an acid deriv. of 2-ethoxy-4-quinolinecarboxylic acid on diethylaminoethanol. The 2-ethoxy-4-quinolinecarboxylic acid diethylaminoethanol ester, formed b. 134–136° at 0.02 mm., is used in therapy.

**Thiazole derivatives.** I. G. FARBENIND. A.-G. Brit. 306,558, Feb. 23, 1928. 2-Mercaptoarylenethiazoles are prep'd. from arylenethiazthionium compds. of the general formula  $R.N.S(X).S$ , in which R is an arylene group (which may or may not be

substituted) and X is Cl or OH, by heating with an alkali and a salt of a thiocarboxylic acid. The products may be used for pharmaceutical purposes, as dye intermediates, or as rubber vulcanization accelerators.

**Glucosides.** F. HOFFMANN-LA ROCHE & Co. A.-G. Ger. 480,410, Feb. 14, 1926. A glucoside is obtained from the herb *Adonis vernalis* L. by treating the ext. with  $(AcO)_2Pb$ , mixing with an absorption agent such as C or fuller's earth, drying, extg. with, for example,  $CHCl_3$ , and pptg. the glucoside by addn. of petroleum ether. Cf. C. A. 23, 483.

**Lupinine.** KALLE & Co. A.-G. (Erich Bartholomäus and Otto Schaumann, inventors). Ger. 481,285, Aug. 19, 1923. Addn. to 386,936. Halogen derivs. are prep'd. from lupinine by the action thereon of hydrohalides at temps. below 150°.

**Theobromine.** KNOLL A.-G. (Eugen Bernhard and Hans Prillwitz, inventors). Ger. 479,715, Aug. 14, 1924. Theobromine is prep'd. from natural products by pulverizing, treating with water and alk.-earth metal hydroxides or  $Mg(OH)_2$ , filtering, concg. and pptg. with  $CO_2$ , and treating with acid. Thus, cocoa husks are stirred with chalk and water, and filtered. The filtrate is concd. to  $\frac{1}{6}$  its vol. and  $CO_2$  led in. The ppt. is treated with dil. HCl and the theobromine remains undissolved.

**Vitamins.** K. HELHOLT. Brit. 305,929, Feb. 11, 1928. Vitamins are transferred from one oil to another by adding to the first oil an unsaponifiable, edible non-volatile oil such as paraffin oil to protect the vitamins and to ext. them from the soap, which is subsequently formed by treating the oil with an alkali (suitably with KOH in N at a temp. not exceeding 90°, with cod-liver oil), the vitamins being extd. with the added oil by use of a solvent such as acetone, and added to another oil such as peanut oil.

**Vitamin-bearing oils from fish livers.** FERDINAND W. NITARDY (to E. R. Squibb & Sons). U. S. 1,725,964, Aug. 27. Livers such as those of the cod are cooked at a temp. not exceeding 100° while under sub atm. pressure until the livers are disintegrated and the oil is freed from them; an inert gas such as N or  $CO_2$  is introduced above the mass to break the vacuum and exclude air, the mass is cooled while permitting it to sep. into strata, and the upper layer of oil is decanted and stored under an inert gas. An arrangement of app. is described.

**Stabilizing and reducing the viscosity of emulsions of lecithin.** CHEM. FAB. GRÜNAU LANDSHOFF & MEYER A.-G. Ger. 480,616, Jan. 29, 1928. Addn. to 470,954. The method of Ger. 470,954 (C. A. 23, 1995) is modified by using simple or complex salts of the heavy metals or of the rare earths in place of the salts specified therein. Thus, the emulsions may be treated with  $CeCl_3$  0.06 and NaCl 0.04%, or with  $Na_2Fe(CN)_6$  0.08%.

**Magnetic surgical probe of special cobalt steel.** RALPH C. HARTSOUGH (to West-ern Elec. Co.). U. S. 1,726,349, Aug. 27.

**Plaster of Paris surgical bandage.** GUSTAVE S. MATHEY (to Johnson & Johnson). U. S. 1,726,403, Aug. 27. See Brit. 282,243 (C. A. 22, 3747).

**Thickening cosmetics and lubricants with montan wax bleached by oxidation.** I. G. FARBENIND. A.-G. Brit. 305,955, Sept. 12, 1927.

**Disinfectant.** LLOYD E. HARRIMAN. Swiss 132,148, Aug. 2, 1927. A disinfectant comprises the oil obtained by the treatment of lanolin with ultra-violet rays 116.96, NaCl 4.32, AgI or iodobenzenesulfonic acid 7.85 and  $BiO.NO_3$  350.87 parts.

**Disinfecting agent.** OTTO GERNGROSS and KURT RÜLKE. Ger. 476,992, June 28, 1924. A disinfecting agent contains thiocyanates, HCHO and cresol.

## 18—ACIDS, ALKALIES, SALTS AND SUNDRIES

E. M. SYMMES

**The chamber process.** XVII. Analytical study on Glover tower function. M. MATSUI AND T. SAKAMAKI. J. Soc. Chem. Ind. Japan 32, 476–81 (1929).—At several places in a Glover tower, gas temp., acid temps., acid concns. and nitrosities of

acid were measured. The acid concn. was a min. at a midheight of the tower; the acid concn. of any height can be expressed as the third order function of height. With these data, the denitration and cooling of acid in the tower are discussed. R. K.

**Parabolic reinforced concrete sheds for storage of salts.** J. VERDEVEN. *Bull. tech. assoc. ing. sortis école polytech. Bruxelles* 25, No. 2, 59-67(1929).—Description of several such sheds built in France, England and Belgium, having spans up to 27 m. and holding from 12,000 to 30,000 tons. E. I. S.

**High-temperature technic and new fluorides.** O. RUFF. *Z. angew. Chem.* 42, 807-10(1929).—Vapor pressure diagrams of Fe, Co and Ni are shown, based on actual detns. in C-tube furnaces improved by the use of double, water-cooled walls. The many reactions of the refractory oxides with W and other low-volatility metals, e. g.,  $W + 3 CaO = WO_3 + 3 Ca$ , caused renewed interest in this field. X-ray analysis was used. The main cause of cracks in pure zircon vessels above  $1000^\circ$  was found to be reversible conversion of monoclinic  $ZrO_2$  to the more dense, tetragonal form, which could be avoided by adding foreign oxides, such as  $MgO$ , to form a cubic lattice at  $1700^\circ$ , which is stable to sharp temp. changes. X-ray diagrams of the system  $ZrO_2$ - $CaO$  are shown. Heating chambers for  $3000^\circ$  have been built.  $NF_3$  was made by electrolysis of  $(NH_4)HF_2$ ;  $NO_2F$  from  $NO_2$  and  $F_2$ .  $NO_2F$  b.  $-70^\circ$  instead of  $-63^\circ$  given in the literature. Liquid and gaseous  $NF_3$  is colorless, slightly sol. in  $H_2O$ , inert to  $NaOH$  solns., and its mixts. with  $H_2$  and  $NH_3$  explode violently.  $NF_3$  and  $H_2O$  vapor is not dangerous, and on ignition forms  $N_2O_5$ ,  $HF$  and a white ppt. of  $SiO_2$ . Mixts. of Cl and F are explosive but can burn through a nozzle with a yellow flame; app. of Cu are used instead of glass because  $4ClF + SiO_2 = 2Cl_2O + SiF_4$ . The heat of formation of  $ClF$  is  $+22$  cal.; that of  $HF$  by calcn.  $+64.8 = 1$  cal.  $ClF$  ignites cotton instantly and burns Al more rapidly than does F. In addn. to  $RhF$ , there is  $RhF_4$  or  $RhF_5$ . Black  $PdF_4$  takes fire in  $H_2$ . Light brown  $CoF_3$  gives up 1 F atom readily to most substances, e. g., warming a mixt. of  $CoF_3$  and Si causes the mass to glow, and is therefore useful in preparative chemistry. E. M. SYMMES

**A new sulfur-fluorine compound, sulfur tetrafluoride (preliminary communication).** JOSEPH FISCHER and WERNER JAENCKNER. *Z. angew. Chem.* 42, 810-1(1929).—A mixt. of  $CoF_3$  and S decomposes at room temp. with a disagreeable odor. Slight heating or use of large quantities in closed app. causes explosion and deflagration. Diln. with fluorspar avoids danger. The gas evolved is condensed in app. cooled by liquid air. The equation is mainly  $4CoF_3 + S = 4CoF_2 + SF_4$ .  $SF_4$  is colorless and distills between  $-120^\circ$  and  $-90^\circ$ ; mol. wt. = 107. Analysis is made by passing it into a mixt. of  $NaOH$  and  $H_2O_2$  solns., forming  $Na_2SO_4$  and  $HaF$ , pptg. F as  $CaF_2$  and  $SO_4$  as  $BaSO_4$ . At  $-40^\circ$  and atm. pressure  $SF_4$  condenses to a water-white, mobile liquid, which at  $-124^\circ$  (1.3 mm.) forms colorless crystals. Its vapor pressure is given by the equation  $\log p = -1132/T + 7.746$ . Pure  $SF_4$  does not attack dry glass but attacks Hg.  $H_2O$  decomposes  $SF_4$  to a clear soln. Paraffin oil, rubber and S have no effect. E. M. SYMMES

**Fluorspar and its uses.** E. L. BROKENSHERE. *Mining Met.* 10, 425-8(1929).

**Phosphate rock and superphosphate.** A. N. GRAY. *Chem. Trade J.* 85, 215-7(1929).

**Recovery of bromine from sea water.** CHAS. M. A. STINE. *Ind. Eng. Chem.* 21, 434-42(1929).—A description of the plant equipment of the S. S. Ethyl for the recovery of Br from sea water and of the first sea voyage for this purpose. Sea water was chlorinated and treated with dil. aniline sulfate, resulting in the formation of cryst. tribromoaniline, which was sepd. in filter presses. The estd. cost of the essential materials, based on a yield of 70% and a Br content of sea water of 68 p. p. m., is \$0.177 per lb. of Br. L. T. FAIRHALL

**Extraction of iodine from Black Sea algae.** S. KOMARECKYJ. *Chem. Listy* 23, 5-7(1929).—The yield of I from algae is 24-41% less when air is freely admitted during combustion than when the supply is restricted. A mixt. of various Black Sea algae contained 0.0859-0.172% of I, or 0.138-0.338% of the ash remaining after combustion. The corresponding figures for *Cystosira* are 0.095 and 0.146% of I, and for *Phyllophora* 0.645 and 1.01%. B. C. A.

**Nitrogen fixation. Development of the industry in Holland.** ANON. *Chem. Trade J.* 85, 176-7(1929).

**The production of sulfur from pyrites by sublimation or volatilization.** ARTHUR J. CADDICK. *Mining Mag.* 40, 220-1(1929).—Methods are classified into those aiming to recover 1 atom of S and those aiming to recover all the S. Various processes are outlined and patents cited. A. BUTTS

**Activated charcoal as a catalyst (the phosgene industry).** M. JACQUÉ AND L. JACQUÉ. *Chimie & Industrie* 22, 19-25(1929); cf. C. A. 22, 1573.—A description of its manuf.

**Progress in carbon-black manufacture.** H. L. KAUFFMAN. *Oil Weekly* 54, No. 8, 31-2, 71(1929).  
E. I. S.

**A popular lesson on the chemistry of aktivin.** RICHARD FEIBELMANN. *Am. Dyestuff Repr.* 43, 453-5(1929).—The unique position of aktivin as a bleaching agent and starch solubilizer is explained by the structure of the aktivin mol. All Cl atoms bound to O are available and those bound to N exhibit varying degrees of availability, depending upon other radicals with which N is connected. In aktivin this group is  $C_6H_4CH_2SO_2$ .

**Chromium-plated molds for bakelite parts.** C. R. GIVEN. *Machy.* (N. Y.) 35, 889-90(1929).  
H. H. MOSHER  
E. I. S.

**The benzidine color reaction of Japanese acid clay.** NAOTO KAMEYAMA AND SHUMPEI OKA. *J. Soc. Chem. Ind. Japan* 32, 294-301(1929); Suppl. Binding 32, 87-9B(1929).—The color reaction of Japanese acid clay towards  $NH_2C_6H_4C_6H_4NH_2$  was tried in complete absence of air. There are 2 different reactions in the so-called oxidase-like reaction of Japanese acid clay as usually tested by the aq. soln. of benzidine base with access of air. The first main and quick reaction is oxidation due to certain oxidizing agents present in the clay and therefore can be reproduced in the  $O_2$ -free atm. The second minor and slow reaction is the catalytic oxidation due to the atm.  $O_2$  in the presence of the clay.  
S. OKA

**The color reaction of the Japanese acid clay upon carotin.** KYUHEI KOBAYASHI AND KENICHI YAMAMOTO. *J. Soc. Chem. Ind. Japan*, Suppl. Binding 32, 182-3B(1929).—Japanese acid clay adsorbs carotin from its orange soln. and turns it into blue or green. The order of the strength of color reaction of various acid clays upon carotin is just parallel to that of color reaction of acid clays upon liver oil. As a solvent for carotin,  $C_6H_6$ ,  $CCl_4$  and petroleum ether are suitable, but EtOH and  $Et_2O$  give poor results. An analogous color reaction is also produced with anhyd.  $ZnCl_2$ ,  $AlCl_3$  and concd.  $H_3PO_4$ . The acid clay dried 2 hrs at  $100^\circ$  showed the most intense reaction.  
S. OKA

**The Poupin system of caliche treatment.** H. GERLACH, WARNECKE AND F. BLANCKENHORN. *Caliche* 10, 534-56; 11, 5-29(1929).—In this system, with the false bottom of the Shanks leaching tanks raised and the heating coils placed below the bottom, and each tank capable of individual treatment, steam rises through the charge while the liquor is concd. Proper sequences of downward washes follow. For the particular plant where the expts. were conducted the calens. of factors are shown in extensive tables.  
J. HOWARD FLINT

**Physico-chemical properties of Japanese acid clay (KOBAYASHI, YAMAMOTO) 2.**  
**Non-metallic construction materials for the acid industry (WÄSSER) 20.** Apparatus for making bleaching powder, etc. (Brit. pat. 305,883) 9. Treating Zn ores [gas for use in manufacture of  $H_2SO_4$ ] (Brit. pat. 306,569) 9. Emulsions for detergents or sheep dips (Brit. pat. 305,742) 20. Catalytic production of alcohols, etc. [of  $NH_3$ ] (Brit. pat. 306,512) 10.

**Hydrocyanic acid.** I. G. FARBENIND. A-G. Brit. 305,860, March 23, 1928. Alkali metal cyanides are decomposed with an excess of  $NaHCO_3$  in the presence of water at temps. up to  $50^\circ$ .

**Hydrocyanic acid.** T. EWAN AND IMPERIAL CHEMICAL INDUSTRIES, LTD. Brit. 305,816, Feb. 10, 1928. Alumina, zirconia or thoria for use as a catalyst for dehydrating formamide vapor to produce HCN is submitted to heat treatment at a temp. above  $1000^\circ$  to reduce the activity of the oxide. Com. alundum may be used.

**Molybdic and tungstic acids.** METALLWERK PLANSEE G. M. B. H. Ger. 480,287, Apr. 27, 1926.  $H_2MoO_4$  and  $H_2WO_4$  are prepd. directly from the ores by smelting, evapg. and condensing. The ore is completely desulfurized before smelting and the temp. during smelting is so high that the acids are vaporized.

**Concentrating nitric acid.** HERMANN FRISCHER. Ger. 479,668, Dec. 7, 1926. See Brit. 281,891 (C. A. 22, 3744).

**Phosphoric acid.** JULIUS KERSTEN. Ger. 479,827, July 20, 1926.  $H_3PO_4$  is prepd. by heating powd.  $Ca_3(PO_4)_2$  or phosphorite to dull red heat and passing there-  
over HCl.

**Phosphoric acid.** KARL MÜLLER. Ger. 479,767, Aug. 27, 1926.  $H_3PO_4$  is prepd. from phosphates such as natural phosphate contg.  $Ca_3(PO_4)_2$ ,  $CaCO_3$ ,  $MgCO_3$ , and

$\text{CaF}_2$  by heating with flux and pitch or lignite to 1300–1550°. Air is blown in during the heating giving  $\text{P}_2\text{O}_5$ , which is condensed by water.

**Phosphoric acid and hydrogen.** I. G. FARBENIND. A.-G. Ger. 480,961, Dec. 4, 1925. P vapor and steam at 650° are led over active C. The product is cooled to 110° to condense the phosphoric acids formed. The residue consists of steam and H and is led over an Fe-Cr contact agent at 550° with steam-satd. CO. The  $\text{CO}_2$  produced is removed from the product, leaving H. Cf. C. A. 23, 4303.

**Contact process for sulfuric acid and anhydride.** VEREIN FÜR CHEMISCHE UND METALLURGISCHE PRODUKTION. Ger. 479,080, May 6, 1927. The production of  $\text{SO}_2$  and  $\text{H}_2\text{SO}_4$  from  $\text{SO}_2$  and O or gases contg. O, by contact agents, and the app. necessary are described.

**Concentrating sulfuric acid.** WALTER H. SIMONSON and OTTO MANTIUS. U. S. 1,726,321, Aug. 27. In concentrating  $\text{H}_2\text{SO}_4$  under vacuum, a flowing liquid heating medium such as oil is used out of direct contact with the acid and at a temp. varied from time to time suitably to insure vaporization of water from the acid under the conditions prevailing at different stages of the process. An app. is described.

**Containers for acids.** GEORG WECK. Ger. 480,529, Nov. 15, 1928. Containers with a high resistance to  $\text{H}_2\text{SO}_4$  and HCl are made from an alloy contg. 10–30% NiSb<sub>2</sub>, 0–20% Ni and the rest Cu.

**Carbon dioxide.** RHEINISCHE-WESTFALISCHE KALKWERKE. Ger. 480,342, Feb. 8, 1927. Pure  $\text{CO}_2$  is prepd. from furnace and generator waste gases rich in  $\text{CO}_2$  by passing the gas into a soln. of Mg salts to form  $\text{MgCO}_3$ , which is then dried and heated to evolve pure  $\text{CO}_2$ .

**Apparatus for recovering the gaseous carbon dioxide escaping from stored solid carbon dioxide.** WALDEMAR HESSLING. Swiss 128,810, Mar. 15, 1928. Details are given.

**Ammonia.** FIRMA CARL STILL. Ger. 479,002, Jan. 20, 1924 and 479,693, April 11, 1924. Addns. to 469,003 (C. A. 23, 1253).  $\text{NH}_3$  and  $\text{NH}_4$  compds. are obtained from such gas mixts. as those from the distn. of coal by passing the gases through a cooler at a temp. just above the dew point of the  $\text{NH}_3$  and  $\text{NH}_4$  compds. A stream of water may be allowed to trickle through filling material in the cooling tower to absorb the  $\text{NH}_3$  and  $\text{NH}_4$  compds.

**Synthetic ammonia.** AMMONIA CASALE S. A. Ger. 479,714, Aug. 5, 1924. Synthetic  $\text{NH}_3$  is prepd. from gas rich in N and H under pressure by aid of a contact agent. The app. is indicated.

**Ammonia synthesis.** A. HURTER. Brit. 305,753, Dec. 7, 1927. A catalyst for  $\text{NH}_3$  synthesis consists of a double compd. of Fe with cyanogen and alkali, alk. earth or other earth metal together with  $\text{ZrO}_2$  or other Zr compd. Details of prepn of the catalyst are given.

**Apparatus for ammonia synthesis or other exothermic gas reactions.** I. G. FARBENIND. A.-G. Brit. 306,054, Sept. 15, 1927. The reaction chamber is cooled by the incoming mixt. or other cooling fluid which flows in a sinuous course around the walls. Various structural details are described.

**Catalytic oxidation of ammonia.** C. W. DAVIS (to E. I. Du Pont de Nemours & Co.). Brit. 306,382, Feb. 18, 1928. See U. S. 1,706,055 (C. A. 23, 2254).

**Alkali nitrates.** I. G. FARBENIND. A.-G. (Wilhelm Wild and Christoph Beck, inventors). Ger. 480,906, July 9, 1926. See U. S. 1,609,643 (C. A. 23, 1222).

**Alkali metal nitrates and calcium phosphate.** P. JOST. Brit. 306,046, Feb. 14, 1928. Chlorides such as NaCl are treated with  $\text{H}_3\text{PO}_4$  to produce alkali metal phosphates and the latter are treated with  $\text{Ca(NO}_3)_2$  to form alkali metal nitrate and Ca phosphate. Excess  $\text{Ca(NO}_3)_2$  may be used for producing a mixed fertilizer. Various details, modifications and auxiliary procedures are described.

**Aluminum salt solution.** I. G. FARBENIND. A.-G. (Friedrich Horner, inventor). Ger. 479,902, Nov. 16, 1924. An Al salt soln. is mfd. from pure alumina by treatment with  $\text{NH}_4\text{OH}$  or  $(\text{NH}_4)_2\text{CO}_3$  or a mixt. of these. The Al gel obtained is filtered off, evapd. and redissolved.

**Chlorides.** I. G. FARBENIND. A.-G. (Karl Staib, inventor). Ger. 480,079, Mar. 7, 1926. Oxides are converted into water-free chlorides by the simultaneous action of Cl and a reducing agent. The oxide is finely divided and heated in a coal-dust furnace in a current of CO and Cl.

**Cyanides.** DESSAUER ZUCKER-RAFFINERIE G. M. B. H. Ger. 479,845, Jan. 5, 1926. Cyanides are prepd. by the action of HCN on molten formates, e. g.,  $\text{HCOONa}$  is melted and HCN led thereover, producing pure NaCN. The HCN may be mixed with inert gases.

**Alkali cyanides from calcium cyanamide.** STICKSTOFFWERKE G. M. B. H. (H. Heinrich Franck and Hugo Heimann, inventors). Ger. 480,905, Jan. 11, 1925. Alkali cyanides are prepd. from "lime-nitrogen" or  $\text{CaCN}_2$  by heating with alkali carbonate to 450–700° and treating the molten mass with CO free from H. The reaction may take place under pressure. Cf. C. A. 23, 4781.

**Decomposition of crude calcium cyanamide.** ALBERT F. MEYERHOFER. Swiss 131,957, Jul. 1, 1926. Addn. to 123,925.  $\text{CaCN}_2$  is broken down to give  $\text{NH}_3$  and  $\text{Na}_2\text{CO}_3$  by heating with NaF in the presence of water. The NaF is recovered by heating the  $\text{CaF}_2$  formed during the reaction with NaCl,  $\text{SiF}_4$  and acid.

**Calcium-alkali phosphates.** A. MESSERSCHMITT. Brit. 306,086, Feb. 15, 1928. In sintering together raw phosphates or phosphate mixts., an alkali sulfate and a strong reducing agent such as C or Fe pyrites, as described in Brit. 300,961 (C. A. 23, 4027), the reducing agent consists at least partly of Ca sulfide which facilitates elimination of S from the reaction mixt. Extraction residues of the Leblanc soda process or like materials may be used.

**Oxysalt compositions such as calcium oxychloride.** CHARLES CATLETT. U. S. 1,726,472, Aug. 27. An oxide or hydrated oxide and a salt, e. g.,  $\text{Ca}(\text{OH})_2$  and  $\text{CaCl}_2$ , are mixed with a relatively small quantity of oleaginous material such as cottonseed oil under reacting conditions, and the resulting reaction mass is finely divided.

**Alumina.** ELEKTIZITÄTWERK LONZA. Swiss 131,590, Aug. 4, 1927. Molten alumina is finely divided by spraying it under pressure into the path of a strong current of atomized water. Cf. C. A. 23, 3057.

**Alumina.** I. G. FARBENIND. A.-G. (Heinrich Specketer, inventor). Ger. 479,768, Oct. 14, 1924. Fe-free alumina is obtained from clay by treating with HCl, reducing the  $\text{FeCl}_3$  to  $\text{FeCl}_2$ , evapg. the soln. of Fe and Al chlorides and decomposing the  $\text{AlCl}_3$  thermally. The  $\text{FeCl}_2$  is then extd.

**Alumina from bauxite, etc.** U. B. VOISIN. Brit. 306,095, Feb. 15, 1928. A mixt. of finely pulverized bauxite or similar aluminiferous material and pulverized fluorspar is heated with concd.  $\text{H}_2\text{SO}_4$ , silica present is evolved as  $\text{SiF}_4$  and may be converted into  $\text{H}_2\text{SiF}_6$  with water. Mixed Al and Fe sulfates formed are dissolved in water, the soln. is treated with  $\text{CaCl}_2$  to form chlorides and Fe and Al hydroxides are pptd. from the chlorides with lime. The mixed hydroxides may be treated with soda lye to form Na aluminate, from which, after sepg. Fe hydroxide,  $\text{Al}_2\text{O}_3$  may be pptd. with  $\text{CO}_2$ .

**Ammonium phosphate.** I. G. FARBENIND. A.-G. (Robert Griessbach and Walther Sommer, inventors). Ger. 480,198, Feb. 12, 1927. Crude phosphate is treated with an acid forming a readily sol. Ca salt, particularly with HCl, and the soln. is partly neutralized and then treated with Fe or a compd. of Fe so as to ppt.  $\text{FePO}_4$ . The ppt. is suspended in water and treated with  $\text{NH}_3$ , or with  $\text{NH}_4\text{OH}$  and  $\text{CO}_2$ , or with a salt of  $\text{NH}_4$ , capable of pptg. Fe by double decompn.; the soln. of  $(\text{NH}_4)_2\text{PO}_4$  so obtained is worked up.

**Hydrated chromic chloride.** I. G. FARBENIND. A.-G. Brit. 306,305, March 23, 1928. Hydrated chromic chloride is obtained from the anhyd. salt by effecting soln. in approx. only sufficient water to produce the hydrated salt in the presence of a reducing agent such as chromous chloride,  $\text{SnCl}_2$ , Fe, Cr, Zn, Sn or Al. The hot soln. is filtered and allowed to cool and solidify. Cf. C. A. 22, 1658.

**Copper sulfate.** HÜTTENWERKE TEMPELHOF A. MEYER. Ger. 481,391, Jan. 14, 1926. Waste metal from alloys of Cu with Sn, Pb and Sb is melted with S to form a sulfide mixt., which is then roasted in air. The mixt. of  $\text{CuO}$ ,  $\text{Cu}_2\text{O}$  and  $\text{CuSO}_4$  so formed is washed out with  $\text{H}_2\text{SO}_4$ , giving a soln. of  $\text{CuSO}_4$ .

**Lead chloride solutions.** H. W. ROBINSON and D. W. PARKES. Brit. 305,827, Feb. 17, 1928. Pb chloride and an alkali acetate are heated to about 80° in water and a small quantity of an acid such as  $\text{HNO}_3$ , HOAc, HCl, citric acid,  $\text{H}_2\text{SO}_4$  or tartaric acid is added. Solns. are obtained contg. up to 35% of Pb chloride, which remain clear at temps. above about 50°.

**Sodium sulfide.** KALI-CHEMIE A.-G. (Friedrich Ruisberg and Paul Schmid, inventors). Ger. 479,766, Nov. 29, 1927. Addn. to 424,193.  $\text{Na}_2\text{S}$  and similar chemicals are made up into predetd. shapes and amts. by molding.

**Sodium hyposulfite.** VEREIN FÜR CHEMISCHE UND METALLURGISCHE PRODUKTION. Ger. 480,431, Apr. 11, 1926. The size of the crystals of  $\text{Na}_2\text{S}_2\text{O}_4$  is increased by dissolving finely divided dry crystals in an amt. of solvent such as NaCl, insufficient for complete soln., and recrystallizing. The larger crystals are more stable to moist air.

**Zinc oxide.** "SACHTLEBEN" AKT.-GES. FÜR BERGBAU UND CHEMISCHE INDUSTRIE and MAX HERDER. Ger. 481,284, Jan. 27, 1927.  $\text{ZnO}$  is prepd. from lye contg. Zn by treating with a carbonate, bicarbonate, oxide or hydroxide of an alkali metal or alk. earth metal such as milk of lime or soda, and subjecting the ppt., washed free

from  $\text{CaCl}_2$  or  $\text{NaCl}$  and suspended in water at  $70-80^\circ$ , to the action of  $\text{CO}_2$ . The filtered mass is dried and heated to  $300-400^\circ$ , producing  $\text{ZnO}$ .

**Beryllium.** WILHELM KROLL. Ger. 480,128, Sept. 29, 1926. Metallic Be is prepd. by the decompn. of molten Be-alkali double fluorides by an alk. earth metal, Mg or Li at temp. above  $1000^\circ$ . In the example, Mg is added to molten  $\text{MgF}_2\text{BeF}_2$  at  $1300^\circ$ . Pure Be is produced.

**Phosphorus.** I. G. FARBENIND. A.-G. Ger. 480,513, Feb. 27, 1926. P is sepd. from gases with which it is mixed by allowing rapidly moving drops of liquid such as water, soln. or molten P to impinge on the P mist formed by bringing the gaseous mixt. to the dew point.

**Activated carbon.** I. G. FARBENIND. A.-G. Brit. 306,490, Feb. 21, 1928. Dis-integrated wood is soaked for a long time or boiled in a soln. of  $\text{ZnCl}_2$ ,  $\text{H}_3\text{PO}_4$  or other activating agent and then dried and ignited (suitably after a further impregnation with the activating agent). Various details are given.

**Active carbon.** VEREIN FÜR CHEMISCHE UND METALLURGISCHE PRODUKTION. Ger. 479,828, Feb. 4, 1928. See Brit. 285,386 (C. A. 22, 4738).

**Plastic composition.** I. G. FARBENIND. A.-G. (Karl Daimler, inventor). Ger. 479,965, Jan. 21, 1927. Plastic masses are obtained by treating castor oil with maleic acid or anhydride. Steeping, solvent or filling agents may be added. Examples are given.

**Plastic compositions.** HANS KAPPELER. Swiss 131,597, July 14, 1927. A plastic mass is prepd. by the action of urea on furfural.

**Plastic compositions.** E. THOMAS. Brit. 305,973, Nov. 11, 1927. Fibrous material such as asbestos in a freely flowing aq. pulp is mixed with a small quantity of an oily substance such as wood oil immiscible with water, which uniformly coats the fiber; the fiber is then sepd. from the water and molded into sheets or other forms by the action of heat and pressure. Numerous details and modifications are described.

**Adhesive.** MAX LANDECKER (to American Nuplax Corp.). U. S. 1,725,805, Aug. 27. A neutral casein soln. suitable for use as an adhesive is prepd. by dissolving casein in an aq. soln. of urea.  $\text{CH}_2\text{O}$  also may be added.

**Water-resistant adhesive.** CHARLES N. CONE, GLENN DAVIDSON and IRVING F. LAUCKS (to I. F. Laucks Inc.) U. S. 1,726,510, Aug. 27. Protein-contg. material from soy beans is used with a halogen substitution product of paraffin hydrocarbons such as  $\text{CCl}_4$ .

**Molding compositions.** HERMANN BURMEISTER. Ger. 480,832, July 23, 1924. Shaped articles are obtained in one operation by hot-pressing (1) a dry compn. prepd. by mixing a filler in the cold with a polyhydric phenol, e. g., resorcinol, and a solid polymerized aldehyde, e. g., paraformaldehyde, or (2) a compn. comprising a filler and a semi-condensate prepd. from the phenol and the aldehyde at ordinary temp., or (3) a compn. obtained by fusing the filler with the reagents separately or mixed. Examples are given. Cf. Brit. 275,678 (C. A. 22, 2445).

**Casein compositions.** R. ARNOT. Brit. 306,168, Nov. 12, 1927. Casein itself or material such as soy-bean meal, horse chestnuts or lupin seeds is hydrolyzed (for prep. adhesive or food products) by heating with water and an alkali carbonate or bicarbonate or an alk. earth oxide or magnesia or an org. base such as urea under pressure and at a temp. not exceeding  $135^\circ$  (suitably about  $115-125^\circ$ ). Several examples are given, some of which include use of preservatives or addns. such as rubber latex, fillers, natural gums and resins and varnishes.

**Molding casein and the like.** PFENNING-SCHUMACHER-WERKE G. M. B. H. Ger. 480,090, April. 9, 1926. The products obtained by hot-pressing powd. casein and the like are improved by allowing the pressed products to cool under a higher pressure than was applied during the pressing.

**Condensation products of phenols and formaldehyde.** SOCIÉTÉ DES VERRERIES DE FOLEMBRAY. Ger. 481,207, July 4, 1922. Plastic masses sol. in acetone and alc., and kneadable in the cold, are prepd. by condensing phenols with  $\text{HCHO}$ , using chlorides of alk. earth metals as catalyzers.

**Phenol-aldehyde condensation products.** I. S. MELLANOFF (to Kemikal, Inc.) Brit. 306,522, Feb. 23, 1928. Plastic compns. are prepd. by the interaction of an alk. soln. from peat, a phenolic compd. and an aldehyde. Reaction starts at room temp. and may be completed by heating. Fillers, etc., may be added.

**Artificial fibers.** FIRMA HEINRICH SCHMUCK. Ger. 479,795, Mar. 17, 1927. Artificial fibers consist of a fiber core with a thin transparent coating of cellulose. The core may be first coated with a thin layer of metal.

**Porous compositions.** H. BECKMANN. Brit. 306,129, Feb. 17, 1928. Porous

materials for filters, etc., are made by binding together permeable or impermeable fibrous, granular or powdered substances by porous vulcanized rubber. Numerous examples are given.

**Composition for removing carbon deposits from engine cylinders.** CARROLL A. HOCHWALT (to General Motors Research Corp). U. S. 1,726,437, Aug. 27. Furfuraldehyde, alc. and  $C_6H_6$  are used together.

**Shaft furnace for burning lime and dolomite.** WALTHER WITSCEL. Ger. 481,473, Dec. 14, 1927. Details.

**Vertical kiln for burning limestone.** WM. D. MOUNT and IRVING WARNER. U. S. 1,725,763, Aug. 27. Structural features.

**Cleansing painted cloth and wood.** ADOLF ENGEL. Swiss 131,823, Sept. 30, 1927. A cleansing agent for painted cloth or wood consists of aq.  $NH_4OH$ ,  $(COOH)_2$ , KOH,  $AcOAm$ , alc. soft soap, water and  $AcOH$ .

**Composite sheet materials for book covers and other uses.** L. RADO. Brit. 306,225, Aug. 31, 1927. A base of paper, cloth, leather, rubber or other material is covered on one or both sides with metal foil upon which is a coating of cellulose hydrate foil, which in turn carries a coating of celluloid or like material.

**Sheet material for panels of airplanes, etc.** BRITISH CELANESE, LTD., and W. A. WIRZ. Brit. 305,694, Nov. 8, 1927. Perforated sheet metal plates are placed between sheets of cellulose acetate compn. or similar material which may be subjected to heat and pressure so that it penetrates the perforations of the metal. Various details and modifications are described.

**Artificial threads, films, etc., from animal protein solutions.** HEBERLEIN & Co. A.-G. Brit. 306,464, Feb. 20, 1928. Protein materials such as horn shavings, skin, waste wool or waste silk are subjected to a swelling operation (as with hot water and salicylic acid) and to a simultaneous or subsequent treatment with phenol or its homologs or derivs. until soln. is effected. Various details are given.

**Diaphragms for gramophones or other acoustic instruments.** W. A. HALDEN. Brit. 306,193, Oct. 21, 1927. Metallic gauze, perforated plates or interlaced strips are coated with celluloid, ebonite or wax with which may be admixed fine particles of wood or other solid substances.

**Transparent material for plant shelters, etc.** I. G. FARBERNIND. A.-G. Brit. 306,242, Jan. 2, 1928. A network of org. material such as wool, yarn or webbing carries transparent or translucent artificial resins such as condensation products of urea with formaldehyde and casein or cellulose ethers, etc.

**Cleaning printing presses.** FIRMA OTTO C. STRECKER. Ger. 479,983, Dec. 21, 1928. The rubber parts of printing presses are cleaned by a mixt. of castor oil and one or more aldehydes.

**Printing plates and matrices.** EDWARD S. HOLE. U. S. 1,726,151, Aug. 27. A sheet of plastic material such as paper pulp is impregnated with a phenolic condensation product in moist and water sol. state and contg. Cr oxides, chromates or dichromates; the sheet is dried and is subjected to heat and pressure in contact with an original to effect hardening of the phenolic condensation product and to convert it into the water-insol. state.

**Cleaning linotype matrices.** WILLIAM DUNKLIN. U. S. 1,725,785, Aug. 27. Brass matrices are immersed in a soln. contg. Cr trioxide 3.5 and water 95-97%.

**Vermin-destroying composition.** CHEM. FAB. H. STOLTZENBERG HAMBURG. (Wilhelm Gump, inventor). Ger. 480,349, Mar. 28, 1924. HCN adsorbed in purified silica gel is used.

## 19 GLASS, CLAY PRODUCTS, REFRACTORIES AND ENAMELED METALS

J. E. BARTON, C. H. KERR

**Modern glass-forming machinery.** ANON. *Engineering* 128, 27-9, 91-2, 153-5 277-8, 304-5 (1929). E. H.

**Opal covering glasses.** G. KÖRRN. *Keram. Rundschau* 35, 601-3, 620-1 (1927).—Methods of covering transparent blown glass articles with white or colored opal glasses are described and batch compns. for the clear and opal glasses are given. H. INSLLEY.

**The properties and applications of "vita" glass.** F. E. LAMPLUGH. *Pottery Gazette* 54, 1120-3 (1929).—The special properties of "vita" glass, its use, transmission of health-giving rays, present installations and cost are reviewed. R. A. HEINDL.

Electrically conductive antimony mirrors on glass. STANDISH MILLER. *J. Optical Soc. Am.* 19, 101-2(1929). E. J. C.

An example of disintegration of a silica brick in a glass-melting furnace. M. A. BESBORODOW. *Keram. Rundschau* 35, 515-6(1927).—A silica brick which had been in contact with a clay brick in the wall of a used glass-melting furnace had a sponge-like incrustation with drops depending from it. Analyses were made of the unaffected silica brick, the clay brick, the incrustation and the drops. Conclusion: The incrustation as well as the drops were caused by the clay and the silica and alkalis from the furnace atm. melting to form a glass having approx. the compn. of feldspar. It is not advisable to have clay blocks and silica blocks in contact in the upper walls or crowns of glass-melting furnaces. H. INSLEY

The operation of modern shaft kilns. HÄGERMANN. *Tonind.-Ztg.* 53, 1269-71 (1929).—A review, including recent pats. F. O. ANDERHOGG

Contributions to the ceramics of highly refractory materials. III. The system zirconia-thoria. OTTO RUFF, FRITZ EBERT AND HANS WOITINKE. *Z. anorg. allgem. Chem.* 180, 252-6(1929); cf. *C. A.* 23, 3396.—There is no reaction between  $\text{ThO}_2$  and  $\text{ZrO}_2$  up to  $2400^\circ$ . After heating to  $2600^\circ$ , 1:1 mol. mixts. gave x-ray evidence of 2 new mixed crystals. These were cubical and had  $a = 5.32$  and  $5.51$ .  $\text{ThO}_2$  can just be melted by the oxyacetylene flame. Its m. p. is estd. at  $3050^\circ$  and it is the most refractory material known. M.-p. data indicate a continuous series of mixed crystals from  $\text{ZrO}_2$  to  $\text{ThO}_2$  while x-ray diagrams of the cooled melts show 2 series. Hence a sepn. into 2 different mixed crystals must take place shortly below the m. p. No lower oxide of Th formed by thermal decompn. or reduction was found. A. C. H.

Refractories service conditions in furnaces burning anthracite on traveling grate stokers. R. A. SHERMAN, EDMUND TAYLOR AND H. S. KARCH. *Trans. Am. Soc. Mech. Eng.* 51, 183-96(1929); cf. *C. A.* 23, 4545.—Data obtained under actual operating conditions are presented on the service conditions which govern the life of refractories in furnaces. Temp., compn. and velocity of furnace gas, temp. of refractories and amt. and compns. of the solids carried in the furnace gas were investigated. The nature of the slag action was studied. The investigation disclosed no reason why, with the proper design of furnace to obviate the extremely high temps and high content of reducing gas, the burning of anthracite of the sizes smaller than brickwheat No. 3 should be accompanied by more difficulty with refractories than the burning of the larger steam sizes. A. WHITE

Procedure for the determination of the permeability of refractory materials to gases. A. KANZ. *Arch. Eisenhüttenw.* 2, 843-9(1929).—App. and procedure are described and results are given on a large no. of materials. A. WHITE

Pickling steel for vitreous enameling. F. G. JAEGER. *Metal Cleaning and Finishing* 1, No. 3, 299-302(1929). E. I. S.

Non-metallic construction materials for the acid industry (WAESER) 20. The use of fuels in tunnel kilns (RICE) 21. Clay and water (SALMANG) 2. Economics of firing stained glass electrically (RUGG) 4. Refractories for gas retorts (HARVEY) 21. Continuously acting melting furnace for glass (Ger. pat. 480,619) 1. Annealing kiln (Swiss pat. 131,865) 1. Gelatin and glue [binder for making "splinterless glass"] (Brit. pat. 306,439) 29. Enameling furnace (Ger. pat. 480,718) 1. Apparatus for drying enamel plates (Ger. pat. 480,571) 1.

SEARLE, ALFRED B.: *An Encyclopedia of the Ceramic Industries*. 3 Volumes. London: Ernest Benn, Ltd. 1200 pp. £ 9: 9s the set plus postage.

Glass. N. V. MIJ. TOT BEHEER EN EXPLOIT. VAN OCTROOIEN. Ger. 478,582, April 8, 1928. A method and app. for rolling and cooling glass plates are described.

Glass. LUDWIG GLASER. Ger. 479,930, Mar. 19, 1926. A process of mfg. glass objects is described.

Glass. KURT KUNZEL. Ger. 481,364, Feb. 11, 1925. Glass is melted in a shaft furnace through which the melting flame is projected under pressure.

Manufacture of glass. LUDWIG HOCHSTEIN. Ger. 480,753, Mar. 19, 1925. A glass is made by melting together  $\text{SiO}_2$ ,  $\text{B}_2\text{O}_3$ ,  $\text{Al}_2\text{O}_3$  and  $\text{ZrO}_2$  in such amts. that the finished glass contains them in the proportions 80-85, 16-12, 2-1.5 and 2-1.5%, resp., with no alkali.

Glass-blowing machine. LYNCH GLASS MACHINERY CO. Ger. 480,780, April 16, 1920.

**Glass-blowing machines.** GLASFABRIKATIONS-AUTOMATEN-G. M. B. H. Ger. 479,928, July 23, 1926, and 479,929, Nov. 19, 1926. Details are described.

**Glass thread manufacture.** GOULD STORAGE BATTERY CO. Brit. 306,332, April 26, 1928. An app. is described.

**Rolling molten glass.** HERZOGENRATHER GLASWERK BICHEROUX & CIE G. M. B. H. Ger. 481,365, Nov. 7, 1926. Details.

**Drawing sheet glass.** WM. A. MORTON. U. S. 1,726,114, Aug. 27. Stretching and setting of the glass is effected in a zone under super-atm. pressure.

**Plate and sheet glass production.** COMPAGNIES REUNIES DES GLACES ET VERRES SPECIAUX DE NORD DE LA FRANCE. Brit. 306,441, Feb. 20, 1928. Glass is melted and refined in a pot furnace, poured into a small tank or regulating furnace, and then flows through a slot to a rolling app.

**Process for drawing plate glass.** WILHELMINE BRAUER. Ger. 480,620, July 16, 1926. Details of the method and app. are given.

**Uniting sheets of glass and celluloid.** J. H. ROBERTSON. Brit. 306,351, June 25, 1928. The glass is first coated with a cement consisting of a gelatinous silicate in a hot soln. of gelatin with or without K Cr alum, or of albumin or casein, dried and joined with a sheet of celluloid softened with an acid such as propionic acid and the sheets are pressed together in a bath such as PrOH. Various details and modifications of procedure are described.

**Uniting glass sheets with celluloid, etc.** P. H. HEAD. Brit. 306,279, Feb. 13, 1928. The united sheets are sealed at the edges by heating the intermediate sheet with a wire or by treatment with acid or NaOH or phenol. The action of NaOH may be stopped by application of diacetone alc. When dry, the edges are coated with lacquer or varnish.

**Uniting glass or other sheet materials with cellulose derivatives.** C. DREYFUS (to British Celanese, Ltd.) Brit. 305,992, Feb. 13, 1928. Cellulose derivs., such as cellulose acetate, are used in finely powdered form with plasticizers, fillers, dyes, etc., under heat and pressure. Numerous details and examples are given.

**Composite sheets pervious to ultra-violet rays.** C. DREYFUS (to British Celanese, Ltd.) Brit. 306,397, Feb. 18, 1928. Sheets of material such as pure quartz glass are united with intermediate sheets of a cellulose ester or other compn (or by use of similar powdered material) under the action of heat and pressure.

**Tunnel kiln for cooling glass ware.** HARTFORD-EMPIRE CO. Ger. 481,366, Mar. 18, 1924 and 481,367, Mar. 24, 1926. Details of construction are given.

**Tunnel kiln for firing objects made from carbon-slag.** WILHELM HOFFMEYER. Ger. 480,479, June 8, 1927. Details of the circulation of the hot gases are given.

**Annular or zig-zag kiln for firing earthenware.** BORNKESSEL & CO. M. B. H. Ger. 481,397, Aug. 11, 1925. Details of construction and arrangement are given.

**Drying plant for ceramic goods.** OSWALD HELLER. Ger. 480,276, Oct. 30, 1925. Addn. to 479,414 (C. A. 23, 1789)

**Drying plant for pottery, etc.** BORNKESSEL & CO. M. B. H. Ger. 480,526, July 31, 1925.

**Ceramic compositions.** HERMANN MEHNER. Ger. 472,653, July 14, 1923. A method of making porous stone from clay by high-pressure steam treatment is described.

**Ceramic compositions.** LIPSA CHEMISCHE FABRIK A.-G. Ger. 481,214, Mar. 16, 1926. Heat insulating coverings are made from granular basic  $MgCO_3$ .

**Ceramic compositions.** QUARTZ & SILICE SOC. ANON. Ger. 481,472, Nov. 3, 1926. See Brit. 263,765 (C. A. 22, 148)

**Ceramic compositions.** SCHUMACHER'SCHE FABRIK G. M. B. H. Ger. 481,387, May 28, 1925. Porous molded bodies for diffusion or filtering purposes, which are non-conductors of electricity, are prep'd by mixing granular material such as quartz, glass, asbestos or glass wool with a plastic binding material m. below  $400^\circ$ , such as S or asphalt.

**Ceramic compositions.** STERCHAMOLWERKE G. M. B. H. Ger. 480,586, Oct. 21, 1925. Porous fire bricks are made by mixing the clay with material which is swollen by water, e. g., cork dust, before molding, and burning it out after molding.

**Refractory materials.** R. L. FRINK. Brit. 306,216, Aug. 29, 1927. In forming refractory products by the union of materials such as sillimanite, bauxite, andalusite, etc., with bonding materials such as silica, oxides and chlorides of the alk. or rare earths such as Zr, Ce and Th are added to effect a cementing action prior to heating. Numerous details and examples are given. Cf. C. A. 23, 1732.

**Enamel.** DRUSCHKE GASGLÜHLICHT AVER-GES. Brit. 306,019, Feb. 14, 1928. An opaquing medium suitable for use in enameling metal is made by fusing Zr silicate

with about an equimol. proportion of oxide of Ca, Ba, Sr, Mg or Zn together with a small quantity of a flux.

## 20—CEMENT AND OTHER BUILDING MATERIALS

J. C. WITT

The four-component system, cement-sand-large aggregate-water. G. KATHREIN. *Tonind.-Ztg.* 53, 1122-5(1929).—A tetrahedral figure and certain projections thereof are useful for indicating various properties of different concretes. F. O. A.

A simple sedimentation apparatus. HANS KÜHL AND WOLFGANG GRAF CZERIN. *Tonind.-Ztg.* 53, 1247-50(1929).—When a suspension of cement in abs. alc. is introduced into the upper part of a tube contg. alc. only, the difference in sp. gr. causes the suspension to spurt down into the alc. This is overcome by heating coils placed at intervals along the tube, the temp. being maintained so that a 10° differential occurs along the tube. Then alc. in the topmost section is heated 20° hotter as is also a suspension of a little cement in alc. The latter is introduced in the top of the tube by a simple metallic dump arrangement. When the largest particles approach the bottom, the alc. is allowed to flow out through a capillary tube at a rate of 100 drops per min. and caught in 4 fractions. The sepn. is accurate above 25 microns for 3 fractions, but the 4th fraction ranging from 25 to 15 microns is not so reliable. F. O. A.

Constitution of hydrated portland cement. G. ASSARSSON AND N. SUNDIUS. *Sveriges Geol. Undersökning*, Series C, No. 357, 9 pp.(1929).—Clinker grains remaining in cement can readily be determined microscopically and are found to consist mainly of disilicate, with some trisilicate but mostly as larger fragments; the hydrolyzing process during the hardening of cement is explained. E. I. S.

The action of calcium chloride on portland cement. I. C. R. PLATZMANN. *Chem.-Ztg.* 53, 477-8(1929).—Addn. of  $\text{CaCl}_2$  to the mixing water results in quicker hardening, higher early strength and less shrinkage. Compression strength is increased while tensile strength is unchanged at first and later on slightly decreased. Opt. concn. is a 4%  $\text{CaCl}_2$  soln. The beneficial action of  $\text{CaCl}_2$  seems to be due to the prevention of cracking and hair checking due to its hygroscopic nature. It was not decided whether or not the ultimate action of  $\text{CaCl}_2$  would be detrimental because of a possible chipping action later on. II. *Ibid* 494-6.— $\text{CaCl}_2$  increases the setting temp. proportional to the amt. used. According to Killig this may be explained by assuming a more intensive crystal formation due to the greater soly. of  $\text{CaO}$  in  $\text{CaCl}_2$  soln. This results in quicker hardening and also makes low-temp. concrete work possible. The action of  $\text{CaCl}_2$  varies with different cements. No final conclusion can be drawn yet as to the advisability of using  $\text{CaCl}_2$  in concrete work. G. H. VON FUCHS

Fatigue in concrete. D. D. EWING. *Elec. Ry. J.* 73, 829-30(1929).—Concrete loses strength when subjected to repeated stresses. The properties of concrete are affected by age, moisture and other conditions which make fatigue testing a rather tedious and expensive matter. The probable endurance limit for bond strength is about 60% of the bond strength as detd. by the static test. Present knowledge of the effect of repeated loads on concrete is summarized. W. H. BOYNTON

Tar-bitumen mixtures for surfaces (of streets). B. VON LEMBERKE. *Erdöl u. Teer* 22, 409; *Teer u. Bitumen* 27, 413(1929).—Mixts. of 70-75% tar and 25-30% bitumen are recommended. A. W. FRANCIS

Non-metallic construction materials for the acid industry. BRUNO WAESER. *Korrosion* 3, 29-30, 46-7(1928); 4, 1-3, 21-2, 33-4(1929).—A general review of the org. materials, natural and artificial stones, cements, minerals, glasses. A table shows the phys. properties of quartz, porcelain and glasses, with improvements from 1921 to 1926. Patent and literature references are given. J. H. MOORE

Absorption of wood preservatives. J. D. MACLEAN. *Eng. News-Record* 102, 176-9(1929).—M. points out that present practice of basing specifications for preservative treatment on the net retention of impregnating material per cu. ft. of wood does not make provision for the widely different ratios of surface area to vol. of timbers of different dimensions and the ratio of end to side penetration. Retention per cu. ft. is a satisfactory unit for sapwood, which is completely penetrated, but not for heartwood, which cannot be fully penetrated even by the most effective methods of treatment. Tabulated data are given showing that with the same vol. absorption the depth of penetration in timbers of different sizes may vary several hundred percent. A method is suggested for detg. within reasonable limits the proportional vol. absorption required

for timbers of various dimensions to obtain treatment equiv. to that of a given timber taken as a standard, and the values so obtained are tabulated. R. E. THOMPSON

"Waste" heat recovery in the Japanese cement industry (KASAI) 21. Density of  $\text{Ca}(\text{OH})_2$  and the role of that material in the shrinkage of portland cement (JOYE, DEMONT) 2. Solubility of  $\text{Ca}(\text{OH})_2$  (MILLER, WITT) 2. Copal oil and copal condensation oil [as wood preservatives] (GREMPE) 26. The operation of modern shaft kilns (HAEGERMANN) 19. Effect of percolating water on concrete dams (BOWERS) 14. Parabolic reinforced concrete sheds for storage of salts (VERDEYEN) 18. [Wood preserving composition] (Brit. pat. 305,943) 15.

**Cement.** PERRIN & TUSCHER. Swiss 120,818, Feb. 1, 1928. A cement contains slag 60–80, lime 2–22, and portland cement 7–27%.

**Method of impregnating cement blocks with coal tar or pitch by pressure.** "DIANA" BAU- & ISOLIERPLATTEN A.-G. Swiss 131,761, Feb. 2, 1928.

**Device for aerating wet cement.** GEORGE B. HINTON. Swiss 131,757, Feb. 27, 1928 and 131,759, Apr. 4, 1928

**Device for aerating cement paste.** GEORGE B. HINTON. Swiss 131,541, Feb. 27, 1928.

**Cooling shaft for a rotary furnace for burning cement.** KLÖCKNER-WERKE A.-G. Ger. 480,525, May 11, 1926 Addn to 464,761

**Porous concrete.** N. E. BROANDER (to K. P. Billner). Brit. 306,444, Feb. 20, 1928. Gases are injected or generated in a plastic mix of pulverized pozzolanic material, portland cement or lime, water and aggregate such as slag, cinders, sand and crushed stone. Al powder is preferably mixed with the compn. but soap solns., yeast, etc., may be used. Cf. C. A. 22, 1454.

**Lime and cement mortars containing blood serum, etc.** A. GENAIRON. Brit. 306,038, Feb. 14, 1928

**Bricks and stones from copper slag.** SUKESAKU JOSHIMOTO, TORATARO OKUMURA and SEISHICHIRO NAKAMURA. Ger. 479,895, Aug. 27, 1926. Bricks and stones are made from the molten slag of a Cu smelting plant by pouring into a mold and sprinkling with powd. S, Fe, mica and bran. The bricks may then be cooled in straw ash.

**Emulsions for use on roads or for detergents or sheep dips.** R. LISTER ET CIE. Brit. 305,742, Nov. 26, 1927. Bituminous, coal-tar or oil derivs. are emulsified with soap and amylaceous water and the mixt. is heated to about 96°. Various examples and details are given.

**Cellular building material.** G. M. THOMSON. Brit. 305,806, Jan. 31, 1928. A foam, the d. of which is regulated in accord with the cell size desired in the finished product, is mixed with a slurry of quick-setting cementitious material such as calcined gypsum and water, in such manner as to prevent occlusion of addnl. atm. air.

**Heat and sound insulating material for building construction.** C. A. UPSON (to Upson Co.). Brit. 306,559/60, Feb. 23, 1928. Structural features.

**Composition for coating walls, ironwork, roofing, etc.** R. F. BANKS. Brit. 306,256, Jan. 21, 1928. Cement, Na silicate,  $\text{BaCl}_2$  and water are used together, with or without acid K oxalate.

**Plastic compositions from benzyl cellulose.** H. BÖRNSTEIN AND N.-V. NEDERLANDSCHE LINOLEUMFABRIEK. Brit. 306,140, Feb. 17, 1928. In forming floor or wall coverings or the like, benzyl cellulose is plasticized by gelatinizing agents such as tri-cresylphosphate and mixed with fillers, coloring materials, linoxyn, etc., and may be applied to jute or other fabric.

**Bleaching wood.** I. G. FARBENIND. A.-G. (Helmuth Korte, inventor). Ger. 479,801, Aug. 11, 1927. The wood is washed with hot alkali, and bleached with  $\text{HClO}_4$  and  $\text{H}_2\text{O}_2$ .

**Preservation of wood.** I. G. FARBENIND. A.-G. (Hans Finkelstein and Oskar Loehr, inventors). Ger. 481,184, Jan. 8, 1928. The wood is preserved by impregnation with soln. contg. compds. of org. nitro compds. with org. bases. Preferably compds. of nitrated phenols with hydroxyalkyl amines are used. An example is given. Cf. C. A. 23, 4548.

**Wood preserving.** GRUBENHOLZIMPRAGNIERUNG-G. M. B. H. Ger. 480,205, Feb. 21, 1926. A wood preserving and hardening agent consists of a mixt. of  $\text{NaF}$  and  $\text{Na}_2\text{SiF}_6$ . Other insecticide and fungicide may be added together with fireproofing agents.

**Impregnating wood.** KARL BURLA. Ger. 481,534, May 6, 1925. The wood is

subjected to a vacuum and impregnated with a strong soln. of  $\text{HgCl}_2$ . The app. is described.

Device for impregnating wood. FRIEDRICH MOLL. Ger. 479,770, Jan. 1, 1927.

## 21—FUELS, GAS, TAR AND COKE

A. C. FIELDNER

The training of fuel engineers in Austria. W. J. MÜLLER. *Trans. Fuel Conference, World Power Conference, London, 1928 3*, 1277-81(1929). A. H. E.

Organizations for the promotion of fuel and heat economy in German industry. F. ZUR NEDDEN. *Trans. Fuel Conference, World Power Conference, London, 1928 3*, 1291-1304(1929). ALDEN H. EMERY

Organizations concerned with the efficient use of fuel in industry. E. C. EVANS. *Trans. Fuel Conference, World Power Conference, London, 1928 3*, 1305-46(1929).—E. gives a list and a statement of the objects of 93 organizations concerned with efficient fuel utilization in 14 countries. ALDEN H. EMERY

General problems of fuel utilization. M. I. LAPIROFF-SCOBLO. *Trans. Fuel Conference, World Power Conference, London, 1928 3*, 1347-70(1929).—A general survey of the training of fuel technicians and the organizations concerned with fuel utilization in Russia. ALDEN H. EMERY

"Waste" heat recovery in the Japanese cement industry. S. KASAI. *Trans. Fuel Conference, World Power Conference, London, 1928 3*, 901-8(1929).—Descriptive. ALDEN H. EMERY

Evaluation of fuels used for aviation in Germany. E. RACKWITZ AND A. VON PHILIPPOVICH. *Trans. Fuel Conference, World Power Conference, London, 1928 3*, 610-25(1929).—The compression ratio of German airplane engines lies between 1:5.5 and 1:6.3 and suitable fuels are hard to find. Properties to be met include: aniline point below  $52^\circ$  for pure gasoline and  $58^\circ$  for gasoline-benzene mixts., less than 2% unsaturates, sp. gr. more than 0.710, withstand  $-30^\circ$  temp., non-corrosive, non-gumming (no diolefins allowed), less than 0.3% S, calorific value more than 8500 cal. per kg., and boils as follows: 1st drop  $50-60^\circ$ , 10% to  $70^\circ$ , 60% to  $100^\circ$ , 80% to  $120^\circ$ , 96% to  $130^\circ$ , dry  $140^\circ$ , or for gasoline for gasoline-benzene mixts. 1st drop  $50-60^\circ$ , 10% to  $75^\circ$ , 60% to  $110^\circ$ , 80% to  $130^\circ$ , 96% to  $150^\circ$  and dry  $160^\circ$ . A. H. E.

Improving the combustibility of fuel. JOHN ROBERTS. *Eng. & Finance* 21, 79-80 (1929).—By prepg. suitable blends of coking and non-coking coals and shortening the coking period the Woodall-Duckham Co. has succeeded in producing a free burning, smokeless, high-temp. coke contg. about 4% volatile matter. L. B. B.

Pulverized fuel in marine work. H. W. BROOKS. *Trans. Fuel Conference, World Power Conference, London, 1928 3*, 506-41(1929). Marine boiler practice demands release of 60,000-80,000 B. t. u. per cu. ft. per hr. Expts. toward obtaining this capacity in pulverized-fuel-fired boilers are described in detail. It is necessary to secure (1) extra fine pulverization (75% through 300 mesh), (2) high flame turbulence, and (3) even distribution of the coal stream among burners. ALDEN H. EMERY

Progress of pulverized-fuel burning for steam boilers in Japan. SHUICHI YAMAUCHI. *Trans. Fuel Conference, World Power Conference, London, 1928 3*, 385-400(1929).—Typical Japanese pulverized-fuel-burning installations are described. ALDEN H. EMERY

Pulverized-fuel firing. F. H. ROSENCRANTS. *Trans. Fuel Conference, World Power Conference, London, 1928 3*, 323-61(1929).—An excellent general discussion. ALDEN H. EMERY

The use of fuels in tunnel kilns. W. E. RICE. *The Clay Worker* 92, 28-34(1929) cf. C. A. 22, 308.—R. deals with the use of fuels in continuous-heating furnaces of the railroad car tunnel type, which furnaces at present provide the most efficient means of heat-treating such materials as metallurgical products, steel sheets, C electrodes, brick, tile, pottery, etc. He first takes up the various fuels, gas, oil and coal, following which he deals with the movements of the gases in the various zones of the kiln, and finally with the confinement of products of combustion in muffles when accurate control of atm. is required as in many high-grade metallurgical and ceramic products. R. A. HEINDL

The use of ethyl alcohol as a motor fuel. E. HUBENDICK. *Trans. Fuel Conference, World Power Conference, London, 1928 3*, 724-48(1929).—Up to 25% EtOH can be mixed with gasoline without materially affecting its properties as a motor fuel. With

greater amts., intake air must be preheated (100–150°), the float must be adjusted for the different sp. gravities, and the size of the carburetor jet must be increased in inverse proportion to the thermal value of the alc. fuel and the gasoline per unit vol. The miscibility of the system and the effect of air humidity are discussed. A. H. E.

**Examination of alcohol motor fuels.** K. R. DIETRICH AND H. JEGLINSKI. *Chem.-Ztg.* 53, 177–8, 198–9 (1929).—The most usual diluents for alc. fuels are benzine, benzene and ether; the alcs. are removed by treatment with water. The residue after this washing is benzene if it has  $d_{15}$  0.87–0.88, while if it is lower a more detailed inspection is necessary, and this may conveniently take the form of the Dietrich or Formánek color test (*cf. C. A.* 22, 2826). The presence of alcs. is more certainly detected by the use of  $\text{CaCl}_2$  soln. or by the addn. of a dye which is sol. only in alcs.;  $\text{EtOH}$  is identified by Schiff's reagent. Ether or acetone is sepd. from a large vol. by careful fractionation, and if acetone is present the aq. ext. of the distillate will give a red or violet coloration, on the addn. of Na nitroprusside. Detns. are carried out along the same lines, and a crit. review of the methods available is given. B. C. A.

**The fusibility of the ashes of some fuels from U. S. S. R. according to the data of the Chemical Laboratory of the Institute for Thermotechnic.** N. UVAROV AND V. UVAROV. *Izvestiya teplotekh. Inst.* 1926, No. 8, 26–37; *Chem. Zentr.* 1929, I, 334.

**Laboratory examination of the ashes of solid mineral fuels regarding their fusibility.** O. NEFEDVEVA AND V. UVAROV. *Izvestiya teplotekh. Inst.* 1927, No. 10, 37–50; *Chem. Zentr.* 1929, I, 334.—Cones similar to the Seger cones were made from the ash under examn. by grinding the powd. ash with a few drops of water. If necessary, some dextrin was added. The cones were heated in refractory crucibles. The temp. at which deformation begins, the softening temp. and the fusing temp. (at which the cone deliquesces) were observed. The detns. were carried out in an atm. of the products obtained by complete combustion ( $\text{CO}_2 + \text{H}_2\text{O}$ ) or in a half-reducing atm. (a mixt. of equal vols. of  $\text{CO} + \text{H}_2 + \text{CH}_4 + \text{C}_2\text{H}_4$  and  $\text{CO}_2 + \text{H}_2\text{O}$ ). The results of the examn. of the ashes of different fuels are compiled in tables. G. SCHWOCH

**Some chemical aspects of power production from mineral fuels.** J. T. WARD. *Chemistry and Industry* 48, 547–51 (1929).—Increased efficiency in fuel utilization and conservation is an industrial necessity. The present power generation methods are limited in scope. A few ways are suggested in which efficiency of power might possibly be increased and some of the more important chem. problems involved in their soln. are pointed out. FRANK V. JOHNSON, JR.

**Transmission over various distances of energy in the form of coal, coke, oil, gas and electricity.** E. W. SMITH. *Trans. Fuel Conference, World Power Conference, London, 1928* 3, 828–30 (1929).—English costs per therm of the above fuels are calcd. for transmission over various distances and at various loads. There is a limiting distance beyond which transportation of fuel is cheaper than the transmission of gas or electricity. ALDEN H. EMERY

**Industrial heating by solid, liquid and gaseous fuels.** ROBT. HADFIELD AND R. J. SARJANT. *Trans. Fuel Conference, World Power Conference, London, 1928* 2, 1003–35 (1929).—Gaseous and liquid fuels are more adaptable and occasionally discount the lower thermal cost of solid fuel. The iron and steel industry is the largest English consumer of coal for industrial heating, using in 1927 over 13 million tons to produce pig iron and about 12 million tons for steel and other purposes. The fuel requirements of different processes are (in cwt. per ton): soaking pits 1.5–4, reheating furnaces—heavy 1.75–5, reheating furnaces—light 2–10, forge furnaces—heavy 3–8, forge furnaces—light 2–10, plate mill 4 (approx.), sheet mill (av.) 7.2, etc. There is considerable scope for the direct use of solid fuel by further development of mech. stokers and other means of burning solid fuel (such as pulverizing). Metallic recuperators of heat-resisting alloy operating at high temps. are practicable and valuable aids to fuel economy. In an investigation of air regenerators, the coeff. of heat exchange per unit of surface area was shown to increase as the path of the heated gas was ascended. This suggests that the checker work should be built as near the furnace ports as possible. The rate of heating was shown to have a marked influence on the relative storage of heat in unlagged firebrick walls as compared with external surface losses. A. H. E.

**The function of the combustion chamber of a powdered fuel-fired boiler installation.** W. LULORA. *Trans. Fuel Conference, World Power Conference, London, 1928* 3, 362–84 (1929).—The proper design of the combustion chamber of a powd.-fuel boiler is thoroughly discussed, beginning with fundamental principles.

the limiting size of a boiler according to the percentage of  $\text{CO}_2$  in the flue gas at  $1200^\circ$  in the combustion chamber.

ALDEN H. EMERY

**Theoretical considerations on the question of preheated air in the cupola.** E. PIWOWARSKY AND R. VOGEL. *Die Giesserei* 16, 147-53 (1929).—The authors advance some criticisms of former studies on the combustibility of fuels. They studied the mechanism of the reaction  $\text{C} + \text{O}_2 = \text{CO}_2$  in the region of small reaction velocities (low temps.). Charcoal, heating coke, petroleum coke and graphite at various temps. were in contact with 1.5 to 9.0 l./hr. of  $\text{CO}_2$ -free air. The calcd. reaction const. for given temps. can be detd. by means of the formula for reactions of the first order. In studying the reaction  $\text{CO}_2 + \text{C} = 2\text{CO}$  with graphite at a temp. of  $910^\circ$  to  $1010^\circ$ , and a gas consisting of 79 vol. %  $\text{N}_2$  and 21 vol. %  $\text{CO}_2$ , the value for the reaction const. can be detd. by the formula for reactions of the second order. Conclusion: The reaction  $\text{C} + \text{O}_2 = \text{CO}_2$  is of the first order, while the reaction  $\text{CO}_2 + \text{C} = 2\text{CO}$  is of the second order. A study was made to det. the effect of air velocity on cooling a bed of hot coke. In the region of low temps. the amt. of heat developed per unit time is less than the heat removed by the cold air entering. Cubes of heating coke and petroleum coke 40 mm. on edge were heated to  $850^\circ$  in a small column furnace. Various amts. of cold air were passed through the hot coke, and temps. of the outgoing gas taken every 5 sec. Petroleum coke could not be blown cold. Heating coke began to cool for air vols. of 2 cu. m./min. Great differences in combustibility exist between cokes. By an economic preheating of air the velocity of the reaction  $\text{C} + \text{O}_2 = \text{CO}_2$  will increase and the cooling action of the inblown air in and above the tuyère zone of the cupola will lessen, bringing about the following advantages: the amt. of coke burned per unit time will increase by the introduction of more air per sq. m. of furnace cross section; the melting performance will increase; Fe and slag temps. will be raised; heat loss through radiation will lessen with a corresponding saving in coke; thermal efficiency will increase; melting zone will be lowered, and desulfurization will increase.

C. H. LORIG

**Analysis of coal for export.** ANON. *Colliery Guardian* 139, 801-3, 900-2 (1929).—Methods adopted by the Brit. Engineering Standards Assoc. are outlined. E. J. C.

**The assay of coal for carbonization purposes. II. Results of experiences with the Gray-King method.** J. G. KING, C. TASKER AND L. J. EDGCOMBE. Dept. Sci. Ind. Research, Fuel Research Div., *Tech. Paper* No. 21; *Gas World* 90, 697-9 (1929).—The latest improved design of the Gray-King app. (*C. A.* 15, 1390) is described. The considerations which have led to it, the modifications desirable with strongly swelling coals and the information obtainable by its use are discussed. F. S. GRANGER

**Some chemical aspects of coal carbonization.** S. ROY ILLINGWORTH. *Gas World* 90, No. 2339, Coking Sect. 18-20 (1929).—Sevler's classification of coals, the components of coal by extn., and H content are discussed with reference to coking qualities. For a given C content, available H is some measure of cementing and swelling properties, since the  $\gamma$  constituent of coal is richest in H. It was found by extn. after various heating stages that the material factors of coke formation—namely, the ulmins and the  $\beta$  and  $\gamma$  constituents, are all destroyed below  $500^\circ$ , so that the nature of the coke is detd. by the behavior of the coal below this temp. The relative decompn. temps. of the  $\beta$  and  $\gamma$  constituents responsible, resp., for bubble formation and the plastic stage, are an important factor. Factors and effects related to the rate of heat penetration and economic questions relating to tar also are discussed. F. S. GRANGER

**Electrical conductivity of coal during carbonization. I. Low-temperature carbonization.** SADAŌ IKI. *J. Soc. Chem. Ind. (Japan)* 32, 367-75 (1929); Suppl. Binding 32, 11-2B (1929).—Anthracite has some cond. at ordinary temp., which begins to increase at  $300^\circ$  and rapidly increases from  $400^\circ$ . Bituminous coal, brown coal and sawdust have practically no cond. at ordinary temp.; their conductivities begin to increase slowly at  $400^\circ$  and rapidly from  $500^\circ$ . A very moist brown coal shows a large transitory cond. at  $100$ - $200^\circ$ . The temp. at which the rapid rise of elec. cond. begins is a little higher than the softening temp. of coal, and nearly coincides with the temp. at which the coal begins to evolve gases and to swell. The cond. during cooling depends upon the properties of cokes produced; the higher the temp. attained, the larger is the cond. This cond. measurement can be used for the detn. of the decompn. temp. for the examn. of coke produced and for the investigation of the progress of carbonization. **II. High-temperature carbonization.** *Ibid* 375-80, 112-3B.—During high-temp. carbonization of coal, the elec. cond. increases in 2 stages, at  $400$ - $500^\circ$  and at  $700$ - $800^\circ$ . The former corresponds to the temp. at which coal begin to decomp. and evolve gas and tar; the latter corresponds to the temp. at which the tar decomposes and binds the coke mass together. The change of elec. cond. of the coke produced depends greatly upon the temp. of coking; the higher the temp. of coking, the

lower the temp. at which the cond. becomes apparent. The temp. coeff. of cond. depends on the coking temp.; the higher the temp., the smaller the coeff. When coal is heated for a long time at const. temp., the cond. increases; at temps. below 600°, the rate of increase is very small, and above 700°, very large. S. OKA

**The Bussey process of low-temperature carbonization.** DAVID BROWNLIE. *Gas Age-Record* 64, 141-2, 148, 150(1929).—A large plant of 14 standard retorts with a total calcd. throughput of 600-700 tons of bituminous coal per 24 hrs. has just been completed at Glenboig, Scotland. A description of the retorts with dimensions is given and the results of operation of exptl. retorts in the United States are discussed.

**The Pehrson process for the low-temperature carbonization of coal.** W. R. CHAPMAN. *J. Soc. Chem. Ind.* 48, 189-94T(1929).—The essential principle of this process involves the use of a rotary dryer or preheater for the first stage in which the coal is heated up to a crit. temp., and a retort in which the carbonization is completed. Cuts and diagrams are included. LESLIE B. BRAGG

**Status of low-temperature carbonization in Europe.** B. F. HAANEL. *Gas World* 91, 119-22(1929); *Gas Age-Record* 64, 203-6, 214(1929).—The usual objective of low-temp. carbonization is to produce the largest quantity of solid residue and tar oils without the formation of gas. The solid residue may be intended for domestic or industrial fuel. At present the tar oils must generally be credited as fuel or gas oils. A brief description is given of the types of retorts and processes used in 11 European plants showing promise of com. success. H. L. OLIN

**Low-temperature and high-temperature carbonization.** H. NIELSEN. *Gas Eng.* 46, 137(1929).—Comparison between low- and high-temperature methods shows no marked demarcation. J. B. CARPENTER, JR.

**Coal blending in carbonizing practice.** H. S. MADDEN. *Gas Eng.* 46, 83-4(1929).—Blending practice is considered to offer a field of development in the use of cheap non-coking coals with those of strongly pronounced coking qualities. E. I. S.

**Low-temperature distillation of low-grade fuels, especially lignites.** MAX TOLTZ. *Trans. Am. Soc. Mech. Eng.* 51, 209-11(1929); cf. *C. A.* 23, 500.—The utilization of low-grade fuels by low-temperature carbonization is discussed. A WHITE

**A large-scale laboratory apparatus for the low-temperature carbonization assay of coals.** N. SIMPKIN, C. G. WOOD, A. DAWE AND W. GIBSON. *J. Soc. Chem. Ind.* 48, 183-9T(1929). The app. consists of an elec. furnace, retort, air-cooled condenser, Woulff bottle, by-pass, spiral condensers, U-tube, tar-fog filter, NH<sub>3</sub> tower, light-oil absorption tower, meter guard tube, gas meter, gas holder and manometers. Cuts and diagrams are included in the description. H. L. OLIN

**Carbonizing Illinois coal.** S. W. PARR. *J. Western Soc. Eng.* 34, 458-71(1929).—See *C. A.* 23, 3557. H. L. O.

**Distribution of ash in the Merrimac coal seam.** F. H. FISH AND J. A. ADDLESTONE. *Va. Polytech. Inst. Bull.* 22, No. 10, 3-18(1929). E. I. S.

**Specific gravity of Alabama coals.** B. W. GANDRUD AND S. A. BRITTON. *Alabama State Mine Expt. Sta., Bull.* No. 2, 57 pp (1928).—Samples of Alabama coal were taken from 19 mines of the Warrior and Cahaba fields. These coals on analysis had d. 1.26-1.37%, ash 2-15%, moisture 2-4.5%. Ordinarily the sp. gr. increases uniformly with the percentage of ash, the discrepancies observed may be due to change in the character of the ash-forming material, to variation in the volatile-matter content, or to their combined effect. In those cases where the seams consist of benches of coal sepd. by partings of shale, etc., of high ash content, crushing will be necessary to eliminate the ash-forming impurities, and the resulting finer sizes of coal will furnish the most difficult problem in effecting improvements in the washing of Alabama coal. B. C. A.

**The coals of Nottinghamshire and Derbyshire.** J. W. WHITAKER. *Iron Coal Trades Rev.* 119, 39-40, 79-80(1929).—Several methods of classification of coals are discussed. The classification and uses of the various seams of Nottinghamshire and Derbyshire, England, coals are then taken up in detail. The effect of moisture, ash and S on the value of coals and the utility of the above-mentioned coals for gasification and hydrogenation are further considered. LESLIE B. BRAGG

**The action of chlorine on coal.** A. MARSH, A. McCULLOCH AND E. PARRISH. *J. Soc. Chem. Ind.* 48, 167-74T(1929).—Gaseous Cl reacts vigorously with coal with evolution of heat, the amt. of which may serve as an index to the tendency of the coal to spontaneous heating in storage. At temps. below 550° the Cl is given off quantitatively as HCl. H. L. OLIN

**The coking of coal.** M. BARASH. *J. Soc. Chem. Ind.* 48, 174-83T(1929).—The effects of various thermal and chem. treatments of coals with respect to coking or

agglutinating values were studied. Cl, among the oxidizing agents, was found to be especially destructive to the coking agents. An extensive review of the literature is appended. Also in *Blast Furnace Steel Plant* 17, 1358-62(1929). H. L. OLIN

The combustion of anthracite culms and brown coals in pulverized form. L. K. RAMZIN. *Trans. Fuel Conference, World Power Conference, London, 1928* 3, 438-58 (1929).—Grinding culm to 85% through 200 mesh and using a moderate rate of combustion increased efficiency of furnaces to 90.6%. Radiation losses were 3%. The coeff. of excess air behind the boiler was 1.36 and losses through incomplete combustion were 2.1% (10.5% previously). A table gives full data including heat balances on tests with 7 culms, 2 brown coals and 2 oil shales. An extensive tabulation shows the results of low-grade fuel combustion in different furnaces. Conclusion: (1) the lower the content of volatiles in the combustible matter and the higher the ash content, the more difficult it becomes to obtain high-combustion efficiency on mech. stokers (pulverized firing of such fuels is recommended) and (2) costs of drying and crushing so greatly reduce net efficiency of powd. fuel firing that high-grade coals could probably be stoker-fired most economically. ALDEN H. EMERY

The history and recent developments of pulverized coal for fuel. W. W. DULMAGE. *Natl. Eng.* 33, 309-12(1929). E. I. S.

Powdered coal for steam purposes. HENRY KREISINGER AND MARTIN FRISCH. *Trans. Fuel Conference, World Power Conference, London, 1928* 3, 459-505(1929).—A general discussion of the burning of powd. fuel and the equipment needed to secure max. efficiency. ALDEN H. EMERY

Some selected topics in the field of pulverized coal research in Germany FÖRDER-REUTHER. *Trans. Fuel Conference, World Power Conference, London, 1928* 3, 275-322(1929).—The following subjects are discussed: methods of chem. and phys. analysis of powd. fuel, hygroscopic property of fine coal, m. p. of coal ash, bulk measurement, ignition temp., temp. of spontaneous combustion, velocity of combustion, measurement of particle size, grinding characteristics, costs of drying and prepg. coal dust, transportation of powd. coal, type of furnaces to be used, special applications of powd. fuel, safety in use, etc. ALDEN H. EMERY

The reliability of the Eschka method for the determination of sulfur in solid fuels. K. STROCKFISCH. *Mitt. Lab. preuss. Geol. Landesanstalt* 1928, No. 7, sep. 10 pp.; *Chem. Zentr.* 1928, I, 2557.—In coals of high and low S content, S found that sulfide-S from pyrites was completely recovered, but from pyrrhotite, only after prolonged heating. The S of sulfates is readily recovered. Long heating is necessary to set free org. S. The procedure makes use of 1 g. of the pulverized sample mixed in a porcelain crucible with 3 g. of the Eschka mixt. and overlaid with 1 g. of the mixt. The crucible is slowly heated for 1 hr. with the tip of the flame merely touching the base of the crucible. A triple burner is used for an addnl. hr. An asbestos pad is fitted around the crucible to protect the contents from S in the gas. After cooling, the residue is well extd. with 150 cc. of H<sub>2</sub>O and 20 cc. of 3% H<sub>2</sub>O<sub>2</sub>, boiled for 10 min. and filtered. The filtrate is acidified with HCl and pptd. with BaCl<sub>2</sub> in the usual way. C. R. FELLERS

Rate of burning of individual particles of solid fuel. H. K. GRIFFIN, J. R. ADAMS AND DAVID F. SMITH. *Ind. Eng. Chem.* 21, 808-15(1929).—Pulverized bituminous (gas) coal, semicoke, beehive coke and activated charcoal were tested as to time required for burning by dropping through a vertical furnace electrically heated and provided with windows for making photographic records. Coal and semicoke particles required longer time for burning at higher temps. than at lower. The neg. temp. coeff. was much smaller for the fuels very low in volatile matter. Explanations are suggested. Charcoal particles were much longer in burning than coal, wt. for wt. Also in *Blast Furnace Steel Plant* 17, 1368-73(1929). EMMA E. CRANDAL

Evaluation of bituminous coal for gas works on basis of analyses. ROBERT MEZGER *Gas u. Wasserfach* 72, 770-6(1929).—Methods of comparing the relative value of various coals are discussed, and a method is recommended which is based on the cost of producing 100,000 calories of unpurified gas. R. W. RYAN

Behavior of bituminous coals in the water-gas generator. E. S. PETTYJOHN *Gas Age-Record* 64, 237-40(1929).—A summary of an investigation conducted by the Dept. of Eng. Research of the Univ. of Michigan. The test results of 7 different coals are given. Operating conditions, as detd. by the size of the coal, the quantity of fines, the coking properties, ash content and the ash fusion temp., are most important. LESLIE B. BRAGG

Tests of bituminous caking coal in a large low-pressure heating boiler. P. NICHO-LLA, C. E. AUGUSTINE AND B. A. LANDRY. *Bur. Mines, Rept. of Investigations, No. 2943*, 8 pp.(1929); *Fuel Econ. Ind. Products* 1929, 545-7.—Continuation of tests pre-

vously reported (C. A. 23, 1242) but with various modifications. A furnace equipped with tuyeres for secondary air produced an improvement in the smoke condition, but did not eliminate it. Boiler and furnace efficiency was only 1.0% higher. T. P. K.

**Texas plant burns lignite.** E. T. KECK. *Coal Age* 34, 429(1929).—In the plant of the Texas Power and Light Co. pulverized lignite has proved economical. The boilers are 18,756-sq. ft. Babcock and Wilcox type with interdeck superheaters. The steam pressure of 425-lb. gage; the main turbines are 20,000-kw., 14-stage, 1800-r. p. m., single-cylinder, General Electric units for steam pressure and temp. of 375-lb. gage and 700°.

**Drying of lignites according to the Fleissner system.** P. ROSIN. *Braunkohle* 28, 649-58(1929).

**Pulverized fuel firing at the Mydlovary Power Station of the South Bohemian Electricity Works at Budějovice.** FR. WIESNER. *Trans. Fuel Conference, World Power Conference, London, 1928* 3, 259-74(1929).—Mydlovary lignite, the poorest fuel in Czechoslovakia, contains 50-60% H<sub>2</sub>O and only about 1600 cal. per kg. It cannot be successfully fired on grates. The powd.-fuel installation using this fuel is thoroughly described; 4 boilers, each of 500 sq. m. heating surface, produce 100,000 kg. of steam per hr. and operate at 84% efficiency. Ash is removed hydraulically. Power consumption of the coal-dust-prepn. units and costs of construction are discussed.

**Fusain.** JOSEPH D. DAVIS. *Mining Congress J.* 1929, 197-200; *Bur. Mines, Circ.* 6115, 10 pp.(1929).—The literature on fusain is reviewed and an extensive bibliography is given. The occurrence of fusain and its recognition in coal by streak tests and microscopical exams. are described. Fusain may make up 1-5% of a coal bed. The different theories as to the origin of fusain and the difficulties arising in sepp. it from the other coal substances are stated. The phys. properties of fusain, its fibrous needle-like structure, sp. gr. 1.53 to 1.98, and ease of ignition are given, also the chem. properties and a table of distn. data. Chem. analyses for 21 samples of fusain and of the coals from which it is obtained are tabulated. The practical significance of fusain in coal is discussed; it has no coking power and relatively thin sheets of fusain may reduce the strength of a large proportion of the sized lumps of coke as marketed. Fusain rapidly absorbs O at low temps. and so may possibly increase the tendency of coal to ignite spontaneously. Fusain is the black smudgy material found on lumps of coal; it dries quickly and increases the dustiness of coal.

**Microscopical examination of fine-coal-cleaning products by the methods of relief-polishing.** ERICH STACH AND F. L. KÜHLWEIN. *Glückauf* 64, 841-5(1928).—The products obtained in the cleaning of fine coal have been examd. microscopically by embedding the material in Schneiderhohn's resin mixt. (Venetian turpentine 1, dammar resin 3, shellac 2 pts.), which is then cast into small blocks, ground and relief-polished. The characteristic appearance of the different constituents, vitrain, durain, fusain and shale, is illustrated by photomicrographs. They can be recognized at once and their resp. amts. detd.

**The phenol waste liquor problem.** MAX PRUSS. *Gas u. Wasserfach* 72, 791-801(1929); *Gas J.* 187, 404 7. The phenol content of waste liquor from coke-oven plants in the Emscher region of Germany is so great as seriously to affect fish life and the taste of the drinking water, when chlorinated, and has been especially damaging to the Rhine. Biological methods of purification were studied by the Emscher Commission and a new biological filter was devised that required a diln. of the raw liquor with only 1 vol. of water or treated effluent. This method destroys practically all of the phenol and thiocyanates, but is too expensive for the Emscher. A method of extg. the phenol (Pott-Hilgenstock) from the liquor with about 50% of benzene (based on liquor vol.) was then developed but the cost of recovery by distn. was excessive, so the phenol was recovered from the benzene ext. by treating with NaOH soln. For a large coke plant, the cost of producing crude phenol was about 5¢ per lb., or slightly less than the German selling price. The Am. Koppers Co. hot gas process is also reviewed, but the capital cost was higher than that for the Pott-Hilgenstock process. It was also noted that other constituents of the liquor were nearly as harmful as the phenols. Active C can also be used to remove phenols but the recovery of the phenols by steam distn. causes rapid disintegration of the C. Benzene extn. can be used to remove phenol from the C at least 100 times, but doubt was expressed as to the value of such an involved process.

**Naphthalene recovery and purification.** OTTO KREBS. *Teer u. Bitumen* 27, 254-8(1929).—A review and discussion of industrial practice.

**Study of the desulfurizing of ammonia liquors.** YVAN QUERRT. *J. usines gaz* 53,

373-86(1929).—A brief survey of previous work followed by a description of expts. where the  $H_2S$  of the  $NH_3$  liquor was oxidized to sulfate by air. Various salts were used as catalysts.  $NiSO_4$  was best. Co, Fe and Cu were of some value. Cr, Mn, Sn, Zn and Al had no activity. Activation of the catalyst by an elec. current, either a. c. or d. c., greatly increased the efficiency of oxidation, particularly with Fe and Mn. Com.-scale equipment with Fe electrodes and Fe catalyst is described. W. J. M.

Notes on refining benzenes by treatment with sulfuric acid. W. H. HOFFERT. *Gas Eng.* 46, 161-3(1929).—The 6th report of the Benzole Research Committee for 1928 is divided into 4 parts: (1) resin forming in benzenes, (2) comparative absorptive efficiencies of wash oils for  $C_6H_6$  recovery, (3) reduction of sp. gr. and vol. to  $60^\circ F$  and (4) notes on refining benzenes by treatment with  $H_2SO_4$ . E. I. S.

Calculation of thermal capacity of combustible gases. W. C. BUELL, JR. *Fuels and Furnaces* 7, 1049-52(1929).—A discussion of the construction and use of curves for a simplified calcn. of thermal capacity of combustible gases. T. P. KELLER

Operating costs for continuous heating with gas. KAISER. *Gas u. Wasserfach* 72, 725-8(1929).—A comparison of operating costs for continuous heating with gas with other fuels and central heating. R. W. RYAN

Interpretation of stack-gas analysis. II. G. E. SALKVIST. *Blust Furnace and Steel Plant* 17, 1226-9(1929); cf. C. A. 23, 4555.—The method of detg. the efficiency of combustion from analysis of fuel and stack gas. C. L. READ

Proper flue-gas conduits for gas fires. GÜLICH. *Gas u. Wasserfach* 72, 761 6(1929).—Gas fires and gas-using equipment are blamed for many accidents really due to defective flues or chimneys. Illustrations and examples of faulty installations are given. R. W. RYAN

Elimination of sulfur compounds from flue gases. J. ARTHUR REAVELL. *Chem. Age* (London) 21, 103(1929).—Washing flue gases in a chamber which reduces their velocity to below that in the flues, with ample supplies of water furnished by non-plugging, rotary sprayers will remove 90-95% of the S compds. Records show years of operation at 97.5% removal. Unless eliminators are used entrained water is carried out the stack. E. M. SYMMES

Gas oil value and supply. HUGH E. FERGUSON. *Gas Age-Record* 64, 235-6, 241-4(1929).—Specifications and proposed standard grades of carbureting oils are discussed. LESLIE B. BRAGG

Observations during the control and working of horizontal retorts. G. PERCIVAL. *Gas Eng.* 46, 89-92(1929).—Details of retort arrangement and operation at the plant of H. M. Fuel Research Station, East Greenwich, Eng. E. I. S.

British make practical test of MacLaurin process. A. C. BLACKALL. *Eng. & Finance* 21, 84-5, 96(1929).—A short description of the MacLaurin retort and a partial report of a test on a retort at the Dalmarneok Gasworks of the Glasgow Corp. carried out by the Dept. of Scientific and Industrial Research. LESLIE B. BRAGG

Refractories for gas retorts. FRED A. HARVEY. *Am. Refractories Inst., Tech. Bull.* No. 29, 14 pp(1929).—An analysis of the service requirements of coal gas bench refractories by means of the "Utility of Refractories" chart. M. A. EDDY

Gas producers. F. E. LEAHY. *Iron and Steel Eng.* 6, 451-2(1929).—The status of gas-producer development is outlined and a description is given of the producer in operation for 2 years in the seamless tube dept. of the Youngstown Sheet and Tube Co. For high rates of gasification, selection of proper coal is very important. E. I. S.

Reactions in the gas producer. W. P. RYAN. *Fuels and Furnaces* 7, 1037-8(1929).—A detailed discussion of the reactions occurring in a gas producer, with particular reference to air-steam ratio and fuel-bed thickness. T. P. K.

Suction gas producers for motor vehicles. J. AUCLAIR. *Trans. Fuel Conference, World Power Conference, London, 1928* 2, 854-77(1929).—An engine designed for gasoline will lose more than 30% of its h. p. efficiency when adapted for gaseous fuels. The price of fuel must be 40% that of gasoline to make competition possible. Progress in gas generation has led to great simplification by eliminating steam injection and air preheating. Producers for burning charcoal with downward combustion and fabric gas filtration are being used. The difficulties of combustion in the producer under max., min. and zero output of the engine are discussed together with the phys. nature and condition of the combustible and the qualities of a standard synthetic fuel. ALDEN H. EMERY

The purification of brown-coal tar of alcoholic substances and the recovery of Frosol in the patented continuous alcohol wash. OTTO KREBS. *Teer u. Binnman* 27, 273-7(1929).—Great economy has been effected, in certain plants, by using alc., instead of caustic soda, for the removal of creosote from the paraffin oil fraction. The alc.

ext. contains also the resinous and other unsatd. substances and so is a new material to which the trade name Fresol has been given. It has proved a valuable article of commerce, covering completely the cost of the process as a method of tar purification. The app. and process are described and discussed.

**Tar and bitumen from the colloid-chemical viewpoint.** H. GROHN. *Teer u. Bitumen* 27, 365-8(1929); cf. C. A. 23, 4800.—A review.

**Separation of tar from producer gas.** R. W. MILLER. *Blast Furnace and Steel Plant* 17, 1172-3(1929).—Description of methods employed abroad for the cleaning of gas to eliminate the burning out of gas mains and to recover the tar products.

**Coke research.** R. A. MOTT. *Colliery Guardian* 138, 2505-8(1929).—Work of the Midland Coke Research Comm. shows a rational basis for the use of the *shatter test* to assess the hardness of different cokes by the use of the 2 in., 1½ in. and 1 in. shatter indices.

**Constitution of low-temperature tar.** *Repts. Imp. Fuel Research Inst. Japan* No. 7, 54 pp.(1929).—This rept. includes 4 papers: **Constitution of gas benzene obtained from low-temperature gas.** YOSHISADA BAN. See C. A. 22, 4231. **Constitution of neutral oil in low-temperature tar.** K. KURIHARA. Neutral oil was fractionated into 2 parts: (I) distd. up to 200° and (II) above 200°. I contains toluene, *o*-, *m*- and *p*-xylenes and a substance resembling 1,3-dimethyl-5-ethylbenzene. II contains naphthalene,  $\alpha$ -methyl-naphthalene, dimethylnaphthalene, anthracene, and methylanthracene. **Action of sulfuric acid on neutral oil of low-temperature tar.** K. KURIHARA.—H<sub>2</sub>SO<sub>4</sub> (concn. is up to 90%) acts upon unsatd. compds; it acts upon aromatic compds as it increases its concn. and its action is almost completed at 95% concn. **New method of low-temperature tar distillation.** ISAMI ARAKAWA.—Two special methods of distn of low-temp. tar are described: (I) acid clay is added to low-temp. tar to decomp. unsatd. compds. and (II) low-temp. tar is treated with dil. H<sub>2</sub>SO<sub>4</sub> and a metal such as Zn is added to sat. unsatd. compds. Distn of low-temp. tar by the above methods gave better yield and better quality.

**Recent research on the production and utilization of coke.** II. W. T. K. BRAUNHOLTZ. *Gas World* 91, Coking Sect. 78-83(1929); cf. C. A. 23, 4556.—Expts. are made in full-scale ovens of various types and with various coals showing the influence of various carbonization conditions on the coke as indicated by shatter tests, sp. gr. and porosities. The conditions covered are method of charging, width of oven, carbonizing time, position of coke in oven, "soaking" in oven after completed carbonization and blending of Durham coking coals with anthracite duff. The data are insufficient for general conclusions. Other articles included are comparisons of cokes made from identical coals in tins and full-size oven charges, behavior of different cokes in full-size cupolas, and lab. combustibility tests. From the last it is concluded that an increase in FeO<sub>2</sub> materially increases the rate of consumption of the coke under a given air blast, and tends simultaneously to lower the temp. produced in the combustion zone. Removal of Fe and alkalis from coke by acid extn. markedly diminishes its rate of consumption in the lab. combustibility app. Less total ash in coke, from a given coal, washed to different degrees of cleanness, tends to reduce the rate of C consumption under the test conditions, probably because of the smaller proportion of catalytic material. Decreasing the size of the coke results in an increase in the temp. of the combustion zone and an increased C consumption. Also, the max. temp. in the combustion zone is obtained lower in the fuel bed with small coke than with large.

**The reactivity of coke.** Extracts from Fuel Research Board Tech. Paper No. 22. I. H. JONES, J. G. KING and F. S. SINNATT. *Gas World* 91, Coking Sect. 84-7(1929).—CO<sub>2</sub> reactivity tests were made on a large variety of metallurgical cokes for the purpose of ascertaining whether any relationship exists between the reactivity of a coke and its behavior in the blast furnace. A broad correlation is found with the phys. strength, as indicated by the shatter test, which, however, cannot be extended to particular cases. Data are also given on the influence of carbonization conditions and inorg. constituents.

**The economy of various methods of coke-oven heating.** ERNST WEISE. *Z. oesterr. Ver. Gas Wasserfach.* 60, 142-50(1929).—See C. A. 23, 2019.

**The design of the modern coke-oven.** G. E. FOXWELL. *Gas Eng.* 46, 143-5(1929).—Review of development and general tendencies in coke-oven design indicates increase in capacity of ovens, adoption of ovens operating with small pressure differences, and general adoption of combination ovens.

**Studies on coke and charcoal.** YOSHIKIYO OSHIMA AND YOSHITANI FUKUDA. *J. Soc. Chem. Ind. Japan* 31, 1222-43(1928); Suppl. Binding 31, 288-90B(1928).—

O. and F. proposed to classify porosity into total porosity, open-pore porosity and closed-pore porosity. The total porosity is given from true and apparent specific gravities; open porosity is given by an air expansion porosimeter designed by O. and F.; closed porosity is given by the difference of the two. The results obtained with several kinds of coke show the amt. of closed pore is small (2-5%), while the open-pore vol. is usually between 40 and 70%, which is evidence of a remarkable continuity of porous structure. Assuming that the coke pores are the remnants of the path of gaseous products during carbonization and consist of a bundle of capillary tubes, O. and F. derived an equation of flow of liquid in the capillary bundle. The coke pores practically met the theoretical requirements. The effect of structure on the reactivity of coke toward  $\text{CO}_2$  was studied. The high-temp. coke showed considerable increase of reactivity by pulverizing, which may be due to the increase of the edges and corners of the min. C particles and consequently to the development of the unsatd. valency force of C atoms and mois. situated at the corners and edges. The low-temp coke, which consisted chiefly of so-called amorphous C, displays no such increase in reactivity by pulverizing. Therefore, the microstructure of coke is more important to the reactivity than macrostructure. The structure of charcoal was examd. by photomicrography. The distribution of the pores of charcoal is just the same as that of original wood, and the cracks or fissures correspond to the pith ray of the original wood. The max. temp. of carbonization exerts a determinative influence upon the starting temp. of reaction of coke and charcoal. Powder methods of x-ray analysis showed that the modification of C of charcoal called "Sirozumi" (high-temp. charcoal) was very much like that of high-temp. coke. This "Sirozumi" is much more reactive than coke. This suggested structure plays an important part in the reactivity. S OKA

Synopsis of waste purification from coke plants and related industries (REICH) 14. Coordination between blast furnaces, coke ovens and Martin furnaces in a metallurgical works (BERTHELOT) 9. Gas production of the treatment plant at Stuttgart (MATER, SOHLER) 14. Time of reaction and apparatus construction [combustion time of common fuels] (ALLNER) 1. WYNNE, THOMAS N.: **Facts on Indiana Coal.** Indianapolis: W. K. Stewart Co

**Powdered fuel.** WALTHER & CIE A.-G., WILHELM OTTE and MAX BIRKNER. Ger. 480,855, April 27, 1924. Addn. to 443,111. Powd. fuel is prepd. from distd coal by milling. The app. is described. Cf. C A 23, 2020.

**Machine for pulverizing and delivering solid fuel.** SOC ANON. POUR L'UTILISATION DES COMBUSTIBLES. Ger. 479,585, Feb. 16, 1924. Details of construction are given.

**Apparatus for mixing liquid fuels.** PAUL NEUNDORF. Ger. 480,323, Aug. 25, 1927. App. for mixing liquid fuels in desired proportions is described.

**Briquetting fuel.** KOMMANDITGES EMANUEL FRIEDLAENDER & Co. Ger. 479,824, Nov. 28, 1926. A binding medium for fuel briquets is made from burned chalk and  $\text{Mg SO}_4$  soln.

**Fuel containers.** RENÉ COURTIN. Ger. 479,887, June 11, 1927. Fuel containers, especially for aircraft, are given a protective coating of a mixt. of glycerol and carbohydrate such as glucose.

**Destructive hydrogenation.** C. H. LANDER, F. S. SINNATT and J. G. KING. Brit. 306,564, Sept. 17, 1927. Prior to destructive hydrogenation, coal is treated to remove part of its content of fusain or durain, as by crushing and sepg. the fines, and hand picking. The caking properties of the coal may be modified by a preliminary hydrogenation as described in Brit. 301,720 (C. A. 23, 4328), by preheating in the absence of air to 100-350°, by heating in the presence of air, O, steam, hydrocarbons or inert gases under pressure to 300°, by exposure to air or O for long periods or by treating with various oxidizing reagents.

**Distilling solid carbonaceous materials.** D. M. RAMSAY. Brit. 306,714, Nov. 11, 1927. Materials such as coal, shale, lignite or peat are distd. by contact with superheated steam and under a constant vacuum in an app. provided with feeding and discharge elevators in water-sealed barometric ducts. Various details of the app are described.

**Distilling solid carbonaceous materials in oil.** H. A. HUMPHREY AND IMPERIAL

**CHEMICAL INDUSTRIES, LTD.** Brit. 305,744, Nov. 30, 1927. Solid carbonaceous material is distd. in oil by causing the comminuted material to move through a body of oil so as to be subjected to progressively increasing temps. Superheated steam, H or a gas contg. H may be introduced at the hottest part of the oil so as to increase the yield of oil and to agitate the charge. Various details of app. and operation are described.

**Increasing furnace-plant combustion.** WILHELM BALLUFF. Ger. 481,495, Nov. 17, 1928. Atomized ozonized water is blown into the fire chamber.

**Agglomerates of coal or other fuels.** L. LIAIS. Brit. 306,085, Feb. 15, 1928. The powdered fuel is heated to 125–45° and poured as falling sheets which come into contact with falling sheets or jets of liquid pitch or the like to form a mixt. which may be led to a press. An arrangement of app. is described.

**Apparatus for washing coal.** P. WOLF. Brit. 306,169, Nov. 14, 1927. Structural features.

**Apparatus for washing coal.** R. NORGATE. Brit. 306,170, Nov. 14, 1927. Structural features.

**Centrifugal apparatus for drying coal mud.** ALFRED KITTNAR. Ger. 479,674, Feb. 4, 1928.

**Removing oil and fat impurities from a steam-heated coal-drying app.** LOTHAR WOLF and KARL KUNZE. Ger. 480,408, Feb. 11, 1928. Addn. to 478,637 (C. A. 23, 4803).

**Stand-pipe construction, etc., for retort coal distillation and gas-making apparatus.** WILLIAM M. CARR and THOMAS J. ASHLEY. U. S. 1,726,058, Aug. 27.

**Phenol.** EUGEN KARPATI and M. GEORG HÜBSCH. Swiss 132,312, Oct. 31, 1927. PhOH is obtained from the distn. products of coal by mixing them with a PhOH solvent which has been diluted with water, subjecting the whole to a high pressure at 100°, allowing to settle into two layers, and tapping off the aq. PhOH layer.

**Peat.** WILHELM CLEMENS. Ger. 479,953, July 6, 1926. The water-content of peat is diminished by adding an electrolyte to the diggings.

**Lignite briquets.** DEUTSCHE ERDÖL A.-G. Ger. 480,282, July 5, 1927. Addn. to 475,844. Lignite briquets are cooled by air currents and spraying with water.

**Cooler for lignite.** "EINTRACHT," BRAUNKOHLENWERKE UND BRIKETTFABRIKEN. Ger. 480,960, Oct. 5, 1928.

**Drier, especially for lignite (comprising plates and rotary stirrers).** DEUTSCHE ERDÖL A.-G. (Hermann Langewald, inventor). Ger. 480,147, Nov. 10, 1927.

**Gas.** OTTO MISCH. Ger. 480,751, July 17, 1925. A gasification process is described in which bituminous fuel is distd. in the upper half of a column partly by the sensible heat of water gas generated in the lower half of the column and partly by the heat derived from the combustion of some of the water gas in a heating chamber surrounding the column. The improvement consists in supplying compressed air to the heating chamber so that a temp. of above 700° is attained in the upper half of the column. Tar or oil may be sprayed in at the hottest part of the column to enrich the distn. products.

**Gas.** SOUTH METROPOLITAN GAS CO., E. V. EVANS and H. STANIER. Brit. 306,435, Nov. 19, 1927. Hydrocarbon vapors from low-temp. distn. of coal are heated with H to produce gases of high calorific value and hydrocarbons of lower b. p. than the original hydrocarbons. Water gas (or gas obtained by the high-temp. distn. of the coke obtained, with or without steaming, mixed with a gas contg. H) is passed through coal heated to 600–650° and the mixt. of gases and vapors is passed to a cracking chamber, which may contain a catalyst, heated to about 750°, without intermediate cooling, and the treated gases are thence passed through a condenser, scrubber and purifying box. An arrangement of app. is described. Cf. C. A. 22, 313.

**Purification of gas mixtures.** METALLGESELLSCHAFT A.-G. (Friedrich P. Kerschbaum, inventor). Ger. 481,127, June 29, 1923. Gas mixts. are purified by the adsorption of one or more constituents by a solid adsorption agent. Thus a mixt. of the gases from the distn. of coal is passed over active C to remove the light oil vapor.

**Removing soot from gases.** C. DANTSIZEN (to British Thomson-Houston Co., Ltd.). Brit. 306,043, Feb. 14, 1928. A current of water is used for removing soot from gases, the soot is sepd. from the water by flotation, and the water is used again. Atomized oil is also supplied, in an arrangement of app. which is described.

**Gas-producer operation.** C. CARPENTER and SOUTH METROPOLITAN GAS CO. Brit. 305,764, Dec. 10, 1927. Waste of fuel during clinkering is minimized by reducing the temp. of the fuel bed by means of a current of gas which is either inert or acts endothermically on the fuel. Structural features of a producer are described.

**Gas producer and furnace construction.** DRAKES, LTD. and J. W. DRAKE. Brit. 305,695, Nov. 9, 1927.

**Gas producer with rotary fire chamber.** GES. FÜR INDUSTRIE-OFFENBAU M. B. H. Ger. 480,612, Jan. 23, 1926. Addn. to 479,033 (C. A. 23, 4804). Details.

**Gas-producing furnace.** EDUARD RIEPE. Ger. 481,267, Sept. 15, 1927. Details of construction are given.

**Gas-producing plant.** PAUL DVORKOVITZ. Ger. 481,174, Aug. 21, 1924. Plant for producing gas from finely divided carbon, coke or C-contg. material and steam is described.

**Plant for producing fuel gas and vapor.** SIEMENS-SCHUCKERTWERKE A.-G. (Wilhelm Gunz, inventor). Ger. 480,522, Feb. 17, 1927. Details of arrangement are described.

**Plant for making power gas from steam, air and fuel.** RAPHAEL MALBAY. Ger. 479,868, Oct. 23, 1924. Details of arrangement.

**Plant for the production of gas from coal dust.** GÉZA SZIKLA and ARTHUR ROZINEK. Ger. 479,793, July 10, 1926. Addn. to 452,015. Details of arrangement are given.

**Gases rich in ethylene from tar oils.** HERMANN SUIDA (to I. G. Farbenind. A.-G.). U. S. 1,726,048, Aug. 27. Tar oils of high b. p. are subjected to destructive distn. in the presence of steam at 800–900°.

**Water gas.** RICHARD NÜBLING and ROBERT MEZGER. Ger. 480,489, Nov. 11, 1926. An app. for producing water gas, comprises one or more towers filled with heated coal through which steam is blown.

**Water gas from pulverized fuel.** BAMAGMEGUIN A.-G. and O. HELLER. Brit. 306,143, Feb. 17, 1928. Details of construction and operation of a producer are described.

**Carbureted water-gas apparatus.** ROBERT M. SEARLE. U. S. 1,726,317, Aug. 27. Structural features.

**Apparatus for automatic control of water-gas plants.** W. A. BARR (to Western Gas Construction Co.). Brit. 306,537, Feb. 23, 1928. Numerous structural features are described.

**Liquid seals for gas holders.** MASCHINENFABRIK AUGSBURG-NÜRNBERG A.-G. Brit. 306,310, March 31, 1928. Felt sheets dip into the liquid in the seal. Various structural features are described.

**Distilling tarry materials.** S. P. MILLER (to Barrett Co.). Brit. 306,003, Feb. 15, 1928. Gases from the uptake pipes of a plurality of coal-distn. ovens or retorts are collected and passed at high temp. through a common collecting main through which thin tar is continuously circulated from a storage tank, to effect partial distn. of the tar. An arrangement of app. and various details of procedure are described. Cf. C. A. 23, 2278.

**Destructive distillation of tar sands or carbonaceous materials.** H. NIELSEN and B. LAING. Brit. 306,429, Oct. 19, 1927. Oil vapors evolved are subjected to fractional condensation in sep. scrubbers at successively lower temps. by a liquid medium. The scrubbers contain disks rotating in opposite directions; various other structural details and details of procedure are described.

**Tar heater.** CASPAR TOPHINKE. Ger. 480,226, Apr. 13, 1926.

**Hard low-temperature coke.** E. ROSER. Brit. 306,092, Feb. 15, 1928. The dry fuel such as dust coal or slime coal is mixed with wet bituminous fuel, pressed and distd. at about 600–700°, forming large pieces of high volatile content.

**Coking plant.** C. OTTO & Co. G. M. B. H. Ger. 480,746, Feb. 5, 1925. A method of regulating the height of the gas collecting part of a multiple-oven coking plant is described.

**Loading device for a coke oven.** C. OTTO & Co. G. M. B. H. Ger. 480,763, Sept. 30, 1926.

**Coke oven.** MAX KELTING. U. S. 1,726,494, Aug. 27.

**Ascension pipe, main and valve construction for coke-oven plants.** LOUIS WILPUTTE (to Wilputte Coke-Oven Corp.). U. S. 1,726,092, Aug. 27. A jet device is provided for supplying washing liquor to the cut-off valve.

**Device for dry-cooling coke.** FIRMA HEINRICH KOPPERS. Ger. 479,579, Dec. 11, 1923. The coke is shot into a stepped cooling tower with tubes for the cooling gas in the steps.

**Drum for dry-cooling coke.** J. POMLJO A.-G. Ger. 479,729, July 25, 1926. Details of construction are given.

**Device for automatically quenching glowing coals.** C. OTTO & Co. G. M. B. H. Ger. 480,429, May 18, 1927. Details of arrangement are given.

**Coke quenching.** KARL SASSENHOFF. Ger. 480,865, Feb. 8, 1927.

## 22—PETROLEUM, LUBRICANTS, ASPHALT AND WOOD PRODUCTS

W. F. FARAGHER

**Thermochemical investigations of petroleum.** II and III. RYONOSUKE ABE. *J. Soc. Chem. Ind. Japan* 32, 152-7(1929); Suppl. Binding 32, 54B(1929).—The heating curve of petroleum was taken under atm. pressure by means of an improved app., the difference of temp. of the sample and the neutral substance showing whether there is an exothermic or endothermic reaction. With the oil, Socony Service No. 4, exothermic changes were observed at about 50°, 220°, 375° and 440°, and endothermic reactions at about 128°, 307° and 405°. I value,  $n$  and sp. gr. of distillates and residue were measured. The exothermic point at 220° corresponds to a thermochemical change, probably a polymerization. At 300° the exothermic thermal decompn. commenced and became rapid at about 400°. The decompn. products consisted mainly of light oil and higher unsatd. hydrocarbons. The former distd. V. **Thermal change of liquid paraffin.** *Ibid* 217-9; 63B—The heating curve was taken. At about 180° a slow exothermic reaction begins, probably a polymerization of unsatd. hydrocarbons. From 300°, cracking becomes rapid. R. K.

**Synthesis of petroleum hydrocarbons from hydrogen and carbon monoxide at ordinary pressure.** KIUCHI KOBAYASHI AND KENICHI YAMAMOTO. *J. Soc. Chem. Ind. Japan* 32, 54(1929); Suppl. Binding 32, 23B(1929).—Expts. are described in which petroleum hydrocarbons were obtained by passing a mixt. of 3 vols. of  $H_2$  and 2 vols. of CO over a catalyst consisting of Co, Cu and Mn at about 300° under atm. pressure. S. OKA

**Scientific and technical study of oil sources in Austria.** JOSEF PRELEUTNER AND J. FLEISCHMANN. *Montan. Rundschau* 20, 661-76(1929).—A general article.

**Standardization of crude oil products in Russia.** M. M. DAVIDOV. *Neftyanoe Khozyaistvo* 16, 377-87(1929).—Standards accepted on Dec. 1, 1928 by the Committee on Standardization of the Supreme Economic Council are given for spindle oils, machine oils, cylinder oils and gasolines. A. A. BOEHLINGK

**Cause of failures in sulfur determinations in mineral oils.** H. D. WATERMAN AND M. J. VAN TUSSEN BROEK. *Erdöl u. Teer* 23, 424-5(1929).—Polemic against Fischer and Hess (*C. A.* 23, 2281). Cf. *C. A.* 22, 2528. A. W. FRANCIS

**Presence of pyridine bases in the tar oil from Russian bituminous shales.** JAKOB DODONOV AND EKATERINA SOSHESTVENSKAIA. *Ber.* 62B, 1348-52(1929).—It had been found that the tar oil from the Russian bituminous shales from the Kashpirsky mines in the middle Volga region consists chiefly of thiophene and its derivs., with only very small quantities of  $C_6H_6$  and PhMe. In order to identify any other possible heterocyclic substances, chiefly pyridine bases, large quantities of the oil were first roughly fractionated and the fractions below 250° were treated separately with  $H_2SO_4$  and the bases liberated from the acid soln. as usual with KOH; the yield of crude product was somewhat more than 1% of the original oil. By repeated fractionation and pptn. as the Hg-Cl<sub>2</sub> compds., pyridine,  $\alpha$ - and  $\beta$ -picoline, and 2,4-, 2,5- and 2,6-lutidine were identified with certainty. C. A. R.

**Anthracene from oil tar.** I. BESPOLOV. *Azerbejdjanskoe Neftyanoe Khozyaistvo* 1929, No. 5, 72-8.—Crude oil tar was stripped of fractions boiling below 280° and the remaining pitch further distd. until crystals appeared in the condenser. The fraction distd. was repeatedly refractionated, the final temp. being 370°. Up to 0.6% of anthracene was obtained by the pyrogenetic decompn. of a tar of 1.062 sp. gr. which had a fraction of 30.8% distg. below, and 40.2% above, 300°. Anthracene crystd. out partly at room temp., partly at -10°. Repeated refractionation produced more anthracene with each repetition, but the amt. of pure anthracene obtained through freezing and recrystn. from toluene and a light-oil cut (120-150°) decreased in proportion. An 80% pure anthracene was finally obtained from the xylene fraction of the light oil. The green anthracene oils obtained besides anthracene meet part of the expense and make the process com.; the yield of anthracene depends greatly upon the method of running the coking retorts, which also produce coke for electrotechnical purposes. A. A. B.

**Shale—some new reactions.** F. J. POPHAM. *Ind. Chemist* 5, 269-72(1929).—A discussion of the character of the org. matter in oil shale is followed by a detailed account of expts. carried out on Estonian shale. The ground shale was heated under pressure with various reagents in an autoclave of 3 l. capacity. Conclusions: The org. matter

in the shale can be decompd. to liquid hydrocarbons by heat and pressure, giving a higher yield of low-b.-p. hydrocarbons than by ordinary retorting. Similar treatment with superheated steam in the absence of catalysts is ineffective. The presence of  $H_2$  is a distinct advantage. The presence of a cracking oil (largely assisted by the inorg. matter in the shale) is a distinct advantage. For this purpose the heavier portions of the oil produced by the process can be advantageously used. The shale should be heated as rapidly as possible (preferably ground in a liquid medium). The products should be removed rapidly from the reaction, or if this is not possible, the retarding effect of superheated steam may be utilized to advantage.

E. G. R. ARDAGH

**The crystal form of paraffin.** YOSHIO TANAKA. *Repts. Imp. Fuel Research Inst. Japan* No. 8 (1929).—The samples (crude and purified) were dissolved in org. solvents and the effect of concn. of paraffin, velocity of cooling, and viscosity on crystal formation studied. The fundamental form of the paraffin crystal is a rhombic plate, having angles of 110 and 70°. The plate and the needle form are interchangeable. The plate crystal is formed at low viscosity while high viscosity favors the needle crystal. The presence of isoparaffin and pitch-like materials disturbs the crystn. of paraffin from low-temp. tar. The velocity of the growth of the crystal nucleus can be expressed by the equation

$$V = \frac{L}{\eta}(c - 1),$$
 where  $L$  is a constant depending upon the amt. of impurity, rate of cooling, and the method of stirring,  $\eta$  the abs. viscosity of the medium,  $c$  the concn. of paraffin at the time of crystn., and  $l$  the soly.

F. I. NAKAMURA

**The influence of cylinder design on pinking.** G. B. MAXWELL AND R. V. WHEELER. *J. Inst. Petroleum Tech.* 15, 415-27(1929).

E. J. C.

**Weighing gasoline samples for combustion in the oxygen bomb.** L. R. RAYMOND. *Chemist Analyst* 18, 7(1929).—The use of gelatin capsules is advocated.

W. T. H.

**Gasoline engines and their fuels.** H. R. RICARDO AND O. THORNYCROFT. *Trans. Fuel Conference, World Power Conference, London 1928*, III, 602-84(1929).—A discussion of engine efficiency and power, factors limiting compression ratios, and detonation characteristics of fuels.

ALDEN H. EMERY

**Effect of antiknock materials on the condenser discharge spark energy required to ignite the mixture of air with the vapor of ethyl ether.** YUZABURO NAGAI. *J. Soc. Chem. Ind. Japan* 31, 503-7(1928); Suppl. Binding 31, 123-4B(1928); cf. *C. A.* 23, 1500.—N. investigated the effect of  $Et_3Se$ ,  $Me_4Pb$  and  $Me_4Sn$  on the spark energy required to ignite a mixt. of 4.25% of  $Et_2O$  and 95.75% of air by a condenser discharge. The min. igniting capacity at the condenser at 100 v. increased with increasing content of antiknock materials, e. g., 2.0 microfarads in the absence of antiknock material, 3.1 in the presence of 1% of  $Me_4Sn$  and 4.0 in the presence of 1.5% of  $Me_4Sn$ .

S. OKA

**The use of heavy oils in internal-combustion engines.** E. HUBENDICK. *Trans. Fuel Conference, World Power Conference, London 1928*, III, 749-62(1929).—H. gives detailed data on a test using heavy oil in an internal-combustion engine.

A. H. E.

**Fuel oil for heavy-oil engines.** HAROLD MOORE. *Trans. Fuel Conference, World Power Conference, London 1928*, III, 685-99(1929).—The suitability of various oils for use in present-day internal-combustion engines and the relation of lab. analysis to the practical problem are discussed.

ALDEN H. EMERY

**Discharge-stability tests on insulating oils.** W. ZIMMERMANN. *Petroleum Z.* 24, 1213-30(1928).—Tests have been carried out on the oils by means of the Siemens Schukert-Werke app., which differs from previously described app. in that a fixed potential difference with a variable electrode gap is used. By including a circuit-breaker in the low-tension circuit of the 110-220/30,000 v. transformer, immediate cessation of the discharge is effected following each individual test, thus protecting both the oil and the electrodes; otherwise, a prolonged discharge after the breakdown potential gradient is reached causes a lowering of the discharge stability ("breakdown voltage"). Individual figures for the discharge stability obtained from successive discharges using the same sample of oil show great variation. The min. value is usually given by one of the earlier of a series of discharges, often by the first, but may be given by even the tenth. When the first discharge gives the lowest value, the result is not necessarily due to incomplete cleansing of the electrodes. The min. value may vary by as much as 50% below the mean of a series of detns.; it is questionable whether such a mean value alone characterizes an oil. Exchange of moisture between the oil sample and the atm. has a great influence on the discharge stability. Careful sampling of the oil is necessary since different samples of oil from the same consignment show great variation in discharge stability. Used oils may be brought up to their original insulating value by refining by means of floridin alone or with acid.

B. C. A.

The determination of the total sulfur in transformer oil. MASAKICHI MIZUTA. *J. Soc. Chem. Ind. Japan* 32, 320-5(1929); Suppl. Binding 32, 97B(1929).—Five methods commonly recommended were compared. M. recommended 2 methods as satisfactory; namely, the Waters methods (*C. A.* 15, 594) and the method of oxidizing the oil in a calorimeter bomb. The Eschka method gave somewhat low results. The method of oxidizing with  $\text{NH}_4\text{NO}_3$  and MgO and of oxidizing with fuming  $\text{HNO}_3$  and MgO gave too low results.

Synchronous converter lubrication. F. W. BRAUND. *Elec. Ry. J.* 73, 854(1929).—The installation of automatic control has introduced the necessity of employment of an oil with a minimum viscosity change between  $-18^\circ$  and  $71^\circ$ . The oil chosen is a treated product contg. a portion of edible tallow, and functioning in extreme temps. with a viscosity change of but 2%. A table shows: room temp., bearing temp. with ordinary oil, and with the treated oil. Differences in bearing temp. favoring the latter oil are  $8-15^\circ$ .

Measurement of the lubricating property of oil in bearings. V. VIEWEG and J. KLUGE. *Arch. Eisenhüttenw.* 2, 805-11(1929).

Spanish essence of turpentine from *Pinus halepensis* (Aleppo pine). MARIANO T. LACRUZ. *Bull. inst. pin.* 1929, 97-9(In Spanish).—Spanish essence of turpentine from *Pinus halepensis* has the same characteristics as that obtained from the same tree in other Mediterranean regions, and contains almost wholly *d*- $\alpha$ -pinene. E. M. S.

Spanish essence of turpentine from *Pinus pinea* (pignon pine). MARIANO T. LACRUZ. *Bull. inst. pin.* 1929, 99-101(In Spanish).—Redn. of characteristics of essence of turpentine from *Pinus pinea* shows that in the heads of distn. there is a constituent of lower rotary power than limonene, namely pinene, to the extent of 16%. It is probable that previous results obtained by the Institut du Pin were not on pure materials. E. M. SYMMES

Comparison of the conditions of occurrence of bituminous coal and petroleum (TAYLOR) 8. Decolorizing oils (Ger. pat. 480,345) 27. Sulfonating oils (Ger. pat. 480,157) 13.

FILHOL, J., AND BIIHOREAU, CH. *Le pétrole*. Paris: Editions pittoresques. 208 pp. F. 30.

SCHWARZ, ROBERT. *Petroleum Vademecum*. International Petroleum Tables. 6th ed. enlarged. Berlin and Vienna: Verlag für Fachliteratur. 564 pp. \$5.

Apparatus for sampling crude-oil products. YA. I. PELEVIN. Russ. 2271, Aug. 17, 1925.

Treating emulsified hydrocarbon oils. ELMER H. PAYNE and SAMUEL A. MONTGOMERY (to Standard Oil Co. of Ind.) U. S. 1,726,309, Aug. 27. Sepn. of emulsified oils is effected by treatment with a spent  $\text{NaOH}$  soln. previously used in oil refinery operations for washing hydrocarbon oils or oil refinery gases and heating (suitably at a temp. of about  $65^\circ$ ) until stratification occurs. U. S. 1,726,310 specifies similar use of a spent alk. soln. derived from the neutralization of sour oils.

Destructive hydrogenation of oils. H. TERRISSE and L. DUFOUR. Brit. 305,981, Feb. 13, 1928. Oils such as gas oil, lamp oil, schist oil or brown-coal tar are converted into gasoline by heating at  $200-500^\circ$  under a pressure of 5-40 kg. per sq. cm. in the presence of  $\text{FeCl}_3$  and gases such as  $\text{H}$  or water gas. Desulfurization of the oils is simultaneously effected. Various details are given.

Cracking. E. K. KVITKO, V. S. KVITKO and K. S. SEMENOVA. Russ. 211, Nov. 15, 1924. Gasoline and other crude-oil products are obtained by preheating the raw material by hot residues and hot gasoline vapors, in special heat exchangers and finally in a special preheater, and passing it into tubular dephlegmators mounted on the domes of stills where it is cracked.

Apparatus for treating hydrocarbon oils with aluminum chloride and distilling them. GEORGE D. WHITE (to Texas Co.). U. S. 1,726,280, Aug. 27.

Refining oil and oil products. B. TICHININ. Russ. 31, Nov. 28, 1921. Crude oil and its products are treated cold with  $\text{S}_2\text{Cl}_2$ ; heavy oils are dild. with gasoline, etc., and these are then evapd. The sludge, which settles on the bottom, is sep'd. as usual and the oil washed to remove the dissolved impurities.

Purification of lubricating oil. THE DE LAVAL SEPARATOR CO. Ger. 479,866, Sept. 1, 1925. Oil from a machine is circulated back through a cooling app. in which it is brought to at least  $27^\circ$  to ppt. dissolved matter

**Distilling lubricating oils.** SUN OIL CO. Brit. 305,846, March 7, 1928. Lubricating oils of low C content, low org. acidity, good color and demulsibility, and high flash and fire tests are obtained by distg. lubricating stock from an asphalt-base oil, in a system closed against O, passing the stock through a series of vaporizers in which it is distributed over extended surfaces and brought into heat exchange with Hg vapors under conditions avoiding cracking and to obtain progressively higher b. p. fractions, and sep. distillates are subjected to reflux condensation and vacuum treatment to remove odor-producing gases. An app. is described.

**Apparatus for removing impurities from used lubricating oils by evaporation and filtration.** JOHN C. BRIEL. U. S. 1,725,845, Aug. 27. Structural features.

**Bituminous emulsions.** J. A. MONTGOMERIE. Brit. 305,716, Nov. 11, 1927. An aq. emulsion of artificial material of petroleum derivation such as Mexican asphalt is treated with a small quantity of Na laurate or similar salt to improve the wetting, spreading and penetrating power of the emulsion. Cf. C. A. 23, 4061.

**Acetate liquors from wood carbonization.** EDUARD LÖW (to Verein für chemische Industrie A.-G.). U. S. 1,726,401, Aug. 27. Gases from wood distn., contg. varying quantities of HOAc vapor, are divided into 2 streams; one stream is passed through hot liquid contg. a neutralizing agent such as Ca(OH)<sub>2</sub> in an absorption plant, and the other stream is passed through a condensation plant for recovering pyroligneous acid and the latter is used for keeping constant the acetate concn. in the absorption plant. App. is described.

## 23 CELLULOSE AND PAPER

CARLETON E. CURRAN

**The acetolysis of cotton cellulose.** CLAYTON C. SPENCER. *Cellulosechemie* 10, 61-73(1929).—In a study of the influence of temp., duration of acetolysis and H<sub>2</sub>SO<sub>4</sub> content of the reaction mixt. upon the yield of cellobiose octa-acetate (I) S. obtained a max. yield (46.5%) by treating 2 g. of cotton (98.6%  $\alpha$ -cellulose) with 2 cc. H<sub>2</sub>SO<sub>4</sub> and 8 cc. Ac<sub>2</sub>O and heating at 50.4° for 14 days. The products on 2 crystals from hot alc. varied in m. p. 227.5-8° and  $[\alpha]_D$  41-41.8. Curves and tables show the effect of the variations in the exptl. conditions upon the yield. Using the method in which Hess and Friese (cf. C. A. 21, 174) claim yields of 50% (of theoretical) of (I) S. records only 37% and under certain conditions he obtained a considerable quantity of glucose penta-acetate not reported by H. and F. C. W. SONDERM.

**Lignin and cellulose. X. The aromatic nature of lignin.** KARL FREUDENBERG, WALTER BELZ AND CHRISTIAN NIEMANN. *Ber.* 62B, 1554-61(1929); cf. C. A. 23, 3342.—The object of this work was to det. whether and to what extent the C<sub>6</sub>H<sub>5</sub> ring is present in lignin and whether its MeO group belongs to an aromatic or aliphatic system. A lignin prepd. from pine-wood meal by alternate treatment with boiling 1% H<sub>2</sub>SO<sub>4</sub> and Cu(O-NH<sub>2</sub>)<sub>2</sub> was used. Its MeO content was 17%, that of detectable methylenedioxy groups (HCHO) up to 1.4%. The lignin (1 g.) was allowed to stand at exactly 18° with 2 g. Br in 100 cc. of 10% HBr, and after 2, 24 and 48 hrs. was filtered in a closed app. under pressure and the Br was titrated back iodometrically. None of the lignin dissolved and special expts. showed that HBr alone does not act on it. The filtered solid was carefully washed, dried at 65° under 1-mm. pressure and analyzed. Parallel expts. were run on methyl lignin (I), dehydrodivanillin (II), polymerized coniferyl alc. (III), 5-bromovanillic acid (IV) and methylcellulose (V); the II and III remained practically unchanged. When the results with the other 3 compds. and lignin are plotted with the length of reaction of the Br as abscissas and with the loss in Me (in mols.), the amt. of Br (in atoms taken up by the substance and the total amt. of Br used up, resp., as ordinates, there are obtained in all cases curves entirely similar to each other in form (a steep rise within the first 2 hrs. followed by a negligible or very much slower rise during the next 46 hrs. and differing only in their height above the axis of abscissas. The picture, as a whole, is as follows: The main reaction is a substitution, RHH + Br<sub>2</sub> = RHBr + HBr, followed more slowly by a further substitution, RHBr + Br<sub>2</sub> = RBr<sub>2</sub> + HBr. The amt. of Br taken up by the substance, however, is less than 0.5 of the total Br used up; this is undoubtedly due to the initial side reaction which results in the loss of Me; it competes at first with the substitution reaction and rapidly comes to a standstill as soon as the first substitution reaction ends. It is very probable that the loss of MeO is connected with a quinone formation. The reactivity of the 4 compds. increases in the order I  $\rightarrow$  lignin  $\rightarrow$  III  $\rightarrow$  IV. With HI (d. 1.7) the following percentages of the MeO content of various substances are split off at 90° (unless otherwise stated) in the no. of min. given in

parentheses: lignin 56 (30), 93 (300); bromolignin 30 (20); I, 88 (45 at 100°); III, 70 (20); V, 92 (20); vanillin 60 (20), 74 (18 at 100°), 96 (48 at 100°); 3-methylglucose 96 (20); 6-methylgalactose 100 (20). These results indicate that the 17% of MeO in insolated lignin is present in a system of the vanillin type. After subtracting the identified O-contg. groups there remains for the basic hydrocarbon the formula  $(CH_{1.4})_x$ ; this also, as well as the high  $n$  (about 1.61) of lignin, speaks for the aromatic nature of lignin.

**Lignin. II. (Preliminary communication.)** R. O. HERZOG AND ARMIN HILLMER (with ERWIN PAERSCH AND ERICH HELLRIEGEL). *Ber.* 62B, 1600-2 (1929); cf. *C. A.* 21, 1407; preceding abstr.—Attention was called in the 1st paper to the similarity in the ultra-violet absorption spectra of lignin and of compds with coniferyl residues. In the uniting in nature of the structural units of lignin, atm. O may be assumed to play a material role and this is also probably true of the change (polymerization) which coniferyl alc. readily undergoes. In order to have as clear an example as possible of such changes the action of mol. O on isoeugenol (I) was studied. If a current of air or O is passed through I, best at a high temp., the viscosity increases, and from the ether soln. of the product petroleum ether ppts. a substance (II) different from vanillin, dehydrodivanillin, diisoeugenol and dehydrodiisoeugenol; although it was not obtained in cryst. form it could be purified to such an extent by repeated pptn. that its compn. could be detd. with some certainty (C 69.69, H 6.58, MeO 18.03-18.07%, mol. wt. in freezing PhOH 300.3-305.8);  $Ac_2O-H_2SO_4$  gave an *acetate* (also not cryst.) with C 67.78, H 6.00, MeO 15.17-15.21, Ac 21.82-22.07%. These results indicate that 2 mols. I combine with addn. of O. II in  $Et_2O$ , in cold or hot  $AcOH$  is not reduced by II and Pt black. The absorption curve in the ultra-violet has the typical form of the curves for I, coniferyl alc. and lignin (max at 273, min. at 257  $m\mu$ ). In solns. of equal % concn. of the (monomeric) I and (dimeric) II the depths of layers showing equal extinction are approx. as 1:2. The simplest interpretation is that in the combination of the 2 mols. of I one optically active (propenyl) group becomes inactivated (chemically satd.); the non-reducibility of the other "end" propenyl group is connected with the addn. of O to the complex. By specially mild treatment of rye straw (extrn. of the powd. and purified straw with 2% NaOH in MeOH at room temp. in the absence of light and air) and electro dialysis there was prepd. a lignin sol not only in alkali but also (colloidally) in  $H_2O$ ; its ultra-violet absorption spectrum was of entirely the same type as that of other lignin preps.; in neutral aq. soln. the max. and min. were shifted towards the red as compared with those of ligninsulfonic acids; the mol. wt. in resorcinol was very small (about 2 coniferyl residues); attempted reduction with Pt black as catalyst gave negative results.

**Study of the beating of nitrocellulose.** M. JUPEAU. *Mém. poudres* 23, 183-97 (1928).—A 350 g. Pb sphere supported by a thin steel wire was immersed in a nitrocellulose slurry in a beater of the Hollander type. The angle from the vertical, which the wire makes during the beating, is used in a viscosity formula, from which fineness curves are plotted. The curves vary with nitrocelluloses of different viscosities, because of variations in the rate at which they are reduced in fineness. The influence of size of charge and consistency is studied in relation to h. p. consumption.

**Wood. IV. Chemical composition of pulp woods from North Korea.** Y. UYEDA AND T. MORITA. *Cellulose Ind. (Tokyo)* 4, 233-4 (1928); cf. *C. A.* 22, 3775.—Analyses are given of "Ezomatsu" (*Picea jezoensis*), "Tōshirabe" (*Abies nephrolepsis*) and "Chōsenimomi" (*Abies holophylla*). These woods have a total cellulose content (by chlorination) of 50-51% on the wt. of air-dry wood (10% moisture), 90% of which is  $\alpha$ -cellulose.

**The thermal decomposition of the wood pulp from deciduous trees.** K. KOROTKOV. *Weiss-russ. staatl. Landwirtschaftsakademie* 1927, 3 pp. separate; *Chem. Zentr.* 1928, II, 34.—The lignin is obtained from wood pulp by sep. treatments with 1% HCl or 72%  $H_2SO_4$ . The former method gave higher yields of lignin. By dry distn. in a glass-lined retort at 360°, yields of MeOH as high as 50-65% were obtained. In addn. to about 0.5%  $AcOH$ , 100% increased yield of charcoal was obtained over what would normally be expected from the original wood. More MeOH was secured from lignin prepd. by decompn. with HCl rather than by  $H_2SO_4$ .

**Viscose. IV. The analysis of viscose.** I. FUKUSHIMA, Y. TAKEMATSU AND I. WATANABE. *Cellulose Ind. (Tokyo)* 3, 214-9; in English, 25; *Chem. Zentr.* 1928, II, 509.—Besides the detn. of NaOH,  $Na_2CO_3$ ,  $Na_2S$  and Na xanthogenate in ripened viscose,  $Na_2CS_3$  may be estd. in the presence of other alk. substances according to the reaction:  $Na_2CS_3 + I_2 = 2NaI + CS_2 + S$ . The methods outlined preclude the detn. of the variations in viscose during the ripening process.

**Viscose. XXII. Viscosity of viscose.** G. KITA, S. IWASAKI, T. NAKASHIMA,

S. MASUDA AND K. MATSUYAMA. *Cellulose Ind.* (Tokyo) 5, 59-71(1929); cf. *C. A.* 23, 4064, 4570.—It is generally acknowledged that the viscosity of viscose soln. falls during the first stages of ripening, reaches a min., rises very slowly, and, shortly before coagulation, suddenly rises quickly. The ripening process was studied for different cellulose materials by means of the Ostwald viscometer and falling-sphere methods, and the fiber-forming capacity of the viscose was also measured. The change of viscosity as found by the falling-sphere method is always the same, whereas that found by means of the Ostwald viscometer varies with the kind of cellulose used. The change in the fiber-forming capacity follows the viscosity as measured by the former method, and Schuster's theory (*C. A.* 20, 2077) as to the fall of viscosity during ripening is not upheld; it is thought more likely to be due to the increased dispersion produced by the soln. of the cellulose xanthate. Conclusion: The change of viscosity is due to 2 factors, viz., to dispersion and structure formation; the former effect is completed during the first days of ripening. This would explain the differences obtained when the viscosity is measured in the above 2 ways. Measurements of the viscosity of viscose under a range of pressures in the Ostwald viscometer have been carried out, and the results may be tolerably well expressed by means of the Ostwald equation. Results of fiber thickness measurements for different pressures also show good agreement with this equation. It is deduced that fiber thickness is not directly proportional to the pressure—which is actually the case. B. C. A.

The Erkensator. B. KOLB. *Chem. App.* 16, 107(1929).—A new purification centrifuge for the paper industry is described. It does not use a sieve.

Cellulosic fiber. SOC. ANON. PAPETERIES NAVARRE. Brit. 306,072, Feb. 15, 1927. In obtaining cellulose from wood, straw, etc., the material is heated in a series of heaters, charged with and emptied of cellulose in turn, and the lye, such as soda, is systematically circulated at the required temp. so that the material in the most advanced heating stages receives the fresh lye while the raw material is treated with lye which has passed through the previous heaters. Soda-wood cellulose or straw cellulose of good light color is thus obtained.

Improving cellulosic materials such as jute or cotton. LEON DE WOLF. U. S. 1,726,142, Aug. 27. The material is subjected in a crude state to the action of a soln. of NaOH and phenol to sep. it from foreign substances and to transform it into a finished product suitable for manufacturing.

Cellulose halogen carboxylates. I. G. FARBENIND. A.-G. Brit. 306,132, Feb. 17, 1928. Cellulose carboxylates such as cellulose triacetate are dissolved or suspended in an indifferent medium such as  $C_2H_5Cl$ , and treated with a chlorinating agent such as  $PCl_5$  to replace all the H atoms of the acid radical of the cellulose carboxylate with Cl. The products have increased stability toward hydrolytic agents and increased solv. Various details of procedure are given.

Cellulose ethers. I. G. FARBENIND. A.-G. Brit. 305,946, Feb. 10, 1928. Alkyl ethers of cellulose contg. 1.5-2.5 alkyl groups per mol. of cellulose are rendered resistant to the action of water by employing in the alkylation 2 mols. of an alkylating agent such as benzyl chloride for every 10-30 mols. of the alkylating agent such as  $EtCl$ . An alc.- $C_6H_5$ -sol. product is thus obtained from pasteboard pretreated with a 60% NaOH soln. and ripened.

**Cellulose ethers.** A. WACKER GES. FÜR ELEKTROCHEMISCHE INDUSTRIE GES. Brit. 306,125, Feb. 17, 1928. Cellulose ethers insol. in the usual simple solvents are obtained by treating alkali cellulose with alkyl halide in the presence of water, but in the absence of any added salt, e. g., soda cellulose 100 and water 400 parts may be treated with an excess of EtCl. The products are sol. in mixed solvents such as  $C_6H_6$ -alc. and  $C_6H_5Cl$ -alc. and may be used for making films, threads, etc.

**Cellulose esters and ether-esters.** I. G. FARBENIND. A.-G. Brit. 305,946, Feb. 11, 1928. The processes for prepg. cellulose higher aliphatic acid esters described in Brit. 283,181 (C. A. 22, 3988) and Brit. 297,766 (C. A. 23, 2822) are modified by (a) using mixts. of different halides of the higher aliphatic acids; (b) adding the esterifying agent in stages, different acid halides being used if desired in successive stages, and (c) substituting for the halide of the higher aliphatic acid, wholly or in part, a halide of a cyclic substituted aliphatic acid or of an alicyclic carboxylic acid. Numerous details and examples are given. Cf. C. A. 23, 4818.

**Reducing the viscosity of cellulose esters.** BORIS N. LOUGOVOY (to Ellis-Foster Co.). U. S. 1,726,357, Aug. 27. A cellulose ester such as a nitrocellulose, the viscosity of which is to be reduced, is dissolved in acetone or other solvent of high dispersing power; sepn. of the ester is then effected by gradual dilm. of the soln. with a mixt. of the solvent and a non-solvent such as water, which is miscible with the solvent.

**Cellulose acetate.** L. M. BURGHART (to U. S. Industrial Alcohol Co.). Brit. 306,531, Feb. 24, 1928. An acetylating medium such as  $Ac_2O$  or  $AcCl$  is caused to react on cellulose (preferably below  $30^\circ$ , suitably at  $17-18^\circ$ ) in a reaction medium of liquid  $SO_2$  with or without glacial  $HOAc$ , and with use of catalysts or condensing agents such as  $H_2SO_4$ ,  $ZnCl_2$ ,  $H_3PO_4$ , or  $Me_2SO_4$ . Various details of the acetylation and after-hydration process are described.

**Filaments, etc., from viscose.** "BORVISK" CO. M. B. H. Ger. 480,478, Oct. 16, 1919. Filaments and other products are prepd. from fresh viscose while using a pptg. bath comprising a salt soln. of at least  $20^\circ$  Bé. to which sufficient acid to prevent development of alky. has been added, the length of travel of the filaments, etc., through the bath being at least 20 cm. Cf. Brit. 116,268 (C. A. 13, 74).

**Filaments, films, etc., from viscose.** LAMBERTUS A. VAN BERGEN. Ger. 480,519, May 7, 1924. Products of improved elasticity are obtained by using an acid pptg. bath contg. a salt of a bivalent metal ( $MgSO_4$ ), together with a small quantity of a Zn salt ( $ZnSO_4$ ).

**Device for the production of air- or light-silk.** DEUTSCHE ZELLSTOFF-TEXTILWERKE G. M. B. H. Ger. 479,794, Mar. 7, 1926. Addn. to 467,241 (C. A. 23, 705). The viscose is passed through sieve-like electrodes on its way to the spinning nozzle to form the necessary small bubbles.

**Apparatus for spinning or winding artificial silk.** ALFRED SCHÖTZ. Ger. 480,348, Apr. 14, 1927.

**Apparatus for making artificial filaments by dry-spinning.** VEREINIGTE GLANZSTOFF-FABRIKEN A.-G. (Konrad Hoffmann, inventor). Ger. 480,752, Mar. 13, 1925. See Brit. 249,141 (C. A. 21, 1011).

**Regulating the amount of lime in sulfite lye.** METALLGESELLSCHAFT A. G. Ger. 480,672, July 15, 1926. Addn. to 437,531. The amt. of lime in the lye from the manuf. of cellulose sulfite is detd. by the temp. of the irrigating tower, which is regulated by the passage of waste gas brought to the required low temps. by a refrigerator.

**Spent cellulose sulfite lye.** I. G. FARBENIND. A.-G. (Hans Wesche and Karl Brodersen, inventors). Ger. 480,898, Jan. 1, 1925. Addn. to 419,224. A non-deliquescent powder is obtained from spent cellulose sulfite lye by treating it with amines, phenols, aromatic sulfonic acids or aldehydes in the presence of a small quantity of acid before evapg. The reaction is stopped before compds. insol. in water are formed. Examples are given.

**Treating waste alkali lyes.** I. G. FARBENIND. A.-G. Brit. 305,931, Feb. 11, 1928. Waste alkali lyes contg. org. substances such as are obtained in making artificial silk are treated with Cl at about ordinary temp. Org. substances are oxidized to  $CO_2$ , which escapes, and a soln. of alkali hypochloride remains.

**Wood pulp.** WILLIAM D. MOUNT. U. S. 1,725,818, Aug. 27. See Brit. 269,256 (C. A. 22, 1474).

**Apparatus for mechanically preparing pulp and rags for paper manufacture.** GERHARD ANDREWS. Ger. 481,423, June 12, 1926.

**Cellulosic material for paper manufacture.** CARL LEVST (one-half to Arthur H. Lyman). U. S. 1,726,078, Aug. 27. Finely disintegrated bamboo is boiled with quick-

lime to form a pulp, washed and pressed into coherent form, dried and treated with soda lye. Various details are given.

**Paper manufacture.** KRISTIAN HOLTER and OLAF QVILLER. Ger. 480,643, Apr. 27, 1926. In pressing the water out of cellulose sulfite, salts (e. g., NaCl) are added to the pressing pad to increase its efficiency.

**Paper manufacture.** CHARLES MÜLLER. Ger. 481,048, Mar. 10, 1927. Details of removing water by suction are described.

**Paper-making apparatus.** PAPYRUS A.-G. and C. BÜCHNER. Brit. 306,022, Feb. 14, 1928. Structural features.

**Steam-heated drying cylinders for paper-making machines.** LINKE-HOFFMANN-BUSCH-WERKE A.-G. Ger. 480,134, Aug. 9, 1927.

**Apparatus for seasoning and "rectifying" paper stock.** GEORGE E. POGGEL (to Advance Mfg. Co.). U. S. 1,725,764, Aug. 27. Structural features.

**Parchment paper.** I. G. FARBENIND. A.-G. (Rudolf Richter, inventor). Ger. 481,123, Feb. 12, 1925. Parchment paper is prepd. from pressed crude paper by couching with a layer of ordinary paper with a squamous surface, or by couching with a layer of flaky paper material.

## 24—EXPLOSIVES AND EXPLOSIONS

CHARLES E. MUNROE

**A photographic investigation of flame movements in carbonic oxide-oxygen explosions.** WM. A. BONE AND REGINALD P. FRASER. *Trans. Roy. Soc. (London)*, A228, 197-234 (1929).—A study has been made of the initiation and development of flame when a mixt. of CO and O in combining proportions is exploded at atm. pressure under varying conditions such as dryness, source and intensity of ignition, and under the influence of superimposed shock waves up to and including detonation. A new high-speed photographic machine, which is described in detail, was specially designed for the work. From the first group of expts. it was found that progressive and intensive drying of the  $2\text{CO} + \text{O}_2$  mixt. over  $\text{P}_2\text{O}_5$  greatly lowered the flame velocity and hindered combustion, although after very intensive drying the medium could still be ignited and the flame maintained in and slowly propagated through it, extinction occurring only when the flame reached a region where the medium had become diluted with the product of combustion. The hindering effect of intensive drying could be overcome by imposing a strong elec. field upon the medium. A second group of expts. detd. the effects of varying types and intensities of ignition on the flame movements through a moist  $2\text{CO} + \text{O}_2$  mixt. With very feeble sources of ignition, such as a glowing wire or a condenser discharge of small capacity, there was a definite induction period between the imparting of the igniting energy and the appearance of flame; and with condenser discharges the general flame speed and combustion were not greatly accelerated even by great increases in the intensity of the spark; and the duration of combustion was prolonged in cases where violent oscillations, originating in the spark discharge, were set up in the burning medium. In the third group of expts. it was found that under the influence of successive shock waves superimposed on it, at suitably timed intervals, the uniform velocity of the initial flame movement can be increased in successive stages, each of uniform type, until the flame-front is traveling at a velocity comparable with that of the shock waves; and that uniform flame movements at still higher velocities may occur in what is provisionally called the "predetonation" stage of the explosion, during which detonation may be initiated in a region of the medium a little ahead of the advancing flame in cases where such region is under the influence of shock waves. The rate of detonation, while uniform in any one expt., may vary from 1900 to 2200 m. per sec. Some of the photographs on which the study is based are reproduced. C. C. KRESS

**High explosives.** ARTHUR LAMOTTE. *Chem. Met. Eng.* 36, 460 3 (1929).—An account of their development with the view of securing greater safety, and efficiency through specialization. The factors which govern the production of an explosive for a specific use are enumerated and it is stated that a manufacturer may make 12 different types of dynamite, each type being in 10 different grades or "strengths" and each grade in 14 different sizes.

**Effect of storage at 50° on powder B and nitroglycerin powders.** M. DESMARCEUX. *Mem. poudres* 23, 230-5 (1928).—Test of Powder B and of French, German and Italian powders contg. ethyl centralite and nitroglycerin showed that the greatest loss and the

CHARLES E. MUNROE

most rapid rate of loss accompanied the powders which contained the highest ratio of solvent to nitrocellulose.

**Vacuum heating of nitroglycerin powders.** M. MARQUEVROL. *Mem. poudres* 23, 178-82(1928).—Curves are plotted for the gas evolution of nitroglycerin powders heated in a vacuum at 50° for periods up to 1800 days, in comparison with straight diphenylamine powders.

**Study of different stabilizers.** M. MARQUEVROL. *Mem. poudres* 23, 158-77 (1928).—*Smokeless powder* samples contg. up to 10%  $(C_6H_5)_2NH$  were heated at 110°, 100°, 75°, 60° and 40° in open and in closed containers for periods extending up to 4083 days. At intervals the nitrocellulose was pptd. from the samples, extd. with  $CHCl_3$  and the N detd. in a nitrometer. The results show that  $(C_6H_5)_2NH$  attacks the powders at 75° and 60° but only feebly at 40°, with the production of *nitrosodiphenylamine* which itself acts as a stabilizer. In addn. strongly colored secondary reaction products are formed. Powders stabilized with varying amts. of nitrosodiphenylamine were superior to powders contg. the same amt. of  $(C_6H_5)_2NH$  with regard to the amt. of denitration of the nitrocellulose. There was no indication that nitrosodiphenylamine destroys unstable products in nitrocellulose during the manuf. of powder. The speed of denitration and the instability of the powders increase sharply at the moment when the products of decompn. react on the powder. Nitrosodiphenylamine immediately fixes these products in a stable form and as distinguished from  $(C_6H_5)_2NH$  it remains intimately mixed because of its faculty for gelatinizing nitrocellulose. The result is that small quantities of nitrous products which normally give rise to decompn. of the nitrocellulose are more rapidly fixed and held by the nitrosodiphenylamine than by the other stabilizers. It has been generally considered that nitrocellulose is an essentially unstable substance which has at any definite temp. a regular speed of decompn. which cannot be retarded. The role of stabilizer is to maintain the speed of decompn. within reasonable limits and prevent the decompn. from accelerating too rapidly by reason of a reaction under pressure, between the nitro cotton and the products of decompn. However, these tests indicate that nitrocellulose is in itself a very stable substance and it loses this property only when its own products of decompn. react partially or totally upon it. This happens when pulverent nitrocellulose is heated alone, even in an open vessel. It likewise happens when the nitrocellulose is heated with a stabilizer which forms with the nitrous products an unstable compd. or with a stabilizer which is imperfectly mixed with the nitrocellulose. There are 2 phenomena which merge here and studies made up to the present do not distinguish between these 2 conditions: denitration proper of the nitrocellulose and denitration under the more or less attenuated action of its own decompn. products. These 2 processes are indistinguishable if the tests are run at a temp. at which the stabilizer forms an unstable product with nitrous fumes. The results also show what deceptive results are obtained when different stabilizers are compared at the same temp. The stabilizing properties of nitrosodiphenylamine do not appear when the heat tests are conducted at 110°. This indicates that it is decompd. at this temp. The denitration of powders contg. 10% of this material is slight at 75° and still less at 60°. It appears that reliable tests can be obtained only by using 2 temps., so that at these temps. the stabilizer will not decompose, nor will the product formed from the stabilizer and nitrous products. Further studies showed that although carbazole is not as efficient as nitrosodiphenylamine at the same temp. and same percentage, because of its less intimate combination with the nitrocellulose, it has less direct action on nitrocellulose at high temps. and therefore a larger percentage of it may be used with safety. Studies with amyl alc., diphenylbenzidine, nitronaphthalene and naphthalene at 75°, showed the diphenylbenzidine to be superior to nitrosodiphenylamine and much superior to  $(C_6H_5)_2NH$ . Many charts and table accompany the article.

A. J. PHILLIPS

**Laboratory and field tests of the Martienssen permissible-type methane detector.** A. B. HOOKER, W. J. FENN AND R. D. CURRIE. *Bur. Mines, Repts. of Investigations* No. 2919, 10 pp.(1929).—This is a detailed rept. of the various tests to which the detector was submitted with results and an illustrated description of the device which measures the  $CH_4$  content of an atm. with reasonable precision. It is of no value in the detection and detn. of  $CO_2$ .

CHARLES E. MUNROE

**Combustion at high pressures.** L. C. LICHTY. *Trans. Am. Soc. Mech. Eng.* 51, 37-44(1929).—Const. vol. combustion of H air mixts, ranging from  $1H_2 + 0.85$  air to  $1H_2 + 6.5$  air, under pressure was investigated. Photographic records were obtained from which were detd. the effects of compn. of the mixt. on max. pressure, on time of the pressure rise, on rate of flame propagation, on heat loss during pressure rise and the effect of surface-vol. relationships on max. pressure.

A. WHITE

**New method for extinguishing of pulverized-lignite fires.** J. HAUSEN. *Wärme*

52, 504-6(1929).—Erkalen, produced by I. G. Farbenindustrie, when dissolved in water, greatly increases efficiency of extinction by water. Practical application of the process is described. E. I. S.

Coal-dust explosions in mines—causes, effects, and recommendations for prevention. GEORGE S. RICE. *Bur. Mines, Tech. Paper 448*, 24 pp.(1929).—The section on phenomena observed in coal mine explosions is particularly new and valuable.

CHARLES E. MUNROE

Different kinds of explosions in cupola practice, causes and measures of prevention (LÖBNER) 9.

Explosives. A. C. SCOTT. *Brit.* 305,722, Nov. 11, 1927. A charge of O-carrying salts for subsequent impregnation with combustible liquid mixts. to form explosives is admixed with asbestos or similar insol. silicate such as mica which assists in preventing exudation of the liquid when it is added. Examples are given.

Porous material for storage of acetylene or other explosive gases. EDMUND STREIL (to American Gasaccumulator Co.). U. S. 1,726,323, Aug. 27. A suitable porous org. material is treated with a soln. of Cu chloride in a quantity short of satn. and then treated with a soln. of  $\text{FeSO}_4$ .

## 25—DYES AND TEXTILE CHEMISTRY

L. A. OLNEY

X-ray investigation of dyed cellulose. The theory of dyeing. FRITZ BION. *Helv. Phys. Acta* 1, 165-85(1928).—It is intended to decide by means of x-rays if the particles of a dye or metal pptd. on a fiber are deposited at random orientation, or if compd. formation with the fiber or adsorption takes place. Au, Ag, Se and Te are to a great extent deposited as unoriented crystals; Hg is present in the liquid state; I gives rise to an amorphous ring and it seems to be adsorbed; org. dyes do not give sharp lines, though in some cases of acid dyes the salts of lead were pptd. on the fiber in order to increase the intensity of scattering; it is therefore most probable, that they are adsorbed. From the breadth of the lines on the x-ray pattern it is concluded that coagulation takes place during the process of dyeing; this effect can be obtained if the fiber is previously treated with hot salt solns.

EGON BRETSCHER

The chemical and allied industries. III. The dyestuffs industry. REX FURNESS. *Chemistry & Industry* 48, 827-31(1929); cf. *C. A.* 23, 1475.—A review. E. J. C.

Production of printed effects with combinations of anthraquinone and indigoid vat dyes. R. HALLER. *Melliand Textilber.* 9, 924-6(1928).—Printed effects of excellent fastness may be obtained by printing anthraquinoid vat dyes on grounds prepd. with indigoid dyes, of the Ciba series for example. The ground is prepd. in the usual manner, and printed with the desired anthraquinoid color (e. g., Cibacolor Blue GCDN) made up with Rongalit CL,  $\text{FeSO}_4$ ,  $\text{SnCl}_2$  and glycerol. The fabric is then steamed and next passed rapidly through hot concd.  $\text{NaOH}$  soln., squeezed, rinsed and soured. White discharges may be made with Leucotrop W.

E. R. CLARK

Adipic acid and its derivatives for use in the textile industry. WALTER OBST. *The Melliand* 1, 442-3(1929).—Adipic acid, which has lately been made commercially available in Germany, is less expensive than tartaric acid and by being non-poisonous is preferable to oxalic acid in certain uses. The various esters and alkyl derivs. show a wide range of phys. properties and are being introduced to the textile trade under the name, "Sipalin." One ester may be a good substitute for camphor.

E. R. CLARK

The influence of hypochlorite solutions with and without stabilizers on the strength of textile fabrics. BRUNO WALTHER. *Spinner u. Weber* 1928, 14; *Chem. Zentr.* 1928, II, 1151.—Expts. were conducted on the strength of fabrics as influenced by hypochlorite solns. without stabilizers or in presence of alkali silicates, borax, or  $\text{Na}_2\text{PO}_4$ . Cl bleaching is a very good method of bleaching. The danger lying in faulty application also exists in other bleaching processes.

G. SCHWOCH

Fiber plants of the *Crotolaria* family. J. H. H. ROSS. *Faserforschung* 8, 36-44 (1929).—Of some 250 sorts of fiber plants of the *Crotolaria* family, *Sunn hemp* is the best known and most important. The deterioration upon immersion or storage in damp places of articles made from this fiber is distinctly slow. It is also noteworthy that the moisture content (11%) of this fiber after exposure to satd. air is low. Many botanical, agricultural and technological notes are given.

E. R. CLARK

**Vistra fiber.** A. HARTGEN. *Melliand Textilber.* 10, 220-2(1929). *The Melliand* 1, 776-8(1929).—Vistra fiber is specially spun viscose rayon of 1.2-1.5 denier single filament size, cut to lengths suitable for spinning on cotton systems. The yarns have unique heat-retaining and absorbent properties as compared with the common continuous-filament rayons making them very suitable for underwear. The subdued luster is valuable for diverse effects. Samples are affixed.

**Swelling of plant fibers in cuprammonia solution.** HERBERT MÜLLER. *Faserforschung* 7, 205-91(1929).—A previous effort to assemble and reconcile the extensive literature on this subject was reported by Dischendorfer (*C. A.* 17, 3417). The Sorau Inst. has continued this work, and the present report outlines recommended methods and gives detailed illustrated descriptions of the behavior of all the common fibers. Extensive bibliography.

**Heat required for retting flax in closed vats.** W. KLUBOW. *Faserforschung* 8, 18-36(1929).—The data presented are on the operation of a com. rettery operated throughout the year in Russia. The tanks are of steel plates with little insulation set on concrete bases. No mech. agitation is provided and the heat is supplied electrically. The temp. is maintained at 28-35° and while the end point is detd. by hand tests, the av. time requirement is 108 hrs. Using 72 kg. straw to 950 kg. H<sub>2</sub>O, 70-80 kw. hrs. is considered sufficient. At least 65% of the heat needed to maintain the temp. is generated by the fermentation.

**Making duplex fabrics.** WALTER M. MÜNZINGER. *Melliand Textilber.* 10, 301-2(1929).—"Revertex," a latex concentrate contg. about 75% total solids, is suitable for making waterproof 2-ply fabrics. It may be applied from aq. dispersion to one or both the fabrics and vulcanized by hot calendering. A suitable mixt. contains 50 kg. Revertex, 15 kg. mineral color, 4 kg. lithopone, 0.8 kg. S, 0.08 kg. "Vulcazit 774" (an accelerator suited to low-temp. vulcanization) and 0.8 kg. Nekal BX.

**Avivage of rayon.** J. F. STÖCKER. *Melliand Textilber.* 10, 302-4(1929).—S. recommends Viscosil S, an oil emulsion used at high diln., for removing the brittle feel and harsh luster of rayon.

**Finishing machinery for rayon.** R. GÜNTHER. *Melliand Textilber.* 10, 304-8(1929).—Line drawings illustrate several calendering devices

**Influence of nutrients on the value of bast-fiber plants (FABIAN) 15.** Crystallization phenomena of dye salts (WAGNER) 2. The naphthoisindigotins (WAHL, LOBECK) 10. Thiazole derivatives of 1,4-naphthoquinone [dye] (U. S. pat. 1,726,265) 10. Thiazole derivatives [dye intermediates] (Brit. pat. 306,558) 17.

BRASS, KURT. *Praktikum der Färberei und Druckerei.* 2nd ed., revised. Berlin: J. Springer. 104 pp. Paper, M. 5.25. Reviewed in *Chem. Trade J.* 85, 174(1929).

**The Flax, Hemp and Jute Year Book.** Belfast, 25 Donegall St. H. R. Carter. 5s. net. Reviewed in *J. Textile Inst.* 20, P 150(1929).

**Dyes.** R. S. BARNES, J. E. G. HARRIS, J. THOMAS and SCOTTISH DYES, LTD. Brit. 306,573, Nov. 17, 1927. Anthraquinonecarboxylic acids contg. an arylamino substituent in the *o*-position to the COOH group are treated with a tertiary base-SO<sub>3</sub> compd. in the presence of a metal such as Cu and of an excess of the tertiary base. The products (which may be esters of anthrahydroquinonecarboxylic acids contg. an *o*-aryl substituent) are converted into anthraquinoneacridones by working up with alkali and treating with acid oxidizing agents. The products obtained by alkali treatment also may be applied to animal, vegetable or artificial fibers by dyeing, padding or printing processes and converted into anthraquinoneacridones on the fiber by treating with an acid oxidizing agent in dil. soln. Several examples are given.

**Dyes.** BRITISH ALIZARINE CO., LTD., and P. BEGHIN. Brit. 306,434, Nov. 17, 1927. Pyranthrone or its substitution products such as dichloro- or dibromo-pyranthrone, in soln. or suspension in an org. liquid such as PhNO<sub>2</sub> or nitrotoluene, are treated with SO<sub>2</sub>Cl<sub>2</sub> at 140-205°. The products dye cotton from a vat green, changed to brown by after-treatment with oxidizing agents.

**Dyes.** J. R. GRIGY AKT.-GES. Brit. 306,447, Feb. 20, 1928. Azo dyes contg. either resorcinol or its derivs., 1-methyl-2-amino-4-hydroxybenzene,  $\alpha$ -naphthol or 1,5-dihydroxynaphthalene as components are treated with an oxidizing agent such as air or MnO<sub>2</sub> in the presence of NH<sub>3</sub>. The resulting products (which are still azo dyes) are suitable for dyeing leather but not for wool or silk. Several examples are given. Brit. 306,448 specifies disazo dyes for mordant dyeing made by coupling a diazotized amino-

sulfonic acid of the benzene or naphthalene series with  $\alpha$ -naphthylamine or its 6- or 7-sulfonic acid, rediazotizing the aminoazo compd. thus formed and coupling with an aromatic *o*-hydroxycarboxylic acid. Cr compds. of the dyes may be used for printing. Several examples are given. Cf. C. A. 23, 4827.

**Azo dyes.** FRITZ HESS (to General Aniline Works). U. S. 1,726,266, Aug. 27. Dyes made by coupling the diazo compd. of a safranin, advantageously in an acetic soln., with a compd. contg. a substituted malonyl group dye silk and cotton mordanted with tannic acid valuable shades. A no. of salts of these dyes are distinguished by their excellent copying power and are, therefore, particularly suitable for the manuf. of copying materials, such as *copying pencils, copying inks, copying printing-pastes, typewriter-ribbons* and the like. Cf. C. A. 23, 4827.

**Azo dyes.** I. G. FARBENIND. A.-G. Brit. 306,415, Feb. 18, 1928. Monoazo dyes are made in substance or on the fiber by coupling a diazo compd. of the benzene series such as 5-nitro-2-amino-1-methoxybenzene or 4-chloro-2-toluidine with a 2,3-hydroxynaphthyl-4'-alkyloxy-1'-naphthylamine.

**Azo dye.** I. G. FARBENIND. A.-G. (Hans Heyna, Werner Kirst, Herbert Kracker and Karl Moldaenke, inventors). Ger. 479,925, Mar. 22, 1927. The diazo compds. of dihalo-3-amino-1-toluene are coupled with compds. such as arylamides of 2,3-hydroxynaphthoic acid and  $\beta$ -ketocarboxylic acids, which act on vegetable fibers. Lists of baths and developing baths are given.

**Azo dye.** I. G. FARBENIND. A.-G. (Karl Dobmaier, inventor). Ger. 479,926, Aug. 20, 1927. Diazo compds. of sulfonic, carboxylic or sulfocarboxylic acids of amino- or aminohydroxybenzene or naphthalene contg. a middle component with a free amino group, are condensed with  $O_2NC_6H_4COCl$  or its derivs. The acid can be reduced and again condensed with  $O_2NC_6H_4COCl$  further reduced, diazotized, and coupled with aminophenyl-methylpyrazolone or its derivs. The disazo dye resulting can be further diazotized in the fibers of the material and combined with coupling components. Examples are given.

**Azo dyes.** I. G. FARBENIND. A.-G. (Hermann Wagner, Erwin Hoffa, Ernst Runne and Erwin Thoma, inventors). Ger. 480,826, July 10, 1926. Azo dyes giving fast red shades on cotton are prepd. by coupling the diazo compds. from 1,3-dimethyl-4-amino-6-halobenzene or 1,3-dimethyl-4-amino-2,6-dihalobenzene with arylamides of 2,3-hydroxynaphthoic acid. Coupling may be effected in substance or on the fiber. Examples are given. The 1,3-dimethyl-4-amino-2,6-dihalobenzenes are new compds. and may be prepd. by halogenating *asym.-m* xyldine in  $H_2SO_4$ .

**Azo dye.** SOC. ANON. POUR L'IND. CHIM. A BALE. Swiss 131,727, May 7, 1927. Addn. to 128,228 (C. A. 23, 2300). An azo dye compd. contg. both Cr and S is prepd. by treating the Cr compd. of the dye from diazotized 1,2-aminonaphthol 4-sulfonic acid and  $\alpha$ -naphthol, with a sulfurizing agent, such as polysulfide, in the presence of EtOH and *m*-nitrobenzenesulfonic acid. The dye colors cotton in wash- and light-fast green-blue tones in  $Na_2S$  baths.

**Azo dye.** SOC. ANON. POUR L'IND. CHIM. A BALE. Swiss 131,818, Oct. 31, 1927. A trisazo dye is prepd. by diazotizing the disazo dye obtained by coupling monoazobenzene with a mixt. of 1,6- and 1,7-aminonaphthalenesulfonic acid, further diazotizing and coupling with the same mixt., diazotizing and coupling with 1-amino-5-hydroxynaphthalene-7-sulfonic acid in an alk. medium. The new dye is a black powder which colors cotton green-gray.

**Azo dyes containing chromium.** I. G. FARBENIND. A.-G. (Hans Krzikalla, inventor). Ger. 480,827, Feb. 13, 1927. Azo dyes giving fast red- to blue-violet shades on wool are prepd. by the action of trivalent Cr on the monoazo dyes obtainable from 4-chloro-2-aminophenol and naphtholmonosulfonic acids. Examples are given. Cf. C. A. 23, 716.

**Chromium compounds of azo dyes.** SOC. ANON. POUR L'IND. CHIM. A BALE. Ger. 480,225, Feb. 23, 1926. See Brit. 260,830 (C. A. 21, 3468).

**Chromium compounds of azo dyes.** SOC. ANON. POUR L'IND. CHIM. A BALE. Swiss 131,502 to 131,504, Aug. 19, 1927. Addns to 128,006 (C. A. 23, 2042). A chromium azo dye is prepd. by treating the dyes from diazotized 5-nitro-2-amino-1-phenol, and 2-(3'-amino)-benzoylamino-5-hydroxynaphthalene-7-sulfonic acid (131,502) or 2-acetyl-amino-5-hydroxynaphthalene-7-sulfonic acid (131,503), or 2-(3'-nitro)-phenyl-amino-5-hydroxynaphthalene (131,504), with Cr-yielding reagents. The dyes color cotton in fast green-blue tones. Cf. C. A. 23, 3814.

**Vat dyes.** I. G. FARBENIND. A.-G. (Georg Kalischer, Heinrich Salkowski and Fritz Frister, inventors). Ger. 480,377, Oct. 2, 1926. Vat dyes of uncertain constitution but contg. Cl and S are prepd. by treating  $C_{14}H_{18}$  or its derivs. or substitution products contg. Cl and (or) S with  $S_2Cl_2$  in the presence of a catalyst such as I,  $FeCl_3$ ,  $AlCl_3$ .

**Sb or SbCl<sub>5</sub>.** An indifferent solvent or diluent may be present. The process may be conducted by treating C<sub>14</sub>H<sub>10</sub>, etc., with Cl at a high temp. in the presence of an excess of S. The reaction proceeds in stages and the intermediate products may sometimes be isolated. The final product prepd. from C<sub>14</sub>H<sub>10</sub> itself is identical with that prepd. according to Ger. 247,416 (C. A. 6, 2542). Examples are given.

**Vat dyes.** I. G. FARBENIND. A.-G. (Max A. Kunz, Erich Berthold and Eduard Gofferjé, inventors). Ger. 480,917, Aug. 29, 1926. Vat dyes are prepd. by the action of N<sub>2</sub>H<sub>4</sub> or its salts on 2-aminoanthraquinone-3-aldehyde or its derivs. or materials giving rise thereto, such as anthraquinone-2,3-isoxazole. The product from 2-aminoanthraquinone-3-aldehyde itself gives orange shades on cotton. Examples are given.

**Vat dyes.** SOC. ANON. POUR L'IND. CHIM. À BAËLE. Ger. 480,487, Jan. 22, 1928. Addn. to 465,988. Vat dyes giving blue shades fast to water are prepd. by chlorinating certain violanthrone derivs. at a temp. above 80° in the presence of a diluent not miscible with water. The violanthrone derivs. treated are the halogen derivs. dyeing in shades not fast to water, with the exception of such halogen derivs. as are prepd. in the presence of HClSO<sub>3</sub> or by means of halogen carriers such as FeCl<sub>3</sub> or SbCl<sub>5</sub>. Examples are given.

**Vat dye.** SOC. ANON. POUR L'IND. CHIM. À BAËLE. Swiss 131,729, Jan. 17, 1928. Addn. to 125,480. A new vat dye is obtained by sulfonating Bz-1, Bz-1'-dibenzanthrone with 12% fuming H<sub>2</sub>SO<sub>4</sub>, melting with caustic alkali and methylating. It colors cotton a fast gray in a red-violet bath.

**Sulfur dyes.** I. G. FARBENIND. A.-G. (Erwin Kramer, Ludwig Zeh and Bernhard Bollweg, inventors). Ger. 478,351, July 9, 1927. Addn. to 477,698 (C. A. 23, 4347). Binaphthalene dioxide is treated with S halide such as S<sub>2</sub>Cl<sub>2</sub> with or without diluent and the mixt. warmed to 80–120° when it solidifies to an orange-yellow mass. The mass is then heated to 250–260° to complete the formation of the dye. S may be added during the heating. The dye gives a red Na<sub>2</sub>S soln. and dyes cotton violet-brown. Examples mention SCl<sub>2</sub> as the halide. Cf. C. A. 23, 3815.

**Brown dyes.** M. CHILIKIN. Russ. 335, June 6, 1922. A mixt. of naphthenic acids is fused with NaOH and S in the presence of Cu or Zn salts or without the addition of the latter before the mixt. becomes dry.

**Dye preparations.** I. G. FARBENIND. A.-G. Brit. 305,787, Jan. 11, 1928. The process described in Brit. 303,942 (C. A. 23, 4580) in which nitrosamine printing colors are purified by use of org. solvents is modified by dissolving an azo component and a nitrosamine of an aromatic amine separately in small quantities of water with the addn. of a sufficient quantity of alkali, filtering the sp. solns. and mixing them at such a concn. that no dye formation occurs. Several examples are given.

**Dyes and intermediates.** BRITISH DYESTUFFS CORP., LTD., ARNOLD SHEPHERDSON and ANTHONY JAMES HAILWOOD. Ger. 480,541, May 3, 1927. See Brit. 278,102 (C. A. 22, 2668) or Fr. 634,686 (C. A. 22, 3995).

**Dye intermediates.** I. G. FARBENIND. A.-G. Brit. 305,763, Dec. 16, 1927. Hydroxydiaryl ketones are made by treating an *o*-hydroxyaryl carboxylic acid halide with an aromatic hydrocarbon, which may contain a non reactive substituent, in the presence of acid condensing agents such as AlCl<sub>3</sub>. Examples are given.

**Coal-tar intermediate.** SOC. ANON. POUR L'IND. CHIM. À BAËLE. Swiss 131,494, Oct. 22, 1927. Addn. to 103,430. A new coal-tar dye intermediate product is prepd. by the action of 1 mol. CNCl and 1 mol. 1,8-aminonaphthol-3,6-disulfonic acid on 1 mol. dehydrothiolumidinesulfonic acid. The product is a yellow powder which readily attacks cotton fibers and facilitates dyeing by azo compds.

**Substitution products of isoviolanthrone.** SOC. ANON. POUR L'IND. CHIM. À BAËLE. Ger. 479,611, Dec. 17, 1925. Chloro substitution products of violanthrone are obtained by removing part of the Cl from the polychloro leuco compd. by reduction in alk. soln. and then oxidizing. The oxidation may take place in the fibers of the material to be dyed. Thus, dichloroisoviolanthrone is suspended in warm NaOH, and NaHSO<sub>3</sub> added. An intense blue dye contg. 1 atom of Cl is produced.

**Dyeing.** CHEMISCHER FABRIK VORM. SANDOZ. Ger. 479,595, Nov. 19, 1927. See Brit. 300,662 (C. A. 23, 4082).

**Dyeing.** DURAND & HUGUENIN SOC. ANON. Ger. 479,678, Nov. 30, 1926. Addn. to 418,487. A process for fast dyeing and printing consists in developing the color of an ester of a leuco dye by oxidation with steam and an acid which does not decompose the slop-soln. or printing paste. Examples give suitable mixts.

**Dyeing.** I. G. FARBENIND. A.-G. (J. Nüsslein, inventor). Ger. 479,915. In dyeing by the oxidation of aromatic amines, a highly dispersed prepn. of the amine in water is used.

**Dyeing.** SOC. ANON. POUR L'IND. CHIM. À BAËLE. Ger. 479,713, July 8, 1923.

Addn. to 393,701. Fast color tones are produced in fibers by soaking them in diazotized 4-chloro-2-aminobenzene-1-phenyl ether and treating with arylides of 2,3-hydroxynaphthoic acid. Examples are given.

**Dyeing cellulose ester or other silk.** I. G. FARBENIND. A.-G. (Winfrid Hentrich, Max Hardtmann and Rudolf Knoche, inventors). Ger. 480,904, Feb. 3, 1927. See Brit. 284,652 (C. A. 22, 4834).

**Dyeing viscose materials.** I. G. FARBENIND. A.-G. Brit. 306,153, Feb. 17, 1928. Uniform dyeings are produced by use of dyes obtained by either (a) coupling tetrazotized *m*- or *p*-azoxyaniline or a substitution product with a component or, (b) coupling diazotized *m*- or *p*-nitroaniline or a substitution product with a component and treating the monoazo dye with an alk. reducing agent to obtain a disazoazoxy or trisazo product. Several examples are given. Cf. C. A. 23, 4351.

**Bleaching and dyeing.** G. F. LLOYD (to Spectrum Dyes Proprietary, Ltd.). Brit. 305,922, Feb. 11, 1928. Dyed fabrics are subjected to the action of slowly acting stripping solns. (such as may be prepd. by treating  $\text{NaHSO}_3$  with Zn) to regulate the final color produced. Numerous details are given.

**Apparatus for the local dyeing, especially stripe dyeing, of hanks.** JULIUS LEVY. Ger. 480,958, Aug. 1, 1925, and 480,959, Aug. 11, 1927.

**Apparatus for dyeing textiles.** I. G. FARBENIND. A.-G. Ger. 479,914, Nov. 28, 1926. Addn. to 368,734, App. for treating textiles with developing dyes is described.

**Air-drying machine for textiles.** GEBRÜDER SÜCKER. Ger. 479,764, May 27, 1925.

**Machine for impregnating and dyeing fabrics.** MASCHINENFABRIK BENNINGER A.-G. Swiss 131,956, Feb. 21, 1928. Details are given.

**Apparatus for dyeing long pieces of fabric on both sides.** FRANTISEK RUDOLF. Swiss 131,568, Jan. 4, 1928. Details are given.

**Dyeing apparatus for treating textile materials in lengths.** C. P. COLE. Brit. 306,462, Feb. 20, 1928. Structural features.

**Automatic reversing device for dyeing apparatus.** MASCHINENFABRIK BENNINGER A.-G. Brit. 306,484, Feb. 21, 1928. Mech. features.

**Apparatus (with rollers having rubber strips on their surface) for dyeing, mordanting or other treatments of paper or textile fabrics.** C. S. BEDFORD. Brit. 305,901, June 27, 1928. Structural features.

**Printing fabrics containing cellulose acetate or similar materials.** C. DREYFUS (to British Celanese, Ltd.). Brit. 306,534, Feb. 23, 1928. In printing fabrics contg. cellulose org. esters or ethers, substances for preventing delustering (or to effect relustering when delustered) are incorporated with the printing pastes. Examples are given of substances which may be used.

**Cloth printing dyes.** I. G. FARBENIND. A.-G. (Max A. Kunz and Friedrich Feller, inventors). Ger. 479,976, May 24, 1927. Alkali-fixed dye preps. used in cloth printing consist of dyes mixed with vegetable mucilage. The alkali coagulates the mucilage in the fibers. Cf. C. A. 23, 3107.

**Cloth printing.** I. G. FARBENIND. A.-G. (Alfred Fischesser, inventor). Ger. 479,977, Oct. 27, 1927. In printing fabrics with basic dyes from tannin substitution products, prepd. as in 390,931, the tannin compd. is removed by oxidation and the dyeing completed. Two lists of components of suitable finishing solns. are given.

**"Shading" artificial silk.** SOC. POUR LA FABRICATION DE LA SOIE "RHODIASETA." Ger. 480,899, Aug. 29, 1925. The application of a fugitive color to dry-spun threads of cellulose esters or ethers, for the purpose of distinguishing threads of different nature, is effected in the course of production of the threads, i. e., on the filaments before union into threads and inside or outside the spinning cell, or on the threads before or during reeling. Various ways of applying the color are described. Cf. Brit. 251,580 (C. A. 21, 1362).

**Apparatus for washing, desulfurizing, decoppering, dyeing or other treatments of artificial silk on bobbins.** C. LANDESKROENER. Brit. 305,980, Feb. 13, 1928. Structural features.

**Singeing device for textile fibers.** GEORG ERNE. Swiss 131,570, Feb. 25, 1928.

**Wadding from flax fibers.** SOC. DES TEXTILES ROANNAIS. Brit. 305,709, Nov. 10, 1927. Raw or retted flax fibers are treated to produce hydrophilous wadding by subjecting them to a hot bath contg.  $\text{NaOH}$ ,  $\text{Na}_2\text{CO}_3$ , soap and lime, rinsing in water, treating with a soln. of  $\text{Na}_2\text{S}_2\text{O}_4$ , rinsing, drying, subjecting to a bath contg.  $\text{H}_2\text{SO}_4$ , bleaching with chlorosone, rinsing and further treating with a bath contg.  $\text{H}_2\text{SO}_4$ ,  $\text{Na}_2\text{S}_2\text{O}_4$  and  $\text{HNO}_3$ .

**Apparatus for loading silk fabrics.** MASCHINENFABRIK TILLM. GERBER SÖHNE & GEHR. WANKLEBEN. Ger. 480,937, Apr. 5, 1925.

**Degumming silk.** BRITISH CELANESE, LTD., and G. H. ELLIS. Brit. 306,067, Nov. 15, 1927. Degumming of natural silk, alone or assocd. with other materials, is effected by use of an alk. liquor of a  $pH$  not exceeding 10.5. The process (details of which are described) is especially suitable for treating silk which is assocd. with cellulose acetate or the like. Cf. C. A. 22, 317.

**Composite yarns with a cotton core covered with artificial silk.** O. RASCH. Brit. 306,007, Oct. 10, 1927. Mech. features of manuf. are described. The finish of the material may be improved by treatment with a soln. of soap, oil and a fat solvent, e. g., with Marseilles soap, olive oil and  $CCl_4$ .

**Artificial silk.** S. I. VLES and D. VAN DER WANT. Brit. 306,050, Aug. 10, 1927. Adherence of filaments constituting a thread is prevented by treating them with a substance which acts as a solvent or swelling agent especially at temps. slightly  $\pm$  working temp. Various details of compns., procedure and app. are described.

**Apparatus for introducing an artificial silk filament into a rarified space.** GEORG FRANK. Ger. 480,829, Dec. 24, 1927.

**Centrifugal apparatus for the wet treatment of artificial silk on the spools.** I. G. FARBENIND. A.-G. (Alfred Friederich inventor). Ger. 479,621, May 4, 1924, addn. to 456,190.

**Delustering "viscose silk.** C. TERRELL. Brit. 305,828, Feb. 17, 1928. An insol., uncolored, opaque ppt. is produced on the material by impregnating it with an aq. soln. of a salt such as  $BaCl_2$  and then treating it with a pptg. agent such as  $(NH_4)_2SO_4$  or  $(NH_4)_2CO_3$ . Examples are given of various other treating substances which react similarly.

**Treating mixed fibers containing cellulose derivatives.** CAMILLE DREYFUS, ROBERT G. DORT and HERBERT PLATT (to Celanese Corp. of America). U. S. 1,725,857, Aug. 27. Fabrics contg. both vegetable fibers such as cotton and org. derivs. of cellulose such as cellulose acetate or propionate are subjected to the action of a carbonizing soln., e. g.,  $AlCl_3$  or  $HCl$ , to render the vegetable fibers removable.  $Na_2SO_4$  or other delustering preventive also is used.

**Artificial threads of cellulose derivatives.** CHARLES F. RYLEY, CHARLES W. PALMER and SIDNEY A. WELCH (to Celanese Corp. of America). U. S. 1,725,829, Aug. 27. In the dry-spinning and winding of threads such as those formed from cellulose acetate the threads are treated with paraffin oil, oleic acid, olive oil or other suitable lubricating dressing, which facilitates the winding.

**Apparatus for treating yarn or rove with liquids.** M. WADDELL and H. C. WATSON. Brit. 306,206, Nov. 25, 1927. Structural features.

**Detergent mixtures.** A. R. JENNINGS. Brit. 306,119, Feb. 17, 1928. Compns. for removing stains from delicate fabrics comprise a finely powdered material such as talc, chalk or pyrophyllite and a softening or loosening agent such as liquid soap or oils of turpentine, cedar, camphor, pine, rosemary or eucalyptus. Water may be added to form a paste.

**Mothproofing wool, fur, hair, etc.** I. G. FARBENIND A.-G. (Wilhelm Lommel, Heinrich Münzel, Winfrid Hentrich and Max Hardtmann, inventors). Ger. 480,180, Mar. 16, 1920. The goods are treated with esters of  $H_3PO_4$ . A 2% soln. of diphenyl *o*-cresyl phosphate or a 1% alc. soln. of tri-*o*-chlorophenyl phosphate is suitable.

## 26 -PAINTS, VARNISHES AND RESINS

A. H. SABIN

**Causes of paint failures on sidewalls.** OTTO R. HARTWIG. Am. Paint & Varnish Mfrs. Assoc., Circ. 355, 742-808 (1929).—A study of 1500 cases of paint failure on exterior sidewalls revealed moisture to be the cause in 75-80% of the cases. The presence of moisture was usually due to one or more of the following circumstances: wet lumber, careless or improper carpentry, damp basements or painting too soon after a rain. Photographs of typical cases of failure, improper and proper installation of flashing, means for drying buildings during construction, locating the places where rain water has entered, etc., are given. G. G. SWARD

**Oxidation and weathering of linseed oil paints.** D'ANS. Z. angew. Chem. 41, 1193-7 (1928).—The effect on the oxidation of linseed oil of light and moisture is discussed. The swelling of linseed oil and paint films exposed to moisture, which varies with different pigments, is recommended as a delicate criterion in the evaluation of

paints. It is pointed out that, under favorable conditions of warmth and moisture, paint films, especially if recently applied, are susceptible to attack by molds (*Penicillium*, *Aspergillus*) which may cause rapid and extensive deterioration. The development of molds appears to be hindered by the presence of ZnO and certain colored pigments: the possibility of attack by molds should not be neglected when assessing weathering tests.

B. C. A.

**Testing paints.** A. V. BLOM. *Z. angew. Chem.* **41**, 1178-81(1928).—For testing the strength of paint films, strips of iron of known tensile strength are painted on one side and then pulled in the usual tensile machine until microscopic cracks begin to appear in the paint film. With freshly painted strips this happens at or near the breaking point of the iron; after the paint has aged somewhat, fracture occurs during the region of plastic flow of the iron, but with very old and brittle films it may occur as soon as the elastic limit is exceeded. The shape and position of the fissures in the paint film after the test provide an indication of the state of preservation of the paint, and, by observing whether the first cracks appear along the Lüder-Hartmann flow lines or whether they are evenly distributed over the surface of the strip, conclusions may be drawn as to the intensity of adherence of aged paint films. The value of the method in testing red lead paint is described; after aging for 12 days at 80° the elongation of films of ordinary red lead paint decreased from 27 to 16.5%, and that of films of highly dispersed red lead paint from 14.7 to 0.2%. The latter therefore harden and become watertight sooner than the former, and the permanent elongation of 0.2% suffices for paint films on iron as it exceeds the usual limit of proportionality of the metal.

B. C. A.

**Comparative investigations on the toxicity of basic lead sulfate and of white lead.** K. B. LEHMAN. *Arch. Hyg.* **101**, 197-204(1929).—White lead and the basic Pb sulfate of commerce are equally poisonous to cats and rabbits when administered under similar conditions.

E. R. MAIN

**Comparative investigations on the toxicity of basic lead sulfate and basic lead carbonate.** F. KOELSCH, E. LEDERER AND R. KOELSCH. *Arch. Hyg.* **101**, 234-56(1929).—The com. product,  $2\text{PbSO}_4 \cdot \text{PbO}$ , sold as a non-poisonous substitute for white lead, appears to be equally as toxic as the latter to guinea pigs and rabbits, either upon inhalation or oral administration.

E. R. MAIN

**A comprehensive theory of the drying process and of the heat polymerization of fatty oils.** B. SCHEIFELE. *Z. angew. Chem.* **42**, 787-90(1929); cf. *C. A.* **22**, 3053.—The drying of an oil depends on the no. and position of the double bonds in the fatty acid radical. Conjugated double bonds greatly increase the rate of drying or polymerization. The behaviors of china wood, linseed and poppyseed oils are explained on this basis. Objection has been made that butadiene should be at least as good a drying oil as china wood oil since it contains conjugated double bonds. S. replies that butadiene does polymerize to rubber-like substances but the mol. is too small to be classed with the ordinary drying oils.

A. C. HIGGINS

**Composition of Chinese wood oil (tung oil).** A. STEGER AND J. VAN LOON. *J. Soc. Chem. Ind.* **47**, 361-3T(1928).—The authors give an account of the preliminary analysis of a typical wood oil, which they believe to consist principally of the glyceride of an isomeride of linolenic acid. Practically only fatty acids with an 18 C straight chain are present; the satd. fatty acids appear to consist of a mixt. of 75% of palmitic and 25% of stearic acids.

B. C. A.

**Copal oil and copal condensation oil.** P. MAX GREMPE. *Teer u. Bitumen* **27**, 383(1929).—A new by-product from the lacquer industry, copal condensation oil, is described. It is suitable for use in wood preservatives, linoleum finishes, etc.

W. A. GALLUP

**Turpentine. Type A.** ANON. *Brit. Eng. Standards Assoc.* (London), No. 290, 8 pp (June, 1929).—Specifications cover description, sp. gr., distn., residue, n, polymerization, flash point, sampling and size of sample.

R. I. S.

**Physical properties of shellac solutions.** I. M. RANGASWAMI AND M. VENUGOPALAN. *Indian Lac Assoc. for Research Bull.* **1928**, No. 1, 14 pp.—The variation of viscosity with concn. of shellac solns. in various alc. solvents was detd. "Solvent-power nos." of the solns., using water and light petroleum as non-solvents, are plotted against concn. and against viscosity, it being demonstrated that both solvent power and viscosity must be correlated in rating a solvent. Wood naphtha is shown to exhibit peculiar behavior, a second peak in the solvent power occurring at about 30% concn., such peak being absent with the other solvents.

B. C. A.

**The world's recent progress in synthetic resins.** ALADIN. *Plastics* **5**, 258-60, 326-8, 449-51, 507-9(1929).

E. J. C.

Applications of recent [paint] analytical interest (Fox) 7. Enameling furnace (Ger. pat. 480,718) 1.

BAUER, K. H.: *Monographien aus dem Gebiete der Fett-Chemie*. Vol. XI. *Die trocknenden Öle*. Stuttgart: Wissenschaftliche Verlag m. b. H. 354 pp. M. 27. Reviewed in *Chemistry & Industry* 48, 816(1929).

**Color indicator for pigment.** MAX ASCHER & Co. G. M. B. H. Ger. 479,721, Jan. 8, 1926. A color indicator for paint which is color-sensitive to heat, for use on automobiles, comprises a mixt. of  $\text{HgI}_2$  and  $\text{CuI}_2$  or  $\text{AgI}$  with varnish or  $\text{HCHO-PhOH}$  condensation products.

**Treating copper salts of naphthenic acids.** M. POTOLOVSKII. Russ. 30, May 14, 1923. Cu salts of naphthenic acids obtained by any of the known methods are treated with superheated steam, hot air or other gas heated to  $250^\circ$ . A green paint pigment of high quality is obtained.

**Varnish and paint oils.** J. SCHEIBER. Brit. 306,452, Feb. 20, 1928. Ricinoleic acid or the mixt. of fatty acids obtained from castor oil are subjected to prolonged heating (suitably *in vacuo*) to effect splitting off of water which leads to an isomeric linolic acid with conjugated double bonds which is then esterified with glycerol or other polyhydric alc. Excess glycerol may be used and a supplementary esterification effected with rosin, copal or the like. Brit. 306,453 specifies subjecting mixts. of fatty acids from good drying oils such as wood oil, linseed oil or perilla oil and those from semi-drying or non-drying oils to a common esterification with glycerol or other polyhydric alc. (and also if desired to a further esterification with colophony or copal or the like if an excess of glycerol is used).

**Varnish.** GEORG FEY & Co. Swiss 132,318, Feb. 12, 1927. Nitrocellulose varnish is caused to dry with a mat surface by adding vegetable oil. Thus, a varnish contg. pyroxylin,  $\text{AcOBu}$ ,  $\text{BuOH}$ ,  $\text{C}_{12}\text{H}_{26}$ , alc., softening material and resin is given a mat drying surface by addn. of wood oil.

**Cellulose nitrate solutions.** W. J. JENKINS and IMPERIAL CHEMICAL INDUSTRIES, LTD. Brit. 305,960, Oct. 12, 1927. Solns. of nitrocellulose suitable for use as *lacquers* or *enamels* are prepd. with a Me, Et, Pr or iso-Pr ether of a lactic acid ester (such as may be made by treating  $\alpha$ -chloro- or  $\alpha$ -bromo-propionic acid esters with the corresponding Na alcoholate) with or without other solvents, plasticizers, etc.

**Metal-coating japan.** WHEELER P. DAVEY (to General Electric Co.). U. S. 1,726,473, Aug. 27. A japan comprises water as a dispersion medium with a disperse phase including bituminous material, a drying oil and rubber having in the aggregate a d. less than that of water and a finely divided solid such as clay or lampblack having a d. greater than that of water, so that the disperse phase as an entirety has a d. approx. the same as water.

**Resinous compositions.** CHEM. FAB. KURT ALBERT G. M. B. H. Ger. 480,488, Apr. 27, 1921. Addn. to 440,003. According to Ger. 440,003, fresh natural acid resins are improved by combining them under the action of heat with resins prepd. from  $\text{PhOH}$ , or its homologs and  $\text{CH}_2\text{O}$ , the combined product being then neutralized or esterified in a known way. This method is now modified by using resins prepd. by condensing  $\text{PhOH}$ , etc., with other aldehydes such as  $\text{AcH}$  or with ketones or mixts. of ketones with aldehydes. Cf. Brit. 259,030 (C. A. 21, 3276).

**Resin from cashew-nut oil.** MORTIMER T. HARVEY (to Harvel Corp.). U. S. 1,725,791, Aug. 27. Cashew-nut shell liquid and  $\text{CH}_2\text{O}$  are caused to react by heating in the presence of an acid catalyst such as  $\text{HCl}$ . U. S. 1,725,792 specifies a reaction product of cashew-nut shell oil with an oxidizing agent and an acid such as  $\text{MnO}_2$  and  $\text{HNO}_3$ . The product is an *elec. insulator*. U. S. 1,725,793 specifies the production of compns. for use in *coatings, impregnating or for molding*, by heating cashew-nut shell oil with  $\text{CuCO}_3$  or other O-contg. metalliferous drying agent. U. S. 1,725,794 specifies heating cashew-nut shell oil in a Cu kettle to remove the non-drying characteristic of the oil. U. S. 1,725,795 specifies bringing  $\text{CH}_2\text{O}$  and cashew-nut shell oil together in the presence of gasoline or other suitable solvent for the initial reaction product which is formed, under acid conditions, to produce a product which dissolves as it is formed and which may be used on paper, etc., for *insulating*. U. S. 1,725,796 relates to a modified cashew-nut shell liquid,  $\text{CH}_2\text{O}$  and a drier together in a common solvent. Cf. C. A. 23, 3998.

**Vinyl ester resins.** HOWARD W. MATHESON and FREDERICK W. SKIRROW (to Canadian Electro Products Co., Ltd.). U. S. 1,725,362, Aug. 20. Gummy or resinous

products with plastic rubbery consistency are formed by reaction of a compd. contg. an  $C_2H_4$  linkage such as vinyl acetate with  $AcH$  or other satd. aliphatic aldehyde.

**Synthetic resins.** IMPERIAL CHEMICAL INDUSTRIES, LTD., R. HILL and E. E. WALKER. Brit. 305,965, Nov. 11, 1927. A polybasic acid or its anhydride such as phthalic anhydride is condensed with a plurality of alcs. at least one of which is di- or polyhydric (products of low-acid value and high soly. being obtained if a mono- or dihydric alc. is used). Numerous details and examples are given.

**Synthetic resins.** I. G. FARBENIND. A.-G. Brit. 306,501, Nov. 22, 1927. See Fr. 644,015 (C. A. 23, 1764).

## 27—FATS, FATTY OILS, WAXES AND SOAPS

E. SCHERUBEL

The qualitative test for fats and their components with special regard to micro-chemical methods. ANNELIESE NIETHAMMER. *Biochem. Z.* 209, 447-57 (1929).—The use of Sudan III, sapon., solidification types and sublimation in the identification of fats is discussed. S. MORGULIS

**Bayberry fat and its optical activity.** G. WALLRABE. *Arch. Pharm.* 267, 405-12 (1929).—The fat obtained from the fresh berries by extr. with petr. ether and the essential oil therefrom (by distn. with steam) yielded the following consts., resp.: acid no. 5.31, 6.06; sapon no. 210.85, 219.6; I no. 67.94, 65.7; apparent Ac no. 15.27, —; unsaponifiable —, 5.00%;  $H_2O$ -insol. fatty acids —, 84.69%;  $[\alpha]_D^{15}$  11.21, 8.429°. Sepn. of the  $H_2O$ -insol. fatty acids *via* Twitchell gave 58.5% liquid and 37.5% solid fatty acids. The av. mol. wt. of the solid acids (m. 38.5-39°) was 228.7, while that of the liquid acids was 306. The liquid fatty acids contain oleic and linoleic acids. The high av. mol. wt. of the liquid acids leads to the conclusion that they contain another constituent; this is confirmed by the formation of a rubber-like substance on brominating the mixt. The unsaponifiable portion contains, as other workers have found, phytosterol, melissyl alc. laurane and considerable liquid constituents. That the optical activity of bayberry fat must be profoundly influenced by the presence of "bayberry camphor" is indicated by manipulating the fat with very cold alc. (final refrigeration to -50°), and repeated isolation of the accompanying glycerides with alc., whereupon the alc. soln. gave on evapn. a dark yellow, bayberry-odorous oil ( $[\alpha]_D^{15}$  45.68°), which on long standing yielded colorless cryst. masses ( $[\alpha]_D^{15}$  137.65°). This substance crystg. in 1.5-cm. needles has the formula  $C_{22}H_{36}O_4$ , and is the main source of optical activity in the fat. W. O. E.

**Cacao butter.** DAVID W. HORN AND ARTHUR OSOL. *Am. J. Pharm.* 101, 601-11 (1929).—A report of comparative tests upon com. samples of cacao butter, cacao butter olein, cacao butter stearin and cacao butter from "Dutched" nibs. Although these 4 products are different, the differences lie within the range of exptl. error in the detns. of sp. gr. of sapon. no., of unsaponifiable residue and of liquid fatty acid by the Pb salt-ether method. The results are for cacao butter  $d_{15}^{20}$  0.8572, sapon no. 194.66 unsapon. matter 0.76%; for olein  $d_{15}^{20}$  0.8572, sapon. no. 194.63, unsapon. matter 0.90%, liquid fatty acids 36.9; for stearin  $d_{15}^{20}$  0.8574, sapon no. 193.67 unsapon. matter 0.93%, liquid fatty acid 37.8; Dutched cacao butter  $d_{15}^{20}$  0.8576, sapon no. 194.52 unsapon. matter 0.90. The differences lie not far outside the range of exptl. error in the detns. of  $n$  and of surface tension at 40° and of viscosity (Stormer) at 80°. The results are for pure cacao butter  $n_D^{40}$  1.4572, surface tension (in dynes per cm.) 35.5, viscosity (sec. required for 100 revolutions at 80°) 21.8; for com. olein of cacao butter  $n_D^{40}$  1.4579, surface tension 35.2, viscosity 22.7; for com. stearin of cacao butter  $n_D^{40}$  1.4580, surface tension 34.9, viscosity 22.0; for Dutched cacao butter  $n_D^{40}$  1.4578, surface tension 35.7, viscosity 21.1. Distinct indications of differences are brought out in the detns. of I no. (Hanus), of m. p. (Wiley) and of "transition point" and possibly also of acidity (stated as mg. of KOH required to neutralize the acid in 1 g. of fat). The 4 products were subjected to a study as follows: The melted fat was placed in a Dewar test tube, which was held firmly in the center of a bath of water and ice. The fat was stirred constantly with a thermometer and when its temp. had fallen to 33° or thereabout, the readings of the thermometer every min. were written down. The results were then plotted, the temp. vertically and the time horizontally. In general the form of the resulting graph is that of the root-sign of algebra  $\sqrt{\quad}$ . The liquids gradually cool until they are undercooled as much as 5° to 10°; finally crystn. sets in accompanied by a gradual rise in temp. This rise continues

to a max., which max. is maintained quite exactly to within  $0.1^\circ$  for a period (in these expts.) of 8–20 min. This temp. is called the "transition point" of the product. The results are for cacao butter I no. 37.73, m. p.  $33.2^\circ$ , "transition point"  $29.3^\circ$ , acidity 2.4; for olein I no. 41.02, m. p.  $31.0^\circ$ , "transition point"  $27.8^\circ$ , acidity 3.31; for stearin I no. 38.69, m. p.  $34.6^\circ$ , "transition point"  $28.9^\circ$ , acidity 2.60; for Dutched cacao butter I no. 37.02, m. p.  $33.3^\circ$ , "transition point"  $30.0^\circ$ , acidity 2.81.

W. G. GAESSLER

**Indirect analysis of three-component systems, particularly of fatty acid mixtures.** K. TAUFEL AND M. RUSCH. *Z. Untersuch. Lebensm.* 57, 216–24 (1929).—Triangular coordinates are used for the indirect analysis of 3-component systems. Examples are: (1) mixts. of oleic, linoleic and erucic acids of known I and neutralization nos.; (2) mixts. of  $(\text{NH}_4)_2\text{CO}_3$ ,  $\text{NH}_4\text{HCO}_3$  and  $\text{NH}_4\text{CO}_2\text{NH}_2$  of known  $\text{CO}_2$  and  $\text{NH}_3$  contents. The method is also applicable to a mixt. of linoleic, linolenic and oleic acids inasmuch as the iso-I and iso-neutralization values are parallel.

C. R. F.

**The highly unsaturated acids of sardine oil. I. A new acid  $\text{C}_{18}\text{H}_{32}\text{O}_2$  and the highly unsaturated  $\text{C}_{18}$  acids.** YOSHIYUKI TOYAMA AND TOMOTARO TSUCHIYA. *Bull. Chem. Soc. Japan* 4, 83–91 (1929); cf. *C. A.* 23, 2586.—Japanese sardine oil was treated by the Na-soap-acetone method (*C. A.* 19, 3606) and crude highly unsatd. acids were obtained from the acetone-sol. Na soaps. On vacuum distn. of the Me esters the part boiling up to  $215^\circ$  at 15 mm. was brominated. The  $\text{Et}_2\text{O}$ -insol. part of the bromides was sepd. by  $\text{C}_6\text{H}_6$  into 2 parts: sol. at  $40^\circ$  and insol. on boiling. The debromination product of the part sol. at  $40^\circ$  was distd. at 15 mm. The part b.  $180$ – $215^\circ$  was redistd. Sapon. of fraction I,  $b_{18}$   $180$ – $90^\circ$ , yielded the free acid, a yellow liquid of  $d_4^{20}$  0.9324,  $d_4^{20}$  0.9288,  $n_D^{15}$  1.4876,  $n_D^{20}$  1.4855, neutralization no. 221.6, sapon. no. 222.6, 1 no. (Rosenmund and Kuhnemann) 298.5, (Wijs) 310.7; bromide insol. in  $\text{Et}_2\text{O}$ , hexabromohiragonic acid: yield 50.80%, m. p.  $190^\circ$ , 66.10% Br. Hydrogenation produced palmitic acid. The new acid,  $\text{C}_{18}\text{H}_{32}\text{O}_2$ , was named *hiragonic acid*. The Me ester fraction yields methyl-hexabromohiragonate of 64.95% Br. and m. p.  $180^\circ$ . Similar treatment of fraction II showed that it contains mainly the ester of acid,  $\text{C}_{18}\text{H}_{32}\text{O}_2$ , with acids of lower and higher unsatn. present. The bromides insol. in boiling  $\text{C}_6\text{H}_6$  furnished, by debromination and vacuum distn., fraction I  $b_{18}$   $200$ – $15^\circ$  and fraction II  $b_{18}$   $215$ – $30^\circ$ . After redistn. of fraction I the fraction  $b_{18}$   $205$ – $15^\circ$  yielded, after sapon., the free acid of  $d_4^{25}$  0.9332,  $d_4^{20}$  0.9298,  $n_D^{15}$  1.4942,  $n_D^{20}$  1.4921, neutralization no. 202.5, sapon. no. 206.4, 1 no. (R. and K.) 327.8, (W.) 340.8; bromide insol. in  $\text{Et}_2\text{O}$ : yield 53.82%, m. p. about  $220^\circ$ , 69.67% Br. Hydrogenation produced stearic acid.

G. TOERNIES

**Iodine number and its relation to the source and age of olive oil.** E. DE CONNO AND D. RAGO. *Ann. chim. applicata* 19, 98–107 (1929).—Detns. of  $I_2$  no. on olive oils from Sorrento, Lucca and Bari show some variation. However, this variation is not much greater than the variation due to the age of the oil, i. e., an oil of  $I_2$  value of 103.4 in 2 yrs. decreases to 99.0. Therefore, the age as well as the source of an oil must be considered in detg. its  $I_2$  value.

A. W. CONTIERI

**The extraction of olive oil by the Acapulco process.** J. BONNET. *Rev. vit.* 69, 69–77 (1928).—The novelty of the process consists in the use of a device for sepg. the stones from the pulp prior to extrn. of the oil, and upon the use of a mech. extractor which results in a high yield of oil from the pulp. The first object is accomplished by means of a rotating shaft provided with blades which beat the pulp through holes bored in the surface of a stationary Fe cylinder. The oil is sepd. from the pulp by a process of mech. kneading carried out in a semi-cylindrical app. fitted with a very fine Ni screen at its lower end through which the oil drains during the maceration of the pulp. By this method of treatment the oil contained in the endocarp of the seeds, in the seeds themselves and in the pulp adhering to the stones is lost but part of this loss is counterbalanced by the quality and the increased yield of oil from the pulp itself. The most important loss is that of the pulp itself which is converted into a slime of no economic value. A comparison of the Acapulco and pressure processes, especially as regards yields and compn. of the oil, rate of operation and economics involved, is given.

K. S. M.

**The oil of silk-worm chrysalides.** E. DE CONNO AND A. QUARTO. *Ann. chim. applicata* 19, 91–7 (1929).—As chrysalides give a yield of over 20% oil, on extrn., which can be readily solidified by hydrogenation, this oil has been studied and some of its properties have been detd. as follows: m. p.  $11$ – $18^\circ$ , sp. gr. 0.927, acid no. 45.55, sapon. no. 194.2,  $I_2$  no. 134, volatile acid 1.3%.

A. W. CONTIERI

**Viscosity of soap solutions.** B. WALKER. *Allgem. Oel- u. Fett-Ztg.* 25, 448–50 (1928).—The viscosity of 0.3% (of fatty acid) soap solns at  $20^\circ$  was 52–56.2 sec. (water at  $20^\circ$ , 50.8 sec.). Generally, K soaps gave higher values than Na soaps, tallow and lard excepted. Values for  $30^\circ$ ,  $40^\circ$  and  $50^\circ$  are recorded.

B. C. A.

Viscosity of different soap solutions (WALTHER) 2. Separation of glycerides (SUZUKI) 10. Compressing soap (Ger. pat. 480,700) 13. Sulfonating oils (Ger. pat. 480,157) 13.

**Hardening fats, fatty acids, waxes, etc.** I. G. FARBENIND. A.-G. Brit. 306,053, Sept. 15, 1927. A small proportion of montan wax that has been bleached by oxidation (suitably by chromic acid or by electrolytic treatment) is added to materials such as stearin, tallow, paraffin, ozocerite, ceresin or beeswax.

**Decolorizing oils.** HERMANN BOLLMANN. Ger. 480,345, Jan. 7, 1925. Fatty or mineral oils are treated with decolorizing earths by a continuous method in which the oil and the earth are fed in predetd. proportions to a mixer in such a way that fresh oil meets fresh earth, the mixt. being continuously withdrawn. App is described.

**Decolorizing and refining crude cottonseed oil.** WALTER S. BAYLIS (to Filtrol Co. of Calif.). U. S. 1,725,895, Aug. 27. The oil is heated to a temp. not exceeding 43°, intimately mixed with water, and the water and assocd. substances are removed from the oil, the latter is brought into intimate contact with activated clay, and then sepd. from the clay.

**Soy-bean oil.** J. D. RIEDEL-K. DE HAËN. A.-G. Ger. 474,543, Aug. 29, 1923. Addn. to 464,554. The waste products of soy-bean oil production are extd. with alc. and then with acetone to obtain the oil, lecithin, phosphatide and mucin therein.

**Phosphatide emulsions.** HERMANN BOLLMANN. Ger. 480,480, Oct. 7, 1925. An oil emulsion of phosphatides such as from soy beans, is purified by removing most of the oil and distg. under reduced pressure (60°) to remove water and substances which impart an unpleasant taste.

**Extracting oils from fish livers.** MANUFACTURE DE MACHINES AUXILIAIRES POUR L'ELECTRICITE ET L'INDUSTRIE. Brit. 306,020, Feb. 14, 1928. An arrangement of app is described suitable for disintegrating the material in the presence of hot water and sepg. the oil by centrifuging.

**Plastic compositions.** JEAN BAER. Swiss 132,325, Nov. 8, 1927. Wax-like bodies are prepd. by the action of  $C_2H_4Cl_2$  on  $(NH_4)_2S$  soln. The product has a higher m. p. than beeswax or carnauba wax.

**Soap.** KARL LÖFFL. Ger. 479,908, Nov. 28, 1925. In the sapon. of fats under pressure for making soap, the empty portion of the sapon vessel is cleared of air and gas so that only vapors of readily condensable liquids remain. An example is given.

**Soap.** HANS SCHNYDER. Swiss 132,321, Nov. 11, 1927. Dry soap is prepd by kneading soft soap with calcined soda in the warm until not more than 7 mols. of water of crystn. remain to each mol. of  $Na_2CO_3$ , cooling and pulverizing.

**Apparatus for cutting soap flakes.** ERNST FLAMMER and I. CHRISTIAN KELLER. Ger. 480,675, May 10, 1925.

## 28 SUGAR, STARCH AND GUMS

J. K. DALE

**The economy of the German sugar industry.** P. RIEFER. *Deut. Zuckerind.* 54, 538-42(1929). J. F. LERTE

**Utilization of exhaust heat in sugar factories.** K. SCHIEDL. *Centr. Zuckerind.* 37, 577-80(1929).—A discussion with calcns. J. F. LERTE

**Special lubricants in the sugar industry.** ERNST W. STEINITZ. *Centr. Zuckerind.* 37, 683-4, 703-4(1929). J. F. LERTE

**Sugar in the "reform-houses" (natural food stores).** ROSSÉN. *Deut. Zuckerind.* 54, 494(1929).—R. presents data showing several "patent" sugars selling at high prices to consist of 82-96% sucrose and 0.5-1% invert sugar with varying amts. of other ingredients such as whitening, starch and grain germs. J. F. LERTE

**Raw sugar and affination.** E. PELTZ. *Deut. Zuckerind.* 54, 542-3(1929). J. F. L.

**The valuation of raw sugar.** O. SPENGLER. *Deut. Zuckerind.* 54, 537-8(1929).—S. discusses the successful use of the shorter method (Spengler and Brendel, C. A. 22, 4859) and their longer method (C. A. 22, 1870) in practice, and recommends, as a result of some 8000 detns., certain changes in procedure and the adoption of the methods for factory control. J. F. LERTE

**Determination of ash of some Philippine raw sugars by the electrical conductivity method.** V. G. LAVA and F. G. ISAAC. *Sugar News* 10, 186-9(1929).—This is an adaptation of the work of Zerban and Sattler (C. A. 21, 2394). For 11 samples of sugar representing 8 Philippine Sugar centrals, L. and I. found that: (1) at 28° the value

of the *c*-ratio calcd. by the method of least squares is 1511 (Zerban's and Sattler's value is 1566.5); (2) in some cases there is an appreciable difference between chem. ash and cond. ash, which is explained by assuming that the value of the ash is different in different centrals and at different seasons; (3) the sample from the sugar mill of the Univ. of the Philippines which has low extn. gave an abnormally high *c*-ratio. V. G. L.

**The significance of sampling for chemical analysis.** JOSEF HAMOUS. *Listy Cukrovar.* 47, 645-6 (1929).—Correct sampling does not account for losses due to caramelization of the heated sugar solns. Liquid entering one chamber from another is superheated for that chamber. Such losses may be as high as 0.2%. Caramelization may be detd. by measuring the color produced during boiling. FRANK MARESH

**The preparation of sugar from carob by alcoholic extractions.** G. ODDO. *L'ind. sacc. ital.* 21, 460 (1928); *Listy Cukrovar. Rozhledy* 47, 36; cf. C. A. 22, 4861.—The fruit contains 20-34% sucrose and 10-20% reducing sugars. Extn. with H<sub>2</sub>O lead to sirups which did not cryst. Alc. ext. gave sirups which crystd. after 10-15 days standing yielding 16.4-21.6% of raw sugar figured on the fruit. The mother liquor contained 2-3% sucrose and reducing sugars. Carob is a very stable fruit and could be worked throughout the whole year in small plants. Dried beets extd. with MeOH and EtOH yielded sirups which crystd. readily. FRANK MARESH

**Cercospora of sugar beets.** E. SAILLARD. *Revue de Path. Végétale et d'Entomologie Agricole* 10, 292 (1928); *Listy Cukrovar. Rozhledy* 47, 38.—Beets diseased with cercospora give highly impure and colored sugar liquors, a low percentage of sugar, large amide and NH<sub>3</sub> content, require the addn. of Na<sub>2</sub>CO<sub>3</sub>, and yield an excess of molasses. Soaking seeds in germicides was ineffective. Spraying the greens with CuSO<sub>4</sub> soln. every 8-10 days was effective but spraying with dry CuSO<sub>4</sub> was better. F. M.

**French growing experiments with 14 beet varieties.** E. SAILLARD. *Circ. hebdom.* 10, III (1929); *Listy Cukrovar. Rozhledy* 47, 33.—Varieties of beets, 7 domestic and 7 foreign, were grown on exptl. plots in 11 localities. The data on the best varieties is tabulated.

Variety	Yield of beets g per ha	Sugar content, %	Yield of sugar g. per ha.
Zapotil	314.2	18.24	57.3
Kleinwanzleben Z	311.5	18.18	56.6
Vilmorin B	305.9	18.12	55.4
Dippe W I	303.3	18.27	55.4

FRANK MARESH

**New experiments on the effect of breaking the greens upon the yield and quality of sugar beets.** JAROSLAV SOUČEK AND JOSEF SUK. *Listy Cukrovar.* 47, 599-601 (1929).

FRANK MARESH

**Drying sugar beets and extracting the sugar by means of diffusion.** N. L. KARAVAEV AND A. P. PALKIN. *Acta Univ. Asiae Med.* Sci. 6 No. 3, 3-12 (1928); cf. C. A. 23, 299.—With the climatic conditions existing in Middle Asia, sugar beets may be dried in the sun until the middle of October. Dried sugar-beet cuttings with a moisture content of 8-10% can be preserved indefinitely without spoiling. The extn. of sugar from dried-beet cuttings is as good as with raw beets. The purity quotient of the diffusion and satn. liquors from dried beets is not, in general, lower than that from raw beets. The quantity of lime for the defecation of the diffusion liquors from dried beets is considerably lower than that for raw beets. R. P. WALTON

**Treatment of beet juices with sodium carbonate, and the juice alkalinity.** V. STANEK. *Z. Zuckerind. Tschoslovak. Rep.* 53, 173-7 (1929).—Na<sub>2</sub>CO<sub>3</sub> added for the reduction of the Ca content of juices during their clarification should be introduced before the first carbonation, e. g., to the juice in the measuring tanks. If triple carbonation is applied, the alkali should be mixed with the second carbonation juice before turning on the gas, the colloidal CaCO<sub>3</sub> formed being thus entrained by the carbonation scums. In practice, it is found that the quantity of Na<sub>2</sub>CO<sub>3</sub> added should be somewhat more than the equiv. of the Ca present, otherwise, the desired final alk. will not be realized. B. C. A.

**The coloring of beet juices during evaporation.** E. SAILLARD. *Suppl. Circ. hebdom.* No. 2000 (1929); *Listy Cukrovar. Rozhledy* 47, 36.—Observations were made on the changes of color during evapn. of liquors treated with SO<sub>2</sub>. A few runs were made on liquors which had not been so treated. The increased color was slight, from 100 to 108. FRANK MARESH

**Evolution of carbon dioxide in the boiling of thin [beet] juices.** I. E. THIELFAPE AND P. MEIER. *Z. Ver. deut. Zucker-Ind.* 78, 385-92 (1928).—The CO<sub>2</sub> evolved in the boiling of thin juices is not derived entirely from bicarbonates; other decompn.

processes occur to some extent. Juices boiled under pressure at  $116^{\circ}$  evolve during the first hr., a definite amt. of  $\text{CO}_2$ , which does not appreciably increase during the second hr., and the amt. of sugar decomposed is negligible. At  $124^{\circ}$ , however, considerable decompn. of sugar occurs and  $\text{CO}_2$  is evolved as long as boiling is continued. At both temps. the juices, originally alk., become slightly acid in time. B. C. A.

Lime content (of sugar beet liquors) and the addition of soda. C. TSCHASKALIK. *Centr. Zuckerind.* 37, 523-4(1929).—A discussion. J. F. LESTY

Frothing of [sugar] juice during carbonation in the beet-sugar factory. V. STANEK AND J. VONDRÁK. *Z. Zuckerind. tchosllovak. Rep.* 53, 81-98(1928).—See C. A. 23, 2059. B. C. A.

Decolorizing cane and beet sugar juices with sulfur dioxide and activated charcoal. G. MEZZADROLI AND E. VARETON. *L'ind. sacc. ital.* 21, 552(1928); *Listy Cukrovar. Rozhledy* 47, 30.—Treating with  $\text{SO}_2$  in the cold causes no inversion; at  $80^{\circ}$  no inversion occurs as long as the free acidity is less than the org. acid acidity of the juices. Treatment with norite in the cold or warm causes no inversion at a pH 4-5.2; the acidity of the soln. is decreased due to an adsorption of the acids by norite. Treatment with  $\text{SO}_2$  and norite does not produce an inversion even at  $85^{\circ}$  for norite adsorbs the excess  $\text{SO}_2$ .  $\text{SO}_2$  decolorized the liquor, lowered the viscosity and permitted evapn. to proceed without bumping or foaming. Norite decolorized the liquor, adsorbed colloids and lowered the viscosity. Treatment with  $\text{SO}_2$  followed by norite gave better clarification. Lowering in viscosity was greater than with either treatment alone. Surface tension was increased, no foaming occurred, and, after the addn. of norite, the original alky. was restored so that the consumption of  $\text{CaO}$  was not increased. The decolorization was permanent and remained so after the soln. was made alk.; this is not true for treatment with  $\text{SO}_2$  alone. Treatment in dil. soln. followed by a concn. to  $60^{\circ}$  B $\acute{e}$ . gave better results than when solns. were concd., treated with  $\text{SO}_2$  and followed with a norite treatment. The expts. were carried out with beet and cane molasses, sirups and liquors from various processes. FRANK MARESH

Comparative examination of "Norite" and "Carboraffin" in sugar refining. K. REICH AND G. VAVRINECK. *Z. Zuckerind. tchosllovak. Rep.* 53, 285-9(1929).—Analytical figures observed for "Norite Supra 3X" and "Carboraffin" were, resp., loss of wt. at  $150^{\circ}$ , 12.73, 11.10; ash 6.50, 2.98; water-sol. ash 2.27, 1.57%; reaction, alk., neutral;  $\text{Fe}_2\text{O}_3$ , 0.60, 0.34%. Inverting effect was observed by heating 2 g. of each carbon with 100 cc. of a 50% soln. of sugar for  $\frac{1}{2}$  hr. at  $90^{\circ}$ , and detg. the Cu reduced from 50 cc. of Fehling's soln., the figures found being 30.9 and 58.6 mg. (blank 26.0 mg.) To charge a Danek filter of 13 sq. m. surface, the wt. of the 2 carbons to give the same thickness of layer was 30 and 20 kg. After a factory run lasting 49 hrs. using such filters, the color removed by the 2 media was, resp., 29.9 and 39.4%. Boiling the used carbon for 1 hr. with water showed only a slight revivification with the "Norite," but re-stored the "Carboraffin" to 50% of its original decolorizing power. B. C. A.

Advances in the control of saturation. K. SOLOS. *Deut. Zuckerind.* 54, 540-51(1929).—A review. J. F. LESTY

Experiments on diffusion. W. SZYMANSKI. *Gaz. Cukrowc.* 64, 311(1929); *Listy Cukrovar. Rozhledy* 47, 30.—Observations on diffusion in the cell were made by packing beets into sacks of a coarse weave of 1 kg. capacity and distributing them throughout the diffusion cells. Before blowing the cell, the sacks were withdrawn and analyzed. The least diffusion occurred at the surface opposite to the  $\text{H}_2\text{O}$  intake. F. M.

Innovation in diffusion batteries. HERMANN GUTHERZ. *Centr. Zuckerind.* 37, 522-3(1929).—G. describes a new type of relief sieve with slits which, placed inside the customary round-hole sieve, increases the efficiency of the battery, especially when small beets are handled. J. F. LESTY

Determination of sugar content at receiving and diffusion time and its significance in determining the losses. KAREL HERZBERG. *Listy Cukrovar.* 47, 644-5(1929). The change in sugar content was  $18.08-17.80 = 0.28\%$  at Mironovka. H. found a difference of  $0.20\%$  in 1927-8. It is not correct to take the wt. of beets and subtract  $1.5\%$  for adhering  $\text{H}_2\text{O}$  as advised by Kryž when losses are computed. F. M.

Scale formation in evaporators. K. FEUERLEIN. *Centr. Zuckerind.* 37, 630(1929).—F. describes, with analyses, deposits in evaporators at 4 beet sugar factories. J. F. LESTY

Freeing the heating surface of evaporators of deposits. H. A. SCHLOSSER. *Deut. Zuckerind.* 54, 545-8(1929).—S. discusses the problem and recommends, especially when much  $\text{SiO}_2$  is present, boiling 1 hr. with 1% solns. of  $\text{HCl}$ ,  $\text{NH}_4\text{Cl}$  and  $\text{NaOH}$ , resp. Changing the order of treatment leads to poorer results. Examples are given of analysis and treatment. J. F. LESTY

**How much water is necessary to leach out the sugar from the mud in the presses?** FRANZ KERCHER. *Centr. Zuckerind.* 37, 597–601(1929).—Expts. under controlled and varied conditions lead to the following conclusions: (1) The amt. of sugar extd. varies directly with the time and inversely with the water pressure. (2) The leaching effect of cold water is 11% higher than that of hot. (3) Leaching is favored by diln. of diffusion liquor, a shorter time of diffusion and lower battery temp. Under the most favorable conditions the leaching of 0.1–1% sugar required water equal to 80% weight of mud. Other conclusions, tables and curves are given.

**Inversion of sucrose by weak acids.** V. ZAFOUK. *Z. Zuckerind. Tschoslovak. Rep.* 53, 33–42(1928).—Under like conditions regarding molar concn. temp. (70°) and H-ion concn., aspartic acid hydrolyzes sucrose more rapidly than does succinic acid. Glutamic acid, on the other hand, has the same rate as succinic acid at  $p_H$  4.5, but this increases with rising  $p_H$ , until at  $p_H$  5.1 it is the same as in the case of aspartic acid. At a still higher  $p_H$ , glutamic acid inverts more rapidly than aspartic acid. At  $p_H$  5.5 succinic acid inverts insignificantly, and at  $p_H$  5.7 aspartic acid also practically ceases to hydrolyze.

**Following up the inversion danger.** G. BRUHNS. *Centr. Zuckerind.* 37, 702–3(1929).—B. recommends the use of Mueller's soln. instead of Fehling's in testing for invert sugar. 173 g. cryst.  $CuSO_4$ , 331 g. anhyd. (or 893 g. crystd.)  $Na_2CO_3$  and 865 g. Rochelle salt are made up to 5 l. The proportion of Rochelle salt can perhaps be reduced. The soln. can be kept for several months if pure salts are used. Mueller's soln. is less affected by sucrose but more sensitive to invert sugar than Fehling's. Fifty cc. of the former (2 months old) plus 10 g. sucrose, boiled for 2 min., yield 4.8 mg. Cu, for 4 min., 6.4 mg. Cu. The same tests with Fehling's yield 37 and 64 mg. Cu, resp. Boiled 2 min. with 50 mg. dextrose M.'s soln. yields 117, F.'s 97 mg. Cu. Qual. tests for invert sugar are made by heating 5 cc. M.'s soln. with 10 cc. thin liquor, 5 cc. thick liquor dild. to 10 cc. or 2–3 g. sugar made up to 10 cc. for 10–15 min. on a water bath.

**Lafeuille crystallizer-pans at Arayat central.** F. LAFEUILLE. *Sugar News* 10, 210–8(1929).—The pan is described, its advantages being enumerated. V. G. LAVA

**The origin and composition of molasses.** JAR DEDERK. *Chem. Listy* 21, 253–61(1927): cf. *C. A.* 22, 182. Crystn. of molasses was followed over 28 days by measuring the  $n_D$ , loss in weight, etc. Twenty-one salts were observed in their ability to promote crystn. in molasses:  $LiCl$ ,  $NaOAc$ ,  $K_2CO_3$ ,  $K_3PO_4$  and  $KOAc$  did not produce crystn. after 16 months. The "crystg. coeffs." served as a measure of the rate of crystn. and were computed from changes in the  $n$  and loss in  $H_2O$ . They are  $MgSO_4$  66,  $K_2Fe(CN)_6$  57,  $Na_2SO_4$  42,  $KBr$  27,  $NaCl$  26,  $KNO_3$  26,  $NaK$  tartrate 26, sucrose 21,  $Na_3PO_4$  20,  $KCl$  19,  $Na$  citrate 19,  $Na_2CO_3$  17,  $(COONa)_2$  14,  $C_6H_5COONa$  13. No regularities appear; the lowering of the  $f_p$  of a 0.5 N sucrose soln. was observed in 0.5 N glycine, 0.5 N  $NaOH$ , 0.25 N  $KOAc$ , 0.25 N  $NaK$  tartrate, 0.5 acetamide, 0.5 betaine. In all cases the actual depression exceeded the theoretical. In electrolyses of sucrose or diluted molasses and various electrolytes, sucrose was found at the anode and never at the cathode—showing sucrose to behave as an anion. The effect of salts upon the acid behavior of sucrose was detd. by measuring the concn. of  $OH$  ions in alk. solns. of salts with and without the addn. of sucrose. 2 N  $KCl$ , 2 N  $LiCl$ , 2 N  $NaOAc$ , 2 N  $NaK$  tartrate and 2 N  $HCOONa$  were tried with 0.22319 N and 0.55798 N  $KOH$ ; the presence of the salts increased the neutralizing effect, i. e., the acid character of sucrose. The greatest effect is produced by  $Cl$  and may be due to salts of inorg. acids; the salts of org. acids have a smaller effect. This agrees with cond. measurements and indicates the existence of complex ions in such mixed solns. In molasses, salts of weak org. acids predominate and their influence upon sucrose is small so that the problem of molasses crystn. does not lie here. The colloids found in sugar-refining liquors hinder but do not prevent crystn. Viscosity measurements were made on solns. of  $NaCl$ ,  $LiCl$ ,  $Na_2SO_4$ ,  $(COONa)_2$ ,  $Na_3PO_4$  and  $MgSO_4$ , solns. of  $MgSO_4$  and  $(COONa)_2$ , which crystallize well, have a viscosity slightly exceeding sucrose, but  $Na_3PO_4$ , which also crystallizes well, has a high viscosity, and  $LiCl$ , which fails to crystallize, has a low one. Viscosity alone cannot be the cause of noncrystn. although it may retard crystn. Solns. of sucrose and salts crystallize slower than solns. of sucrose alone. About  $1/3$  of the salts failed to produce crystals during 2 months. Of these 70% remained unchanged after 16 months while 30% formed crystals. Phase diagrams are drawn in explanation on the basis of mol. compn. Photomicrographs accompany the exptl. data.

**Nitrogenous constituents of molasses and their bearing on its value.** H. CLAASSEN. *Z. Ver. deut. Zucker-Ind.* 78, 371–84(1928).—Rational evaluation of beet molasses for yeast manuf. or foddering purposes should take account of the contents of total, assimila-

ble and amide N. Assimilable N may be detd. by 2 successive yeast fermentations, with addn. of sugar after the first, as described previously (C. A. 21, 1558). The amt. thus detd. is much greater than that actually assimilated in methods of aeration yeast manuf. where large quantities of  $\text{NH}_4$  salts are added, because the yeast assimilates the  $\text{NH}_4$  in preference to other nitrogenous compds., although the latter are a better form of nutriment. To obtain max. yields of bakers' yeast, the molasses worts should contain 2-2.5 pts. of assimilable N per 400 pts. of sugar, although only about half of the former passes into the yeast crop; a more complete utilization of the assimilable N is only possible at the expense of the quality of the yeast. Beet molasses usually contains, per 100 pts. of sugar, about 3.4 pts. of total N and 1.4-1.8 pts. of assimilable N. The necessary excess of the latter may be provided by addn. of an ext. of malt germs, which contains about 1.8% of total soluble N and 1.4% of assimilable N similar in character to that of molasses. B. C. A.

**Electrodialysis of exhaust molasses.** NAOTO KAMEYAMA AND YOZO MAYEDA. *J. Soc. Chem. Ind. Japan* 32, 674-81 (1929); Suppl. Binding 32, 205B (1929).—For the removal of the mineral ingredients, cane molasses was electrodialyzed in a 3-compartment dialyzer, while  $\text{CO}_2$  was passed into the cathode compartment. The cathodic diaphragm was made of parchment paper on which colloidal copper ferrocyanide had been pptd. Seven kinds of anodic membranes were tried. The best result was obtained with a silk membrane which had been soaked with bichromated gelatin and exposed to sunlight. S. OKA

**The size of seed pieces in relation to germination and the relation of irrigation to germination.** H. ATHERTON LEE AND PABLO QUIZON. *Sugar News* 10, 176-85 (1929).—With Uba cane L. finds that when soil moisture is below the optimum: (1) seed pieces larger than three-eyes are desirable; (2) irrigation following planting had very marked effect in increasing germination of the two-eye and three-eye seed pieces, but had very little effect on the total germination of the ten-eye seed pieces; (3) irrigation increased the speed of germination by at least 1 month for all sizes of seed pieces. V. G. L.

**Manufacture of dextrin.** ANON. *Chemist Druggist* 110, 202 (1929).—Addn. of certain metallic salts, e. g.,  $\text{MnCl}_2$  (cf. C. A. 23, 2844), to the starch-HCl mixt. hastens conversion of the dried mixt. to dextrin at a temp. of only about 120-130°. S. W.

**Starch ester.** I. FUKUSHIMA AND Y. TAKAMATSU. *J. Soc. Chem. Ind. Japan* 32, 130-5 (1929); Suppl. Binding 32, 42-4B (1929).—Alkali starch prep'd. by kneading 1 pt. of starch with 5 pts. of NaOH soln. of various concns. was esterified with 5 pts. of  $p\text{-C}_6\text{H}_4\text{CH}_2\text{SO}_2\text{Cl}$  and 30 pts. of  $\text{C}_6\text{H}_6$ . The ratio of combined sulfonic acid to starch was calcd. from the S content of the product detd. by Carius method. Esterification was complete within 24 hrs. at 40° and was independent of the amt. of  $p\text{-C}_6\text{H}_4\text{CH}_2\text{SO}_2\text{Cl}$ . With an increase of the concn. of NaOH, the acid content of the ester increased, but within the range of 12-30 vol.-% the ratio was practically const., i. e., 1 mol. of sulfonic acid to 1 mol. of  $\text{C}_6\text{H}_{10}\text{O}$ . Lower esters of starch showed color reaction with I, but higher esters did not. Sol starch and dextrin produced similar esters, their acid ratio being 1.5 and 1 mol., resp., to 1 mol. of  $\text{C}_6\text{H}_{10}\text{O}$ . Y. TOMOHA

The effect of sugar factory waste water on streams (MATSCHKE) 14. The waste from [sugar refineries] in Pommern (MÖLLER) 14. Sugar beet parasites (RAMBOUSEK) 15. Statistical collections from the laboratory for soil investigation of the sugar factory of Greifswald, Pomerania (ERDENRECHER) 15. Fertilizer constituent test. Phosphoric acid gives profitable increased yields on lowlands at Bacolod-Murcia mill-site (LEE, *et al.*) 15. An investigation of cane molasses distillery slop (NELSON, GREENLEAF) 16. Some organic acids of sugar-cane molasses (NELSON) 10.

**Removing albuminous substances from molasses or other saccharine solutions.** JACOB POBLMANN and JACOBUS R. F. RASSERS. U. S. 1,726,451, Aug. 27. The soln. in non alk. condition is treated with tannin or other suitable non-alk. substance capable of pptg. the "ferment albumins," and the ppt. formed is sepd.

## 29—LEATHER AND GLUE

ALLEN ROGERS

**The relation between tannins and non-tannins in the extracts.** Contributions to a theory of tanning. V. S. SADIKOV. *Biochem. Z.* 210, 206-333 (1929).—The tannins are very sensitive substances which easily change into insol. condensation or oxi-

dation products (tannoids), and the tannins together with the tannoids may form either reversible or irreversible systems. The relation of these phenomena to the process of tanning as well as the methods for investigation is extensively discussed. S. M.

**Tizrah wood and extract.** W. VOGEL. *Collegium* 1929, 68-74.—See C. A. 23, 729. E. H.

**The Bloom gelometer, a modern instrument for testing glue and gelatin.** HANS MENDEL. *Chem.-Ztg.* 53, 591-2(1929).—Cf. C. A. 19, 2280. J. H. M.

**Faulty liming of glue stock.** H. STADLINGER. *Kunstdünger- u. Leim- Ind.* 25, 200-1, 211-2; *Chem. Zentr.* 1928, II, 1170.—S. points out the great losses resulting from the influence of heat and cold on the glue stock. He discusses the advantages of digestion with lime soln. as compared with NaOH, acid or enzymes. He favors a short, energetic liming of the glue stock. Reduction to small size of the glue stock before liming is necessary. G. SCHWACH

**Rubber in the production of leather (CRISPIN) 30.** The analysis of Na sulfide, sulfite and bisulfite (AUERBACH) 7. Apparatus for drying hides (Ger. pat 480,571) 1. Dyes [for leather] (Brit. pat. 306,447) 25.

**CHAUVEL, HÉRVÉ:** Les tanins végétaux et en particulier les écorces tannantes de Madagascar. Paris L. Declume. 180 pp. F. 18.

**Tanning.** REISCHACH & Co. G. M. B. H. Ger. 479,620, Feb. 19, 1928. Hides are tanned with a soln. of bivalent Fe salt and NO, which is free from higher oxides of N. The example mentions  $\text{Fe}_2\text{SO}_4 \cdot 7\text{H}_2\text{O}$  as a suitable salt.

**Tanning agent.** ANDREA CAMINNECI. Ger. 479,909, Jan. 21, 1925. A solid tanning agent is obtained by adding vegetable tanning material to cellulose sulfite lye and pptg. by acids or salts. The mixt. may be halogenated before the pptn. occurs. Thus, a mixt. of cellulose sulfite lye and quebracho ext. is chlorinated and the tanning agent so formed is pptd. with Fe salt soln. Other examples are given.

**Tanning with iron salts.** REISCHACH & Co. GES. Brit. 306,400, Feb. 18, 1928. NO is passed into a soln. of a ferrous salt such as the sulfate, chloride or acetate, in the absence of air and in the presence of the hides or before their introduction into the bath, and after treatment in the soln. for a time the hides are exposed to air or O (which may be under pressure).

**Leather.** ROBERT H. PICKARD, DOROTHY JORDAN-LLOYD and ALBERT F. CAUNCE. Ger. 480,228, Aug. 25, 1925. Skins and hides to be treated with gaseous HCHO are first dehydrated by volatile water-absorbing substances such as acetone.

**Leather treating.** CHEMISCHE FABRIK POTT & Co. Ger. 479,927, Aug. 31, 1926. Leather and hides are soaked in aliphatic, isocyclic, aromatic and hydrogenated aromatic compds. such as condensation products of naphthalene with satd. alcohols contg. 2 or more C atoms.

**Dyeing chrome-tanned leather.** SOC. ANON. POUR L'IND. CHIM. A BALÉ. Brit. 305,949, Feb. 9, 1928. Alumina-chrome-tanned leather is dyed in fast tints by use of Cr compds. of mordant dyes. Alumina-tanned leather is first softened with warm aq. diastase soln., chrome-tanned in a fresh bath, neutralized with borax soln. and dyed (preferably with addn. of  $\text{NH}_4\text{OAc}$  at first and of formic acid later in the dyeing process).

**Glue from chrome leather waste.** CARL STIEPEL. Ger. 480,378, Feb. 4, 1928. The waste is compressed into thin sheets and then treated by known processes. Fibrous material may be added to assist in forming the sheets.

**Glue.** ERNST BUHTZ. Ger. 479,612, April 24, 1927. Glue prep'd. from animal matter is improved by treating it with yeast under conditions ensuring a strong evolution of  $\text{CO}_2$ .

**Gelatin and glue.** J. T. DIXON. Brit. 306,439, Nov. 18, 1927. Gelatin or glue to form sheets, filaments or the like is treated with 30-50% its wt. of a saponified fatty material, such as linseed or castor oil or a saponified, sulfonated, fatty material, to improve its flexibility, strength and transparency. Hardening agents may be added, and by the addn. of 1-2% of PhOH or NaI or KI a binder especially suitable for use in making "splinterless" glass is prep'd.

## 30—RUBBER AND ALLIED SUBSTANCES

C. C. DAVIS

Chemical analysis of gutta-percha, balata and allied gums. S. MINATOYA, K. ISHIGURO AND K. MARUYAMA. *Res. Electrotechn. Lab., Japan* No. 232, 14 pp.(1928).—Chem. analysis is of great importance in research on gutta-percha, balata and allied gums for submarine cable insulation. The authors collected 26 kinds of gutta-percha, 8 kinds of balata and 3 varieties of allied gums with trade names, and analyzed them for moisture, ash, dust, resin and gutta hydrocarbon. The resin, which has the most influence on the elec. and mech. properties, was subdivided into the so-called "fluavile," "spherical albane" and "needle albane." W. OGAWA

The gutta-percha-like substance obtained from Tu-chung. S. MINATOYA AND K. ISHIGURO. *Res. Electrotechn. Lab., Japan* No. 260, 16 pp.(1929).—The characteristics of the gutta-percha-like substance derived from the bark of Tu-chung were investigated with a view to applying it to insulating material for submarine cables. By extn. it was found that the air-dried bark contains moisture 9.88, resinous 14.65 and gutta-like hydrocarbon 6.46%. The elec. and mech. properties of this hydrocarbon are as good as those of gutta-percha. Elementary analysis and the I value showed that this hydrocarbon is a polymer of isoprene or  $(C_5H_8)_n$ . The authors also detd. the change of plasticity with temp., softening point, tensile strength, elongation at break, hardness, elasticity, water absorptive power, resistance to chemicals, elec. puncture voltage and power factor of the hydrocarbon. W. OGAWA

A study of the viscosity of rubber latex. C. M. BLOW. *Trans. Faraday Soc.* **25**, 458-62(1929).—Samples of different latexes were dild. to different degrees and their viscosities detd. as a function of concn. For dild. the serum of the same latex was used, so as not to introduce new variables arising from colloidal changes which might take place if water was added. From the viscosity values of the dild. latexes, the vols. of the dispersed phase were calcd. by the Einstein formula, taking as the viscosity of the dispersion medium that of the original serum. The shape of the concn.-relative viscosity curves is very nearly similar to that of Borrowman (cf. *Rubber Industry* 1929, 243). There is a deviation from the equation of Einstein, but this equation is valid at low concns. In some there was a slight increase of vol., which may have been caused by the presence of an adsorbed, hydrated layer. On dild. with water, the viscosity and content of the dispersion medium changed as a result of the adsorbed layer going into soln., the viscosity of the dild. serum being lower than that of the serum obtained from latex of the same concn. The thickness of the adsorbed layer was 0.10  $\mu$  in the extreme case. The viscosity of a latex depended greatly upon the viscosity of its serum. C. C. DAVIS

Heat effects which accompany the spontaneous increase in density of raw rubber. H. SACHSE. *Gummi-Ztg.* **43**, 2216, 2218(1929).—The heats of swelling of various samples of rubber were measured in a specially designed calorimeter, which is described and illustrated and which employs  $Ph_2O$  as the dilatometer liquid. By assuming that all samples reach practically the same final state of energy, it is possible to obtain the energy difference of the original state and the heat tone of the spontaneous process, which make the rubber more dense, from the difference between the heats of swelling. The samples included (1) crepe which had been stored 10 yrs. at room temp. and had lost its rubbery properties; (2) hot-milled crepe which had been stored several yrs at room temp. and still showed a calendar effect; (3) para rubber; (4) crepe elongated, fixed and stored several days; and (5) the foregoing samples expanded by storage at 40-50° and then at 20°. Crepe (1) required higher temps. for expansion than (2), the expansion of (2) being complete on warming to 40°. Crepe (5) was particularly interesting, for here a neg. heat effect was obtained at first, followed by a pos. effect. The following data give the sample, the heat effect (in cal.) at 0° and the heat effect at 26.55°, resp.: (1), -3.17, -6.22; (1) (expanded), -1.6, -1.62; (2), -2.16, -; (2) (expanded), -1.34, -1.51; (3), -1.93, -; (3), (expanded), +0.70, +1.70; (4), -2.83, -5.52 (fixed and stored 3 months); (5), -, -0.5 to -1.0. The highest observed value of the heat of condensation of crepe which had not been first treated mechanically was approx. 6.4 cal. per g. This represents the extreme case of condensed rubber which is no longer elastic. Milled rubber samples which had been elongated and fixed showed lower values, which correspond to their power of further condensation. To this may also be attributed the more ready expansion on increase of temp., which is complete at 40°, whereas the crepe, which had been stored for 12 yrs. and was completely condensed, expanded only at higher temps. from 60° to 80°. C. C. D.

**The crystal structure of Tjipetir gutta-percha.** (Comparison with frozen rubber.) F. KIRSCHOF. *Kautschuk* 5, 175-83(1929); cf. *C. A.* 23, 1525.—Purified Tjipetir gutta-percha is a particularly good product for studying the cryst. structure of the gutta-percha hydrocarbon. It was dissolved in  $C_6H_6$  at  $80^\circ$  (16% soln.), filtered, let stand several days at  $15^\circ$  and decanted, which left a mass of microscopically small spherulitic dendritic crystals. Cooling the mother liquor to  $10$ – $12^\circ$  deposited further microcrystals of clustered dendritic form. When the 16%  $C_6H_6$  soln. was let stand 14 days at  $15^\circ$  and then cooled to  $0^\circ$ , delicate fibrous or needle crystals were deposited, followed by complete gelation. On warming any of the solns. above a certain temp. range ( $24$ – $5^\circ$ ), a clear soln. was again obtained. The deposit of gutta-percha from  $C_6H_6$  thus depends upon the temp. and the rate of cooling, as with monomol. fusions or 2-phase hydrosols, e. g., Na oleate. The formation of cryst. nuclei also depends upon the concn. Various other details of the crystn. phenomena are described and illustrated by photomicrographs. The viscosity of the solns. varied in direct proportion to the temp. between  $10.5^\circ$  and  $40.5^\circ$ , but below this range flocculation upset the results. This linear relation is probably a resultant of compensation between the decrease in concn. and the increase in micellar friction. The com. pure gutta-percha melted at  $62$ – $4^\circ$  and froze at  $42^\circ$ , the more highly purified spherulitic dendrites at  $66^\circ$  and  $45^\circ$ , resp., and the needle form at  $64$ – $5^\circ$  and  $41$ – $3^\circ$ , resp. The original material probably contained oxidation products. There was not only a temp. hysteresis between the m. p. and f. p. but also a time hysteresis, both of which are also true of frozen rubber (cf. van Rossem, *C. A.* 23, 2320). This time hysteresis was far shorter with solid gutta-percha than in  $C_6H_6$ , and after crystd. gutta-percha had once been fused its subsequent crystn. was more rapid, perhaps because of the presence of cryst. nuclei. The d. of crystd. gutta-percha was distinctly higher than that of fused gutta-percha or of rubber, the d. of dendritic gutta-percha, fused and partially crystd. gutta-percha, fused gutta-percha, frozen rubber and fused rubber being 0.977–0.992, 0.959–0.960, 0.938–0.939, 0.930–0.945 and 0.900–0.910, resp. The results indicate that the hydrocarbon of gutta-percha is different from that of rubber. Gutta-percha may, however, be a *trans* and rubber a *cis* form of the same hydrocarbon, so that in some cases the same derivs. are obtained. C. C. DAVIS

**New American standards for the correct formulation of rubber mixtures according to the conditions prevailing in February, 1929.** WERNER ESCH. *Gummi-Ztg.* 43, 2536, 2586-8(1929).—A review and discussion of the most recent practice. C. C. D.

**Rubber and its fractions.** R. PUMMERER. *Kautschuk* 5, 129-35(1929).—A review and discussion, with new points of view and new data. Detns. of the I no. and of the O no. (with perbenzoic acid) of various sol and gel fractions of alkali-purified latex, Revertex, crepe and smoked sheet showed that, in general, gel-rubber requires more  $ICl_3$  and more perbenzoic acid than sol-rubber (based on the % of the theoretical per double bond per  $C_6H_8$  group), the values for the gel-rubbers running well over 100 and those of the sol-rubbers 100 and below. Gel-rubber is, however, probably more unsatd. than sol-rubber, for no differences in the addn. of  $HCl$  or of  $PhNO$  were found. The evolution of  $HCl$  with  $ICl_3$  is fundamentally different, no  $HCl$  being detected with sol-rubber, whereas with gel-rubber 5% of the halogen consumed is evolved as  $HCl$ , indicating either substitution or cyclicization. By assuming substitution, calcs. show that sol-rubber and gel-rubber have the same no. of double bonds. Other evidence suggests a difference in the configuration (*cis* and *trans*) or in the micelles. By warming, sol-rubber becomes similar to gel-rubber, its viscosity and tenacity increasing and its chem. properties (titers) also approaching those of gel-rubber. The decrease in viscosity found by Staudinger and Bondy (cf. *C. A.* 23, 3372) can be explained by the fact that air was not excluded and, furthermore, the rate of cooling affects the viscosity, sol-rubber in  $C_6H_6$  being more viscous when cooled slowly after heating than when cooled rapidly. This latter fact indicates a micellar structure of rubber solns. The cooling effect is as great as the total heating effect if cooling is slow. The osmotic pressure is primarily an indication of the tendency of rubber to swell, and it is not a measure of the size of the mol. Cryoscopic and osmotic measurements are sometimes contradictory, and in such cases the cryoscopic method may be erroneous because of the *crystn. of complex phases of rubber and solvent*. In expts. on this subject, crystals of  $C_6H_8$  contg. 0.74–0.85% rubber were obtained. This tendency to form rubber- $C_6H_8$  crystals may be utilized for the further purification of rubber. A general discussion follows the paper. C. C. DAVIS

**The optical anisotropy of stretched rubber.** H. ZOCHER WITH H. J. v. FISCHER. *Kautschuk* 5, 173-5(1929).—A Berek calcite compensator was used for measuring the double refraction of stretched rubber, the complete app. including a means for the

uniform bilaterally symmetrical stretching of the rubber at a const. rate, with examn. by the microscope. Various types of rubber, including frozen samples, were examd., the influence of the rate of stretching, the temp., the degree of mastication and the state of vulcanization being detd. and correlated with the accompanying changes in mech. properties. In place of the theory of Hauser and Mark, according to which the appearance of x-ray interferences is due to crystals already present in coherent form, the hypothesis is advanced that the impurities form a coherent whole, out of which a crystallizable substance is expelled by stretching or by racking, which is purified to an extent that it can crystallize and become a discontinuous phase. Simple models can readily be made to illustrate the phenomenon. Among other features, the well-known differences in the "melting point" are easily comprehensible by the aid of this hypothesis. The Joule-Thompson heat effect is explained as a heat of crystn. and of fusion or soln. A general discussion follows the paper. C. C. DAVIS

**Rubber in the production of leather.** CRISPIN. *Gummi-Ztg.* 43, 2534-5(1929).—A general discussion, with particular reference to certain recent patents. C. C. D.  
**The degree of devulcanization and the valuation of reclaimed rubbers.** Answer to H. Loewen. EUGENIO LINDMAYER. *Kautschuk* 5, 183-4(1929).—Further comments (cf. Loewen, *C. A.* 23, 3373). C. C. DAVIS

Meaning and measurement of plasticity (KARRER) 2. Thiazole derivatives [vulcanization accelerators] (Brit. pat. 306,558) 17. Containers lined with rubber (Ger. pat. 481,283) 1.

**Chlorinating rubber.** F. C. DYCHE-TEAGUE. Brit. 305,968, Sept. 13, 1927. Rubber is first "disaggregated" or depolymerized by continued mastication until the "nerve" is completely destroyed, and is then chlorinated. The mastication may be effected in  $\text{CCl}_4$ , accompanied by exposure to ultra-violet rays; prior to mastication the rubber may be exposed to air or  $\text{O}_3$  to effect oxidation.

**Treating rubber with chlorostannic and chlorostannous acids.** H. A. BRUSON (to Goodyear Tire & Rubber Co.). Brit. 306,390, Feb. 18, 1928. Tough balata-like products or ebonite-like products (depending on the time and temp. of heating) are obtained. The corresponding Br acids also may be used.

**Uniting rubber and cellulose derivatives.** C. MACINTOSH & CO., LTD., S. A. BRAZIER and G. F. THOMPSON. Brit. 305,745, Dec. 1, 1927. Mutual solvents of rubber and of the cellulose derivs. are used as bonding agents. Various details are given.

**Ornamental embossing of rubber sheets.** BROADHURST & CO., LTD., and W. J. DEXTER. Brit. 306,276, Feb. 11, 1928. Mech. features.

**Use of sponge rubber and ordinary rubber in forming rubber brushes, etc.** F. A. LERSON and L. A. KOHLER. Brit. 305,735, Nov. 21, 1927. Structural features.

**Sealing containers with rubber latex.** B. DEWEY (to Dewey & ALMY CHEMICAL Co.). Brit. 306,040, Feb. 14, 1928. The rubber particles of a latex are vulcanized while conserving the aq. suspension as described in Brit. 193,451 (*C. A.* 17, 3430) and the water is evapd. after application of the latex as a sealing material. Bentonite or other materials may be added.

**Devulcanizing scrap rubber.** DUNLOP RUBBER CO., LTD., D. F. TWISS and F. THOMAS. Brit. 305,826, Feb. 17, 1928. Scrap rubber is treated at atm. pressure with a hot soln. of caustic alkali in a polyhydric alc. such as glycerol until it can be sheeted.

**Apparatus for testing the strength and elasticity of cords.** M. L. KOCHHEISER and S. A. STEERE (to Goodyear Tire & Rubber Co.). Brit. 306,555, Feb. 23, 1928. Structural features.

**Plastic compositions.** JEAN BAER. Swiss 132,322, Oct. 15, 1927. Elastic rubber-like bodies sol. in  $\text{CS}_2$  are prepd. by the action of  $\text{HCHO}$  on S or polysulfides in the presence of a solvent.

**Plastic compositions.** JEAN BAER. Swiss 132,505-132,508, Oct. 20, 1926. Rubber-like masses are prepd by the action on S or polysulfides of  $\text{C}_2\text{H}_5\text{Br}$  (132,505),  $\text{C}_2\text{H}_5\text{I}$  (132,506),  $\text{CH}_2\text{Cl}_2$  (132,507) or  $\text{CH}_3\text{Br}$  (132,508) in the presence of a solvent. The products are sol. in  $\text{CS}_2$ .
